PADDINGTON IRON WORKS, LONDON, W.,

AND SANDYMOUNT FOUNDRY, LLANELLY, CARMARTHEN.

**PATENT WROUGHT-IRON SASHES WITH WROUGHT BOSSES**

SPECIALLY ADAPTED FOR WAREHOUSES, SCHOOLS, AND PUBLIC BUILDINGS.

CABLE LIGHT

The Patentee begs to call particular attention to the great strength of this construction. The Bars and Bosses, being of malleable wrought iron, form an exceedingly firm joint at the intersection of bars. They are durable, and of light appearance, the Bosses being small and not unsightly. They can be made at very short notice, and at the price of an ordinary cast iron sash.

PRICES UPON APPLICATION.

CABLE LIGHT.

CLOSE BAR SASH (obviating use of Window Guards.)

ORDINARY WAREHOUSE AND SCHOOL SASHES.

Back view of Boss, full size.

Section through Boss, full size.  
These can be glazed flat, like ordinary wooden sashes, without the corners of the panes being chipped off.

Front view of Boss, full size.  
Obscuring no appreciable light.

Exhibited in the Salon in 1882. In Nine Sections, price Sixpence each. Now ready. Sent by post, carefully rolled, price Sevenpence each.

May be obtained from all Newsagents or Booksellers, or at the

OFFICE OF "THE ARCHITECT," 175 STRAND, LONDON, W.C.

# The Architect.

## HOUSE-HUNTING.

THE trials and perplexities of the man, or woman, who is engaged in the selection of a new abode, have many a time and in many a form been made the subject of description grave or gay; and we observe just now in the daily press an animated correspondence which is being kept up—the subject being no doubt a very useful and appropriate one for holiday time—with more than usual vigour, as if for the purpose of showing that such trials and perplexities are vastly greater in our day than they have ever been before. If they are so, the reason is twofold. It is not that the houses of our towns are worse than they used to be; for indeed, comparing old with old and new with new, they are much better: but what may be called the just demands of those who represent the age, in this as in many other respects, are no doubt considerably advancing, while, at the same time, it is equally plain that the personal fastidiousness of some who do and some who do not represent the age is becoming so very much artificialised and exaggerated as to be difficult to meet. The leading question with which the troubled mind of the house-hunter is now to vex itself is of course the smell of drains; but urgent attention is at the same time not to be denied, according to the new doctrine of house-hunting, to various other important points—aspect and prospect, for instance, party walls and neighbours, and the Queen ANNE style of decoration. In all this, as need scarcely be said, there is a good deal that is more or less new, and a good deal that is more or less true; but if upon investigation it should appear to the bewildered house-hunter that most of what is new is scarcely true, and most of what is true is scarcely new, he may console himself at any rate with the trite reflection that such is the way of a great many other things in social science besides house-hunting.

We are happy to find that the old panacea for all the ills that houses are heir to seems to have dropped out of notice, namely, the conviction and execution of an architect for murder. The various lines of argument which, in former discussions of the same subject in the newspapers, used to converge upon this proposition do not now appear. On the contrary, it is the architect—or surveyor as he is called in this connection—who is to be called in for the conviction and execution of somebody else, generally the builder or the landlord. We are speaking seriously. Knowing a little of the ways of "Crown's quest law," we feel compelled to say gravely that, a few years ago, if a jury could by any means short of too palpable idiocy have delivered over to the late Mr. MARWOOD a real architect, thousands of excellent people would have experienced a melancholy satisfaction, hoping that this would prove to be at any rate a step, however painful, in the direction of house reform. On the same ground, what we now see is the likelihood of a verdict being announced one of these days, to the effect that some enterprising speculative builder whose bricklayer has failed to make his drains airtight, or some dull house proprietor who has failed to appreciate the consequent smells, has thereby rendered himself liable for the sacrifice of innocent life, for which it might be good policy to pronounce him guilty of something closely resembling culpable homicide. At any rate we are glad to see that the poor architect is at length out of danger, and thus to be able to feel that by his means the public indignation in respect of ill-built houses may be now in some degree kept on the right track, and perhaps restrained also within reasonable limits. For we have plainly to say that, amidst the babel of modern sanitarian tongues, it is his alone that may safely be listened to; the experienced architect is the only qualified doctor of houses, and the more the matter is discussed the more will this become manifest.

The peculiar circumstances of house occupation in and around London are such as to make house-hunting here a much more complex business than it is anywhere else. We

have to remember that a population exceeding that of the whole kingdom of Scotland, and every day increasing, is densely massed within a circle a very few miles in diameter; that in the average wealth of even its ordinary classes this population is supreme in the world; and that in an intelligent aptitude to appreciate residential and other material comforts the sense of being at headquarters is dominant throughout the largest possible proportion of the community. To meet this state of things, and especially in view of the constant demand for augmented accommodation, and the restlessness of the people in continually changing their abodes, an enormous trade is carried on without interruption around the whole circumference, in building new houses, under conditions which are (so to speak) facilitated to such an extreme as to be rendered complex to an extreme—what with ground rents, leasehold rents, improved rents, mortgages, public contributions of all kinds, and professional technicalities beyond all comprehension of ordinary minds, over the whole of which, and under the whole, there lies that essential principle of freedom of tenancy, whereby a man has no more personal interest in his home than he has in a box at the theatre, or a seat on the top of an omnibus. In fact, it is this freedom carried to excess which not only has created the practice of house-hunting, but which in and around London has made it the perfectly bewildering and troublous thing so justly complained of. It comes at last to this, that the house-hunter in the suburbs of London is like the pioneer on the American prairie, an explorer without a guide in a perfect wilderness, knowing nothing, trusting nobody, taking every risk as he best can, hoping against hope, and relying at the worst upon his liberty to try again. Leaving out of account the older and more central portions of the town, over which business reigns, the whole vast area around, where residence is the ruling consideration, is a *terra incognita* of this kind, in which house-hunting from time to time has become to many people—we might almost say to most—an adventure of despair.

When the house-hunter is advised to explore with assiduity the drainage of the house he prefers, no one who understands the subject will hesitate to acknowledge that, as a rule, the house drainage of London, both old and new, will take a good deal of exploration. The fact cannot be too persistently urged, or the explanation of it too often reiterated, that one direct consequence of our system of underground sewerage is the continual endeavour of sewer-gas to force its way backward into the houses. In almost every case where extraordinary precautions have not been taken recently, this endeavour is at the present moment more or less successful, and it is best to look the truth fairly in the face that Londoners in general have been actually acclimatised to the inhalation of a moderate quantity of the poison, or they would suffer more from its effects than they do. Now the simple proposition of our sanitary surveyors is that the structural defects which are the cause of this are easily cured—in fact, more easily cured than endured. The advice given to house-hunters on this point therefore, is to call in a surveyor and have the drains examined and reported upon, together with the sinks, closet apparatus, and so on, as matter of course, and the water supply while he is about it. This is good advice. It is further suggested that the landlord should be required to take the legal responsibility of warranting the salubrity of the house; but on this point we confess we are at a loss what to say, except it be that we fear it will be very difficult to get the solicitor of the landlord to see his way to sanction so dangerous a warranty. It might perhaps be fair enough to admit a covenant into ordinary leases whereby the lessor shall keep the drains in a healthy condition so as to satisfy a surveyor, but to allow a lawsuit for damages to be the probable process of arbitrament would be one of the most dangerous conditions that could be attached to house property.

Aspect and prospect are considerations that ought to be much more studied than they are in relation to new houses; indeed, aspect is not studied at all, and prospect, at least rearward prospect, is even ludicrously ignored. That south-east is the most cheerful aspect for all rooms that can have it, is a rule easily remembered. Streets ought to be made to run as nearly as possible north-east and south-west, and then, if on one side of the way the family sitting-rooms be placed towards the front, and on the other side of the way towards the rear, this is perhaps all that can be done in a simple way. Respecting the provision of an agreeable outlook at the back of the house, we need only observe that it is obviously utter folly to

neglect it, and that nevertheless it is almost everywhere neglected absolutely.

Those house-hunters who make a *sine qua non* of Queen ANNE finishings must, we fear, be left to get them if they can; but we cannot advise them to refuse a good house on this ground unless their feelings are really too strong to be subdued. How long the admiration of this somewhat invertebrate if occasionally piquant mode of decoration is to withstand the especial tendency of the admirers of oddity to change their minds, is a question to be particularly asked; and what will be said of it when it is forsaken, or what will then be thought of the houses which have been fashioned in its honour, we are content to leave futurity to reveal.

One thing at any rate is certain, that our houses are improving every day; which may be a consolation to all house-hunters, except perhaps those whose fastidiousness grows with what it feeds upon.

### MECHLIN ART EXHIBITION.

THE ancient city of Mechlin (Flemish, Mechelen; and French, Malines), the ecclesiastical metropolis of Belgium, is situated on the Dyle, a tributary of the Scheldt, about midway between Brussels and Antwerp; and the contrast of the gay animation of the capital with the sober stillness of the archiepiscopal city is very marked. The cathedral of St. Rombold, in the centre of the city, a Gothic edifice of cruciform plan, with radiating chapels, was commenced in the thirteenth century, continued during the fourteenth, and terminated in the fifteenth; but the fine tower remains unfinished. The height intended was 150 mètres (492 feet), but barely two-thirds are attained. The skeleton clock-dials are of iron, gilt, so as not to obstruct the view of the building, and are no less than 15 mètres (nearly 50 feet) in diameter. This immense size is only realised by its reproduction in the pavement surrounding the statue by Tuerlincks to MARGARET of Austria in the Grand' Place, with the figures of the hours, and also the letters of the cardinal points, formed with paving-stones. Looking on to this Place is the old Halle, dating from the year 1340, of severe Gothic style, with projecting turrets. The church of Notre Dame contains the celebrated picture by RUBENS of the *Miraculous Draught of Fishes*; and that of St. JOHN, a triptych on the high altar, also painted by him. Indeed, RUBENS himself was wont to say that, if people would see his best works, they must go to Mechlin.

The staple industry with which Mechlin is chiefly associated in the minds of Englishmen has almost died out; but a spirited attempt is being made by a charitable lady to revive the old glory of Mechlin lace. Another branch of manufacture has, however, now come to the fore; and this is carved oak furniture, which is designed with great taste after ancient models, well executed, and sold at a reasonable rate. This art furniture mainly constitutes the fourth section, "Mechlin industry," of the exhibition in favour of the Free Catholic schools of the city, that was opened by the Bishop of EYTHRÆA, acting for the Archbishop, on August 26. The other sections are: 1, ancient art; 2, the fine arts and sciences; and 3, education; while the fifth class embraces agriculture and horticulture. Unfortunately, the committee have not been able to secure a building of sufficient size to hold all the exhibits, which are, in consequence, spread over four separate localities.

The section of ancient art is divided into twelve classes, of which the first, devoted to sculpture, is very rich. There are two retables, of the sixteenth century, one of painted wood, ornamented with an alabaster alto-relievo representing the scene on Calvary, and the other adorned with silk flowers; while a statue of the Virgin, also in polychrome wood, dates from the fifteenth century. An oak niche, with figures of the Virgin and St. JOHN, is of the thirteenth century; and three key-stones of carved oak were taken from the Goldsmiths' Chapel at Ghent. There is a boxwood crucifix by GAUTHIER POMPE, born at Ath in 1703, who excelled in such work. Another, with cross in shell, is said to have been used by Count FREDERICK DE MÉRODE on the day of his decease. A wood statuette of the *Virgin and Child with St. John the Baptist*, is the work of LUC FAYD'HERBE, born at Mechlin in 1617, who followed the course of lectures given by RUBENS, and became his friend. There is an ivory crucifix by ARNOLD QUELLYN, the younger, who was born at St. Trond in 1625, and became a member of the Guild of St. Luke.

In the second class, goldsmiths' work, must be mentioned a Flemish goblet, called *Molenbeker*, which, when turned upside down, forms the support of a windmill with blow-pipe. When the cup is filled, the person drinking from it is supposed to cause the sails to revolve with the blow-pipe, and to empty the cup before the mill stops. Another goblet, in *repoussé* silver, of the year 1678, bears the escutcheon of the Bakers', Millers', Brewers', Coopers', Carpenters', Slaters', and other guilds, with three figures of satyrs.

The third class is devoted to "Dinanderies," by which is meant brass utensils. They are so called from having been made especially at Dinant, on the Meuse, in the Middle Ages; but they are now produced extensively at Antwerp. An improvement on King ALFRED's candles is shown in a horary lamp of the seventeenth century, in which the hours are marked by the consumption of oil. There is a brass from the church of Notre Dame aux Dominicains at Louvain, recording in a Latin inscription the deaths of JOHANNES RIKE, majister civium, in MCCCLXX; his wife, KATERINA, in MCCCLXXII; and their son, EGIDIUS, canon of St. Peter's, Louvain, in MCCCXCIX. A box for holding weights bears the date 1749, the arms of Mechlin, and the following Flemish inscription:—

Een valsche schael is een grouwel by Godt  
Maer een oprecht ghewicht is syn ghebodt,

while a bell, also with the Mechlin arms, and ORPHEUS charming the animals with his lyre, bears the Latin inscription, "O Mater Dei, memento mei," with the maker's name, "PETRVS GHEINIUS ME FECIT 1574." Some old Roman penates and several objects in bronze found in a tomb at the abbey of St. Ethelberg, Barking, near London, are also included in this class.

The fourth class embraces arms and other objects in wrought or cast iron, and includes a *vuurplaat*, or back-plate for a fireplace, with bas-relief representing the Queen of Sheba's visit to SOLOMON, found in the infirmary of the Mechlin Béguinage, and dating from the sixteenth century. There is an old pair of irons for making gauffres, one of the faces being ornamented with cocks and flowers, while the other is simply lozenged.

Class five, ceramic ware and stained glass, includes several lachrymatory vases. Instead of containing the tears shed at funerals, it is now thought that the lachrymatories were used to hold the scented oil with which the stake was anointed before being kindled, as they are found sometimes in Christian tombs in the Catacombs. A *bollekens kan*—or stone jug—10½ inches high, is contributed by the Baroness VAN DEN BRANDEN DE REETH; and a brown Raeren stoneware pitcher, 8 inches high, found at Neerwinden, dates from 1567. It is ornamented with a double eagle and two lions rampant. M. NUYTJENS has lent three hearth-bricks ornamented with historical subjects, and another with two lions *effrontés*; while the Rev. G. VAN CASTER sends a fourth, ornamented with foliage. A Genoa earthenware dish shows a woman surrounded with children, and bears the legend CAITAS (*sic*). A pane taken from the small Béguinage bears the following Flemish inscription: "O heere doer die vrucht uws duerbaer bloets cracfhicheit soe mogen wy alle sonders verwerpen u ghenadijghe bermerlicheit."—URSEL VAN MOKEN-BORCH.

The first object in class six, furniture, is a knife and fork of the sixteenth century, the handle of the former being ornamented with the history of LOT, ADAM and EVE with the forbidden fruit, the adoration of the Magi and Charity; while the handle of the fork illustrates the story of SUSANNAH and the young TOBIAS on the one side, and the Adoration of the Shepherds, with Hope represented by a woman holding an anchor, on the other. Baron BÉTHUNE contributes a torch, dating from the beginning of the sixteenth century, composed of waxed wicks rolled spirally round a fir rod.

The most noteworthy object in class seven, embracing tapestry, tissues, and lace, is a table-cloth of the seventeenth century, ornamented with subjects from the Book of Numbers—two men carrying a bunch of grapes on a pole, the Israelites bitten by serpents, and MOSES lifting up the brazen serpent. Very interesting to ladies is an album, lent by the Rev. G. VAN CASTER, containing about five hundred patterns of lace of various periods.

Foremost in class eight, drawings, engravings, and pictures, is an old copy of the plan of Mechlin, made in 1564 by the surveyor, J. VAN HANSWYCK, and preserved in the communal

archives. There are also plans of the city in the seventeenth century and in the year 1775, with a section of the cathedral tower. A copperplate, lent by M. G. VAN MELCKEBEKE, drawn by G. HERREYNS, and engraved by the Brothers KLAUBER, of Augsburg, for the jubilee of 1775, represents the arrival of St. ROMBOLD at Mechlin. The same contributor also sends the painting of a garland of flowers by JEAN PHILIPPE VAN THIELER, who was received into the Guild of Painters in 1648. There is an engraving by BOLSWERT of the Miraculous Draught of Fishes, after the picture which RUBENS painted in 1618 for the Corporation of Fishmongers. The series of portraits of Archbishops of Mechlin begins with that of ANTOINE PERRENOT DE GRANVELLE, born at Ornans, in Burgundy, in the year 1517. There is also a portrait of GUILLAUME VAN ENCKEVOIRT, born about 1464, and created cardinal in 1523. M. VAN DEN HECKE has lent a fantastic landscape by JÉRÔME BOS, who flourished about the middle of the fifteenth century, and chiefly painted diabolical subjects; some game, fruit, and vegetables by FRANÇOIS SNYDERS (1579-1657), with a figure added by JORDAENS; and a cavalry combat by PETER SNAYERS (1593-1662), whose speciality was historical subjects and battle pieces. The senator CANNART D'HAMALE contributes a landscape by WILDENS, born at Antwerp in 1580, who often painted the landscape in RUBENS' pictures, while other artists painted figures in his own compositions. There are two garlands of flowers painted by J. BREUGHEL, called "the Velvet," born at Brussels in 1589, son of PETER, called "Zotten BREUGHEL," and brother of PETER, surnamed "Belschen BREUGHEL." M. R. DE PAUW has sent REMBRANDT'S picture of *The Soap Bubbles*, bearing his signature in full. There is a cavalry engagement at the foot of a fortress, by J. COURTOIS, called "the Burgundian," who was born in 1621, and lived for a long time in Italy, where he learnt the manner of PETRAZZI, CARACCI, and FALCONE. A picture of the Queen of Sheba offering presents to King SOLOMON is painted by JAN BAPT. FRANCK, born at Antwerp in 1599; and another of our LORD curing the Blind Man, by RICHARD VAN ORLEY, born at Brussels in 1652.

The first object in class nine, manuscripts and books, which is very well represented, is a small manuscript Bible of the thirteenth century lent by the Baron BROCQUEVILLE, while Baron BÉTHUNE contributes a breviary of the same period, and the Rev. G. VAN CASTER, a parchment manuscript (various) of the twelfth century, obtained from the ancient abbey of Horeffe, and Monseigneur FRANCK a copy of the Vulgate, copied for the Abbaye de Parc in 1263, which tradition says was used at the Council of Trent. The collection includes several books printed by HENRY THOMAS JAYE, a native of London, who established himself at Mechlin in 1611, received rights of citizenship, and became a sworn printer (*ghesworen boeck-drucker*). He lived in the street, then new, called the Bruel, which is now the main thoroughfare between the station and the Grand' Place in the middle of the city. No. 839 is a description of the cavalcade with triumphal cars organised in 1775 by the Latin schools, to celebrate the millenary of St. ROMBOLD.

The tenth class, music, opens with four leaves of an antiphon of the twelfth century. The eleventh class, seals, medals, and money, contains the common seal of Mechlin in 1426; and also that in 1493 with the displayed black eagle, which the Emperor FREDERICK IV. permitted to be borne in the shield. The seal of the Mechlin Monte-de-Piété of 1620 bears the legend "Beatus qui intelligit super egenum et pauperem, in die malâ liberabit eum Dominus." The twelfth and last class consists of reproductions of ancient works of art.

In the section of modern fine art, among the works belonging to private collections, M. DE CANNART D'HAMALE, senator, sends a view, by VERVLOET, of the interior of the church of Notre Dame d'Hanswyck, at Mechlin; and MM. DELEHAYE FRÈRES a silver-gilt medal—the first prize for drawing from nature obtained by GODEFROID JACQUES EVRARD BEKE at the Fine Art Academy, Mechlin, in 1778. M. LÉOPOLD PLUYS, of Mechlin, exhibits his designs, which have been executed, for the stained-glass windows of the cathedral. One of these, 200 square mètres in extent, represents the Tree of JESSE with the glorification of the Virgin.

Turning now to the section of industrial art, the above-named exhibitor, M. L. PLUYS, has contributed all the many stained-glass windows that adorn the principal room. This is divided into bays, each one fitted up by various firms as a dining-room, drawing-room, or study, and containing

great wealth of carved oak furniture. The first object that attracts attention is a monumental chimney-piece, in the Transition style at the end of the sixteenth and beginning of the seventeenth century, designed and executed by COSYNS and VAN BATTEL. The attitudes of the two caryatides representing mercenary warriors in the service of MAXIMILIAN of Austria, one with sword and the other with musket, is striking and natural. Above is a painted medallion of Poetry, while a fool or jester, in carved oak, appears to be stooping as if about to get down from the upper portion. Brass swivelling handles afford a support to the body when leaning over to make up the fire; and the four fire-irons, by L. BERNAERTS VAN DER VORST, are suspended from a brass stand.

In one of the bays, LUCAS SCHEFFERMAYER exhibits a very pure example of the Flemish Renaissance in a *bahut*, or cabinet, finely carved in oak with hinges and fittings of tinned iron. E. TENGELS-SCHIPPERS has fitted up a tasteful boudoir with Smyrna carpet and imitation of Gobelin tapestry. The cabinet is of carved oak in Flemish Renaissance—subject, the Virgin and infant St. JOHN. A RUBENS arm-chair has the seat and back of gilt leather, while the LOUIS XIV. table is of imitation ebony inlaid with ivory. A salon, fitted up by the same exhibitor, is laid with a small and elegant pattern Dutch carpet, and contains a rich cabinet in Flemish Renaissance, minutely carved in oak with subjects relating to the four seasons. It is decorated with water-colour drawings, a handsome mirror, and stained-glass panels, the latter by M. L. PLUYS. VAN INTHOUDT-HENDRICKX & SONS contribute a handsome sideboard in carved oak (Flemish Renaissance style), left the natural colour and only waxed, with chairs to match; and also another sideboard in English Gothic style, stained to imitate old oak. A *jardinière* and *plaques* in *repoussé* brass are reproductions of fifteenth-century Dinanderie; and a TENIERS table is similarly reproduced.

It is strange that the words chandelier and lustre have exactly opposite significations in England and on the Continent. What we usually understand by chandelier is the pendent lighting arrangement in the centre of a theatre or ball-room, generally with cut-glass ornaments; now on the Continent this is known as a lustre. On the other hand, the chandelier of the Continent is the upright candle-holder, standing on its base or supported by a bracket, that we call a lustre. Lustres, then, in the Continental sense, were exhibited by F. SCHROETER-HOLSTERS, brassfounder and "manufacturer of lustres," one rather peculiar in Flemish style, and the other very handsome with Gothic ornamentation.

To complete our notes of the modern portion, H. ZECH sends a Renaissance bed, a Gothic buffet, and a fifteenth-century cabinet, while his foreman joiner, VAN DE PLAS, contributes an inlaid table-top. VAN INTHOUDT DE KOCK sends oak furniture; J. EVRARD, oak desks; VAN INTHOUDT-HUÛGHE, Flemish Renaissance furniture; DE GREEF, dining-room fittings; and THIELMANS, two handsome oak telescope tables. Nor must mention be omitted of the Flemish buffet fitted up in the temporary refreshment-room. It is in carved oak, relieved by imitation ebony, and presents a remarkably fine effect. It is said that the brewers contribute the local beers, "orge" and "drydraet," free of charge, so that the whole receipts may be available for the fund being raised for the schools. This interesting exhibition was organised by M. MEYNS, architect, of Mechlin, while the president is M. FRANZ BROERS, and the secretary, M. EMILE JANSSENS.

Visitors to Belgium can take the city of Mechlin, with its exhibition, on their way to Brussels. On the arrival of the Great Eastern Company's daily boat at Antwerp, a train starts from the quay for the Brussels line of the State Railway, with Mechlin about midway. "Baedeker" says that there is a large and good buffet-restaurant, with tariff, at the station. This is perfectly true as far as it goes; but we found that what was in the tariff did not in all cases exist in reality, while there were other dishes not on the tariff, and a discrepancy between the prices charged and those on paper. We can, however, conscientiously recommend an hotel, the Cheval d'Or, patronised by the exhibition committee, where we fared sumptuously at a 2½ franc table d'hôte. The walls of the *salle à manger* are tastefully decorated with appropriate subjects by a local artist, who has now left Mechlin to become teacher at the art school of a neighbouring town. Mechlin should be visited on Saturday, Sunday, or Monday, when the machinery of the carillon is stopped for an hour or two in the morning, and the forty-five bells are played with great taste by hand at every half-quarter.

## CIRCULAR NOTES FROM FRANCONIA.—IV.

[BY A CORRESPONDENT.]

BAMBERG, built about its five hills overlooking the radiant valley of the Main, rivals in pictorial attraction and exceeds in situation the more popularly-famed Nürnberg. In character the towns differ: while Nürnberg reflects the arts and industries and the citizen life of a free commercial city of the Middle Ages, Bamberg derives its distinctive features from the rule of an ancient and splendid ecclesiastical principedom, which crushed out the independent spirit of the people and has left no trace of their early struggles in the domestic architecture of a later period. Nürnberg has undoubtedly the advantage in a certain unity of old-world style: its towered walls and sculptured churches and quaint houses are the outcome of one epoch, while the ecclesiastical edifices of Bamberg, of more ancient date than anything the rival town can show, have little in common with the substantial domestic buildings over which they dominate. Nevertheless, Bamberg is unique: the charm lies in a combination of picturesque elements rather than in one prevailing trait.

The old saying runs, "If Nürnberg were mine I would swallow it in Bamberg"—a curious way of hinting at the superior situation of the episcopal city. It is built partly in the plain and partly on five steep hills, divided by narrow valleys or clefts, each summit crowned by a church, a palace, or a tower. On the central height stands the grand pile of the cathedral, with its double apse and four towers, with the picturesque remains of the old bishop's palace on its northern side, and the long flank of the new *Residenz* on the eastern edge of the hill; the Gothic Frauenkirche, the Stefanskirche, the enormous mass of conventual buildings (now converted to secular uses), with the church on the Michelsberg, and the transmuted Romanesque church of St. Jacob, are conspicuous on the surrounding elevations; while off to the north-west rises the wooded height and lofty watch-towers of the Altenburg. Frequent gardens and groups of trees make green interspaces among the streets, and occupy the slopes of the hills, and gladden even the more closely built lower town, through which the river Regnitz flows in three streams, crossed by six bridges. On an island at the confluence of the central and left arm of the river stands the somewhat picturesque Rathhaus, covered with faded frescoes of the eighteenth century. A tower in late Renaissance style, with elaborate balconies, forms a gateway at one end of the upper bridge, a massive three-arched span of fifteenth-century construction, over the parapet of which the views down the river are most striking, and justify the title of "German Venice" given to Bamberg by a Bavarian king. The domestic architecture of the town is the product chiefly of the seventeenth and eighteenth centuries, for between the private struggles of the citizens and their lords, the tumults of the Bauernkrieg, the ravages of the Thirty Years' War from the hands of imperialists and ducal troops, and later from Prussians and from French alike, the citizen dwellings of Bamberg suffered frightfully. Thus the rococo ornate style of the seventeenth century alternates with the solid construction of the next hundred years. It is chiefly from the extraordinary variety and sonorous tints of the red tile roofing, and the irregular disposition of the blocks, that the houses of Bamberg gain their irregularly picturesque aspect, and group into striking street or river views. The colour of the tiling varies from a brick red to a deep brown crimson, the deeper shades being the most prevalent, and the pitch and depth of roof have the pitch of a precipice and the depth of a hill side; they are curved outward and curved inward like the bell of a flower, or they slope swiftly to jutting eaves that cast deep shadow on the wall; they break out into projecting windows all over the surface, like multitudinous eyes, or wink with barely-lifted lids through two airholes slit half-way down; they are piled one above another, or set at all sorts of queer angles, that drive an artist wild with a sense of adventure as his pencil follows the lines. In short, if you want to see what picturesque roofing will do to make a town pictorial, go to Bamberg. In addition to the roofs, however, many houses are quaintly set forth with woodwork and with balconies of wood or fretted ironwork, or, among the older stone buildings, show traces of a prior time to their neighbours, in coats of arms carved on the walls, or curious little reliefs of figures or ornaments, remnants of decorative detail or signs of the former character of the building. The newer quarter of the town towards the railway station is not attractive, except

to a modern sense of comfort and cheerfulness; but the proverbial love of the Bambergers for space and garden ground is likely to save them from the horrors of overcrowding. On the outskirts of the town they have secured and planted a large tract of meadow and park inside the stream of the Regnitz, and at its further end, terminating at the confluence of that stream with the Donau-Main canal, which we met on the hither side of Nürnberg. A fairer kind of public pleasure-ground could not be than this delightful Theresien-Hain, with its half-wild, half-cultivated lawns and avenues, and beautiful groups of native and foreign trees.

From the terraces of the Michelsberg or from the Cathedral Square one may see how finely Bamberg is set within a sharp curve of the Main valley, which here lies north-east towards Baireuth, and west with a turn northwards towards Würzburg. The river itself flows some three miles below the town, where the waters of the subsidiary Regnitz discharge into its ample stream. The broken range of the Franconian Switzerland forms the eastern horizon, with the castle of Geich on the nearer heights; to sunset the rich pine forests of the Hauptmoorwald clothe the sloping ground that rises to the Steigenwald. Southward the valley opens wide towards Nürnberg, and to the north the spurs of the Thuringerwald rise as the Bauzen mountains. Within these blue horizon ranges, and amidst the laughing fertility of the well-watered valley, old Bamberg lifts its brown roofs and stately towers, and gives to the glowing landscape the last charm of colour and architectural forms which it needs to make it one of the fairest in all Germany.

The records of Bamberg show that the present cathedral has been preceded by no less than two earlier structures. The first church, founded by the Emperor HEINRICH II. and his consort (the holy CUNEGUNDA) in 1004, was consecrated in 1012 by the Patriarch JOHN of Aquileia; then sixty-nine years later it was burnt to the ground. The second church was begun by St. OTTO, and finished in 1111. What mischance befell this erection does not appear, although the popular tale speaks of a second conflagration; anyway, only the ground-plan of the outer walls of the body of the church and lower stages of the towers remained, and within them the Romanesque or eastern part of the present cathedral, with the noble crypt, must have been raised between 1175 and 1250, and a third consecration of the building took place in 1237. In 1274 further enlargement was undertaken by Bishop VON FREISING, who obtained allowance out of the taxes for expenses, and to this era in the history of the church belongs the western choir, or choir of St. PETER, which is in the early Gothic style, with apse of five bays, groined vaulting, and connected shafts. Later centuries filled the interior with tasteless rubbish, which the indefatigable LUDWIG I. of Bavaria cleared away when, in 1828, he undertook the restoration, which was carried out by GARTNER.

It is charged against the restorer of Bamberg, as in case of like renovations elsewhere under the zealous *dilettante* King of Bavaria, that, with the rubbish, he swept away much that was interesting and pictorial. Certain it is that in the scraping process, which has restored to the interior its beautiful gray tone, not only frescoes of late and degraded period, but also some of the older work, vanished; only the traces of full-length figures of long-limbed saints remain on the outer side of the choir-screen in the western choir, and here and there faint signs on pillars and walls about the church. At one time the whole interior was *übergemalt*, and doubtless much of such decoration was better rubbed off. A quantity of monuments, altars, and church furniture encumbered the interior, most of which have disappeared. Some monuments were sent to the Michelsberg, some to the Altenburg chapel. Of the time of the Renaissance the chief remainder is the monument of Bishop GEORGE of Limburg (1522) in the Peter choir, a notable importation of early Italian work of the revival. Among the most interesting monumental relics is the gray marble sarcophagus of the learned SAITGER, Bishop of Bamberg, afterwards Pope CLEMENT II. (1047), with curious allegorical figures of the Virtues in relief on the sides, of a Classic type, which suggested the origin of the work to be Roman. Recent writers have, however, decided that the sculpture belongs to the archaic mannerism of German work in the first half of the twelfth century. Rather later in date, but still strongly marked by Classic feeling, is the very remarkable sculpture on the marble enclosure of the Georgen or eastern choir. The outer sides of this screen are arcaded in seven round arched niches,

divided by pillars; in each niche on the south wall stand two apostles; in the seventh *The Archangel Michael Fighting with the Dragon*; on the pillars between HEINRICH II., the three kings, CUNEGUNDA—the last a piece of fifteenth-century work. On the north wall the niches are occupied by the twelve prophets, also coupled in twos; in the seventh the *Annunciation*; on the brackets between six figures in the round, a Madonna with the Infant, a sibyl, a figure of a woman, an angel with curious smiling face, which the people call the laughing angel, and the Bamberg token, a bishop and St. DIONYSIUS carrying his head. This sculpture is all of the same period, probably about 1250, except the CUNEGUNDA named above, and perhaps *The Annunciation*, and is in the highest degree interesting and remarkable. The coupled figures in the niches, whether apostles or prophets, are marked by great variety and energetic, almost dramatic, action, difficult and complicated positions having been boldly attempted by the sculptor, whose imperfect command of the figure betrays him into somewhat comic results. But, on the whole, there is nobility and energy, bold relief and drapery freely cast. For beauty, however, the large, nearly life-size figures on the brackets of the northern side, bear the palm. The sibyl is a grand and significant figure, draped about the head and shoulders, and holding a book; the face expressive and massive, the drapery exceedingly fine in cast. The laughing angel also, with drapery caught quaintly about the feet, is charming and full of character. The extremities—hands and arms—are unusually good and well-formed throughout. It pleases a German critic, grouping these figures in the sculpture of the south portal, and the figures on the shafts of the Prince's door, to designate them as wholly free of Romanesque manner and in the pure Early Gothic style. Free of the paralysing Byzantine tradition certainly they are, but precisely not free of the finer inheritance of Classic style, but rather especially interesting as showing the influence of the Gothic perception of the characteristic upon the generalised typical forms of the Classic mode. So, at any rate, we presume to think.

Another curious piece of sculpture not dwelt upon by the ordinary guide-books is the figure of a rider on his horse, set up on the left of the choir arch at the eastern end, and dating from the thirteenth century. Sometimes called the Emperor CONRAD III., this figure seems more probably intended to represent St. STEPHEN, King of Hungary, of whom the old story goes that riding to Bamberg to court GISELA, the Emperor's sister, he found the cathedral door open and rode right up the nave. But the horse, like BALAAM's ass, was wiser than his master, and stood still at the entrance of the choir, signifying in his dumb fashion that here was holy ground. So STEPHEN was converted and baptised, and lived to win the epithet of saint. The statue is broad and simple, both man and horse suggestive in attitude, as if regarding fixedly something before them in an unconventional and natural manner. They are placed on a platform supported by brackets, of which one is fantastically carved as a human face, made out of trefoils. It would be beside the purpose of these letters to go into detail upon other objects in the cathedral, of which every reader may find account in his "Murray" or his "Baedeker"—the beautiful monument to St. HENRY and the holy CUNEGUNDA, for example, which stands in the centre of the nave, commissioned by the Bishop GEORGE I., of Limburg, in 1499, of TILMANN RIEMENSCHNEIDER, of Würzburg, whose effigies of prince-bishops we saw in the cathedral of his native town. The subject reliefs on the sides of the sarcophagus are of the finest work of the kind in Germany. Those in the church are the best examples of the life scale bronze monumental reliefs of PETER VISCHER and his school, notably that in the Georgichor of the Prince-Bishop GEORGE II., 1505, and in the Peterchor, HEINRICH VON GROSS TROCKAU, 1501, and VEIT VON POMMERFELDEN, 1503. The designing and casting of these bronze reliefs degenerated from such original and elaborate work as these into conventional repetition of an accepted typical design and workmanship of indifferent quality, and as the taste for monuments of the kind declined they became mere tablets with armorial shields and inscriptions. In the Chapel of the Nail, or of the sepulchre off the southern transept of the Peterchor, the walls are literally lined with these reliefs, the whole effect of which is very impressive. But here the gradual decadence of the art can be traced from vigorous portraiture and carefully finished detail to characterless and mechanical work. The work of VISCHER stands at the highest

point of the history of these monuments. There is an early piece in the church of great interest, dating from the thirteenth century, in which the bronze reliefs upon a monumental slab of Bishop GUNTHER, represented in profile, is the precursor of the style brought to perfection by the Nürnberg artist. Another feature in the interior furnishing of the cathedral, which seems generally underrated, is the stall work in the Peterchor, the multitudinous little isolated figures in which are brimful of character and beauty. In the Treasury the visitor should on no account fail to study the bronze candelabrum of twelfth-century work, 1½ mètres high, which is almost unique.

Whatever blame may be cast upon King LUDWIG's restoration architect for his "clean sweep," it must be allowed that the cathedral, as it now stands, is a dignified monument of the transition Romanesque-Gothic, consistent and undisturbed by incongruous intrusions. Its unusual richness in sculpture throughout; the surface ornament; the exterior, especially at the eastern end, which has the further ornamental feature of an open arcaded gallery round the apse; the fine coupled windows and deep mouldings, the noble sculptured portals, the symmetric beauty of the whole composition, with a certain lightness in the lofty towers, give to the otherwise severe simplicity of the pile a grace not often associated with this style of architecture.

This letter has already exceeded limits, and we have no space to conduct our readers to the Michelsberg, where the holy ORTO reposes in the crypt behind the high altar. The church, which is of early foundation, though it has suffered in succeeding centuries, offers points of transition and transformation interesting to an expert. The long lines of conventual building, which surround the two sides of a square, are now occupied by a hospital, a museum, town gallery, &c. From the Michelsberg you must drive down again into the town in order to ascend the neighbouring Altenburg, which, as the crow flies, would be not a mile off. But the ascent through the wood is very steep, and the castle, or what remains of its stout walls and turrets, and the lofty towers which Prince Bishop ADELBERT ALBRECHT, of Wertheim, raised to quell his refractory citizens, are raised on an almost precipitous rock, formed at the top into a small plateau. Off the entrance gatehouse, to which a little drawbridge conducts, is the small chapel of the fifteenth century, restored by HEIDELOFF in 1834, and containing an interesting monument in red and yellow marble to a RITTER VON SCHAUMBURG, 1520, in full armour, and some good old glass. In the upper storey of the gatehouse a small chamber is converted into a museum of old weapons, found about the castle hill or belonging to its history. A vault beneath is called the witches' chamber, from the gruesome proceeding therein conducted by Bishop JOHANN GEORG, of Dornheim, during the Hexenprozesse instituted by him. The views from the tower and castle platform are very beautiful, especially towards evening, and the wooded hillsides afford delightful walks. In fact, no better finish to a sojourn at Bamberg can be made than a parting look upon the old city and its beautiful environs from the height of the Altenburg. And there, leaving our reader to find his own way to the city on the Main, whence we started together on our circular tour, we will bid him farewell.

## HOSPITAL COMPETITION AT HEATON.

THE town council having resolved to erect a public fever hospital on a plot of land on the south side of the North Shields turnpike, near the railway junction at Heaton, the sanitary committee were authorised to obtain plans. A large number of plans were sent in, and Mr. Worthington, architect, Manchester, was appointed referee by the committee to examine and report upon them. Mr. Worthington's report has now been sent in, and considered by the committee. Mr. Worthington reported that the best plan is signed "Red Cross," that second in merit is marked "Isolation," and the third in merit "Sunlight and Air." On the committee opening the sealed envelopes, it was found that the plan marked "Red Cross" has been furnished by Mr. A. B. C. Gibson, architect, of Newcastle-on-Tyne, and that the plan marked "Sunlight and Air" is the production of Messrs. Bradshaw & Gass, Bolton. There is a plan marked "Isolation A" and another marked "Isolation B;" and as Mr. Worthington did not state in his report which it is that he places second, it cannot be stated who will receive the premium for being second in merit. In the recent public competition for the new police station, to be erected in Westgate Road, Mr. Worthington placed Mr. Gibson's plan first, and the council last week agreed to adopt his plan.

# ADMIRALTY AND WAR OFFICES COMPETITION.

ON Monday a departmental paper was issued from the Office of Works with reference to the proposed competition for the Admiralty and War Office, and containing instructions and conditions, schedule of the accommodation required, and plan of the site for the new buildings. The following are the instructions and conditions:—

1. It is proposed by the Commissioners of Her Majesty's Works and Public Buildings to erect new offices for the Admiralty and War Departments on a site adjoining the north side of the Horse Guards.

2. There will be two competitions, the first to consist of sketch designs open to all, and the second or final one to be conducted as hereinafter described.

3. Before any designs are sent in the Commissioners will appoint a committee of judges, one, at least, of whom will be an architect. The judges so to be appointed will select ten designs, or such less number as they may think fit, the authors of which will be invited to compete in the second or final competition.

4. In order to obviate the possibility of the sketch designs lodged in the first competition being made use of by the competitors who may be invited to enter into the final competition, such sketch designs will not be allowed to be seen by anyone except the judges and their officers, by whom they will be returned direct to their respective authors.

5. In the first competition the designs of the competitors must be exhibited by sketch plans, elevations, and sections to a scale of 24 feet to the inch, and must consist of—A plan of each floor; an elevation of each of the principal fronts and courts; at least two complete sections from north to south, and one from east to west.

6. The drawings must be made on sheets of plain paper and mounted on plain stretchers, unframed, which shall be 40 inches long and 27 inches high. The elevations must be in outline only, without etching or shading of any kind, but the windows and other openings may be tinted lightly in Indian ink.

The plans and sections must be tinted in light Indian ink.

7. The accommodation to be afforded in the new Admiralty and War Office respectively is shown by a schedule of the numbers and approximate areas of the rooms for each department, with particulars of occupation, &c.

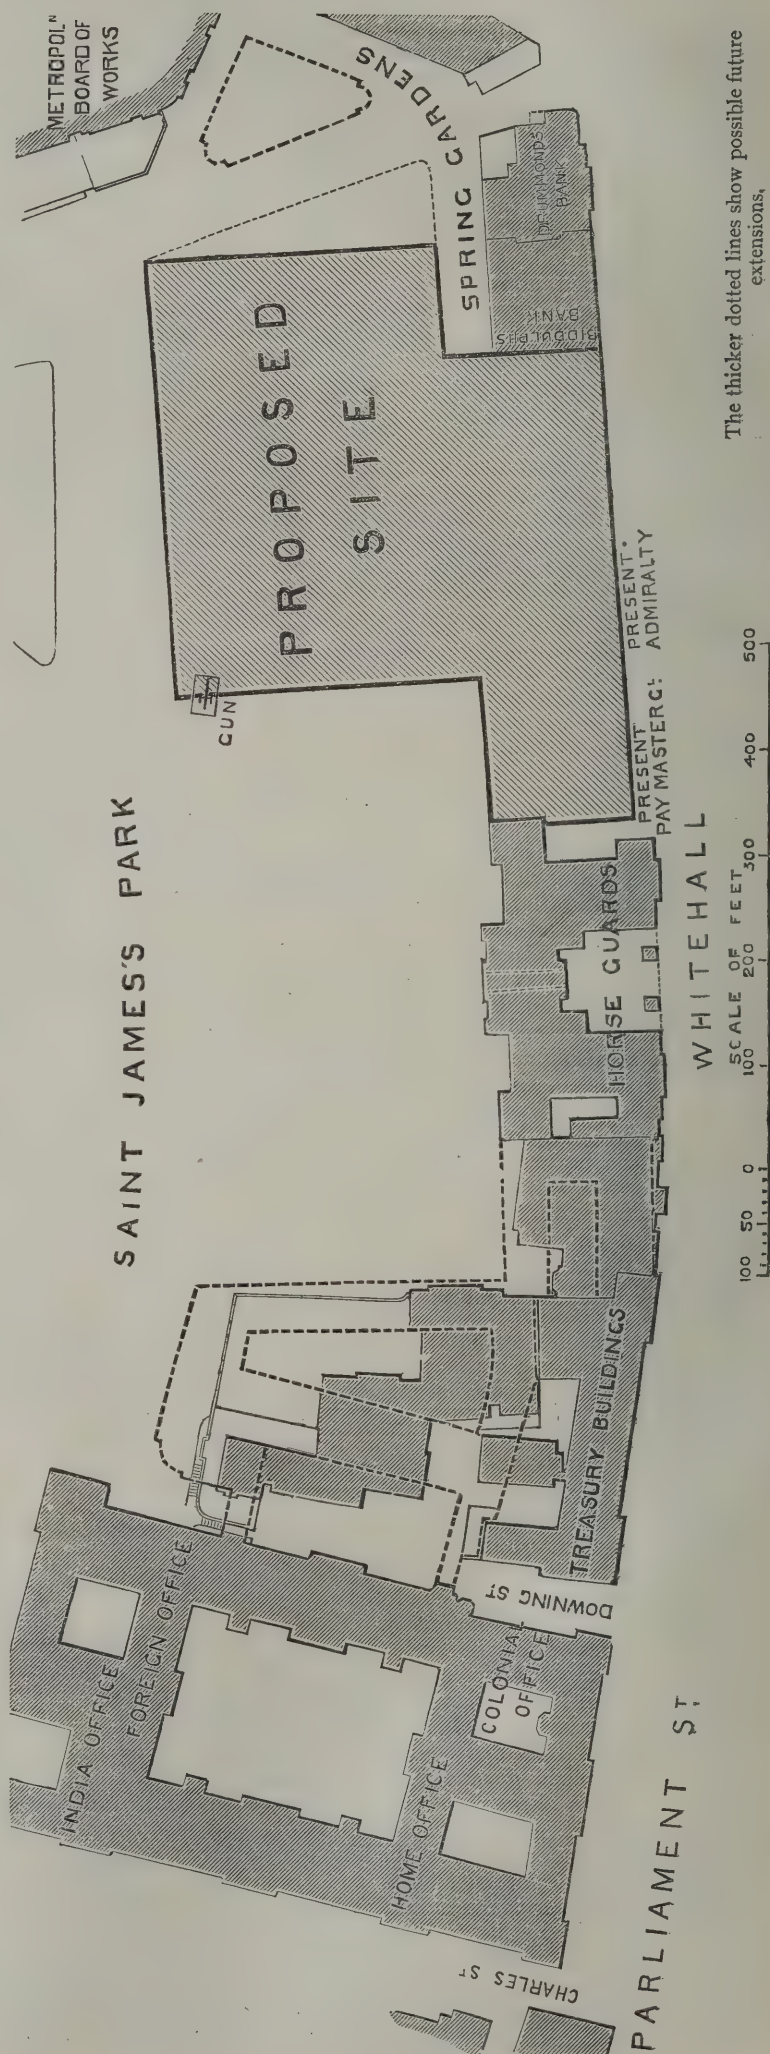

The several rooms proposed to be appropriated to each department and sub-department are to be indicated on the plans by a letter and number corresponding to those in the schedule—those in the Admiralty to be marked in blue and those in the War Office in red.

It is suggested that the different departments should be arranged as indicated in the schedule, but the competitors in preparing their designs are at liberty to make any modification in that arrangement which they may think desirable.

The War Office must be placed on the southern side of the site adjoining the Horse Guards. The rooms of the principal officers of both departments should be on the first floor fronting St. James's Park. There must be a suitable carriage entrance or entrances to the principal courtyards, but not from the south or west sides. Doors may, however, be provided in these fronts for special but not public use. Provision is also to be made for communication between the two departments on each floor.

8. The buildings to be of fireproof construction; provision must be made for warming and ventilating them upon the most approved principles, and particular attention must be given to the general sanitary arrangements.

9. Each design is to be accompanied by a description of the accommodation (stating the areas) provided on each floor for each department and sub-department;

the total cubic contents of each of the two buildings measured from an assumed level of 10 feet below the basement floor line up to half-way between the wall plate and the ridge of the roof; an explanation of the material and mode of construction proposed to be adopted; and an approximate estimate of the cost of each building.

10. The authors of the designs selected by the judges will be invited to enter into the second competition, for which supplementary conditions will be issued. Those conditions will be in general accordance with the above so far as applicable, but may contain such additions or alterations as shall be deemed necessary by the Commissioners of Works.

11. In the second competition each of the selected competitors will be required to send in plans, elevations, and sections to a scale of 16 feet to the inch, together with a perspective view. The competitor shall be at liberty to make such reasonable modifications of his sketch design as he may think expedient. Each selected competitor shall be paid the sum of 600*l.* towards his expenses, provided he shall comply with all the conditions to be hereafter prescribed for the second competition. The whole of the drawings and papers thus sent in shall become the property of the Commissioners.

12. The selection of the architect to carry out the work will be made from the competitors in the second competition, subject to the approval of Parliament.

13. No drawings or photographs or written or printed statements descriptive of or alluding to any of the competitive designs lodged in either of the two competitions shall be sent to the judges, the commissioners, or the public; nor shall any of the designs or copies thereof be exhibited publicly or privately, nor shall any canvassing of the judges or commissioners in favour of any particular design take place. Any competitor violating this condition will be forthwith excluded from the competition.

14. Each design in the first competition must have a design or motto marked on each drawing, and be accompanied by a sealed letter bearing the same device or motto addressed to the judges, giving the name and address of the author, which shall only be opened after the selection mentioned in paragraph 3 shall have been made; and for the purpose of ascertaining the names of the architects to be invited to send in drawings in the second competition, or for the return of unsuccessful designs to their authors. Each set of drawings, if forwarded in a case, must be properly secured and sealed, and marked on the inside of the lid, and in no other place, with the device or motto by which the drawings are distinguished.

15. The designs in the first competition are to be addressed to the judges, but delivered at the expense of the several competitors, and before twelve o'clock noon on March 1, 1884, into the custody of the clerk of the works, Houses of Parliament, at the St. Stephen's porch entrance in Abingdon Street, who will also take charge of the sealed letters above mentioned. Any design which may arrive after that time will be set aside.

16. The designs of unsuccessful competitors in the first competition will be returned to them at the expense of the commissioners. The selected designs will be similarly returned to their authors for the purpose of preparing the drawings in the second competition.

17. The remuneration of the architect will be 25,000*l.* for the entire work, including the sum of 600*l.* to be paid to him for his competition drawings, and the services to be rendered in consideration thereof shall include all those usually performed by an architect, except that he shall be relieved of all expense, trouble, and responsibility involved in determining the times and amounts of instalments to the builders, and in making up the accounts connected with the execution of the works, which will be provided for by the Commissioners of Works.

18. The buildings will be erected in blocks, at such intervals as may be determined by Parliament, and a proportionate part of the architect's remuneration for the entire work will be assigned to each block from time to time by the Commissioners of Works. One-third of the sum so fixed for each block shall be paid to the architect immediately after a contract with a builder for the execution of the works shall have been entered into; one other third part of the same sum shall be paid to the architect as soon as one-half the contract sum shall be paid to the builder, and the remaining one-third part of the said sum shall be paid to the architect after the completion of each block.

19. The plans, drawings, specifications, and other documents relating to the works, whether actually referred to in the contract or not, shall be the property of the Commissioners, and shall be deposited at the Office of Works, and the architect must, at his own expense, make all tracings and copies of plans, drawings, and other documents which may be necessary for the conduct of the works.

20. Except in the case of alterations or additions, made by the previous instructions in writing of the Commissioners, the architect shall not be entitled to any remuneration for his services beyond the sum hereinbefore stated.

21. In case of any additions or alterations to the original design, made by the direction or with the sanction of the Commissioners, the architect shall be entitled to such increased remuneration as may be agreed on, or in the absence of agreement, shall be determined by arbitration in manner hereinafter provided.

22. In case of the architect becoming incapacitated or dying, he or his representatives shall hand over to the Commissioners, or to whomsoever they may appoint, all plans, drawings, and papers relating to the works which may have been in his possession at the time of his incapacity or decease, and he, or his representatives, shall only be entitled to such equitable proportion of the unpaid part of the said remuneration as may be agreed upon.

23. Any dispute or question between the architect and the Commissioners shall be referred to an arbitrator to be appointed by the Treasury, who shall have such powers and authority as the Treasury shall think fit to give him, in addition to the ordinary powers of an arbitrator.

24. No rules of any association or society shall be held binding upon the Commissioners in reference to the works or matters herein referred to.

#### NEW THEATRE, NORTHAMPTON.

PLANS for the proposed new theatre, designed by Mr. C. J. Phipps, F.S.A., have been laid before the Building and Survey Committee of the Town Council and generally approved, subject to some few suggested alterations. The theatre will stand in the Guildhall Road. This strip of ground widens in the rear, and further space will be obtained by the demolition of eight cottages in Cow Lane. Thus the main building will be longitudinally in parallel lines with the Guildhall Road, that part of the building abutting upon it being but a long vestibule or corridor to the principal parts of the house. The total length of the theatre will be 105 feet, of which 37 feet will be occupied by the stage, and 68 feet by the auditorium; the average width is 46 feet. There will be five classes of seats—namely, a small number of private boxes on the balcony level, balcony, upper circle, pit, and gallery. The pit will be a special feature, as it will occupy the whole of the floor of the house, extending under the balcony and dress circle, but it will be so arranged that on the occasions of grand concerts some of the first rows will be convertible into orchestra stalls. The seating capacity of the whole will be about 1,500. Separate entrances will be given to balcony, circle, and pit from the Guildhall Road, whilst the gallery will be approached from Cow Lane. Each of the first three will have vestibules, whilst a special feature on the balcony and circle tier will be a foyer for the exhibition of paintings, statuary, &c. There will be refreshment saloons on each floor, and a box office at the principal entrance, where plans of the house may be seen, and seats booked any part of the day. In case of alarm additional means of exit will be provided for occupants of all parts of the house, both by way of Guildhall Road and Cow Lane. By the double exits thus afforded it is reckoned that the whole house might be cleared in three or four minutes. The landings and staircases will be built in concrete, and all the latest precautions will be adopted to reduce the chances of fire to a minimum. Ventilation will be carefully attended to, and the house will be illuminated by a large sunlight suspended from the ceiling. The stage will be fitted up with all the latest appliances in the shape of scene docks, galleries, flies, and cellars, &c., so that the different component parts of elaborate set scenes may be raised and lowered at one and the same time. There will be six commodious dressing-rooms, green-room, a supernumerary-room, and a band-room. In addition to these, there will be scenic-artist and property rooms. The Guildhall Road front will be composed of white Bath stone in the Classic style. An arcade of three arches will give admission to vestibules leading respectively to circle, balcony, and pit; the next storey will consist of windows, surmounted with a pediment.

In our Notice last week of the death of Mr. George Cole, we omitted to state that he was master of his eminent son, Vicat Cole, R.A.

## NOTES AND COMMENTS.

THE Chelsea Vestry Hall, which has only been built a little over twenty years, is in such a condition that notices have been issued intimating that it cannot be used for public gatherings during the ensuing winter. From the report of the surveyor it appears that in order to restore the hall to a safe condition it will have to be practically rebuilt, and the vestry is now confronted with the alternative of either restoring upon the old lines, or of constructing a larger and more pretentious hall, that would be a credit to the parish and at the same time yield a revenue that might cover the outlay incurred.

It is rarely that an unsuccessful competitor is found to express satisfaction with the good fortune of a rival, but this has been done in Edinburgh. Mr. JOHN McLACHLAN, who attended the last Architectural Conference as a representative from that city, has informed the town clerk of Hawick that he is "delighted that the choice of the referee has fallen upon the design of such an accomplished architect as Mr. WALKER," and that the Hawick authorities may well have the greatest satisfaction in dealing with that gentleman. Mr. McLACHLAN also says "that the appointment of referee was a most happy one, and that he was sure all the competitors would acknowledge cheerfully that they could not have an abler and juster judge than Mr. HONEYMAN." Sentiments like those of Mr. McLACHLAN's do much towards compensating for the efforts which have been made by some of the competitors to deprive a worthy architect of the possession of a prize which he won honourably.

THE dulness of the little town of Hawick has been so much lightened by the town hall competition, we are not surprised to find that the people are eager for more excitement of a similar kind. This time there is likely to be more amusement. A small sum of money has been collected for a BUCCLEUGH memorial, and, with the aid of a grant from the Science and Art Department, some sanguine memorialists anticipate that it may in time reach 2,500*l*. With so much money—the greater part being imaginary—it is proposed a memorial hall, a museum for science and art, class-rooms, a keeper's residence shall be erected, the remainder of the site being filled up with "suitable conveniences," a phrase which may bear a variety of interpretations. At least 8,000 superficial feet of flooring will be required. There are two parties in Hawick on the subject. One would have a low building covering the whole site, while the second party is in favour of a combination of two storeys and one storey. It would spoil the fun if the disputants agreed as to what they want, and architects are accordingly invited to endeavour to solve what is called "an open question" for the benefit of the good people of Hawick. It may be safely assumed that a great number will respond.

THE life of the late JOHN PAYNE COLLIER, who died on Monday, afforded a remarkable example of devotion to old English literature, and it must ever be a cause for regret that a man with his enthusiasm was not living in England a century ago. But his work was not appreciated by many, and his name was unknown to the majority of his countrymen until he published the emendations which he found in an old copy of "Shakespeare." There were people then who did not hesitate to declare that one of the best of English scholars was a forger and an impostor, and it was proposed to issue a "Grimaldi Shakespeare" as a companion to Mr. COLLIER'S. But JOHN PAYNE COLLIER was indifferent to what was said of him by the multitude, and when we find that he printed only fifty copies of some of the emendations, it is not difficult to infer how few were those he cared to please.

THE construction of railways in Japan during the past year has proceeded steadily. From a consular report just issued we note that the number of miles now open between Kôbé and Otsu is 58. Forty-seven miles of this line, the section between Kôbé and Kiôto, lies through the plains, with good gradients and easy curves. On the other eleven miles between Kiôto and Otsu the gradients are heavy, a great portion of the line being laid out to an inclination of 1 in 40, which necessitated more powerful engines to do the work. All the engines are obtained from England, a contract for four new ones

having been given to a Glasgow firm. The iron rails first laid down are being replaced, as they wear out, by steel, in accordance with the modern practice. The rails and all raw material, wood excepted, come from England. On the other side of Lake Biwa railway work was in progress on the branch from Nagahama to Sekigahara, a distance of 14 $\frac{3}{4}$  miles, which was to be opened by the end of April. The works here are light, especially at the Nagahama end, where, for some five miles, the line traverses the plain by the lake side on a small embankment. Further on, at the Sekigahara end, there are some excavations, but nothing remarkable in that way. There is also in hand the line from Nagahama to Tsuruga, which, when completed, will be about 26 $\frac{1}{2}$  miles long. The tunnel under the Yanagase hill is not yet finished. The total length is about 1,400 yards. The heading had, at the end of March, penetrated 700 yards into the hill. The rock is very hard and has given much trouble, but it is being dealt with now by compressed air drills, in the same way as the St. Gothard and Mont Cenis, and the rate of progress is increased thereby. Except the tunnel the line is done, and passengers are, and have been for some time, taken to the foot of the mountain on each side, when they have to get out and walk over the pass.

THE University College at Dundee, which is to be opened in the course of a few weeks, is a notable example of the shrewd way in which building work is undertaken in the North. A site that may well be called eligible was for sale, but upon it was a terrace of five or six detached villas, having the usual bay windows. The demolition of the houses would not be in accordance with Scottish economy, and the architect, Mr. McLAREN, was therefore instructed to utilise them when preparing plans for the college. The fronts, stairs, &c., have been allowed to remain almost intact; a corridor has been constructed connecting all the houses, and will form an excellent promenade in wet weather. The rooms have been transformed into class-rooms, and constitute a college on the pavilion principle. Where the existing buildings were not adapted to teaching, new buildings have been constructed, and the chemical theatre and lecture halls are excellent examples of planning. In fact it may be said that all the money has been expended with the utmost prudence. The trustees appear to have acted on the principle that an industrial university depends for success on professors and appliances rather than on costly buildings.

THE seventeenth annual convention of the American Institute of Architects has, according to the *American Architect*, been a very harmonious and successful one. According to the reports submitted at the meeting, the number of members of the Institute had considerably increased in the year, the Fellows numbering as many as sixty-nine, leaving one vacancy under the rule adopted two years back—a limit which, having since then been found too low, has been abandoned. Various other amendments as to the rules regulating the admission of members to the Institute have been adopted, as well as in regard to the internal constitution of the body. The proceedings included visits to public and private buildings of the city of Providence, as also the reading and discussion of papers. Among these was one on "Strength of Materials," by Mr. LAUZA; on "Competitions," by Mr. Fox; on "The Architect as a Sanitarian," by Mr. CLARK, &c. A novel feature was introduced by a general assemblage of the members on the steps of the church, where a photograph of the party, with the president, Mr. WALTER, was taken.

In a pilaster of the old church at Odilienberg (Netherlands), a stone has been discovered of considerable interest to archæologists. On one of its faces is sculptured what is supposed to be MINERVA, with her helmet on her head and her owl close beside her. The second face, which is in a better state of preservation, bears the representation of another deity, probably APOLLO, his head surrounded with sunlike rays and a bow in his hand. This discovery may perhaps throw some fresh light on an inscription on two other stones found in the same church, which were described in a report of the Abbé HABET's to the Royal Academy of Amsterdam. If carefully detached, an examination of the hitherto concealed faces might reveal an inscription which would apprise us of its pristine destination.

## ILLUSTRATIONS.

THE HALL, NETHER COURT.

OUR illustration, taken from the original drawing in this year's Academy, exhibits the interior of the inner hall, or salon, Nether Court, Hendon, built for Mr. HENRY J. JUBBS. The staircase and screen are of wainscot oak. The chimneypiece is of Chilmark stone, and the flooring of oak parquet. The house was finally finished Midsummer of the present year.

NEW PREMISES IN BEDFORD STREET, EXETER.

THE illustration shows new business premises, erected from the designs of Mr. E. H. HARBOTTLE, of Exeter, for Messrs. ELLIS, DEPREE & TUCKER, goldsmiths and jewellers, at the corner of Bedford Street. The greater part of the building is occupied by the firm as a jeweller's shop and private residence; the remaining portions are intended for offices, and the shop in Bedford Street is occupied by Dr. WOODMAN, owner of the celebrated Alphington Nurseries. The shop and offices occupied by Messrs. ELLIS & Co. are specially adapted to their purpose, the floor and ceiling being of DAWNAY'S patent fireproof construction; the walls are lined with steel sheets, and the windows provided with iron roller shutters. There are strong-rooms and safes provided for family plate and other valuables. The fittings of the shop are made in walnut and ebony, and are designed by the architect. The exterior of the building is of red brick, manufactured at Bracknell; the roofs are covered with Bracknell red tiles, and the pilasters are of yellow Mansfield stone. Messrs. STEPHENS & BASTOW, of Bristol, were the contractors for the whole of the work, except the shop fittings, which were made by Messrs. DREW & CADMAN, of London. The carver of the brickwork was Mr. ALGAR, of Exeter and Plymouth. All the work is elaborate and of the very best quality.

ST. ALBAN'S CHURCH, BLACKBURN.

SKETCHES OF FRENCH ARCHITECTURE.

THE sketches reproduced in the illustration form a companion sheet to the plate published in *The Architect* of last Saturday.

## THE RAPHAEL EXHIBITION.

THE Raphael exhibition which has been opened in the north corridor of the British Museum, lately made available by the withdrawal of the natural history collections, has been organised in accordance with a suggestion of Mr. G. W. Reid. The exhibition consists of 152 carbon photographs of studies, sketches, and drawings, which are either by Raphael, or sufficiently in his manner to have secured in many skilled quarters the benefit of the doubt. The originals from which these photographs are taken are distributed amongst various cabinets and galleries in this country and on the Continent, and over sixty of them, numbered in the exhibition from 3 to 62, are from the so-called "Raphael Sketchbook," preserved in the Academy at Venice. There can be little doubt that two of the drawings (Nos. 48 and 50) are by Raphael himself; and scarcely any that the others are the production of Pinturicchio, some of the sketches for whose frescoes are in the Sistine Chapel in the Vatican. No. 1 of the collection is a portrait of Raphael, reputed to be by himself, but with little real claim to authenticity; but an undoubtedly genuine specimen of Raphael is to be found in No. 63, which is a study from the altar-piece in the Vatican representing the coronation of the Virgin. The original study is in the possession of the trustees of the British Museum, and the date of its execution was about 1502. It seems pretty certain that No. 64 is a study from the same composition, though not by the same hand. The numbers ranging from 73 to 76 inclusive present four admirable genuine studies executed in 1505-6, from the *Madonna del Prato*, in the Belvedere Gallery at Vienna. What will probably be considered as the most interesting of the Entombment Studies is that numbered 85, which represents an original in the print department of the British Museum, and which by far surpasses the painting in the Borghese Library. Very interesting, again, are the two studies, 92 and 93, containing Sonnets by Raphael, one of which is in the British Museum, with slight sketches for a figure in the *Dispute of the Sacrament* in the Vatican, the execution of which may be referred to the years 1507-8. The sketch numbered 114, and engraved by Mr. Fagan, is an exquisite representation of the *Virgin and Child*, the original of which, believed to be a study from the picture belonging to Mr. J. R. Mackintosh, was purchased by the trustees

of the British Museum for the sum of 600*l.* at the Wellesley sale in 1866. The date of the execution of this work is 1511. Another attractive drawing, the production of which may be fixed to the year 1514, and the original of which is now in the Vatican, represents two nude figures forming part of a group from the Battle of Ostia. This drawing was sent in 1515 to Albrecht Dürer by Raphael, who, according to the testimony of an autograph marginal note by Dürer himself, presented it to the great German master as a specimen of his manner. Nos. 145 and 146 are two drawings from the Farnesina at Rome, which are undoubtedly by Raphael, and were executed for Agostino Chigi, 1518-19. The final numbers of the exhibition, 150, 151, and 152, are three studies for his last but unfinished picture of the *Transfiguration*, which even in its incompleteness is one of the *chef d'œuvres* of the Vatican. No. 150 represents two small full-length nude male figures, one of which has the hands clasped over the breast, whilst the left arm and hand of the other are uplifted from the shoulder. No. 151 is the heroic head of St. Andrew, and No. 152 exhibits the heads and hands respectively of St. Peter and St. John. It was the unfinished canvas of the *Transfiguration* which was placed near the bier of the artist, who died on Good Friday, 1520, as his body lay in state in the room in which he had been accustomed to study.

## THE BEN NEVIS OBSERVATORY.

THE building proposed to be erected on Ben Nevis for the purposes of an observatory has been commenced, the designs having been prepared by Mr. Sidney Mitchell, architect, of Edinburgh. What is now in course of construction is a substantial one-storey building, intended as a residence for the observers, the further development of the plans being held in abeyance for the present. The building is situated within 80 feet of the ordnance cairn, marking the summit of the mountain. Externally, it will resemble nothing so much as the Cyclopean buildings of the ancients, being constructed of large blocks of stone, such as are found in abundance over some ninety acres of the mountain top. No mortar is used, but there will, it is understood, be no difficulty in giving the desirable stability to walls which are to have a thickness of 4 feet at bottom and 3 feet at top. Within the rough but substantial casing thus provided there will be placed as an independent structure, separated from the stone work by the space of an inch or two, a firmly compacted wooden frame house. The outer walls will consist of two sheets of boarding, set four or five inches apart, and furnished with a double lining of felt. Of similar construction, though without the felt, will be the partition walls; while the flat roof will also be formed of double boarding, nailed above and below the rafters, with a sheet of felt in the interspace, and the outside covered with lead. The entrance, placed on the south side, and near the west end of the building, will be protected by a porch, having doors on its east and west sides, one or other of which can be opened according to the direction of the wind. To the southward the porch will be protected by a large coal store, rising to the same height as the main building, and roofed with tarpaulin. Straight in front, on entering the house, will be found the offices and store-rooms, the largest of the latter measuring 7 feet by 6 feet. Turning to the right, a short passage will give access to the principal apartment, measuring 13 feet square, and lighted by two windows, on the south side, intended to be occupied as kitchen and living-room. This will be furnished with an American stove, available at once for heating and culinary purposes. On the east side of the kitchen space will be found for two bedrooms, measuring 7 feet by 6 feet respectively, both being so placed as to get the benefit of the stove, while each has a window affording means of ventilation. Opposite will be a third bedroom, 5 feet by 9 feet, also provided with a window; while, opening from the north side of the kitchen there is to be a small recess with a window filled in with plate-glass, from which observations may be made upon instruments fastened to the wall outside. The windows all over the building will be recessed to the extent of the entire thickness of the wall, so as to diminish the pressure of wind before it impinges on the glazed framework. The casements will be double, corresponding with the double boarding of the wooden walls, the outer one being made to open outwards, the inner one inwards. A built drain is carried all round the house, so as to insure dryness, and over the lead of the roof will be placed snow-cradles, with the view of preventing the choking up of the water-pipes in case of thaw. For the sake of warmth, the wooden framework of these cradles will probably be covered with turf, held to its place by means of ropes attached to rings in the walls, just as one often sees the thatch secured on West Highland cabins.

The Dean and Chapter of Ripon Cathedral have recently improved the north-west of the cathedral by pulling down several houses, and, in order to improve the road, they have presented a thousand square yards of land to the town, conditionally on the Corporation contributing a certain sum towards the improvement.

## PARIS NOTES.

A NEW bridge, the Pont de Tolbiac, has lately been opened for traffic across the Seine in East Paris. It has been built on almost the same plans as the Pont National and the Pont Bercy, between which it lies, and like these it serves to connect the Orleans and Ivry quarters on the left bank with those of La Rapée, Bercy, and La Grand' Pinte on the right. In one respect, however, it fills a more important rôle than either of its neighbours, for the Rue Picard leading to it on the left bank forms the eastern end of the great thoroughfare—one of the most important on that side of the water—which leaves the Pont de Grenelle at the other and western extremity of the city, makes a great semicircle through the 15th, 14th, and 13th Arrondissements under the successive titles of the Rue Linois, des Entrepreneurs, de l'Abbé-Groult, de Vouillé, d'Alésia, de Tolbiac, and Picard, and terminates at the new bridge. On the right bank the outlets for traffic are not as yet so important, but a newly-made avenue connects it with the Place de la Nativité, the central point of Bercy, whence a new street now in course of construction will shortly give access to the Place Daumesnil, and so on to La Villette and Montmartre by the line of the old exterior boulevards. Previous to the seventeenth century the furthest bridges on the eastern or upstream side of Paris were the Pont-au-Double and the Pont Notre-Dame; during the reign of Louis XIII. were built the Pont de la Tournelle over the main stream, and the Pont Marie over the small arm. The eighteenth century did nothing under this head for Eastern Paris; but during the present, no less than ten have appeared—the Ponts de l'Archevêché, d'Arcole, de Louis-Philippe, de la Cité, Saint-Louis, de Sully, d'Austerlitz, de Bercy, National, and de Tolbiac; and Parisians may now boast with truth that their city is better provided with bridges than any other in the world.

In a few weeks' time the present Morgue is doomed to disappear, and the establishment will be transferred to the Caserne de la Cité. It may be interesting to know that the lugubrious institution originated with the Sisters of Mercy (*filles hospitalières*) of Sainte-Catherine, generally known as the Catherinettes, who undertook to pick up the dead bodies found lying in the public thoroughfares, and bury them at their own charge in the Cemetery of the Innocents. In 1714 this merciful function of the Sisters is found to have lapsed, for the dungeon of the Châtelet was then used as a receptacle for unclaimed bodies, which were thrown down pell-mell on a thin layer of straw and left until sought for and recognised by some relation or friend groping about by the light of his own lantern. In 1804 the Morgue was transferred to the old slaughterhouse of the Marché Neuf. The existing Morgue was established in 1864.

Colossal photographs of the three windows that form the apsis of the cathedral of Poitiers have lately been taken, and are now hung in one of the vestibules of the Fine Arts Department in the Rue de Valois. These windows, which were thoroughly restored in 1882, are universally acknowledged to be the finest in France, both from their antiquity and from the great variety of the subjects, all representing scenes of Old or New Testament history.

Thirty-six artists took part in the competition for the Prix Troyon for landscape painting, which this year is worth 2,400 frs., double its usual value. The subject was, *A team of oxen yoked to a waggon, guided by a driver, and descending a hollow forest road in early morning*. The canvases sent in will be exhibited during a month at the Caen Museum in the left wing of the Institute.

A remarkable collection of paintings by old masters, which has come into possession of the present owner by inheritance, is now open at 250 Rue St.-Honoré. Among the great artists whose names figure in the catalogue, are Lancret, Nicolas Poussin, Troyon, and Claude Joseph Vernet, as representatives of the French school; and Michael Angelo, Correggio, Caracci (Annibale), and Guido of the Italian masters. There are also a few works by Potter, Schweichardt, and Rubens. Perhaps the gem of this interesting collection is a picture by Potter, *A Bull and a Dog*, which is considered one of the best from this artist's brush.

A Dutch amateur, M. J. Zürcher, who owns a very fine collection of pictures, has purchased seven paintings at the Amsterdam Exhibition, six of them being from the French section—*The Temptation of St. Anthony*, by Morot; *Evening*, a landscape, by Adolphe Guillon; *The Fates*, by Agache; *A Wreck*, by Flameng; *An Old Cornish Road*, by Boudier, and *Father Jacquemin's Cellar*, by Thomas.

The foundations, or lower part, of the pedestal upon which is to be erected Bartholdi's colossal statue of *Liberty lighting the World*, are estimated to cost 16s. 6d. the cubic yard, or a total of about 10,400l. They are to be made in concrete, consisting of cement, sand, and pulverised stone, will be 48 feet 8 inches in height, and cover an area of 93 square feet at the base, tapering slowly to 70 square feet at the top. They commence 15 feet below the surface, and rise 67 feet 8 inches above low-water mark. The pedestal itself will shoot up another 112 feet, with a base of 67 square feet, and a top surface of 40 square feet. The contractor has undertaken to complete the foundations by November 15 next.

## THE VENICE OF THE NORTH.

THE old Flemish city of Bruges lays claim, and not without cause, to be called the Venice of the North. Her many canals and countless bridges give her even to this day some likeness to the fair Queen of the Adriatic, but that resemblance must have been still more striking when her now deserted canals were thronged by the shipping of all nations, when her now ruined quays were crowded with bales of goods from all quarters of the globe, and her now grass-grown streets were alive with the bustle of a world-wide commerce. Enough of her ancient glory yet remains, chiefly in her domestic architecture, to prove that the author of the little book before us\* has in no vainglorious spirit given to the city he knows and loves so well the attractive title of the Venice of the North.

Our author is a most competent and pleasant companion for such as may be tempted to stroll through the streets of the old Flemish city. He is a local antiquary and historian of ability, and is the editor of a local paper, *Rond den Heerd*, which, for those who can read Flemish, contains many interesting articles on the legends, history, antiquities, and language of Flanders. M. Duclos is, therefore, well fitted to conduct us through the maze of streets—dull, narrow, and winding—which, two hundred and more in number, make up the city of Bruges. And of these many streets we venture to say there is not one which has not something of interest in it, for the traveller who cares for what is historic or picturesque. The student of architecture will find in the streets of Bruges much to repay him for toiling over their uneven and tiring pavement. As an instance of the architectural interest of these streets, we may mention that we lately found in one of them three young men standing in a group almost back to back in the centre of the roadway, like skirmishers preparing to resist cavalry. Each was armed, not with a rifle and fixed bayonet, but with paper and pencil, busily engaged in making architectural studies.

Bruges is a rich mine for such studies. No town, we may safely assert, has better preserved its domestic architecture of the last three hundred years. It has even kept two specimens of houses built in wood that date from the sixteenth century, although all such houses were ordered to be demolished so long ago as 1634. But the variety of the domestic architecture of Bruges is not its only merit.

"The mason's art," remarks M. Duclos, "attained at Bruges during the Middle Ages a richness unknown elsewhere. In 1480 it assumed its distinctively local character, which is to be found in all its domestic edifices down to about 1640. A wise set of rules kept alive sound artistic traditions. Thus the masons of Bruges, by the terms of the charter of their corporation, could not admit as master-mason anyone who had not produced certain designs on given subjects and executed two works of art such as the charter specified. It is probably to this rule are due the splendid chimneypieces which adorned many of the houses, and of which some interesting examples are still to be seen." M. Duclos goes on to point out the distinctive feature of the domestic architecture of the city, and incidentally remarks that it did not feel the influence of the Renaissance until the second decade of the seventeenth century, although the interior of most of the churches had succumbed to the bad taste of that movement at an earlier date. This was probably due to the fact that the iconoclasts of the sixteenth century had devastated most of the Flemish churches, and when they were reopened for worship those charged with restoration could think of nothing better than plastering them over to give them a Grecian or Roman appearance. How much beauty,

\* "Bruges en trois jours. Promenades dans la Venise du Nord." Par Ad. Duclos. Bruges, 1883. Claeys & Vandevyvere.

how much of real art, was hidden by this rough and ready process is shown by the beauties daily brought to light by skilful restorations. At the church of Notre Dame the removal of nearly six inches of plaster revealed some exquisite mural painting, quaintly carved mural tablets, and some finely-worked pillars and arches. At St. Jacques' Church the plaster has been removed from a rich oak ceiling. Likewise at the churches of St. Giles and of Notre Dame de la Poterie the knocking away of many cartloads of plaster brought to light a mine of hidden beauty. Perhaps we should be grateful for the vandalism that executed this plastering, as it has kept for our enjoyment much that time by itself might have destroyed, and has provided us with a curious number of architectural palimpsests.

A number of the old houses of the city have recently been restored and relieved of the cumbersome wooden cornices and coats of whitewash, under which the bad taste of the French in the early years of this century had concealed so many a picturesque red brick gable. It may be here noted that most of the buildings in Bruges are built with small bricks, stone being scarce, and the country for many leagues around being a sandy plain. Most of the stone that has been used in Bruges has been brought from the quarries of Hainault. The cathedral and other churches and the belfry are almost entirely of brickwork.

Honour is due to the people of Bruges for the efforts they have and still are making to keep up the ancient picturesqueness of their town. The new buildings are generally in a style agreeable to that of the more ancient edifices. The new Normal School, a large and effective building, is, to our mind, a masterpiece of Bruges architecture, and will well repay a visit by any interested in such matters. It is in the style of the sixteenth century, and has been erected from the designs of M. L. Delacenserie, the architect of the town, on ground formerly belonging to the Archery Guild of St. George's. A vaulted staircase and tower of an older building is being worked into the new. The stonework of the dormer windows of the school is, perhaps, too heavy and florid. M. Delacenserie, in conjunction with M. René Buyck, has submitted plans, in the same style, to the Government, for rebuilding the eastern side of the market place of Bruges. A convent of nuns near the gate of the Béguinage, a hall for meetings of religious societies a little way to the right as the traveller quits the railway station to enter the town, are new buildings also worthy of notice. The new railway station and a new church, in course of erection by the Jesuits, should be noticed, even if they cannot be admired. But it will be to the older monuments the traveller will more gladly turn, all of which are ably treated by M. Duclos. The volume is further enriched with lithographs from careful drawings, forming useful memorials of the most remarkable edifices of the place.

M. Duclos discusses, at some length, the question how to restore the façades of private houses in Bruges. The difficulty lies in the fact that, in many cases, merely to scrape the bricks and reface the stones does not suffice, for time and worse enemies have defaced irreparably both stones and bricks. Under these circumstances, many houses have been repainted in oils to reproduce the old red and white brick and stonework. This proceeding can hardly be considered strictly legitimate, but that it adds to the picturesqueness of the streets there is no doubt.

It is not generally known how much of architectural interest there is to be found in the villages around Bruges. On the way out to these, too, the various gates of the town still are to be seen—fine examples of the military architecture of the Middle Ages. It is to be hoped the local authorities will not consent to their demolition, as they have to that of the many quaint windmills which from time immemorial stood on the ramparts around Bruges.

At Lisseweghe, a village between Bruges and the sea, on the line to be taken by the proposed ship canal, is a handsome church, with a lofty and solid square tower of brickwork—a fine specimen of those towers not uncommon in maritime Flanders. Near here stood the abbey of Ter Doest, of which only a large granary, supported inside by a double row of oak pillars, erected in 1280, remains. At Damme, on the north of the town, is a small but handsome town hall of the fifteenth century. Near this, at Vive-Capelle, is a church, schools, presbytery, and dwelling-house—very good specimens of modern Belgian architecture in the old style, from designs by the Baron Béthune, of Ghent.

To end this stroll, which we have unwittingly prolonged beyond the limits of the town, we will recommend any who have

yet the time still to spare, and have not been to Bruges, to go there at once. Young architects will find there much to interest and inspire them. The early days of October, too, are very often the best in the year for a trip to Belgium, for occasional showers keep down the sandy dust that overpowers the traveller in the summer. Lastly, M. Duclos' little book will prove an interesting souvenir of the visit to the old Flemish city.

## ENGLISH SCHOOL OF IMPRESSIONISTS.

A SOIRÉE has been held in the Walker Art Gallery, Liverpool, where the autumn exhibition of pictures is now on view. In the course of the evening a paper was read by Mr. P. H. Rathbone, on "The English School of Impressionists as illustrated in the present Autumn Exhibition." Mr. Rathbone said: The young school of artists, whose works are exhibited chiefly in this room, are trying an experiment which may have much effect upon English art, beneficial or mischievous, according as to whether it is treated as an idle and passing fashion, or whether it is earnestly studied with a view to carry out its principles with unflinching truthfulness and diligence. It is in some respects the converse movement to that commenced by the pre-Raphaelite brethren about thirty years ago. The old pre-Raphaelites painted what they knew to exist, and verified as existing bit by bit, no point of the picture being less carefully finished than any other, so that their pictures gave an impression of restlessness, because they did not direct the eye to any special point of view. All details of the picture, whether in the eye's focus or not, clamoured equally for recognition, and an absence of atmosphere made itself felt. There is a great deal to be said in favour of this method of working. It induces great carefulness, and is a deadly enemy to scamping work, which was rather the tendency of the English school when the pre-Raphaelites began their crusade, which has been a very beneficial one for English art. The new school do not profess to paint the whole, but, as I gather from an examination of their work, the impression received from a scene or an object at a given time and under certain states of the atmosphere, and with the eye and attention directed to given points. Turner, the arch-Impressionist, carried this idea out to its extreme limit. He said in effect, "Here are certain colours, certain effects of light and shade of atmosphere, which exist in the scene before me, and which so absorb my attention that I point them out to the student, and merely indicate all the rest, giving a vague sense that it is there, but does not occupy the attention." This is, as I have said, the extreme limit of Impressionism, and a great deal beyond what it is safe for any but a painter of supereminent genius to go. The painters to whom I would this evening direct your attention are far from going to this extreme: they paint the scene, and don't merely indicate it, as Turner in some of his later work seemed to do. Take for instance the picture by Mr. Stott, hanging on the opposite wall, *The Kissing Ring*. A group of children are dancing in the grey twilight upon the wet sand, apparently, at first sight, slightly painted and even sketchy. It is, upon close examination, most thoroughly thought out, and studied from nature with loving care. The spectator feels at once how the sand is wet enough, and yet not too wet, to be firm. Observe the reflection of the children in the little pool is more clear than the children themselves. Strange this, is it not? It is true, however. Note the little pink tinge on some of the little pools left by the sea, carefully discriminated, so that, though you cannot find out in the picture the light that causes it, you instinctively feel its truth. If you look at this picture for some time, carefully isolating it from all the surrounding work, you begin to feel as if you were looking at the scene itself in a distinct state of the atmosphere, which may and will vary from minute to minute as twilight closes in, and you become impressed with the reality of the picture and it seems to arouse in you the same tone of feeling, the same line of thought, that the actual scene would do. In fact it is not only the body that is represented, but the spirit of the scene which is infused into the picture. Next to this picture is one by Mr. Millie Dow, *Tramps at Sundown*. Here are two tramps crossing a gloomy waste of sand and rushes in cold grey evening, while in the distance a gleam through a break in the clouds lights up and defines a group of houses towards which they are directing their steps. The effect of this isolated gleam, giving distinctness to the houses in the distance when all else is misty and undefined, is well indicated, and there is much feeling and intention in the picture. Over the picture by Mr. Stott, another by Mr. F. O'Meara, *Evening in the Gatinais*, has also many of the same characteristics, but there is a sense of restfulness and peace which is special to it. A girl is sitting by a streamlet in a wood, but on either side of the picture are grey and white buildings respectively seen through the woods. I would point out that the artist has had sympathy with the anatomy of the trees, and they have their own character and life. So many of our tree-painters forget this, and make their trees more or less crooked and rugged poles with foliage attached, forgetting that a tree is a living organism of which the trunk is a living and characteristic part, that it is worth

while pointing out when a young painter does give life and individuality to his trees. The three pictures, together with No. 413 on the opposite wall, where two children are resting on sandhills, a few sparse flowers cleverly scattered in the foreground to relieve the otherwise monotonous tone of the subject, are all in a very subdued brownish grey, which at present seems to be very much in vogue among our younger artists; and even Mr. Joseph Knight, two of whose finest works are exhibited in this exhibition, seems to confine himself to sand colour and dull green.

The next picture to which I would direct your attention is in a different key, by Mr. Blair Bruce, *A Pear Orchard*. Here attention is fixed upon a boy looking up at a pear tree, but when the eye wanders for a moment it is caught by the contrast of the colour of a light-coloured cart standing against a dark background of wood, which causes the eye unconsciously to define its outline. But the chief attention is directed to the boy's action, and his countenance is therefore distinctly defined. While we are only vaguely conscious of the countenances of the other two children, and so of that part of the tree at which the boy is looking preparatory to shaking some of the pears off, it is distinctly defined because the attention is specially directed to it. Nevertheless we are conscious, though dimly so, of the other features of the scene; the rest of the foliage and the grass, though blurred and indistinct, we feel to be grass and foliage. Below this picture hangs *The Convent*, by Mr. Forbes. The city is fortunate in possessing one of this painter's pictures, and I am informed that one of his works would have been bought out of the Chantrey Fund had it not been unfortunately painted out of England, and so not coming within the terms of the bequest. It must strike the spectator how the artist seems to see everything through a blue medium, and it naturally occurs to ask—Is nature ever like this? Is there ever a scene so completely blue? The answer is that the blue is in nature, if it is looked for; and that, if blue delights the eye, every object with blue in it arrests the attention, which passes over other colours, so that the impression remains with the artist of a blue nature. Other artists are impressed with other colours which accordingly tinge their work. So long as this is really the result of the impression upon the artist, and does not degenerate into a lazy habit of constantly recurring to the same colour to save the trouble of constant and a wearied observation of nature, it is well; but the danger is that it may become a habit and a trick, and consequently untrue and mechanical. Over the central picture is *Lost and Found*, telling a simple story simply and well. In No. 337, T. F. Goodall, we have a different key of colour—*Rocklandbroad, Norfolk*, is seen under the cold, steely effect of an autumn evening, relieved by the red-tiled roofs of the buildings in the distance. The character of the face of the man who is ferrying the load across is well indicated without being defined. Miss Bertha Newcombe's *Evening* deserves also notice from the careful way in which the central group is defined in the details, while those of the other groups are faintly but subtly indicated. It is, however, now natural to ask how the Impressionists deal with the higher branch of art, the human figure. Unfortunately we have only four or five single figures in this exhibition, but one of them, a portrait by Mr. Lathangue (an Englishman, though his name sounds foreign), is a good example. It will be observed how indistinct the outlines are upon examination, yet the figure is firm and solid, and giving the impression of individuality and resemblance to a characteristic subject. Mr. Woodlock has two in this room, *Yusef* and *Love's Letter-box*, both characteristic of the school, but not, I think, doing him as much justice as *An Old Acquaintance*, a portrait of Mr. Samuelson looking carefully over an old violin. There the intention is excellently carried out—the light, shade, and expression are all forcible and characteristic; you get the impression of a living man actually occupied, not merely passively vacant, as is so generally the case with portraits or studies. I would also call attention to a water-colour of Mr. Woodlock's, *The Rendezvous*, which is a young damsel waiting for, perhaps, some other young damsel, or perhaps not; but at any rate, the grace and feeling of which makes it quite worth notice. Here, also, you see the effect given with an absence of defining line, but without weakness. Now, this effort to reproduce the impression received at a given time under certain circumstances by a scene or a person may result in very fine work, or, on the other hand, may degenerate into slip-slop cant and pretentiousness. In the case of some of the French Impressionists I am afraid this is already the case. The difficulty also is that the eye of the artist and the spectator may so vary that the impression given by identical objects may vary considerably, and Impressionism ought not to mean eccentricity for eccentricity's sake, still less ought it to mean a series of tricks and mannerisms. I remember some years ago a small group of young artists who thought they gave breadth and strength to their work by a lavish use of the palette knife, and most unpleasant the effect was of the smeared canvas. Finally, if the spectator wishes to do justice to artists of this school, he must divest himself of all preconceived ideas, and place himself before their pictures trying to recall how similar scenes appeared to himself, not how he has seen them painted. The public so often get into the habit of looking through the spectacles of their favourite painters that they are very apt to do great injustice to any new school who attempt to go to nature

direct and learn their own methods from her. Let us hope that on the one side the young artists of the new school (if I may use such a term of artists many of them working apart from and unknown to each other) may religiously avoid cant, affectation, and a lazy habit of chancing effects; and on the other side, that the public will recognise in a discriminating but a generous way any conscientious endeavour to interpret on canvas, by however novel a method, the manifold and inexhaustible beauties of nature.

## THE HAWICK TOWN HALL COMPETITION.

SOME letters have appeared in the *Hawick Advertiser* upon the competition for the town hall. The following from Mr. Honeyman disposes of the objections which have been raised against his decision:—

It was inevitable that my report on the new town hall designs should give rise to a good deal of dissatisfaction, and I feel grateful to dissatisfied correspondents that while they state very plainly their objections to my recommendations they at all events give me credit for good intentions. So far, indeed, as I am personally concerned, I might very well refrain from taking any notice of their remarks; but this, I think, would hardly be right, because on the one hand I feel bound to satisfy competitors by every means in my power that I have acted fairly to them, and on the other to correct the false and misleading opinions of such correspondents as "Pro Bono Publico," "One who wants a good Town Hall," and others who seem utterly to have lost sight of the fact that there can be no such thing as fair competition where the published conditions are violated. I do not believe these writers wish to mislead, and I am quite sure the people of Hawick wish to act justly, and therefore, with your permission, I desire to show the unfair tendency of suggestions which have been made, and by a simple illustration to bring out the principle involved. Let us suppose that at one of your district agricultural shows Hawick has offered three prizes for two-year-olds, and that when the animals are brought into the ring it is discovered that a lot of breeders have tried to pass off three-year-olds as two-year-olds—what I ask would be thought of the judge who would hesitate for a moment about turning them all out? If only one beast of the class of two-year-olds was left for him to pinch and poke, and he found it all right he would give it the first prize of course, but what would he do with the other two prizes? Will "Pro Bono Publico" or any good man of Hawick tell me that he ought to tie the second and third prize tickets to the horns of the likeliest three-year-olds and let them be led about after the two year-olds? I would be glad to have a plain answer to that question. Again, would any of my friends propose that the difficulty should be got over by altering the conditions, which had been duly advertised, after the animals were in the show-yard? Or, what would they say to this expedient—that the committee should not appoint a qualified judge at all, but leave the selection to a shoemaker or a painter who had never been in a byre in his life, and tell him just to give the prizes to the biggest and best-looking beasts in the lot? That is another question which should be susceptible of a plain answer. Of course such a gross miscarriage of justice is impossible in the case of bovine competitions, and it is fortunately becoming less common than it used to be in the case of architectural competitions, and I trust the people of Hawick will set their faces against anything of the kind. It is worse to class a 12,000*l.* design with one at 8,000*l.* than to class a three-year-old with a two-year-old; and if a mistake has been made, if it is the bigger class of animal they wish to bring together, the straightforward course clearly is to advertise that at the next show the Hawick prizes will be for three-year-olds; and then you may depend upon it when the show comes round there will be no need to turn out any younger beasts. In your editorial remarks you point to the true origin of the present difficulty—the smallness of the sum to which competitors were limited; but it must not be forgotten that *they were so limited*, and any change of opinion on this subject now cannot possibly affect this essential condition of the present competition. What I have already said may serve to answer some of your correspondents who were competitors. It must be evident that if their designs were disqualified they could not be either premiated or exhibited—they are, in fact, placed outside of this competition altogether; and the responsibility of placing them there rests upon me. Now, so far as the probable cost is concerned, I freely admit that there is room for considerable diversity of opinion; and I can only say that I have given competitors the benefit of any doubt I had about the cost of their designs, and that I had every disposition to "stretch a point" in the circumstances. But manifestly stretching a point is not stretching two points. The line must be drawn somewhere. It is not usual, and I think it is not right that it should be drawn out much beyond 10 per cent.; and even your correspondent "Logic" may be able to comprehend that it is possible to "approach" such a margin and yet to remain outside of it. But some competitors maintain that their designs would cost less than the one which has been premiated. Mr. Fairley, in his letter to the town council, is very explicit on this point. I believe him to be wrong, but trust he may have every facility for

ascertaining whether that is so or not. I took great pains with the cubing of the designs and with the pricing of them after they were cubed, but my brethren may rest assured that I would much rather be convicted of inaccuracy than of injustice, and that I would welcome any accurate information which might lead me even yet to name designs entitled to the second and third premiums. I have every reason to believe that the town council would entertain any such recommendation favourably, and I regret to think that there is little likelihood that I shall be in a position to make it.

## BIRMINGHAM ARCHITECTURAL ASSOCIATION.

ON Saturday last this Association took an archæological ramble. Amongst the members present were Messrs. F. E. F. Bailey, Norman Gething, V. Scruton, and Franklin Cross (hon. secretary). The historical hills visited brought to mind many interesting events which have happened in the neighbourhood, especially the severe encounters which took place between the ancient Britains and the Romans; for on Clent and the neighbouring heights the Britons under Caractacus were defeated. Tumuli were erected in numerous places, and are visible and well worthy of inspection. During the afternoon the church of St. Clement at Clent was visited, and also the ancient and beautiful little chapel dedicated to the murdered infant King Kenelm. The situation of this chapel is remarkably picturesque, it being built over a ravine. At the east end was formerly a well which attracted thither pilgrims from all parts of the country, so great was the reputation of the water for its efficacy in the cure of various diseases. At the time of the Reformation the well was destroyed, and Bishop Latimer used every exertion to discourage the resort thither of pilgrims. After dining together at Hagley the members returned by train to Birmingham.

## PANAMA.

THE following description of Panama has been prepared by Acting Consul Chamberlain:—

Panama has increased in population since the establishment of the Interoceanic Canal Company. There are now in Panama and its immediate suburbs over 20,000 inhabitants according to last year's census. There is a village just being finished outside the town called Pueblo Nuevo, where a mixed population of West Indians and Colombians reside. Along the line of the canal there are about 6,000 British subjects, and at Colon they are fully 4,000 to 5,000. Panama, with the villages on the line and Colon, musters a population of 36,000 souls, of whom half that number are of British nationality. The town itself has not much benefited by the increase. The four public squares—Cathedral, St. Anne, Triumph, and St. Francis—have not improved in appearance. The Cathedral square is formed to the north by the bishop's palace, on the south by the Canal Company's offices, and on the east and west by private residences. The main street, running direct east and west, passes through the Cathedral square. The other squares have no particular public or private edifices worth mentioning. The few there are, such as convents and churches, are in a state of ruin. The St. Anne square is reserved for feast days, where bull fighting and public amusements are indulged in. The streets are, as usual, in the same state and style as they were years ago—very inconvenient for those who are not accustomed to walk on angular stones. The buildings have no particular style of architecture; they are generally of stone, and no symmetry is observed in their mode of structure. The cathedral is the only building worthy of notice, being built in the time of the Spaniards, and dates from 1760. It is in the Byzantine style, and its towers are covered with oyster shells (rough mother-of-pearl). Red tiles made of clay, and hardened by being exposed to a certain temperature, are used for roofing. A great many buildings are being constructed, owing to the great profits attached to house rent, which is exorbitant. A house containing six or seven rooms is let for 20*l.* per month; a simple furnished room cannot be obtained for less than 6*l.* The drainage is very imperfect, and the sanitary condition of the town is only preserved by the torrents of rain which take place during seven months of the year. These rains, which occur nearly every day during the wet season (April to November), sweep away all the offal of the streets, and cleanse both the drains and the streets during these months; regular streams run down the streets and carry all before them into the sea. The town is admirably constructed for these deluges to have effect, the city being partly on a tongue of coral and basaltic rock stretching out into the sea, and partly on a gentle rise towards the Mount Ancon. When the rain falls these artificial rivers take their sources from the sides of the mountain, descend impetuously to the middle of the town, where the water divides itself into the several streets and lanes, and empties itself on each side of the spit. These rains not only are beneficial in acting as a municipality, but supply the population with water. The first falls are not generally gathered for drinking, as they sweep from the house-tops dust, dirt, and decayed vegetable matter. Panama in the dry

season has no water. It is brought from sources and rivulets miles away from the town in water-casks, where the vendors make a handsome profit. The rivulet which supplies Panama with water is called Matasnillo. Three buckets are generally sold for 6*d.* It costs a family 4*s.* or 5*s.* per day for this element during the dry season. Nearly all the wells are dried up and the cisterns exhausted at the end of January, so the inhabitants during February and March are obliged to purchase water. A most extraordinary phenomenon occurred on March 8 of the present year. There were two wells in Panama, which boasted of their perennial source, graciously employed in supplying water to the inhabitants of the town. On the above date we had a very sharp shock of earthquake, which lasted 25 seconds; the owners of the wells were surprised the next morning to find their wells completely dry, the earth itself at the bottom of the wells being found to be hard and apparently parched.

The climate of Panama during the dry season (December to April) enjoys a steady and equal temperature of 27 to 29 centigrade. During the wet season (April to November) the heat is very oppressive, owing to the great dampness of the atmosphere, and the want of breezes. Light southerly winds prevail during the wet months, and strong northerly trade winds during the day. A singular coincidence to be remarked at Panama is that the winds during the dry season fall and rise with the tide. This phenomenon also takes place with the wet season, where, at low tide, there is scarcely a breath of air. The showers generally fall at this moment, preceded by heavy storms of thunder and lightning. The air is charged with electricity, and heavy rain-clouds hang over the Isthmus, which melt in heavy showers as soon as the electricity is discharged in the form of fork and sheet lightning. Within my recollection I have seen buildings struck by lightning; the towers of the cathedral were struck last year, and several large masses of stone were detached by the stroke. Notwithstanding the frequency of these accidents from lightning, there is not a single lightning conductor in the whole town. The railway wharf received a discharge in October last, which tore up and splintered several planks. Three people were killed on the Savanna.

The Isthmus is covered with thick vegetation; the wonderful verdure grows pell-mell; the variety and luxuriance are marvellous. Great trees overshadow an interminable and impenetrable jungle of lesser growth, made up of an endless number of nameless plants and vines, all pushing, struggling, clambering towards the light. The flora is perfectly gorgeous and bewildering in beauty and variety. The solar rays cannot penetrate such layers of thick foliage, and the soil always remains saturated. Emanations and effluvia, which arise from the surface being deprived of the sun (who extracts dampness and destroys decayed vegetable and organic matter), are the main cause of the various kinds of fevers in the country, such as yellow, typhus, malignant, remittent, and intermittent. The only specific used by medical men is quinine; the natives use a bitter tamarisk, of which they make a febrifuge. There were 130 lbs. of quinine used last year on the Isthmus, and valued at 3,000*l.*

Panama will become healthier when the city is provided with waterworks. A company has been lately formed, to whom a concession has been granted. Mr. Sosa is the engineer who holds the contract for the conducting of the water to the town, and the Franco-Trading Company have the principal shares, in conjunction with a New York firm. The works are to be constructed and handed over in two years (1885) at a cost of 50,000*l.* The water will be brought from the Rio Grande at a distance of about seven miles in iron pipes. This will be a remarkable improvement to Panama, and a great boon to its inhabitants. Gardens will be planted which could never exist before, owing to drought and expense of water in the dry season. The squares will be embellished and rendered pleasant. The dust will be laid, which is most disagreeable in the dry season, and causes, I am sure, the greater portion of diseases of the chest, which are so prevalent in this period of the year.

There are not many religions. Catholicism predominates. The Jews are numerous. There are no places of worship for any other denominations but Catholics. Protestants generally unite in some appointed place; so do the Jews. Neither of these denominations have any public buildings of worship. There is an assembly house, a presidential residence, a cathedral, a governor's office, and courts of justice. Both these latter are not very imposing structures.

There are several inns, but no really good hotels. There is only one passable, which is frequented by nearly all passengers in transit. A great many persons resident in Panama board at the hotels and live in furnished apartments. There are a few restaurants: one or two are very comfortable, but the remainder are of a very ordinary class. There are three main streets; the others are of no length or breadth, and are kept in indifferent repair. There is but one single road leading to the Savanna, about five miles in length. In the dry season the dust is suffocating, and in winter it becomes almost impassable from the lakes and mud. The Savanna is a large open plain, studded here and there with mounds and hillocks, on which are built *châlets*, where the Panamanian families resort during the dry season to obtain change of air. The great curse attached to this villagiate is the

coloradillas, small insects like a tick (*Pulex penetrans*), where they are found in myriads in the dry grass. They penetrate the skin and produce violent itching. The natives destroy the insect, and allay the irritation with frequent ablutions of camphorated spirit and tobacco-juice.

The only existing promenade in Panama is on the ramparts, which were built by the Spaniards in the 16th century at a cost of 16,000,000 dols. (3,200,000%). The ramparts are situated at the end of the spit on which the town is built. There is a paved road about 400 yards long which leads to the platform. At the end the height from the sea level is 40 feet, the breadth is 60 feet, and the length 200 feet, all constructed with solid granite. Underneath the ramparts is the prison in which convicts are lodged. It is a very damp, dark location, and the cells are not particularly large, nor are they clean. There is another prison on the square, St. Anne, where prisoners are also confined. It is somewhat similar to the former; there is little accommodation of any shape for the inmates, and the rooms are too crowded to be healthy. The smells, too, are not particularly sweet.

There is a good market in the middle of the town, where beef, tropical fruit (bananas, mangoes, plums, &c.), and vegetables can be purchased. Living is very expensive, and is on the same scale as rent. The fact of there being no smaller coin than 5 cents proves that all purchases must be in accordance. On account of there being no copper money, the smallest articles have to be paid for with silver. All silver coins circulate and are received in payment. Gold has a very heavy premium—18 per cent. for English, 24 per cent. for American, and 17 per cent. for French, on the value of the "sol" or "peso." It costs a family living modestly from 60*l.* to 80*l.* per month.

The Isthmus for 50 years was not visited by any phenomena such as earthquakes, &c.; very slight oscillations were felt, but nearly imperceptible to a great many. Lately we have had a succession. The first that took place after this long silence was on September 7 last, at 3.20 a.m. The city was roused by a severe oscillation from north to south, accompanied by a rumbling noise. The façade of the cathedral was destroyed, the columns and balconies of the Parliament House were thrown down, and several public and private edifices were rent. Since then we have had a series, varying in intensity, from three to five per month, and the extraordinary coincidence exists that they are regular and more severe at the new moon.

## MR. JOHN TENNIEL AND HIS CARTOONS.

THE following extracts taken from the current number of *Truth* may be of interest:—

The retirement of Richard Doyle from the staff of *Punch* was a great blow. Fortunately, however, Douglas Jerrold had been struck by the force and originality of the illustrations to a new edition of *Æsop's Fables* from the pencil of a young artist named Tenniel. At his suggestion Mark Lemon invited Mr. Tenniel to do some drawings for *Punch*, and though the early efforts of the new contributor were confined to initials, vignettes, and small cuts, he was soon promoted to more important work. John Leech found social subjects more congenial to his lively vein than political disquisitions, which often required to be treated seriously. There was a dignity and grace about the style of Mr. Tenniel which rendered him an effective substitute, and Leech readily gave him opportunities of developing his natural aptitude. After a while they dropped into the habit of doing the cartoons alternately week by week, until, by degrees, Mr. Tenniel almost monopolised that department. At Leech's death he assumed, as of right, the leading position on the paper, which he has since occupied. He is now the *doyen* of the *Punch* artists, and, with the single exception of Mr. Percival Leigh, who is one of the original literary contributors, he is the oldest member of the staff. Previous to this he had shown great promise, both as a painter and as a draughtsman. He had been an artist almost from his childhood, his skill in drawing having manifested itself in his earliest years. Born in London in 1820, he was educated privately in Kensington. He never studied art in the sense of having undergone a regular course of training. He qualified himself for admission to the Academy, and subsequently at odd times attended a "life" studio in Clipstone Street. Here he followed courses of lectures on anatomy, assisting in the dissections, and making drawings of them afterwards. When a boy of sixteen his first picture was exhibited in Suffolk Street, and was purchased by Tyrone Power, the actor. Later on he was a successful candidate in one of the cartoon competitions at Westminster, and painted a fresco in the Poet's Chamber. But though he had been fairly successful as an exhibitor, both in oil and water-colours, he had demonstrated by means of book illustrations that his forte lay in draughtsmanship. It is an open secret that the subjects for the weekly cartoons in *Punch* are selected and discussed at the weekly dinner of the staff, held every Wednesday; and the artist must often find his imaginative powers rather handicapped and circumscribed by the political exigencies of the hour.

The subject for the following week's picture having been

selected for him, or perhaps suggested by himself, he takes a day to turn it over in his mind, and on the morrow formulates his ideas on paper. He makes his drawing in pencil on the wood, and rarely fails to complete it at a single sitting. It is finished by the afternoon of the day on which he commences it, and it is sent off to the engraver's the same evening. He dispenses altogether with models, relying on his own intuitive knowledge and skill. He is of necessity a rapid worker, for it is never safe to tackle his subject till the last moment. A single day may change the political situation and upset the plans of the artist. The hardship of working at high pressure is that Mr. Tenniel's cartoons always run the risk of being spoiled in the process of engraving. The technical skill of the engraver leaves nothing to be desired, but the time at his disposal is barely sufficient to do justice to the drawings under ordinary circumstances; and if Mr. Tenniel's work is delayed by a few hours, or even if it is more elaborate than usual in its details, parts of it have to be omitted or cut away, to the great detriment of the original design. Another result of the system is that Mr. Tenniel can never enjoy the relaxation of a regular holiday, for, with the exception of a week or two some years ago, his drawings have appeared regularly week after week without intermission since 1851.

## LEGAL.

### Exeter County Court.

(Before Mr. J. GIFFARD, Judge.)

HEMS v. GAYE.

Mr. F. Orchard appeared for the plaintiff, and Mr. Sparkes for the defendant. Mr. Orchard said that the plaintiff was an ecclesiastical sculptor and carver of Exeter, and the defendant was formerly coroner at Newton Abbot, and now a county magistrate, and the claim was for 13*l.* 9*s.* 5*d.*, the balance due to Mr. Hems for the erection of a screen in Wolborough church in memory of the defendant's wife. In the month of January 1881, the plaintiff's tender was accepted for the work, and the screen was erected in a proper and workmanlike manner. The sum of 50*l.* had been paid on account, but the plaintiff had been unable to get the remainder of the money.—His Honour inquired if Mr. Hems was not a gentleman of some reputation? He remembered walking down the streets of Huddersfield and seeing a carving there by Hems, of Exeter.—Mr. Orchard replied that Mr. Hems executed work all over the world.—His Honour thought that if the claim was admitted, as it appeared to be, the balance must follow as a matter of course.—Mr. Sparkes contended that the contract had never been carried out, the work having been left in a very unworkmanlike and slovenly manner.—Mr. Orchard denied this, and said the 50*l.* was not paid for more than twelve months after the work was completed.—Mr. Sparkes said that the defendant had told Mr. Hems that the balance of the money would only be paid when the screen was put in a perfectly satisfactory state.—His Honour said that the question was whether the screen was in a satisfactory state. The payment appeared to have been made upon a distinct agreement that the screen should be put in proper condition, but it would be an admission of the claim if the money was paid unconditionally.—Mr. Orchard said that there was no such condition in Dr. Gaye's letter.—His Honour said that if the money was paid without any condition the liability would be admitted.—Mr. Orchard then read the letter, in which Dr. Gaye said that the balance should be paid when certain defects complained of were remedied.—His Honour thought that was a condition.—Mr. Orchard contended that the screen was erected in accordance with the tender.—His Honour: Will you submit it to any gentleman to settle?—Mr. Orchard: It is as it ought to have been done.—Mr. Sparkes said that he was perfectly willing to leave the question of whether the screen was properly completed to any gentleman of position His Honour would name; but he held letters in his hand from Mr. Hems, who declared that Dr. Gaye's only motive in defending this action was a fraudulent one, and that he wilfully retained the money.—His Honour: When people get into litigation they often lose their tempers and say what they don't mean.—Mr. Orchard said that the defendant went out of England for nearly two years, and as Mr. Hems could not get any money he was naturally a little angry.—His Honour: No doubt the expressions objected to will be withdrawn.—Mr. Orchard: Oh, yes.—His Honour suggested that the question of fact should be left to any architect of celebrity to decide.—Mr. Sparkes said that as Mr. Hems seemed to deny that he had made any charges, he should like to read the letters.—His Honour thought that the reading of correspondence rarely led to harmony.—Mr. Orchard said that the plaintiff only wanted his money; he was not angry.—Mr. Sparkes said that the balance had been paid into the hands of the defendant's agent, so that he had clearly no desire to keep it. The allegations of Mr. Hems, however, were most scandalous, and must be withdrawn.—His Honour: They are withdrawn, I understand.—Mr. Orchard: Yes.—His Honour said it appeared to be all shadow fighting, as

the money was there.—Mr. Sparkes said that the money had been ready for months and months, but the contract had not been completed. Dr. Gaye had been a county coroner for fifteen years, and was now one of the county magistrates, and he had no wish to deprive Mr. Hems of his money.—Mr. Orchard said that if there were any imputations of fraud of course the plaintiff willingly withdrew them; he had, perhaps, been a little angry, but he had no intention whatever of bringing any charges against Dr. Gaye.—His Honour: I do not for one moment believe the plaintiff meant anything by what he said.—Mr. Orchard said that the plaintiff had frequently applied for the money, but had been unable to get it.—Ultimately the case was referred to Mr. Ashworth, architect, to report to the Court whether the work was properly completed or not, and the Registrar said that he would appoint a day for the purpose.

## CHURCH BUILDING AND RESTORATION.

**Birmingham.**—On Monday the Right Rev. Dr. Ilsley, Bishop Auxiliary of the diocese of Birmingham, laid the foundation-stone of a new church, to be dedicated to St. Anne, in Alcester Street, Birmingham. The church is to be erected from designs prepared by Mr. Albert Vicars, 151 Strand, London, in the Early English style of architecture, and is in length 105 feet by 48 feet in width and 50 feet high, consisting of nave and two aisles with chapels at the extremities of the latter, dedicated respectively to the Blessed Virgin and the Sacred Heart. When finished the building will seat 600, and upon emergency accommodate 1,000 persons. The sacristies are well arranged, and there will be a very handsome tower and spire. The contractors are Messrs. Barker & Son, of Handsworth, Birmingham.

**Birmingham.**—Memorial-stones of a new chapel, Rocky Lane, Nechells, in connection with the Methodist Free Church, have been laid. The building, which was commenced about a month ago, is to accommodate between 500 and 600 persons, and is to occupy the site of the old chapel, pulled down a short time since, and a piece of adjoining land as well. It is designed in the Gothic style, and will cost about 3,000*l*. The architect is Mr. E. J. Lloyd, and the builders are Messrs. Sapcote & Sons.

**Edinburgh.**—A new Presbyterian church, situated in Viewforth Place, has been opened. On the right, at the corner of the two streets, is the tower, and to the left hand a smaller tower—each tower containing a staircase giving access to the front and side galleries. On the ground level, doors open from the towers into the aisles, so that there are six doors affording direct access to the church. The length of the building from front to back is 103 feet, and the width across transepts, 70 feet; across aisles, 64 feet; and from centre to centre of nave columns, 32 feet. In style the building is Gothic of an early French type, the square abacus being used throughout, and other details in keeping. The tower is 150 feet high, and maintains the character of the early French towers. The builder was Mr. John Souden, the work being carried out from the designs and under the general superintendence of Mr. J. Russell Walker, A.R.I.B.A. The estimated cost is about 7,500*l*.

**Leeds.**—The church of Holy Trinity, Leeds, has been reopened after restoration, in which a complete renovation of the interior arrangements has taken place. One of the chief features of the restoration has been the alteration of the Corinthian stone columns, five on each side of the nave, which support the cornice under ceiling and roof over church. The great height of the stone pedestals—3 feet square—upon which the moulded bases and columns stood, excluded nearly one half of the congregation from a view of the pulpit or any principal part of the east end. This obstruction was so objectionable, that although great reluctance was felt by the architect and restoration committee on account of structural difficulties and other reasons, some alteration and improvement was an absolute necessity. On account of the base being built in several stones, filled in with loose lime fillings, the old stonework has had to be cut out and new wrought circular stone shafts and moulded bases inserted, which has been most successfully done, without the slightest crack or fracture taking place in any part of the building. The alteration of these columns not only affords a much better view for the congregation, but has added to the proportional effect of the church. The restoration has been carried out from the designs and under the superintendence of Mr. Thomas Winn, architect, Park Lane, Leeds. The contractors for the works are: Bricklayers, masons, plasterers, and concreting, Messrs. Franks & Evans; joiners and carpenters, Craven & Umpleby; hot-water apparatus and ornamental railing, Messrs. Nelson & Son; painter and decorator, Mr. J. T. Pollard; new sunlights and plumbing, Mr. Joseph Lindley; lead, glazed cathedral glass windows, Mr. George Wilson; tiling, Mr. Robert Leason—all of Leeds. The brass lectern was supplied by Messrs. Jones & Willis, of London and Birmingham.

**Llangain.**—This parish church has been further beautified, painted tiles having been introduced in chancel. The subjects are taken from the Apostles' Creed, and are richly painted in colours upon an elaborate ornamental background of subdued tints, pro-

ducing a very pleasing effect. The whole has been designed and executed by Mr. Charles Evans, of Warwick Street, Regent Street, under the superintendence of Mr. R. J. Withers, architect.

**Malton.**—St. Michael's Church has just been reopened, after being restored at a cost of 2,500*l*. The unsightly north and south galleries have been removed, new roofs erected to nave and aisles, two new transepts erected, and the precincts of the church greatly improved by the demolition of a lot of old property which half buried the north side. Mr. Fowler Jones, of York and Malton, was the architect for the restoration.

**Neston.**—The corner-stone of a new Presbyterian church has been laid. The building will consist of nave, with north and south transepts. A narthex at the east end is approached by an open porch; on the north is a porch connected with the tower. The basement will be appropriated for school purposes; schools will hereafter be erected in the rear of the west end of the building. The design is Gothic, or the Early Decorated period. The material is of Yorkshire stone for walling, and Storeton stone for dressing. The ceiling will be waggon-headed. The architect is Mr. James Francis Doyle, and the contractors for the work are Messrs. Hughes & Stirling Booth.

**Newton Abbot.**—The old rood-loft staircase of Wolborough church has been opened out, and an ancient little window, discovered when the north wall of the church was pointed outside, and which has not been seen for some centuries from the interior, opened. During the past seventeen years the church, through judicious restoration, has been transformed from a dilapidated edifice into one of the most interesting in the neighbourhood. Between 2,000*l*. and 3,000*l*. has been expended on the work. Mr. Rowell, of Newton Abbot, was the architect.

**North Tynedale.**—A handsome tower and bell spire in the Early English style is being added to Birtley Church, North Tynedale, the gift of Mr. Geo. Wray, F.R.G.S., Leamington, Warwickshire, as a memorial to his late wife, formerly a resident in the parish. Mr. A. B. Plummer is the architect, and Mr. W. Welton, contractor. It is hoped that the repairs and restoration of the old Early Norman church itself will soon be able to be undertaken.

**Standlake.**—The ancient and interesting church at Standlake has just been restored. The work comprised the restoration of the south transept, the south aisle, south porch, and nave roof. Mr. Clapton Rolfe, of Oxford, is the architect.

**Towcester.**—The church of St. Lawrence has been reopened after restoration. Some years ago attention was bestowed on the chancel alone, a new arch being inserted, and a tile floor, new seats, and altar-rails added, besides general repairs being effected. The work of restoration has now been extended to the nave and its aisles, together with the aisles of the chancel. The work has been carried out by Mr. T. Heath, contractor, of Towcester and London, from the designs of Mr. J. L. Pearson, R.A. Mr. White acted as clerk of works.

**Walmersley.**—The new church of St. Saviour at Walmersley, near Bury, which has been rebuilt on a site adjoining that of the former structure, erected in 1838, is now completed. The church contains nearly 700 sittings, the cost of erection being about 5,000*l*., which sum will be increased by an additional 1,000*l*. when the tower is added. Messrs. Maxwell & Tuke, of Manchester and Bury, are the architects.

**York.**—The memorial-stones of a Wesleyan chapel, to be erected from the designs of Mr. Morley, architect, Bradford, have been laid. The building is to accommodate about 840 persons, and behind the body of the chapel will be four large class-rooms or vestries. The contractors for the work are as follows: Mr. Swalwell, Clarence Street, and Messrs. Naylor & Birch, Union Terrace, brickwork; Mr. Jno. Bellerby, York, painting; Mr. Jas. Deacon, Shipley, joinering; Mr. Geo. Thomson, Leeds, plumbing; Mr. Ben. Dixon, Bradford, plastering; and Messrs. Pycock & Son, Leeds, slating.

## NEW BUILDINGS.

**Greenfield.**—The old school in connection with St. Mary's Church, Greenfield, Yorks, having become inadequate to the requirements of the parish, new schools are in course of erection for the accommodation of 340 children, at a total cost of 2,200*l*. Mr. M. Robinson, of 19 Acresfield, Bolton, is the architect, and Mr. James Bourne and Messrs. Hewkin Bros., both of Greenfield, are the contractors for the stonework and the remainder of the trades respectively.

**Maldstone.**—The new Fever Hospital at Barming has been opened. The hospital consists of four distinct blocks. Two contain the wards, the third is to be devoted to administrative purposes, and the fourth is the disinfecting house and laundry, together with a mortuary, post-mortem room, and ambulance shed. The buildings are of red brick with Bath stone dressings and Aylesford tile roofs, and the walls have been erected in two thicknesses, with an air cavity between in order to insure dryness,

The administrative block includes dispensary, matron's room, kitchen, storerooms, &c., on the ground-floor, and accommodation for six nurses above, with a separate room for the matron. Each of the ward blocks, which are situated in the rear, and to the right and left respectively of the main building, being connected therewith with a covered passage open at the sides, contains accommodation for ten patients, one room being 36 feet by 24 feet, and the second 24 feet square. A nurse's room separates the two wards, and there are the necessary offices, with a separate bath-room. The fourth block is fitted with the disinfecting apparatus. Messrs. Hubert Bensted, Maidstone, and W. Leonard Grant, Sittingbourne, were the joint architects, and the builder was Mr. Avar.

**Reading.**—Temporary buildings have been erected in the Forbury, Reading, for the meeting of the Church Congress, providing in the hall accommodation for 3,000 persons. Thirteen thousand cubic feet of timber, 50,000 superficial feet of inch boarding, 40,000 feet of match boarding, 23,000 feet of roofing felt, 4,000 feet of glass,  $3\frac{1}{2}$  tons of iron, and two tons of nails and bolts have been used, the total weight of timber being about 400 tons, and 40 workmen have been employed in the work. Mr. T. Kingerlee, of Banbury, is the builder.

**Rothsay.**—A Temperance Institute is about to be built at Rothsay, Island of Bute, from plans by Mr. J. Russell Thomson, architect. It will contain restaurant, reading, writing, billiard, and recreation rooms, conference hall, &c. The total cost, including site, will be about 8,000*l.*, and is a free gift to the town by the trustees of the late Mr. Norman Stewart, of Virginia, U.S.A.

## GENERAL.

**Professor Roger Smith** has selected "The Column" as the subject of his public opening lecture at University College, London, and he proposes to consider that feature both from a constructive and an historical and artistic point of view. This lecture takes place on Wednesday, October 3, at six o'clock, and the classes commence the following Monday.

**The Directors of the Crystal Palace** have completed arrangements for holding an International Exhibition of Arts, Manufactures, Science, and Industry during 1884. It is intended that the exhibition should open on April 3, and close at the end of October.

**Mr. Matthew B. Jamieson**, assistant city surveyor, Aberdeen, has resigned his office, consequent on having received an appointment abroad.

**A Monument** is to be raised to the memory of Bishop Alfred Ollivant in Llandaff Cathedral. Mr. Armistead, the sculptor, has received the commission.

**A Marble Monument** has during the past week been erected in the south transept of St. Cuthbert's Church, Darlington, to the memory of the late Mr. R. H. Allan, from the designs of Mr. J. P. Pritchett, architect, of Darlington.

**The National Statue** voted by the Houses of Parliament for erection in Westminster Abbey to the memory of the late Lord Beaconsfield has been finished by Mr. J. E. Boehm, R.A., to whom the work was entrusted. The statue, which is about 7 feet in height, is made of the finest white Carrara marble, and stands on a marble pedestal.

**An Exhibition** of works by modern artists will be opened at Derby on Wednesday, October 3.

**A Design** by Mr. Black, of Falkirk, has been adopted for the new town hall at Grangemouth. A design by Messrs. Franie & Son, of Alloa, was second in the voting.

**Melrose Abbey** has been made more secure by the works in the nave, south aisle, and south transept, which have been carried out at the cost of the Duke of Buccleugh.

**The Annual Congress of the British Association** was opened on Wednesday at Southport.

**A Design** submitted in competition by Messrs. J. Whitehead & Sons, sculptors, of Rochester Row, Westminster, has been selected for a memorial proposed to be erected in the Coventry cemetery of the late J. Starley, inventor of the bicycle.

**The Premises in Bedfordbury** which were illustrated in the last number of *The Architect* have been built for Mr. William Powell.

**A Stone Pulpit** of Early English character, designed by Messrs. Medland & Son, architects, of Gloucester, has been erected in the church of St. Catherine, Gloucester.

**The Amsterdam Exhibition.**—Out of the awards at the Amsterdam Exhibition, Great Britain takes 19 diplomas of honour, 51 gold medals, 70 silver medals, 54 bronze medals, and 25 honourable mentions. Among them occur the names of Messrs. Doulton & Co., diploma of honour; Messrs. Chubb & Sons, gold medal;

Messrs. Kirby, Beard & Co., gold medal; Messrs. W. Woollams & Co., silver medal; Musgrave & Co., Belfast, silver medal; and Messrs. Clark, Bunnett & Co., bronze medal.

**Mr. Walter Tregellas** is engaged on a work entitled "Cornish Worthies," which will give sketches of notable Cornishmen and families. It is to be published in two volumes (octavo) by Mr. Elliot Stock.

**Among the Dozen Works** or more for which Mr. Ruskin said a little time ago he had materials on hand was "A General Description of the Geology and Botany of the Alps," in twenty-four volumes. It would seem that he purposes entrusting some of this work to one of his pupils, for his publisher announces as in the press, "An Account of the Limestone Alps of Savoy, by W. Gresham Collingwood, M.A., late scholar of University College, Oxford; edited, with a Preface, by Professor Ruskin."

**Miss Kate Greenaway** promises this year again to delight young folks with one of her coloured picture-books. Miss Greenaway's book is entitled "Little Ann." It contains some forty pictures, besides many minor illustrations. Messrs. Routledge & Sons are the publishers.

**The Castle of Cortachie**, one of the seats of Lord Airlie, part of which was destroyed by fire last week, was the original castle of Cortachie, erected by one of the Ogilvys of Clova, and Cortachie descended from Thomas, third son of Sir John Ogilvy, of Inverquhar, who deserted his clan at the battle of Arbroath, but the name of the baron by whom it was built and the date of erection are both unknown.

**The Lancashire and Cheshire Antiquarian Society** held its last summer meeting on Saturday last at Macclesfield, when the party visited Macclesfield Old Church, Old Hall, &c. At the restoration of the church in 1851 mural paintings supposed to have been executed in 1500 were discovered under the whitewash. Copies of the paintings have been preserved, but the originals have been destroyed.

**Plans** have been prepared for the erection of a new church at Cloughfold, in the parish of Newchurch-in-Rossendale. The cost is estimated at about 4,000*l.*

**The Middlewich Local Board**, at a special meeting held on September 12, unanimously agreed that Mr. Joseph Waring, engineer and surveyor, of Winsford, be instructed to prepare plans, estimates, &c., for supplying their district with water.

**At a Meeting** held in the Town hall, Aberdeen, on Saturday last, Mr. John Gray, of Spring Gardens Ironworks, and a member of the town council, intimated his intention to present to the city a building suitable for an art school, to be erected from plans submitted at the cost of over 5,000*l.* The site of this munificent gift is in School Hill, fronting Gordon's College, and contiguous to the public museum now being built.

**The First Commissioner of Works** has purchased the Edison electric plant which has been used in the House of Commons during the 103 nights of the past session. The success attending this experiment has induced Mr. Lefevre to adopt the light on a permanent footing, and a considerable extension of machinery is now being made by the Edison Company. Next session, therefore, not only the libraries and the dining-rooms of the House of Commons, but also the division lobbies, Ministers' rooms, and precincts of the House will be lighted by the Edison light.

**The Autumn Meeting** of the Iron and Steel Institute was opened at Middlesbrough on Tuesday.

**The Manchester Cathedral Restoration Fund** has reached 23,000*l.*, and it is expected that the whole of the north side of the nave will be completed by Christmas.

**The Lancaster County Magistrates**, at the annual general sessions just held, approved of a motion that a sum of 27,000*l.* should be raised to complete the buildings in connection with Prestwich Asylum, including the annexe, the farm buildings and gas-works, coal stores, workshops, night attendants' block, the mortuary in connection with the annexe, and the outbuildings for epileptics. It is expected that this sum will complete the undertaking, which will then have cost a total sum of 151,200*l.*—at the rate of 186*l.* per patient.

**Improved Middle-class Dwellings.**—By reference to our advertising columns, it will be found that the trustees of the St. Mary-le-Strand estate, situate in the Old Kent Road, are prepared to receive offers for a portion of their estate upon which to erect fifteen blocks of improved middle-class dwellings, each containing ten suites of apartments. Mr. Albert Vicars, of 151 Strand, is the architect. At the request of the Charity Commissioners, these dwellings are designed so as to meet the requirements of clerks and others of a similar class.

**At the Annual General Meeting** of the "Bee" Land and House Property Investment Company (Limited), held at the offices of the company, 111 Victoria Street, Westminster, S.W., on the 31st ult., a dividend at the rate of 10 per cent. per annum was declared, free of income-tax, a balance being carried forward equal to another 36½ per cent. upon the share capital.

# SUPPLEMENT

TO THE

# ARCHITECT

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, SEPTEMBER 22, 1883.

### TENDERS, ETC

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*\*\* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—  
"Contract Supplement to THE ARCHITECT."*

### TO AMERICAN SUBSCRIBERS.

*All subscriptions are payable one year in advance, and may commence at any date.*

*The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.*

*Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED TO GILBERT WOOD, 175 Strand, W.C., London, England.*

*In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—*

*To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order.*

### COMPETITIONS OPEN.

**BIRKENHEAD.**—Dec. 1.—Plans are required for Laying-out Bidston Hill for Building Puroses. Premiums of 100 guineas and 50 guineas, and four of 15 guineas each. Messrs. Davies & Stephen, Estate Agents, Mollington, Chester.

**BRISBANE.**—Nov. 30.—Plans are invited for the Erection of a Town Hall. Messrs. Gordon & Gotch, 15 St. Bride Street, E.C.

**CAPE TOWN.**—Jan. 30.—The Town Council of the City of Cape Town invite Plans and Specifications, accompanied with approximate estimate of cost, of a System of Drainage. Selected Plans and Specifications to become the

absolute property of the Corporation. All others will be returned free of expense. Premium of 250*l*. A plan of the City, with levels, may be seen, and further information may be obtained, on application to the South African Loan, Mortgage, and Mercantile Agency, 9 King William Street, London, E.C.

**LONDON.**—March 1, 1884.—The Commissioners of H.M. Works and Public Buildings are prepared to receive Designs for New Buildings proposed to be erected in Whitehall for the Admiralty and War Office. Mr. A. B. Mitford, Secretary, H. M. Office of Works, 12 Whitehall Place, London.

**NORTHAMPTON.**—Dec. 1.—Designs are invited for the Erection of a Board School, with Class-rooms and Out Offices, to Accommodate 1,150 Children. Mr. John B. Hensman, Clerk to the School Board, 4 St. Giles's Street, Northampton.

**OLDHAM.**—Oct. 1.—Plans for Schools for the Union, to Accommodate 120 Boys, 120 Girls, and 60 Infants. The building to be a separate one, in an enclosed area, to contain three schoolrooms, dormitories, baths, kitchen, with cooking arrangements; dining-hall to hold 500 persons, to be arranged so as to be usable for religious service; and four sitting-rooms and four bedrooms for officers. Mr. J. W. Mellor, Oldham, Clerk to the Board.

### CONTRACTS OPEN.

**ASHTON-UNDER-LYNE.**—Sept. 22.—For Extensions to Business Premises. Messrs. T. D. & J. Lindley, Architects, Ashton-under-Lyne.

**BANGOR.**—Sept. 27.—For Works for Carrying-out the Craigdyon Sewerage Scheme. Mr. John Gill, Engineer, Bangor.

# The Architect.

## THE DELIGHT OF THE EYE.

**O**f all the senses, that of sight, the most subtle and delicate, is the most enjoyable. The enjoyment of hearing, in the article of music, comes next in order, but it is enough to say that its cultivation is far more artificial, and indeed its pleasures almost entirely conventional. The diatonic scale itself is pronounced by philosophers to be a local custom; but the harmonies of colour and the melodies of form have been beautiful from the beginning and will be beautiful to the end. So also with the arts; although the musician and the elocutionist no doubt possess vast power over the emotions, it is power that is volatile and evanescent, while the painter, the sculptor, the architect, and the ornamentalist in a hundred varieties, seem to embrace in their domain everything in nature or in fancy and to utilise the whole universe in a perpetual and inexhaustible function of delight. The proposition is not at all too broad that nothing less than everything seen by man forms the subject of that intellectual pleasure which is the function of art; even the crankiest and crookedest of things, when they have quite ceased to be in nature anything but ugly, supplying to a certain quaint supplementary artificial sense of grace material for the picturesque.

Every great city ought to be made full of the delight of the eye. In the open country nature supplies abundance of such satisfaction, and one may go so far as to assert that the humblest toiler in the field, although often unconsciously, enjoys it well—missing it very much, for instance, when transplanted to the town, where the gauds of the gin-palace and the gas-lighted streets are the substitutes for the beauties of hill and dale, wood and stream, blue sky and cloud. Why is it, then, that our great cities, and alas! very particularly those of princely England, are not made full of the delights of the eye?

Probably the answer to this question is pretty clearly recognised everywhere to be something like this: that the town has for its *raison d'être* the cultivation of pure utilitarianism, the manufacture of goods, in short, and their distribution, and all else that comes of these proceedings. Labour of one wholly artificial sort or another is the business of towns, primarily, secondarily, and to a great degree in most cases, finally, and why vex the labourer with that which is incompatible with his work?

Stated thus in its unsophisticated severity, the argument may seem to defeat itself; but this is only because we are now happily awaking to a feeling of shame that such very hard lines should be laid down for human living and dying. We are beginning to feel a little ashamed of our "civilisation"; our political economy may be all quite clear, and its conclusions irresistible, and yet we begin to think there is something beyond political economy in the science of society, something that may not be very clear yet, but will become clearer by-and-by. One way of dealing with the difficulty is to ask this question—In all this artificiality of ours, do we not fail to complete the circle of artificiality? Amongst the rest, ought it not to be a principle of fair dealing (as we may call it) with humanity that the men who are thus withdrawn from the beauties of nature ought to be amply supplied with the beauties of art?

At the present season of the year it is the custom of the dwellers in our towns to migrate into the country for what is called, amongst other phrases, change of scene, and it seems to those who have occasion to observe such matters that every year this emigration is becoming more and more comprehensive. As affecting our present line of argument, may it not be suggested that change of scene is coming to be increasingly appreciated for this very reason, amongst others, that it is a change from the ugliness of ordinary town life to the beauty of country life? When children of metropolitan slums—born and bred in the narrow alleys of Drury Lane or Shoreditch—are taken out by local philanthropy to have "a

day in the country" for the first time, it is said they will lay themselves down upon the real grass in sheer rapture, and pluck real daisies or gaze into a real brook in amazement irrepressible; and what is this, in its degree, but the same sense of a hopeless artificiality of life which leads all who can by any means afford it to rush away from London now and then and lose themselves—in spite, perhaps, of no inconsiderable sacrifice of the comforts of home—in those simple delights of the eye which are, however simple, the most natural of all distractions?

It has been frequently remarked that in Paris—which is in many respects the best counterpart of London in the world—the people as a rule do not in this way seek relief in country expeditions. Like DICKENS'S tavern waiter in the City, whose enjoyment of the only holiday he had ever had consisted in helping the waiter of a neighbouring tavern, the true Parisian, when he takes a holiday, goes to see some other town, some other Paris. The reason for this, we should say, lies in the fact that Paris, no more artificial in its purposes than London, is so much more completely artificial in its results. The delight of the eye especially is an all-pervading element in the artificiality of that exquisite town, and the consequence is that the ordinary Parisian, except it be for some direct object of restoration to health, does not appear to require the same sort of change of scene which in English towns is so much in request. The motive here involved is a different one from that which leads people in Paris to get up their little family pleasure parties for the Champs Elysées, the Bois de Boulogne, or the forest of Fontainebleau. Their custom of living in the open air, even in the densest quarters of a town, is a national principle, a question of race, inherited from the east, just as the contrasted Anglo-Teutonic principle of avoiding the open air as much as possible is inherited from the north; and we may say almost with certainty that the enjoyment of a suburban picnic by a Parisian party from Belleville, compared with an excursion to Epping Forest by a family from Bethnal Green, is very much like the enjoyment of no more than an amplified boulevard compared with that of an excursion to Margate—nothing more than the acquisition of a little wider elbow-room in the one case, but a positive act of emigration in the other.

The fact is that the cultivation of the artistic delights of the eye must be said to be in England in a very backward state. One of the most peculiar differences in the world is that which distinguishes in this respect the English gentleman from the French. The same principle of dignity which on the one side of a narrow channel has always compelled men of patrician fortune to rejoice in the study of art for the sake of its pleasures, has led the same order of persons on the other side to regard everything of the sort with a suspicion of effeminacy and indeed of vulgarity. To this day, the aristocrat in France, even if not wealthy, is a *connoisseur* by nature, surrounding himself with the elegance and grace of all the arts as matter of course; while the typical English squire, in the midst of his broad acres, prefers to live in a crude and possibly shabby old house, filled, if with anything of value, with heirlooms more archæological than artistic, dressing himself like a superior groom or gamekeeper, and although one of the best fellows in the world and an excellent judge of a horse, a man, and perhaps a good song, professing no better opinion upon the mysteries of art than that the whole business is a pedantic affectation.

But it is matter for continual satisfaction that amongst the community at large that intelligent if vague appreciation of works of delineative, formative, and chromatic design, which is the forerunner of a vigorous artistic nationality, is clearly seen to be advancing steadily. The time is coming when English towns, even those which are now the most sordidly devoted to trade and toil, will be filled with the delights of the eye; and the mansions of the country gentry also, emulating the same spirit—as the churches of the country clergy have already so happily done almost everywhere—will be swept and garnished as the abodes of elegance and refined culture ought to be.

The absolute harmlessness, serenity, and virtue of those enjoyments of art which are received through the eye, it is sufficient to suggest without either description or argument. To be a supreme master in the production of artistic work is permitted to only one here and there; but to be successful imitators and followers is no more than a great many of us may joyously attempt; whilst to have an intelligent admiration for all that is done honestly, and a never-failing appreciation of all that is done well, is open to every one who will take a little

trouble to learn the simplest data of design. "A good eye," BURGESS used to say in his quaint way, "is the gift of the good GOD;" but we may add with even greater force that the commonest of eyes, if well used, may be made the means of more refined enjoyment than all the other senses together can afford.

## IN CLEVELAND WITH THE IRON AND STEEL INSTITUTE.

[BY A CORRESPONDENT.]

LAST autumn we accompanied the members of the Iron and Steel Institute in their excursion to the banks of the blue Danube, to Vienna and Buda Pesth, and to the very south of Hungary. This year they have chosen for their holiday gathering the banks of the Tees, silver now no longer, for Middlesbrough, that infant Hercules, "the youngest child of England's enterprise," has arisen upon its shores within the last fifty years.

The district of Cleveland—the cliff land, as CAMDEN derives the name—forms the "north-east shoulder of Yorkshire," and was before the Roman invasion inhabited by those "brave Brigantes" whose habit of "conveying" any "portable property" is supposed to have given rise to the word "brigands." WILLIAM THE CONQUEROR bestowed Cleveland on ROBERT DE BRUS, ancestor of ROBERT BRUCE, the "patriot king"; and the first record of Middlesbrough, now Middlesbrough, its chief town, is in the reign of HENRY I., when the same ROBERT DE BRUS gave a cell at this place to Whitby Abbey, on the condition that some Benedictine monks should be permitted to reside there. In 1808 there were only four farmhouses and a population of twenty-five; but "this piece of waste ground," as it was spoken of by an old chronicler, was so far improved by the opening of the Stockton and Darlington Railway, its subsequent extension to Middlesbrough, and especially the formation of a port by JOSEPH PEASE in 1829, with the later impetus of iron-mining and smelting, that at the last census in 1881 Middlesbrough had a population of 54,965, and possessed no less than 10,361 houses, with more handsome buildings than many places of its size.

The cell of Whitby Abbey, given by ROBERT DE BRUS, developed into a priory, some of the stones of which are built into the gable of the Middlesbrough Hotel. On the site of the graveyard, which was used until recently, the present church of St. Hilda was erected in 1840, after designs by J. & B. GREEN, of Newcastle. This, the parish church, was followed successively by St. John's, by Mr. NORTON, of London; St. Peter's, by Mr. W. H. BLESSLEY; St. Paul's, by Mr. JOHNSON, of Newcastle; and All Saints, by Mr. STREET. The railway station, mainly in Venetian Gothic, forms a great ornament to the town, having been erected by the North-Eastern Company at a cost of 150,000*l.* The town-hall, in the Early English style, from designs by Mr. HOSKINS, will cost more than 100,000*l.* The High School is a prominent object at the end of the Albert Road furthest from the railway station, having been provided by Sir JOSEPH WHITWELL PEASE, M.P., and partners, at a cost of nearly 20,000*l.* The neighbouring Albert Park, ninety acres in extent, was the princely gift of the late Mr. HENRY BOLCKOW, who paid 18,000*l.* for the ground, and spent 5,000*l.* in laying it out. This was opened by Prince ARTHUR in 1868; and in 1881, when Middlesbrough celebrated its jubilee, Lord FREDERICK CAVENDISH unveiled the statue to its benefactor, cast in bronze by Sir JOHN STEELL, after the work of D. W. STEVENSON, and erected near the Exchange referred to below. The Middlesbrough Estate of 500 acres, which was bought in 1830 for 30,000*l.*, has been considerably increased by reclamations from the banks of the Tees, and by upwards of 150 acres of marsh on the west. Building sites have more than tripled in value during the last twenty years, special lots obtaining very high prices; so that the motto of "Erimus," chosen by the corporation, has been fully justified.

Strangely enough, the iron trade did not originate with the extensive, if comparatively poor, iron deposits in the Cleveland hills, but was an imported industry encouraged by the shipping facilities, and by the presence of coal, if not on the spot, at any rate within a short distance. HENRY BOLCKOW, a German of remarkable energy and enterprise, and JOHN VAUGHAN settled at Middlesbrough in 1851, and started the first ironworks. Owing to a period of commercial depression

the firm nearly became swamped, when the discovery of ironstone at Eston, the existence of which had long been suspected, gave it a fresh start; and from that period success has gone on increasing until the present time, when BOLCKOW, VAUGHAN & Co. (Limited) turn out 5,000 tons of steel a week.

Middlesbrough is the cradle of the Iron and Steel Institute, which was founded in 1869 by some of its leading citizens, on the initiative of the late Mr. JOHN JONES; and it was here that the first annual provincial meeting was held. On returning to their home, after an interval of fourteen years, during which they have visited other centres of the iron manufacture, including those in Belgium, France, Germany, and Austria, the members find great progress, and what amounts to an industrial revolution. The BESSEMER process of steel-making, which depended on pure ores, has now been supplemented by that of THOMAS and GILCHRIST, so that it can now be applied to the Cleveland ores, largely impregnated with phosphorus; and half the output of the largest works in the world, those of BOLCKOW, VAUGHAN & Co., above mentioned, is derived from local oolitic ore, while the North-Eastern Steel Company have put up works especially for its treatment by these combined processes.

Some preface was necessary on the occasion; we are not, however, going to follow our metallurgical brethren through all the technicalities of their profession as discussed at the meeting, but only touch upon such subjects as we think will interest our readers. As the meeting of last year was essentially gay and joyous, so this was eminently sober and practical; and it was also strongly tinged with sadness owing to the disaster at the North-Eastern Steel Works, by which a newly-elected member lost his life, through the accidental overturning of a "ladleful" of molten metal.

Proceedings were commenced in the Oddfellows' Hall on Tuesday, September 18, Mr. BERNARD SAMUELSON, M.P., F.R.S., president of the society, occupying the chair; and the members were welcomed by Mr. CARL BOLCKOW, nephew and heir of Mr. HENRY BOLCKOW, and chairman of BOLCKOW, VAUGHAN & Co., Limited. The election of 60 new members was announced, bringing up to 135 the additions during the present year; and the BESSEMER gold medal of the Institute, which had been conferred on Mr. SYDNEY THOMAS, was received on his behalf, in his absence through illness, by Sir HENRY BESSEMER. Papers were read on new methods of making coke, by which all the gases, until lately wasted, are preserved, and all the valuable by-products recovered. These were so keenly discussed that they occupied the whole of the morning. After luncheon in the Drill Hall, on the invitation of the local ironmasters, the immense works of BOLCKOW, VAUGHAN & Co., covering 200 acres and employing 4,000 men, without including the iron mines and collieries, were inspected. A 30 cwt. steel ingot is rolled off at one heat into a bar 150 feet long, which is cut into four rails; and, as this immense bar would be otherwise difficult to manage, it rises on an inclined plane, so as to facilitate its subsequent passage through the rolling mill. The works are kept going day and night, being illuminated by the electric light on the BRUSH system.

On Wednesday the subject of cranes was first dealt with, being introduced by two papers, and calling forth an interesting speech from Sir HENRY BESSEMER. One member declared chains to be the curse of the engineer, while another defended their use, remarking that thousands upon thousands of tons were raised by their means every day. The next subject, and that which was perhaps the most warmly debated, was "hot blast stoves"; but the discussion was put a stop to, and the meeting adjourned on account of the sad accident mentioned above.

In the afternoon the party crossed the Tees, and visited the bore-holes that Messrs. BELL BROTHERS have undertaken for raising salt. An inspection of their furnaces and of the Anderston foundry, with the launch of a large iron vessel from Messrs. DIXON's yard, filled up the remainder of the afternoon; and the day's doings were brought to a close by the annual banquet of the Institute. This was held in the Middlesbrough Exchange, a magnificent building of 2,500 square feet area, the length of frontage in Marston Road being 178 feet, and that in Albert Road 130 feet. The 100*l.* prize for designs was awarded to Mr. C. J. ADAMS, as being the most suitable and as having the finest elevation, while the plans were capable of modification where alterations might be deemed necessary. The foundation-stone was laid in 1866 by

the late Mr. BOLCKOW ; and the building has been erected at a total cost, including site, of 30,000*l*.

On Thursday, the discussion begun on the previous day was concluded ; various complimentary votes of thanks were passed, and nearly 1,000*l*. subscribed for the widow and family of the unfortunate member who had been killed. The visitors then proceeded to Stockton-on-Tees, where they were entertained at luncheon in the Exchange Hall by the local iron-masters, subsequently visiting various works in the district. At the Thornaby ironworks of Messrs. W. WHITWELL & Co., the testing-house was decorated with the word "Welcome," wrought in T iron, underneath which was a grotto composed of coke, limestone, and iron ore, interspersed with ferns and containing a rabbit. The *raison d'être* of so apparently inappropriate an animal excited the curiosity of some of the party, when it turned out that the foreman had regarded it as mainly instrumental in the discovery of the ore, as it was in shooting rabbits on the Cleveland hills that the late Mr. VAUGHAN first made a near acquaintance with this valuable mineral.

In the evening the visitors were conveyed by North-Eastern Railway special train to Saltburn-on-the-Sea, the "child of the railway," as it has been called, and one of the newest of our seaside resorts. The iron-workers of Middlesbrough were in the habit of repairing on holidays to the "Ship" at Saltburn, to eat "fat rascals," a special kind of pastry for which the hostelry was noted ; and it occurred to some of the leading men of the district that this healthy and picturesque spot would serve admirably for a place of residence. Although 150 feet above the sea level, it is sheltered by hills from the east and north-east winds, while the surrounding district is noted for its grand scenery, varied with rocks and glens, bounding streams, and wood-clothed hills. The climate is dry and bracing, and the temperature is said to be remarkably equable. Again, the beach consists of sand, which is firm, dry, and trustworthy. Accordingly, the iron-masters formed the Saltburn Improvement Company, laid out the romantic pleasure gardens, and built the Zetland Hotel. This is a handsome free-stone structure, in the Italian style, with semicircular tower in the centre, the first stone of which was laid in 1861 by the late Earl of Zetland. A *fête* was arranged for the visitors in these gardens on the evening of Thursday, the band of the 5th Dragoon Guards being in attendance, and a magnificent display of fireworks having been prepared by Messrs. Brock, of the Crystal Palace.

Friday was devoted to excursions, the members, who mustered 500 strong, separating into three groups. The first, which was limited to a hundred, proceeded in a steamer down the Tees, to inspect the works undertaken for the improvement of the river by the Tees Conservancy Commissioners. This body has made a well-defined channel, increased the depth at

low water from 2 to 11 feet, and reclaimed 2,600 acres of land which will prove most valuable. These works have been carried out with 2,000,000 tons of blast-furnace slag, which has until lately been regarded as a waste product. Thanks, however, to the inventions of Mr. CHARLES WOOD, of Middlesbrough, slag is now formed into sand, which is used for mortar and also for making bricks and concrete. The Cleveland Slag-Working Company have laid concrete pavements on several of the footways of Middlesbrough ; and they form a hard, and yet not too smooth, uniform and durable path, which is certainly not secured by the Yorkshire flags. So pleased are the Yorkshire BRUSH Electric Light Company with this substance, which has been used for the walls and floor of their new works, that they have determined to adopt

the same construction in a projected extension. This company has been formed in Middlesbrough to supply several ironworks with the electric light from a single central station, and have already let the whole of the light they are able to produce with a forty-light Brush dynamo, representing eighty thousand standard candles. They supply five works as well as their own, on special contract, and hope soon to charge by meter for the light employed. It is worthy of note that they are able to work incandescent as well as arc lamps in the same circuit.

The second group went by North-Eastern special train to Darlington, the birth-place of the locomotive, where they visited that company's fine engine works, and were entertained at luncheon. Several other works were open for inspection, and a large portion of the party went on to Crook, in the South Durham coal-field, which is the most prolific in the whole world. The great point of interest was a bank of twenty-five SIMON-CARVÉS

coke ovens, erected by Messrs. PEASE and partners, the merits of which had been discussed at the meeting.

The third group visited the Cleveland iron-mining district, catching glimpses of some fine scenery on the way. The members left Middlesbrough by North-Eastern Railway special train at ten o'clock, passing historical Guisborough, or

Gisbro', great in woe.

Those tow'ring rocks, green hills, and spacious plains,  
Circled with wood, are Chaloner's domains ;  
A generous race, from Cambro-Griffin traced,  
Famed for fair maids and matrons wise and chaste.

Although the priory, founded in 1119 by ROBERT DE BRUS, has almost entirely disappeared, the isolated peak, Roseberry Topping, more than a thousand feet above the sea, forms a prominent object. The line passes Skelton-in-Cleveland, whose castle, with its "fayre hall and large towers," built by the first DE BRUS, is spoken of in the Cottham MSS. as "one of the jewels of this kingdom," but it was rebuilt in 1788.

MARTON HALL,

Shortly afterwards the railway edges Hutchcliffe, 4,000 feet above the sea, which lashes it below; and so appalling is the sight that some persons cannot be induced to travel by this line a second time. A glimpse is also obtained of Rawcliffe, 660 feet above the sea, and the highest cliff on the east coast; of Kilton valley, with the picturesque ruins of its venerable castle, built, it is supposed, in the reign of STEPHEN; and of the Skinningrove ravine, celebrated as having been one of the last strongholds of smuggling, and for the exploits of PAUL JONES.

Arrived at Loftus—mentioned in Domesday Book as *Loctsvm*, and so altered in name to distinguish it from Loft-house near York—the visitors proceeded to the Liverton mines, recently purchased by the Cargo Fleet Iron Company. Descending the shaft, they witnessed the boring of holes for blasting by machines invented by Mr. W. WALKER, the engineer. So rapid and effective in operation are these mechanical borers that a single one, aided by powder, which is used in a compressed form, will keep a blast furnace supplied with ore. Whereas the mine has hitherto been a losing concern, it is now made to pay well, thanks to these machines and the admirably laid-out surface works. Not a horse nor a locomotive is employed, but all the locomotion is effected by gravitation, lifts worked by stationary engines raising the trucks to the height necessary to give the incline. The ore and shale, as raised together from the mine, are received on an endless band, composed of steel links and plates travelling over rollers, on which the ore is separated from the shale as it travels along, the former being raked into railway waggons, and the latter tipping itself into smaller trucks, which discharge their contents automatically into a valley, thus being gradually filled up to make more ground. Luncheon in the schoolroom and a few complimentary speeches terminated the excursion.

The *bonne bouche* of the meeting, and one which recalled the gaiety of the Vienna gathering of last year, was, however, reserved for the last evening. This was the *conversazione* given by Mr. and Mrs. BOLCKOW at Marton Hall, which is, if not an ancient, at any rate one of the “stately homes of England.”

Marton Hall was begun in 1853 by the late Mr. BOLCKOW, on the site of a stately mansion erected by Major RUDD, which was burnt down in 1786. The plans of Herr GUSTAV MARTENS, of Kiel, were carried out by Mr. CHARLES ADAMS, of Stockton; and the present owner, Mr. CARL BOLCKOW, made further additions in 1874 and 1875, superintended by Mr. BLESSLEY, of Middlesbrough. The house is in the Renaissance style, and admirably adapted for internal comfort, as well as for displaying the rare works of art it contains. The large dome forms a conspicuous object from all parts of the surrounding country, and the portico is a splendid piece of art work, ornamented with sculpture in low relief. The house forms a fitting casket for the art treasures it contains, and which in value are surpassed by few collections in this country. The sketch of the building on the preceding page is taken from Mr. H. G. REID's interesting book on “Middlesbrough and its Jubilee.”

### PARIS NOTES.

THE new building destined for the reception of the library of the Ecole de Droit is now finished. It is absolutely distinct from the body of the school, and has a separate entrance in the Rue de Cujas. The principal room measures 56 feet by 24 feet, and there is a second 46 feet by 20 feet. The cost, including fitting-up, &c., has amounted to nearly 8,000*l.*, and the new library supplies a want long felt among students of the long robe, who had just reason to complain of the miserable accommodation hitherto afforded them in the small, low, and badly-lighted rooms formerly set apart for the library of the first school of law in France.

The work of enlarging the Mouffetard barracks, which, after those of the Rue de Lourcine, are the oldest in Paris, is to be commenced forthwith. The extension will take in the plot lying between the existing buildings and the Place Monge, in addition to another strip of ground belonging to the State, and running at right angles to the Rue Mouffetard and the Place Monge behind the houses of the Rue Neuve-Saint-Médard. When the alterations are completed the barracks will be isolated on three sides by

the construction of a new street from the Rue Mouffetard and the Place Monge. The total cost of the proposed extension is estimated at 2,500,240 frs. (100,000*l.*) The Caserne Mouffetard has been for upwards of fifty years the near neighbour of the celebrated Bal du Vieux-Chêne at No. 69 of the same street. For keeping order within and around these dancing-rooms, which for many years formed the favourite resort and rendezvous of scavengers, bullies, thieves, and other criminals, the services of quite an army of police and municipal guards had to be called into requisition every night. Happily for the peace of the quarter they were closed by order of the authorities in August of last year.

The Lille lottery, started, by special permission of the Government, for the purpose of raising the necessary money to erect a palace of fine arts at Lille, has just been drawn. 4,000,370 frs. worth of tickets were disposed of to the public; of this sum 1,650,000 frs. has been expended in prizes and expenses, thus leaving 2,350,370 frs., or upwards of 94,000*l.*, to be devoted to the aforesaid object. This is truly an easy and highly successful method of extracting money for artistic purposes from the pockets of the French people.

The paintings sent in to compete for the Troyon prize, which is awarded every two years, are now on exhibition in the western wing of the Institute. This prize was founded by Madame Troyon in memory of her son, the celebrated landscape painter, one of the conditions of entry being that the candidates must be Frenchmen under thirty years of age on January 1 of the year in which the concours takes place. The value of the prize thus offered for competition every other year is 1,500 frs., but as none was awarded in 1881, the winner this year receives 3,000 frs. In all, over thirty pictures are exhibited, the artists not being allowed to append their names, but only distinctive marks or mottoes, to their several works. As announced in last week's *Architect*, the subject given was *A team of oxen yoked to a waggon, guided by a driver, and descending a hollow forest road in early morning*, it being understood that the painting should contain no “figures” beyond those included in the above description. An inspection of the exhibits does not lead to a favourable opinion of their merits as a whole, and they can scarcely be classed as up to the average in such competitions. Some few of them, however, are good, and among these may be mentioned Nos. 15, 4, 5, 27 (taken in Cornwall), 16, 33, 22 and 29 (a bit seemingly from the Forest of Fontainebleau). The colouring of several is very curious, No. 28, in particular, affording an extraordinary view of a couple of positively scarlet oxen, led by a peasant in the bluest of costumes, down a lane which looks as though studied through an inverted telescope. The jury of the Académie des Beaux-Arts has awarded the prize to No. 29, a view in the Fontainebleau Forest, painted by M. Adolphe Marais, a pupil of MM. Busson & Berchère; a first mention being given to M. Henri Laurent, pupil of MM. Bin and Yvon; and a second mention to M. Paul Sain, pupil of MM. Guilbert d'Anelle and Gérôme.

The Minister of Public Instruction and Fine Arts has bestowed the Cross of Officer of the Legion d'Honneur upon M. Harpignies, the well-known landscape painter, and that of Knight of the same Order upon six other French artists, who exhibited works at the Amsterdam International Exhibition.

Four Austrian artists have just been decorated by the French Government. M. Hans Makart, the painter of the *Entry of Charles V. into Ghent*, has been promoted to the rank of Officer in the Legion d'Honneur; while MM. Angeli and Cavoň, painters, and M. Tilgner, sculptor, are made Knights of the Order. M. Makart, who is almost as well-known in Paris as in his native country, exhibits a portrait of the Comtesse Duchâtel in the present Triennial Salon, and M. Cavoň is chiefly known in France as the author of a fine portrait of the late Prince Impérial, executed at the command of the Empress Eugénie.

For some time past a vast thermal establishment has been in course of construction at Bourbon-l'Archambault (Département de l'Allier), at the expense of the State, from the plans and under the superintendence of M. Lecœur. It has been decided to decorate the grand pump-room as well as the great baths in ceramics, and for the execution of this work the choice of the Minister of Fine Arts has fallen upon M. L. Parvillée, admittedly one of the first ceramic artists in Europe.

The Paris Municipal Council has voted the sum of 20,000 frs. to provide for the expenses of ten representative working men to the International Exhibition at Boston. They will be elected by

the Chambres Syndicales, and the successful candidates, who will thus receive the substantial sum of 80*l.* apiece, are to leave Havre on board the *Amérique* of the Transatlantic Company towards the end of next week.

M. Alfred Bellet du Poisat, a painter of considerable merit, and pupil of Flandrin, died last week at the age of sixty. A great number of artists, including MM. Guillaume, Bouguereau, and Abadie, as official representatives of the Société des Artistes, attended the funeral of the deceased, which took place at the Church of the Trinity in Paris.

Among other Paris exhibitors at Amsterdam who have been nominated to the Legion d'Honneur are M. Quantin, the art publisher, and M. Rion, artist of the *Illustration* and *Monde Illustré*, who has illustrated the works of Scott, Mayne Reid, and Erckmann-Chatrion, and has contributed many drawings to the *Tour du Monde*.

A collection of original drawings by the celebrated painter Greuze, eighty-eight in number, has just been discovered in the library of the St. Petersburg Academy. They appear to have been purchased by Count Strogonoff when he was president of the Academy of Fine Arts, and remained there seventy years completely forgotten. The Grand Duke Vladimir Alexandrovitch, who now occupies that position, has given from his private purse a sufficient sum to permit the illustrated papers to reproduce them by photography.

The Museum of Decorative Art is now exhibiting in one of the rooms of Pavillon No. 7, at the Palais de l'Industrie, a bronze vase, 28 inches high and 3 feet in diameter, that the President of the Union Centrale des Arts has just received from Japan. The vase is the *shibashi* of an ancient temple, and a very remarkable specimen of Japanese art.

A M. Forney has lately bequeathed a considerable sum to the City of Paris for the creation of a library of works on industrial art. By the terms of the bequest, which will certainly be accepted by the Municipal Council, the treasures of the new institution are to be open to the inspection of artisans of both sexes, and will without doubt prove an acquisition to everyone connected with the most interesting branches of French industry.

### COLOUR HARMONY.\*

HARMONY of colour consists in the three colour sensations being equally excited, either jointly or separately, by all the colours of a composition, the mean, or general tone of which will consequently be some shade of white. It therefore appears only necessary to ascertain the relative proportions of the three fundamental colours in order to obtain a correct basis of harmony. The subject of colour, however, has two sides—the scientific and the artistic. Physicists have proved that the three primary sensations are scarlet, green, and violet, whilst most artists still support the old theory that the three primary pigments are crimson, yellow, and blue. It has therefore to be determined in the first place, which of the two sets is correct, or are both? Admitting that scarlet, green, and violet are the three primary sensations, because supported by Helmholtz, Tyndall, and, I think, by all modern physicists, we have to inquire upon what foundation the crimson, yellow, and blue theory rests, and what relation these colours bear to scarlet, green, and violet. We cannot obtain any of the colours of the primary pigments by mixture, but conversely almost all other colours are obtained from them. The particular hues of red, yellow, and blue, which mix best with the greatest number of other pigments, are a crimson red, a yellow neither green nor orange, and a blue of a greener hue than is often implied by that term. Crimson, yellow, and blue have therefore been named primary colours.

Each of these colours appears to have the power of exciting two primary sensations, and is therefore complimentary to green. Yellow excites scarlet and green, and is complimentary to violet. Blue excites green and violet, and is complimentary to scarlet. Colours approximating to the primary sensations may be obtained by combining two primary pigments. This relationship of the two sets proves that the primary colour sensations are equally excited in both sets.

It will be seen that harmony of colour being produced by scarlet, green, and violet, will also be produced by crimson, yellow, and blue, and that whether we adopt the scientific or the artistic theory as a basis for colour schemes, our results as to harmony will be the same—providing the pigments we employ are combined in a scientific manner, as colour. True combinations of colours,

as components of white light, can seldom be obtained in the ordinary way by mixing pigments together. One of the most convenient methods for colourists is by a rotating disc, on which the colours are placed. The disc is then revolved rapidly till the colours appear blended. By this means the following results are obtained: Scarlet and green produce yellow; scarlet and violet, light-crimson or pink; green and violet, blue; yellow and blue, grey. These results differ considerably from the colours generally obtained by mixture, and I think sufficiently prove the errors caused by combining colours as pigments, and not as components of white light.

Proportion in colour harmony is of much importance. Until recently the theory was that, dividing white light into sixteen parts, the proportions of yellow three, red five, blue eight, would be obtained; and no composition was considered harmonious unless these colours were present, either pure or combined, in these particular quantities. Professor Rood, however, in a work entitled "Modern Chromatics," gives an almost opposite hypothesis, and his calculations are especially valuable from the fact that, in addition to his being a professor of physics, he is also a practical artist, and therefore conversant with both sides of this subject. To go over his calculations would be tedious and occupy much time; but having abstracted crimson, yellow, and blue from some twelve colours he enumerates, I find that their proportions in white light are respectively about four, seven, five; quantities, especially as regards yellow and blue, almost the reverse of what they were formerly considered to be.

Colour harmony is sometimes divided into two parts. Chevreul divides it into harmony of contrast and harmony of analogy. Strictly speaking, there can be no such thing, in colour, as harmony of analogy, because all true harmonies, when reduced to their simplest form, contain the greatest possible contrasts. Chevreul subdivides analogy into three parts, and names them harmonies of scale, of hue, and of a dominant coloured light. The first is produced by different tones or shades of the same colour only being employed. Such a scheme, it is scarcely necessary to point out, would not be harmonious. The more saturated or intense the colour, the worse would be the effect, for any colour when lightened necessarily brings in a portion of the remaining colours, by which it is neutralised, with the white introduced—hence all light tones of colours are more or less satisfactory. Shades of a colour are also not displeasing from the fact that much of the colour is absorbed by the black. An instance of this so-called harmony was demonstrated a year or two ago in the adoption of very dull colours in decoration and dress. In such schemes proper harmony seldom existed, but discord was hidden by the introduction of so much black or grey. Chevreul's harmony of analogy of hue is produced by any colours of analogous tones or shades, and may therefore include colours which constitute true harmony. An analogous effect by a dominant colour, Chevreul's third harmony, results from one colour being added to all the others in the composition. It can, perhaps, best be realised by viewing a scheme through coloured glass; the colour of the glass seems to pervade everything. A deep red sunset scene is also an example, red being the dominant colour.

The prismatic image illustrates an analogous arrangement of harmonious colours. Beginning at the red end we have crimson, scarlet, orange, yellow, green, blue, and violet, with the most delicate hues between, so that where one begins or ends we cannot tell. All the contiguous colours, so to speak, are analogous, and yet the whole includes the greatest possible contrasts. It may, I think, be concluded that analogy is the method by which contrasting colours should be connected, and not placed in violent opposition, and in this sense may be included in the term harmony, but is incomplete in itself. Analogous colour schemes have lately been termed "tone harmonies," by modern colourists, owing to the late prevalence of dull tints—tints, in many cases, in which little colour is visible at all. The harmony, as the term implies, is of tone, and not of colour. Mr. C. W. Dempsey, in an article published about three years ago, stated that Mr. Morris, in decoration, and Mr. Whistler, in painting, were among the chief exponents of "tone harmonies," and the success achieved by them was well known. But Mr. Morris appears, to me, to be now more inclined to contrast, or at least, to more distinct and definite colour. Mr. Whistler seems as peculiar as ever, his recent "arrangement" being proof enough.\* In the article referred to, the two sides of colour—the science of colour and the art of colouring, and the technical meanings of the principal terms in both—are pointed out; these terms are harmony and melody. Harmony I have already defined, and Mr. Dempsey defines melody as "two or more colours in such juxtaposition that they form a part, or the whole of the prismatic spectrum, whether in their natural direct order or inverted." Melody, then, seems to be another term for the so-called harmony of analogy, and a better one, because it does not confound two meanings in one word, and is applied to the art of colouring, whereas harmony is applied to the science of colour. Both terms are compatible, for when harmony is obtained by melodious means our compositions are then perfect. It has been

\* From a paper read by Mr. G. H. Morton, jun., before the Literary and Philosophical Society of Liverpool.

\* "Arrangement in Yellow and White," Fine Art Society's Rooms, 1883.

argued that there are two schools of colourists. First, that of harmonious contrast; second, that of melodious intervals; but melody appears to be the proper manner of arranging harmonious colours, in the same way that harmonious notes are uninteresting till a melody is composed. Melody in one colour is to some extent similar to playing on one note.

This being the case, how is it that so many apparently in-harmonious compositions have been successful? There are many reasons, mostly unrecognised or unthought of. Many rooms have been decorated entirely in dull greens or blue greens, but contiguous rooms may be in hues of yellows and brown, consequently the two apartments together would be harmonious, separately melodious; indeed, our colour appreciation would be momentarily increased on passing from one room to the other. Then furniture and art objects generally bring in some contrasting colours. The chief cause, however, is due to the low key in which the large surfaces were coloured, the actual amount of pure colour being very small, the greater portion being grey in which the three primaries are present in harmonious proportion. It is seldom, perhaps never, that the three primary colours are absent in decoration, taken as a whole, and including carpets, furniture, everything. All in the room, and all that can be viewed out of the room, must be taken account of, as also the amount of light received into it, and the colour of that light. A room decorated in melodious tones of reds, in which no opposite colours were permitted, having a large window looking out upon a green lawn, might be strictly harmonious in daylight, though at night, when the green was shut out, the impression would doubtless be hot and oppressive. It would appear that the older colourists adopted harmony, the presence of the three primary colours, either pure or in combination, in certain relative proportions, as a rule not to be violated; but they often neglected the subtle melody by which means melodious harmony is most successfully arrived at. Hence their schemes are inclined to be crude and unrefined. The foundation upon which they worked, as to colour, but probably not as to proportion, was correct. They worked under the delusion that the contrast of pure primary and secondary colours, because harmonious, were beautiful; that bright red and bright green, or bright blue and bright orange, when contrasted, produced perfect composition. It is needless to say that such would be extremely vulgar, unless melodiously arranged either by tones or shades, or by those intermediate hues which would melodiously connect them, or by both. On the other hand, the tendency of modern colourists, of the so-called melodious school, is to neglect harmony, which should be the foundation of their ideas; mistaking the method for the fact, and producing effects at first pleasing, but eventually becoming tiresome and wearying. It may therefore be concluded that harmony and melody are essential in the art of colouring. The scientific fact that white light causes three principal colour sensations, all of which must be equally excited, otherwise the eye gets wearied and probably injured, must not be neglected. These three sensations are, as it were, the harmonious notes of colour, the art of composing them may be termed colour melody.

#### PAINTER-ETCHERS.

A CONVERSAZIONE was held at the Art Club, Liverpool, on Monday evening. A lecture was delivered during the evening by Mr. Seymour Haden, president of the Society of Painter-Etchers of London, on "The Relative Merits of Etching and Engraving as Fine Arts," his object being to bring about the restoration of that form of original engraving which was practised by the great masters of painting, who were their own engravers. This art, in his opinion, has entirely faded away, and become merged into that of mechanical engraving. In connection with the lecture there are several facts worthy of notice. The lecturer has been staying in Scotland; and in order to fulfil his promise he journeyed to London for his papers, and thence to Liverpool. From here he will immediately proceed to London, whence he will embark on board one of Sir Donald Currie's steamers for Madeira, at which place he will go on board *The Sunbeam*, on which Sir Thomas and Lady Brassey intend to go on a yachting expedition to the Canary and West Indian Islands. Dr. Haden was entertained at dinner by the members of the club, and in reply to the toast of his health alluded to his endeavours to popularise art in the surgery-room. As a medical teacher he had trained several eminent surgeons and distinguished physicians, who informed him they were greatly indebted for their professional success to the artistic training which he had given them. At the lecture the chair was taken by the president of the club, Mr. Robert Coltart, and Dr. Haden was accorded a warm reception. He said the object of the paper was not to contrast etching as a process with engraving as a process—the etched line with the engraved line—and to say of one that it was better as a form of art expression than the other; but to compare, without regard to the process employed or the person employing it, the practice of the painter-etcher, who was an original artist, with the practice of the modern engraver, who was not an original artist, thereby arriving at an intelligent con-

clusion as to the comparative claims of the two to be considered branches of "fine art." Nor could such inquiry be considered in any sense either impertinent or unnecessary, since etching, though an original art with a great history, was without representation in the Royal Academy, while engraving, which was not an original art, was fully represented there. If art was the brain impulse which it was assumed to be, it clearly followed that the first great fundamental principle of art must be personality—originality. Comparing the work of the older and modern engravers, it was clearly shown that while the etcher, under the influence of brain impulse and in the full exercise of his volition, engraved as he felt, and allowed himself as he did so the utmost latitude and variety of expression, the engraver, animated by no such impulses, was driven to express himself by signs and formulæ which, as art expressions, had no intelligible meaning. He respectfully submitted that this strange departure from all forms of natural representation on the part of the engraver, and his adoption in their place of a set of symbols which he learnt in his apprenticeship, could only be explained by the fact that his task was a mechanical one. Engraving being without personality, except such as may be supposed to be evolved in the art of copying or translating the work of another, originality and all the attributes which attended the exercise of the creative faculty were absent from it. Year after year, for now upwards of twenty-five years, original etchings and engravings, many of them destined to live when much of the mechanical steel-plate engraving of the day should have been forgotten, had been sent to the Academy, to be, if not turned out again, thrust into corners, and hung without order or distinction among what might be called the odds and ends of the exhibition. In no single instance during the whole of that time had the slightest notice or encouragement been given to any one of them, while the mechanical engraver—the adapter of other men's work to purely commercial purposes—had been accorded its fullest honours. The time surely had come when, on the simple ground that the material employed in art production had nothing to do with art, the etchers and the water-colour painters—now refused representation in the Royal Academy—might reasonably demand it. In the French Salon the art of engraving was divided into two classes—"L'eau forte" and "La Gravure"—and a distinct representation given to each. On what reasonable ground, therefore, did the Royal Academy refuse a distinct representation of this kind, for to do so was surely to remain behind the age. The question, however, after all, was not altogether what the Royal Academy, impenetrable in its irresponsibility, might or might not choose to accept as forms of art worthy of its encouragement, but which of the two existing forms of engraved art—that which was original or that which was not—had the most legitimate claim, outside the walls of the Academy, to be considered "fine art." At the close of the lecture a hearty vote of thanks was accorded to Dr. Haden for his interesting address.

#### ROSSETTI'S INFLUENCE ON ART.

THE first number of the *English Illustrated Magazine*, which is published by Messrs. Macmillan, contains an article on "Rossetti's Influence on Art," by the editor, Mr. J. Comyns Carr, which is illustrated by admirable reproductions of the artist's drawings. The following extracts will suggest the author's mode of treating his subject:—

At the age of thirty he had already in some sense refashioned the current ideals of English art, appropriating to its uses new stores of poetry and romance, and revealing by his own practice and example the secret by which the visions of the poet might be shaped to the service of pictorial design. This, indeed, constitutes his real claim to distinction, and it is here at last that we reach the true source of his influence over men whose minds were too seriously engaged to be deluded by any empty promise of the reality. The mere desire of ideal beauty would of itself have been no new thing in English art; for it must be allowed that the poetic ambition had haunted the spirit of many an English painter before the advent of Rossetti. Barry, Fuseli, West, Haydon, even Hilton—they had all been professors of the grand style, had all believed that it was possible to painting to begin again just where Raphael and Michael Angelo left off, and had all so far helped to discredit a cause to which some of them, at least, were passionately attached. It would have been late in the day to revive these hapless and hopeless experiments, nor could the attempt have won the support of a generation that had learned to recognise the supremacy of those English painters who had taken no part in the race for the ideal, but who had won a more enduring fame by simple reliance on nature. Between Reynolds and Barry, between Wilkie and Haydon, there is now no doubtful choice, and at a moment when the claims of realism were once more asserting themselves, any endeavour to revert to a style that was already stamped with failure would most surely have proved fatal to its author and disastrous to his cause.

Nor would such an endeavour have been consistent with the special character of Rossetti's genius. A truer perception of what was possible and needful for the art of his time led him to seek

inspiration in the work of those earlier schools of Europe where the realist and the poet still meet on equal terms, and wherein the exercise of the imaginative faculty leaves room for the faithful record of actual fact. To those who have not accustomed themselves to consider carefully the conditions which govern the processes of artistic degeneration and revival, there will appear to be something savouring of caprice in the enthusiasm with which the leaders of the præ-Raphaelite movement selected as models of style men whose work was confessedly immature. To pass by the crowning triumphs of the great schools of painting, and to revert to the tentative experiments of earlier workers who were only struggling towards the same goal, is like a wilful inversion of the true and natural order of things. And in the realm of science perhaps it might be so. But the ascending scale of scientific research in which the last note is always the highest note, has no counterpart in the history of art, least of all in that higher range of art which claims the closest alliance with the imaginative spirit, and is therefore fated to share its shifting fortunes. Here the onward movement of advancing power and accomplishment though it may seem for a while to be steadily maintained, is suddenly hurried forward by the force of individual genius to some triumph of unlooked-for splendour that discourages all hope of further progress. So it was, as we know, with the art of Italy at its crowning moment, and the very greatness of the men whose achievement closed a brilliant epoch is in itself a lasting hindrance to any direct transmission of their power. For, by the time that the forms of simple nature passing through the hands of a race of gifted artists, and receiving from each in turn some new impress of individual feeling, had at last taken the final stamp of Michael Angelo's mighty spirit, the issue, however noble in itself, could scarcely be turned to account by those who were seeking to regain the first principles of their craft. But the stream which had here grown to a torrent too broad to bridge and too deep to fathom might be tracked to a point nearer to its source: what has become complex and difficult in the art of Michael Angelo is told in simpler dialect by those who had gone before him; and it was, therefore, with a true sense of the high ambition of modern art, and a just estimate of its limited resources that Rossetti and those who were with him led the way to the earlier painters of Florence, in whom the love of beauty had been newly awakened, and whose utterances are always clear, even though they may not be complete. In all that they gave to the world the modest and yet passionate grasp of spiritual and material truth may well serve as an example and a warning to the artists of every school; for as their searching and quiet realism rebukes the confident audacity of later masters whose skill seems to boast a conquest over nature, so also and in equal degree their intense but reticent expression of emotional truth stands as an implied reproach against the laboured rhetoric of later art that would seek to adorn an idea over which the imagination has gained no real or complete control.

In reviewing the later paintings of Rossetti it is easy to perceive that he found it sometimes hard to exclude altogether from his view those tendencies of style against which at the outset of his career he had made the first and the stoutest protest. Something indeed of the change and development that has been noted in the wider history of art finds a reflex in the course of his individual practice. In the ten years immediately succeeding the period which ended with the production of the painting mentioned by Mr. Ruskin, his technical powers reached the highest point of proficiency in which they at any time attained. To these years belong the *Beata Beatrix*, *The Loving Cup*, *The Beloved*, the *Monna Vanna*, *The Blue Bower*, and the *Lady Lilith*. In the early part of the time he had produced the drawing of *Cassandra*, and the design for the frontispiece to "The Italian Poets," the water-colour drawings of *Paolo and Francesca*, and the *Heart of the Night*. It is the central period of Rossetti's career, a season wherein the earlier and the later ideals of his art meet and divide, and when he could command for the expression of both the fullest measure of technical resource. An unexampled richness and splendour of colour is the one quality that is common to the varied work of these ten years, and in this respect such pictures as the *Monna Vanna* and *The Beloved* are clearly distinguishable from all that had gone before and from all that followed. The pure, gem-like tints of his earlier painting had been fused and blended by a new sense of realism, but they had not yet been tarnished by the obscurity of tone that shrouds and shadows the work of later life. And this nearer approach to illusion in the treatment of colour is indicative of a deeper change in the spiritual direction of Rossetti's art. Gradually—at first, indeed almost imperceptibly—the individual qualities of the model gain a more complete ascendancy over his imagination. He begins to concentrate his forces upon the interpretation of distinct types of beauty, no longer using nature as the material out of which he might carve his own invention, but accepting what it offers as the determining motive of his work. A single comparison will serve to mark the significance of this change, and to illustrate its influence upon his design. The *Lady Lilith*, and the drawing for the frontispiece to "The Italian Poets," are both of about the same date. The latter was executed in 1863, and in the following year the same composition was utilised in the water-colour drawing of *The Rose Garden*. To the year 1864

belongs also the *Lady Lilith*, although the version here reproduced is from the replica in water-colour painted in 1867. But this agreement in point of time is manifestly consistent with a marked divergence of character, for as we contrast the two works we feel instinctively that the one belongs to the future of Rossetti's art and the other to the past. In the frontispiece to "The Italian Poets" the sentiment of design is still uppermost in the artist's mind; nature has been used and even carefully studied, as may be seen by a reference to the beautiful pencil drawing that accompanies the finished work, but it has been used to assist and confirm a settled and preconceived idea of poetical beauty. The *Lady Lilith*, on the contrary, starts from the conception of portraiture, and the ideal suggestion, whatever may be its force and fascination, only follows, and does not directly inspire, the reality. It has its own charm of sensuous and sumptuous beauty, uninjured as yet by the kind of exaggeration that overtook the painter in after years. It marks a period during which the contending forces of his earlier and his later style were held in equilibrium, and when his manner of painting combined in some degree the excellence of both. But even the great and brilliant qualities of such a work as this only serve to emphasise the adoption by the artist of an ideal in which his original gifts of poetical design were destined to hold a subordinate place.

If Rossetti had been content to accept the temper as well as the means that belong to realistic painting, this change in the direction of his art might not have affected its value. There are many men in art as in literature who only win the highest triumphs when they have rid themselves of the kind of poetic ambition that haunts the season of youth, and in its place have gained a keener insight into nature. Some of the noblest painting that remains to us is frankly founded upon the direct and simple observation either of the truths of human character or of the beauty of the outward world, and it therefore implies no reproach against a painter that he should elect in later life to put aside the fanciful ideals that had tempted the vision of a boy. But the course of Rossetti's art tells a different story. He was a poet to the end of his days, and though he might seek to divert the strong imaginative impulse with which he had set out upon his career, he could not escape its influence. And so in his case the change that came over his art was not healthful but hurtful; for the poet's vision, no longer finding for itself the earlier form of utterance, left him still unsatisfied with the kind of beauty that might have contented a different order of mind. The individual forms and faces that he chose to present did not now suffice for the purpose for which he sought to employ them. Unconsciously, perhaps, he began to force and exaggerate the reality he was no longer able to control, and it sometimes happened that the result was far removed alike from the intricate beauty of his early design and from the simplicity and truth of portraiture. This is not the place to attempt to examine the causes that may have led to these significant changes in Rossetti's painting; it is enough for our present purpose to note their effects. It is the penalty which natures such as his have to pay, that their art and their life are closely interwoven, and cannot by any means be divorced. From the first Rossetti had thrown himself wholly and passionately into his work, giving to it the best that was in him, and it is scarcely wonderful, therefore, that, with the failing health of later years, there should have come some evidence of a corresponding failure in the task that he had set himself to accomplish.

### ST. ALBANS CATHEDRAL.

THE new west front is now completed by the fixing of the crosses on the three porch gables, and the scaffolding will have disappeared in a few days. But there is still several months' work to do in the great central porch, which was found in worse condition than was expected; and two old features in it have been discovered of which no one was aware, and which Sir Edmund Beckett intends to restore. The restoration of the south side of the nave, beyond the part done under Sir G. Scott, has been begun, and is expected to take about a year. All the external stonework and the windows are completely dilapidated, and the vaulting of the aisle is cracked all over from the destruction of the cloisters which tended to support it. The windows on the north side are in very little better condition. The new west window is of the same width practically as those of York and Exeter and the famous east window of Carlisle, which all differ only by a few inches from 26 feet. The east window of Lincoln is the only one in either of the Decorated styles which materially exceeds it. The stonework of the tracing of this is nearly 3 feet deep from back to front. The width of the whole front is 105 feet above the plinths, and the height 109 feet to the top of the cross; the turrets, 93 feet.

Messrs. Thomas Lawrence & Son write: "The bricks used in the new premises in Bedford Street, Exeter (see your issue of last week), are better known as the 'T. L. B.' bricks, although made near Bracknell. We would also take this opportunity of calling special attention to the brick carving in these buildings, which is all done out of the 'T. L. B.' rubbers made by us."

## NOTES AND COMMENTS.

WE regret to announce the death of Mr. CHARLES REID, of the firm of Messrs. WARDROP & REID, architects, of Edinburgh, which occurred on Friday the 21st inst., and was the result of an accident. Mr. REID while walking, had approached, it is believed, the edge of the precipitous "Samson's Ribs" at Edinburgh, and on looking down, lost his balance, and fell to the ground below. Mr. REID was a native of Elgin, but he was professionally engaged in Edinburgh for many years, and, in conjunction with the late Mr. WARDROP, carried out many public and private buildings. He made a special study of Scottish domestic architecture.

MR. C. T. NEWTON, C.B., and his assistant Mr. C. H. SMITH, will deliver three courses of lectures at University College, London, upon Greek art. The first, by Mr. SMITH, will be on Greek Fictile Art, and will commence on October 5. The second course, to be delivered in January, will consist of seven lectures by Mr. NEWTON, on the sculptures and other ancient monuments from Lycia in the British Museum and the Museum of Vienna. In the third course, which will be commenced on May 2, there will be five lectures on the Greek myths, as represented on vase pictures and other works of art.

THE graphic method of determining strains has secured the approbation of Professor HENRICI. In the mathematical department of the British Association, at Southport, as in other places, he has recommended the adoption of the method in preference to the use of formulæ. Professor HENRICI says that an engineer who knows how to use the graphic method will employ no other, because it is impossible to find one which is simpler. If he were asked to give the formulæ to obtain stresses by calculation, the Professor said he should write them down from a sketch of the diagram, that being the simplest way of obtaining them. But it is necessary that the draughtsman should have a geometrical education, if he is to use graphical methods successfully. There is no doubt that formulæ in pocket-books have been used as if they were charms, and unless the mechanics of a beam are understood graphic devices will become a delusion.

THE prospectus of the classes at University College, London, has just been issued for the session of 1883-84. It will be seen that the department of Applied Science and Technology in this college opens on October 2, along with the rest of the college. The instruction in this department includes (1) lectures on different branches of civil and mechanical engineering and surveying and levelling, drawing and practical experimental work in the engineering laboratory; (2) lectures and practical laboratory work in electricity and allied branches of physics; (3) lectures in architecture and architectural construction; and (4) lectures and practical laboratory work in different branches of chemical technology, including brewing, heating and lighting, metallurgy, chemistry of the alkali trade, and agricultural chemistry. Besides these technical and professional lectures, the Faculty of Science provides very complete courses of lectures in mathematics, physics, chemistry, and geology—the sciences upon which the professional knowledge must be based.

PEOPLE in Sheffield are beginning to ask how it is that the enlargement of Mr. RUSKIN's museum is no nearer accomplishment now than it was eight years ago, and the reason appears to be that no one in particular takes an interest in the museum, to judge at least from some statements of Mrs. EMILY SWAN. That lady says that Mr. RUSKIN has himself superintended and had scaffolds erected around the Ducal Palace, Venice, to take casts of the sculpture; also from the cathedrals of Rouen and Amiens, the casts of which are in the storehouse of St. GEORGE, at Walkley. He keeps two artists constantly employed in making drawings from the best Continental examples of old masters' works. These drawings, that were done especially for the museum for the Sheffield people, are dispersed up and down the country. Many are at the White-lands College, Chelsea, waiting house-room at Sheffield. Mr. RUSKIN is eager to know what the people of Sheffield

are going to do before he begins to arrange his collection systematically. He wrote to Mrs. SWAN to say that he had "van loads more of books and things ready to come when there is a suitable home for them," and that he had enough material in his home at Brantwood, Coniston, to cover the whole of the Walkley Museum. He gave up his professorship at Oxford, and said he would give the rest of his life to teaching the people of Sheffield. The subscriptions amount in all to about 45%, and, if the funds continue to pour in at the same rate, the foundation-stone of an extension to the museum may possibly be laid in another decade of centuries. It is a pity that so much art wealth is unutilised. Many another town would gladly build, if Mr. RUSKIN would consent to move his treasures from unappreciative Sheffield.

THE Guion fleet of steamships has been enlarged by the addition of the *Oregon*, a steamer which is 520 feet long, 54 feet wide, 40 feet 9 inches deep, and has a tonnage of about 5,000 tons. As accommodation is provided for 542 passengers, the arrangements for ventilation must be proportionally effective. It was accordingly resolved by Mr. PEARCE, who constructed the vessel, that the BOYLE system should be adopted. The cabins, state-rooms, dining-rooms, and steerages are ventilated by means of twenty-six patent air-pump extracting ventilators and twenty patent down-casts. They are all of 24-inch diameter, with 12-inch pipes. By means of these appliances there can be no doubt that the travelling public will have all the sanitary comforts at sea that they can have in a well-arranged hotel on shore, and this is the principle which the owners of the fleet have constantly in view.

MR. BRUNLEES prepared some statistics for his address at Southport which suggest the revolution that was caused by the introduction of steel rails on English railways. In May 1862 steel rails were laid down experimentally at Chalk Farm Bridge, side by side with two ordinary iron rails, and after outlasting sixteen faces of the iron rails they were taken out in August 1865, the one face only which had been exposed during a period of more than three years to the enormous traffic amounting to something like 9,550,000 engines, trucks, &c., and 95,577,240 tons, although worn to the extent of little more than a quarter of an inch, even then appeared capable of enduring a good deal more work. Steel rails, however, were dear at that period, costing about double (12% 10s. per ton) as much as iron rails; therefore, although their advantages were manifest, they could not all at once replace iron. Now, owing to the improvements in the manufacture of steel rails, they can be produced as easily and as cheaply as iron rails. It was observed in 1876 that if, in order fully to realise the effect of the enduring quality of steel rails, a section were taken of the busiest portion of one of our leading railways, over which upwards of 7,000,000 tons of live and dead weight pass annually, it would be found that the life of a steel rail on that portion of the line would be forty-two years if the traffic remained the same. This would reduce the cost of maintaining the permanent way of railways from 210% to 106% per mile.

THE question whether green or blue is the national colour of Ireland has again come up for discussion, although it was long since determined by archæologists in favour of blue. Ireland, prior to the English invasion, was divided in petty principalities, each of which had its distinctive colour like the clans in Scotland at a later period. Saffron was a favourite colour for Irish dress, and the most obtuse would perceive that green could not harmonise with it so well as blue or crimson. It is the opinion of Sir BERNARD BURKE, the present Ulster King-of-Arms, that prior to the Anglo-Norman invasion there was not any one colour or banner adopted for Ireland at large, that none such is traceable in the old Celtic records or authorities now handed down by tradition, and none found mentioned in history; and Sir BERNARD BURKE says he is equally certain that since the introduction of English rule the national colour established by and derived from the national arms has been invariably blue. The field in the royal achievement which denotes Ireland is blue, and the colour adopted for the knights of St. PATRICK is blue. Indeed, it may be doubted whether green was much in use before the revolutionary movements of the last century.

THE CITY OF LONDON SCHOOL, THAMES EMBANKMENT.

THE site of the City of London School is an irregular oblong, having a frontage of 136 feet, facing the Embankment, and a depth next the new side street of more than 430 feet. It becomes wider as it recedes from the Embankment. It is bounded on the east by the lofty flank wall of the Royal Hotel, and on the back or north side by some vacant building land belonging to the Corporation next Tudor Street. The site, which was placed at the disposal of the School Committee by the Corporation, has been valued by independent surveyors at 95,000*l*.

The surface of the site of the building is entirely composed of made ground, which has been filled in at various dates at the back of retaining walls, as successive belts of the foreshore have been reclaimed from the river. All the foundations of the school building are carried to an average depth of 28 feet below the level of the school playground, and large rectangular holes were sunk through the made ground down to a bed of Thames ballast, which was met with at that level over the whole site, and which doubtless formed at one time the bottom of the river. The holes were then filled in with Portland cement concrete up to a level of 30 inches below the surface of the playground, so that the school building stands on a series of concrete monoliths more than 25 feet high, and ranging from 10 to 15 or 16 feet square. The foundations of the gymnasium, latrines, and boundary walls are carried to a small depth only, and rest upon compact made ground, which has doubtless been in position for a century. These out-buildings being by no means heavy, are carried by a wide bed of concrete resting on this made ground.

The whole of the floors throughout, except those to the porter's bedrooms in roof, are fireproof, consisting of Portland cement concrete, filled in between rolled iron joists, which are spaced about 27 inches from centre to centre. The lintels throughout are made up of rolled iron joists, and an unusually large amount of constructional ironwork in girders and columns has been employed at the level of the ground floor, so as to avoid obstruction in the covered playground, which occupies so large a portion of the basement beneath the building. Some of the columns and girders have very heavy work to perform, the column in the cloak-room, for instance, and that in the dining-room, having each to bear a load of nearly 300 tons.

The block plan is of the simplest character. The building is L-shaped. The shorter arm of the L facing the Embankment is three storeys high, and contains the great hall on first floor; the administration-rooms and library on ground floor; covered playground on basement. The longer arm of the L, facing the new side street, which leads back from the Embankment to Tudor Street, is the teaching block, and contains natural science school and lecture-hall, and two class-rooms on second floor; eighteen class-rooms on first and ground floors; hat and coat room, dining-room, and covered playground on basement; the gymnasium and latrines are detached buildings in the playground. A common-room and ante-room for assistant masters, a kitchen with its appurtenances, and apartments for the resident porter are provided in suitable places.

The exterior of the hall block facing the Embankment is constructed entirely of Portland stone, but the columns of the windows have polished red granite shafts. It is in the style of Italian Renaissance enriched with carving and sculpture. The Embankment front of the building is 120 feet long, having an ornamentally treated flanking tower at each corner, and a slightly projecting central entrance under a porch. A wide flight of steps leads up to this porch from the Embankment, and there are a series of balconies at the level of the great hall floor. The composition is three storeys in height, the basement consisting of large segmental-headed openings filled with iron grilles enclosing the covered playground. The ground-floor has three-light square-headed windows divided by columns. The first-floor windows have arched heads and are deeply recessed. The tympana beneath these arched heads are filled in with allegorical seated figures representing various arts and sciences, and the wall spaces between these have square-headed niches containing portrait statues of BACON, SIR THOMAS MORE, SHAKESPEARE, MILTON, and NEWTON.

The façade is crowned by a balustraded stone parapet.

Above this rises the great hall roof, which is a high-pitched roof of French character, covered with green slates and surmounted by a central *fèche*. This *fèche*, which forms the crowning central feature of the design, acts as the ventilator of the great hall. One object which this high roof serves is to prevent the school being overpowered by its gigantic next-door neighbour, the Royal Hotel. At the north-west corner of the hall block a smaller turret rises, which is surmounted by a stone bell-cot containing the school-bell. This forms the flanking feature of the west end of the great hall next the side street.

The exterior face of the teaching block next the side street, and the whole of the exterior of the building facing the playground is of very plain character, being faced with white brick and having stone strings and cornices and dressings to the windows. The outside of the lecture-hall on the second floor at the extreme north end of the teaching block rises above the adjoining buildings, and forms the flanking feature at the extreme north end. A low stone balustrade wall encloses the irregular forecourt, which is laid out as a garden on top of the railway tunnel next the Embankment, and is continued along the west front of the teaching block next the side street.

The preliminary contract for the foundations was carried out by Messrs. HIGGS & HILL. The main contract for the building was carried out by Messrs. JOHN MOWLEM & Co. Among the sub-contractors employed by them may be mentioned Messrs. MEASURES, for the constructional ironwork; Mr. MITCHELL, for the marble-work to the principal staircase; Mr. EBNER, for the marble mosaic floor of hall; Messrs. JONES & WILLIS, for the ornamental iron grilles at the front entrance doorway; Mr. BOEKBINDER, for the carton-pierre work in the cove of great hall; Messrs. HOLDEN, for the copper-work to the central *fèche*, with its wrought-iron skeleton and dormers of hall roof; Mr. BOYD, for the class-room grates, and Messrs. STEEL & GARLAND those for library and committee-room; the Coalbrookdale Company, for the pillar lamps on balustrade; Mr. ANDERSON, for the lightning-conductors. Milner's Lock and Safe Company have supplied most of the locks and lock-furniture, and Mr. ODELL the stained glass. Separate contracts were let to Messrs. HERRING & SON, of Chertsey, for the hot-water apparatus; Mr. J. F. CLARKE, for the gas-pipe work and sunlights, cooking apparatus and fittings, and sundry gas-fittings; Messrs. STRODE and Mr. R. H. HUGHES, for the more important gas-fittings; Messrs. DAYMOND & SON, for the sculpture; the North of England School Furnishing Company, for the great hall and school seats and desks; Messrs. STORY, for the general furniture; Mr. LAURIE, for masters' tables, blackboards, &c.; Messrs. WILLIS, for organ; and Mr. SPENCER, for the fitting-up of gymnasium. The architects of the building are Messrs. DAVIS and EMANUEL, whose design was adopted in competition. The water-colour drawing from which the illustration is taken was exhibited this year at the Royal Academy.

DESIGN FOR ALL SAINTS CHURCH, IPSWICH.

THIS design was one of those submitted in the recent competition by Messrs. CROSS, of Hastings and Chancery Lane.

STUDIES BY M. DUPAIN.

AN illustration of an historic painting by M. DUPAIN, of Paris, was lately published. We now give some studies from the artist's portfolio, which will suggest the range of the subjects undertaken by M. DUPAIN.

The Ornamental Candelabra on the two refuges at the entrances to the Northumberland Avenue were completed on Monday last, and the lamps which surmount them were lighted for the first time in the evening. These candelabra have been constructed from the designs of Mr. G. Vulliamy, architect to the Metropolitan Board of Works. On each are supported by curved brackets three of Sugg's flat flame globe lamps, specially adapted to the requirements of the architect. The burners are fitted with governors regulated to consume 35 cubic feet of gas per hour, and to give an effective light of 175 sperm candles, so that each refuge is illuminated by a total light of 525 sperm candles. Each lamp is fitted with an arrangement for reducing the consumption of gas at midnight after the heavy traffic has ceased.

## INDUSTRIAL EDUCATION.

AT the meeting of the British Association a discussion on industrial education followed the presentation of the report of the committee appointed to watch the working of the Education Code. Mr. J. F. Moss, clerk of the Sheffield School Board, stated that the following resolution, proposed by himself and seconded by Professor H. S. Foxwell, had been adopted by the committee of the section: "That the special committee be requested to consider the desirableness of making representations to the Lords of the Committee of Her Majesty's Privy Council on Education in favour of aid being extended towards the fitting up of workshops in connection with elementary day schools and evening classes, and of making grants on the results of practical instruction in such workshops under suitable instructors." He explained that the utility of workshop instruction had been demonstrated in Sheffield, Manchester, and elsewhere. What was more particularly desired was that boys in the upper classes should be taught how to use tools in simple operations upon wood and iron. In Sheffield remarkable results had been obtained in the science classes of the Central Schools, and the elder boys were allowed to attend an hour earlier in the mornings, so as to really put into actual practice some of the theoretical instruction they had received. Without attempting to teach any particular trade, it was sought to make the boys handy, helpful, and accurate, leaving them to get their special technical training afterwards, either in the technical institute or in the manufactory. The instruction given was of such a character as would be useful to the pupils in whatever sphere of life they might afterwards be called upon to occupy, whether as handicraftsmen or otherwise, and would exercise a beneficial influence in diverting them from the too prevalent notion that it was more respectable to seek to earn a livelihood without soiling their fingers than to join in the more directly productive occupations of life in connection with our national industries. Specimens of dovetailing, model-making, the formation of cubes and prisms, &c., together with drawings of machinery and illustrations of various mechanical movements were exhibited, as being the kind of work that could be produced by boys of fourteen or fifteen years of age and the practicability of giving workshop instruction.

Miss Becker said she regarded this as one of the most important committees of the association. Since the establishment of the association a large and comprehensive scheme of national education had been put into execution, and every man, woman, and child was deeply interested in the question of whether the instruction given in the schools should be the best which it was possible to give. The importance of the subjects treated of by the committee could scarcely be exaggerated. She thought that much of what was taught in the schools was comparatively useless, that was, as compared with these great subjects. She would banish altogether grammar, and instead of teaching the meaningless distinctions between adjectives and substantives, and nonsense of that kind, she would have the children taught the principles which underlay their daily lives. As to the girls, she would do away with a great deal of the needlework practised and teach cutting out on mathematical principles.

Mr. McKnight submitted that there was a danger of carrying the scientific instruction too high. We did not want at the expense of the ratepayers to turn out boys as apprentices to trades. Ignorance obtained with respect to history and geography, and the domestic training of girls must be attended to.

Dr. Gladstone observed that the remarks as to ignorance on certain subjects applied not to children, but to grown-up people. The study of history was now compulsory, and, practically, geography was taken up in almost all our schools. State aid should be given for the promotion of this kind of instruction, just as grants were made for needlework and practical cookery in girls' schools, and for chemistry and the fitting-up of laboratories for science classes. He took it that no particular trade would be attempted to be taught, but that boys would in the school workshops learn how to use tools and do for themselves what might be of great value in after-life, whether they took up handicraftsmanship hereafter or not. The committee would, no doubt, have pleasure in considering the matter, and he should personally be glad to see the proposal carried into effect as soon as possible.

"The Education of Artisans" was the subject of a communication by Dr. Barron, who thought that the present standard of elementary teaching was too high. Education must not stop at the three R's, but must be pushed on by State aid to practical and manual instruction in workshops provided to teach technology, in order to bring up our artisans to the level of those of other countries in the art of producing decorative fabrics. Government must aid by grants those artisans who were unable to pay for advanced technical work, by placing them in national workshops containing all the requirements to teach the industries of the country, after passing a certain grade in general education. The State should imitate the Whitworth Scholarships, making small grants of money to the poor class of artisans in aid of general elementary as well as practical education, and encourage art and science teaching in every place.

Dr. Carpenter said the great function of primary schools was to develop the mind, and at the same time to give as much as

possible of such information as would be useful in after-life; but he put in the first place the development of the mind itself. In science teaching in schools a knowledge of objects was the fundamental point. Instruction in science should be given not by the ordinary school teacher, but by one trained in science.

## SANITARY INSTITUTE OF GREAT BRITAIN.

THE Congress of this Institute was opened at Glasgow on Tuesday, the Hon. John Ure (the Lord Provost) presiding. Dr. Humphry, in his address in the outset, referred to the importance of the work carried on by the Institute in its relation to health, mental and moral, as well as physical, remarking that by the providential or natural law of the association of the physical with the other qualities was worked out the predominance of the best. In the great struggles of nations the best won because goodness was the associate of strength and healthfulness, and the maintenance of the sanitary condition of a people was a necessity to the maintenance of a high position among others. This became yearly more and more the case as increasing civilisation made us increasingly dependent upon sanitary regulations, and determined more clearly what those regulations should be. It was thus that civilisation met and counteracted her own evils. The clustering of peoples in masses together promoted in various ways the liability to disease, while growing intelligence and rapidly-advancing science pointed out the means of preventing and arresting it; and as prevention was better than cure, so the science which promoted the former was better than that which attempted the latter. To this the members of his profession were fully alive, and willingly assented; and though their pecuniary gains were won by their efforts to cure disease it was their constant and unselfish aim to trace out and stamp out the sources of disease; and it was their desire and practice to take an active part in every movement which had for its object the improvement of the sanitary condition of our people. Well would it be for our country when increased opportunity was given to them in Parliament and out of Parliament of making a deeper impression on the convictions of the country. One result that might be anticipated from such an influence would ere long be the institution of a Sanitary Department in our Legislature, distinct from the Local Government Board and under the direction of a Minister of Sanitary Affairs, and he could scarcely conceive anything more likely than this to promote the well-being of our people and their success in everything they undertook, whether it were literary, scientific, commercial, or military. Such an office extending its administration to the sanitary condition of cattle would do much to reinstate the interests of agriculture, and to reduce the price and improve the quality of animal food. It would find a further scope for action in considering and checking the diseases to which our various food-producing plants became more liable as they were more highly cultivated; and which, in many parts of the globe, were producing great devastation and pecuniary loss, with accompanying distress and injury to the peoples. Under such a sanitary office the department of the Registrar-General would properly be placed; the Ordnance and Geological Surveys and the Meteorological Office should be in connection with it; and the Sanitary Institute would be a valuable handmaid in carrying on that which was perhaps its most important work, the conducting the examination of surveyors and inspectors. Among other benefits which would be likely to follow the formation of a separate governmental department, giving its full and undivided attention to sanitary matters, was the redistribution and greater equalisation of the sanitary districts, together with a provision for their harmonious co-operation—the bringing, that was, of all into closer relation with one another and with the central department, so that the events which were taking place in one district might be speedily communicated—telegraphed, if necessary—to others, and timely preventive measures against the spread or transmission of disease be taken. Moreover, the higher and more definite relation with the Government of a separate sanitary department would tend to promote that official sympathy which was now much wanting, and would encourage a proper attention to, and recognition of, the services of those men who devoted their time and abilities to sanitary science. It also would lead to a due consideration by Parliament of the pressing sanitary needs of the people—matters of far more importance to the nation than "agricultural holdings," "criminal procedures," and the greater number of those subjects upon which so much of the preceding sessions had been spent. Good sanitary legislation must ere long be recognised as one of the first necessities for a prosperous people; and the Government of England ought not to lag behind, as it had a tendency to do, in its efforts to provide this great boon for the nation. The president concluded by saying that the important points of house sanitation, water supply, food, engineering, and the great sewage question, which it would take some generations satisfactorily to settle, would be discussed in the various sections, and needed no comment.

On Wednesday an address was given by Professor Gairdner in the section of Sanitary Science and Preventive Medicine.

Professor Gairdner said that in general it must be admitted that the attitude of the physician towards his patient in all times had predisposed him to accept empirically, as it were, the disease as an existing fact, and direct his whole energies towards the question, how the individual patient, being already ill, could best be treated so as to emerge whole and sound. Prevention of disease, the great object of modern sanitary science, had too often been regarded as unprofitable, not merely in the common sense of being unremunerative, but also because the inquiry into causes belonging for the most part to the class of speculations, were condemned by inductive philosophy as destitute of fruit, and, therefore, wholly insecure and impracticable. Up to the very beginning of the present century the attention of physicians was but feebly attracted by facts and doctrines which, had sanitary science existed in any real sense, could hardly have failed to become generally accepted. That it should have taken two centuries to reduce to a practical rule in the Navy of Great Britain the measure by which Commodore Lancaster saved his crew from scurvy in 1603, was one of the facts which could not be got over, and which showed that in a practical sense preventive medicines, and the effective study of the causes of disease, were things of yesterday as compared with the ages of effort, not wholly unsuccessful, devoted to the cure of diseases. Professor Gairdner went on to speak of the enormous debt which sanitary and medical science owed to the late Dr. Farr, who gave an impulse of the highest importance to preventive medicine and sanitary science, and was in the end obliged to retire from his work with little of what could be called national recognition of his vast labours and eminent services to the State. He suggested the republication of Dr. Farr's works as the best of all possible monuments to his memory. It was a strong sense of the imperative necessity of maintaining the connection between curative and preventive medicine that led more than anything else to his acceptance in 1863 of the office which alone gave him any claim upon the attention of the Congress that day. As a teacher of the practice of medicine, already of some experience, and recently appointed professor of that subject in the University of Glasgow, he was invited by the authorities to assume the responsibility of the sanitary administration of this great city. He was assisted in the work by Dr. Russell and other devoted officers. During the period he held the post from 1863 to 1872, several considerable epidemics had been dealt with, and these revealed very clearly the weak points of Glasgow sanitation according to the means and resources which then existed. In the course of some further remarks, Professor Gairdner observed that from subsequent facts and observations it became probable that not only as against zymotic diseases, commonly so called, but also as against those inflammatory and even chronic affections of the lungs which formed by far the largest factors in the city death-rate, the true preventive medicine was to be found chiefly in improvements directed towards the ventilation, cleanliness, and general comfort of the houses of the poor. Overcrowding and overbuilding of ground space especially were to be corrected, not only as conducing to typhus fever, but to many other diseases, and that was the great object aimed at by the City Improvement Act. He was in a position to declare his belief that the policy so initiated was eminently beneficial, and that it was only by steadily following out the same principles that our great cities could gradually uproot the evils of centuries. Glasgow was a city peculiarly exposed to numerous causes of ill-health, for its population being upon a relatively smaller acreage than any except Liverpool, it was breeding up from year to year a much larger proportion of young lives than any other city. The inference clearly is that the sanitary state of Glasgow is in some way connected with its intense productiveness, and its too small superficial area. There was still much to do. Let them hope that the authorities of the present and of the future would, as Milton said, "Bate no jot of heart or hope," but go on steadily in the course that had been so well marked out for them.

Mr. E. C. Robins, F.S.A., read a paper on "The Disabilities of Inspectors of Nuisances, and their Remedy." He said that inspectors of nuisances were often handicapped by conditions very unfavourable to the satisfactory discharge of their duties. These duties were of a nature to bring them not only into contact, but also into antagonism with their employers, and influences were brought to bear upon them which rendered it often a very unpleasant and ungracious duty to put in force the provisions of an Act designed for the public benefit but opposed to the personal and private interests of parishioners, many of whom were members of the vestry, guardians of the poor, or sat on local boards of health in the district. The support which the inspectors had a right to expect from their superior officers of health was oftentimes grudgingly given, or absolutely withheld in cases where influential members of local authority were concerned. The preventive measures which it was so important to institute prior to the breaking out of a disease were postponed until the disease itself had appeared, and thus remedial measures were resorted to when too late to prevent their necessity. Periodical house-to-house inspections were essential to the due performance of the duties of an officer of health or inspector of nuisance in the neglected portions of his charge. Let the energetic few in every district, in every parish, take the matter to

heart, and forthwith establish a private society whose honorary self-sacrificing labours for the benefit of all would exercise its moral influence on the rest, and let their house-to-house inspection result in drawing the attention of owners to the insanitary state of their premises, and they would achieve a greater saving of life than would ever take place by the action of the Auxiliary Forces, the so-called volunteers. Let them establish a sanitary life-saving, health-giving movement, and let the officers of the parish authorities feel that they were supported in their arduous and unthankful labours by the public sympathy which such institutions would prove, and they would hear no more of the unrighteous use made by the powers that be of influence they possessed to the discouragement of honest, earnest, and capable public sanitary inspectors.

A paper on "The Dwellings of the Middle Classes," by Mr. H. C. Burdett, dealt with evils attaching to the present system of erecting middle-class houses, and the remedies for their removal. The writer contended that masses of the middle classes are frequently as badly provided with house accommodation as any class in the community. This remark applied chiefly to the poorer middle classes, living in houses let from 35% to 75% a year. These houses were erected by speculating builders, and were usually mortgaged as the work proceeded. This "jerry" builder was often a member of the local board, and he had powerful friends there, and consequently the defects of his work were overlooked. Such houses, because of their taking exteriors and internal plans, deluded the tenant or purchaser with a prospect of comfort; but within a couple of years they became a misery and a danger to the occupants. For the purposes of his paper, Mr. Burdett had visited a "jerry" builder's district at Willesden. The houses had been completed about two years. Their exterior was fanciful, the interior was cunningly planned. But their foundations were "jerry" builders' rubbish, strewn on a clay soil. Already they were damp, the floors were out of level, the roof sagged, the plumbing had been scamped, the walls were cracked and bulging, the soil pipes were ineffectual; in fact, almost every by-law of the Willesden Local Board had been disregarded. He had noticed the same conditions at Stamford Hill, Brixton, and elsewhere. The remedy he proposed was, first, the formation of a Local Householders' Association, part of whose duties it would be to prosecute offending builders. Further legislation on some points would follow, and local government bodies should be made liable to some sort of punishment if they failed seriously in their duties.

Among the proceedings of Thursday a paper was read by Mr. John Honeyman, which will be found in another column.

## THE MERSEY TUNNEL.

A PAPER on the Sub-Mersey Railway was read at the meeting of the British Association by Mr. Charles Douglas Fox, one of the engineers engaged on the Mersey tunnel. He said the question of providing railway communication between Liverpool and Birkenhead is one that has for many years occupied public attention. High-level bridges and tunnels have been on more than one occasion proposed, and amongst these the Mersey Railway was authorised, first as a pneumatic, but afterwards as an ordinary railway. The company was organised as at present constituted in 1881, with the Right Hon. Henry Cecil Raikes as chairman, the Right Hon. E. Pleydell Bouverie as deputy-chairman, Major Isaac and Mr. John Waddell as contractors, and Mr. James Brunlees and the author as engineers. The length of the railway is 3 miles 8½ chains, of which almost the whole is either in tunnel or covered way, and it is being constructed for a double line throughout, with stations at Green Lane, Borough Road, and Hamilton Square in Birkenhead, and James Street and Waterloo Place in Liverpool, the works being arranged for trains every five minutes each way, the traffic being expected to be very large. The land works do not call for special remark, being to a great extent in tunnel through sandstone rock under the public streets. For the purpose of the works under the river two shafts have been sunk on each side of the Mersey, one being for pumping purposes and for communication with the drainage heading hereinafter mentioned, and having a depth of about 180 feet; the other for winding and ventilation from the main tunnel, and about 90 feet deep. These shafts are lined partly with brickwork and partly with iron tubing. From near the bottom of each of the pumping shafts a drainage heading, rising slightly towards the centre of the river to allow the water to run to the pumps, is being driven partly by hand and partly by Colonel Beaumont's boring machine, which cuts a circular heading 7 feet diameter. Out of a total of 1,774 yards, 1,143 yards have already been driven, up to September 5, 1883. The sandstone rock through which the works are carried, though hard and compact, is porous, and yields more or less water. The pumping machinery on each side consists of two 20-inch and two 30-inch sets of bucket lift pumps, driven by compound engines by Hathorn Davey & Co., of Leeds. A 40-inch set of plunger pumps, to be driven by an overhead engine by Messrs. Barclay & Sons, of Kilmarnock, is now being fixed as a duplicate on each side. The 30-inch sets have hitherto been found amply sufficient to clear the

works. The paper described the mode of setting out the works the precautions adopted under the river, the means used for tubbing back the water, and the details of the main tunnel, the excavation for which has now progressed some 1,590 yards, closely followed by the brickwork lining. The paper was illustrated by diagrams and models.

Colonel Beaumont supplemented the paper by a short statement of what the boring machine had done in other places, and what it was expected to do. It was employed on the hard chalk of the Channel Tunnel, and a distance of 5,000 yards had been driven with it. The greatest speed that had been attained with it had been—more as a *tour de force* than with any idea of keeping it up—one foot every ten minutes, and this speed was kept up for two hours; so that the capacity of the machine for boring through the hardest chalk, requiring blasting, might be taken to be at the rate of 48 yards in every 24 hours. The speed which he anticipated getting, and which he had every reason to believe would be got before the machine had completely perforated the rock under the Mersey, was 1 foot per hour, or 8 feet in eight hours. It might be asked why there should be this enormous difference in speed. The reason was the necessity for changing the cutters more frequently in cutting the hard sandstone rock than in cutting the softer chalk, in consequence of the greater heat developed. In the softer chalk from sixteen to twenty feet could be cut without changing the cutters; but in the sandstone rock the greatest distance that could be cut without changing had been 18 inches, and it had been brought down as low as 3 inches. This latter figure, however, was not due to the hardness of the rock, but, to a certain extent, to the want of proper temper in the tools, and to the fact that ice was forming in the engine, and consequently a regular action was not imparted to the cutting tools. The new red sandstone that the Mersey tunnel was being driven in he took to be rather more than half-way in hardness between the chalk and the hardest sandstone. The machine had been tried in the hardest sandstone, and with the most perfect success, so far as demonstrating the possibility of the application of the system to the cutting of the harder rocks. This individual machine was not sufficiently strong to cope with the difficulty of cutting the harder rocks, but a larger machine was in course of construction, and he had not the slightest doubt that the outcome would be that the hardest red sandstone rocks could be driven, without the use of explosives, at an average rate of eight yards in the twenty-four hours. If this could be done, he thought the system of driving would have a very important effect on the development of coal mines, more especially in those cases where they were troubled with gas or where there was any danger from explosions.

## THE FRENCH ACADEMY OF ARTS IN ROME

THE late refusal of the French Government to improve the financial condition of the French Art Academy in Rome makes it interesting to know what are the arrangements in that institution. As is well known it was founded in 1666 by the great French Minister, Jean Baptiste Colbert. At that time it was decreed that only Frenchmen of pure extraction, unmarried, and at least thirty years of age, should be admitted, which regulation is still in force. For the applicants for admission, ten in number, special apartments are provided in the Academy, where they have to work at their first sketches for thirty-four hours without leaving the Academy. Then seventy-two days are allowed for the subsequent carrying out of the designs in oils or clay, as the case may be. No one is allowed to enter the reserved apartments, and no artist may show his sketches on pain of immediate exclusion. Copperplate engravers and gem cutters are allowed ninety-six days for the completion of their designs; architects 110 days, but the latter may not leave the house while making their first sketch for four days and three nights. Each artist receives 950 frs., being 300 frs. from the State, 255 frs. from a legacy made by Madame Laboubtène, and 395 frs. from a legacy made by Charles Dubosc. From a sum destined for the purpose by Madame Leprince, the winner of the grand prize receives 1,000 frs., and 600 frs. for his travelling expenses to Rome from the Government. When the artist arrives in Rome he is provided with a room and studio; the Academy receives from the Government 1,200 frs. yearly for the board of each artist, and a sum of 300 frs. is annually laid aside for him during the four years of his stay. When an artist returns to France on the expiration of the four years, his picture, having won the prize in Rome, is generally bought by the Government for 4,000 or 5,000 frs. A legacy made by the Countess de Caen secures to the laureate, on his return to Paris, a sum of 3,000 frs. annually for a term of three years. The marble necessary for the sculptors during their residence in the Academy is provided by the Government. Architects are nearly as well situated as painters, and receive besides 800 frs. from the Government in order to study in Greece. Copperplate engravers and gem-cutters are less favourably circumstanced, though the former have a share in legacies left by M. Alhumbert and the Duc de Cambacérès. The musicians, who have only been admitted to the Academy since

1803, receive nothing extra. Artists and sculptors who win the second prize receive 1,000 frs. from the legacy of the Duc de Cambacérès and 2,000 frs. from the Pigny legacy. Architects receive 500 frs. from the Lussore legacy. The widow of M. Chaudesaignes left the last legacy to the Academy, consisting of 2,000 frs. for two years' study in Italy for architects.

## THE CARLISLE GRAMMAR SCHOOL.

THE new buildings for the Carlisle Grammar School, which have been erected from the designs and under the direction of Mr. G. D. Oliver, of Carlisle, were opened on Thursday last week. An illustration of the building appeared in *The Architect* of May 13, 1882.

The aspect of the front of the main building is south-east, and as it is approached from Albert Street the most striking feature is the central tower in which the main entrance is placed, the porch being surmounted by a handsome oriel window. Speaking generally, this tower may be said to mark the division between the boarding-house and the class-rooms, the great aim of the promoters of the new scheme being to secure the establishment of a good day-school rather than a large boarding-school. General class-room accommodation has been provided for 250 boys, while provision has only been made for about 30 boarders. Entering the main door the visitor finds on his left in the main building the governors' board-room, and then a series of six class-rooms, two being in the main building on the south front, and the remaining four on the west wing facing Spring Gardens Lane, between the main building and the lecture hall; the side entrance for day scholars from Spring Gardens being about midway between these two points. The class-rooms are all lighted on the left of the scholar, and are each 20 feet 6 inches square, and with open roof of an average height of 17 feet. They are being fitted with dual desks, each capable of holding a class of 32 boys. Four of these class-rooms are provided with lantern lights, with side lights, two of these lanterns for the drawing-class room having also north top lights. These lanterns will also materially assist the ventilation of the rooms. Two of the class-rooms are arranged so as to be easily converted into one for temporary uses. For this purpose William's patent partition has been used owing to its facility in use and the small space it occupies when folded. The walls of class-rooms are lined with a wood dado, 4 feet 6 inches high, and the doors have an opening fanlight above. The laboratory, or practical chemistry room, is 20 feet by 20 feet 6 inches by 17 feet high. It is arranged, in conjunction with a small preparation room adjoining, with a gas sink closet and flue, heated with gas to rarefy and carry off gases to external air. It is also being fitted with chemical rack, benches with hard wood tops, gas positions, sinks, wash-basins, table with balance, furnace, closet, &c. The day scholars' lavatory, &c., conveniently placed opposite to the day scholars' entrance in Spring Gardens Lane, is centrally situated amongst the class-rooms, and is fitted with a range of basins and two long hat and coat racks, besides wall space. The class-rooms and corridors are all paved with solid blocks of wood. The class-rooms open into a long corridor, which leads to the lecture-hall. This is a very elegant apartment, 76 feet long by 28 feet 6 inches wide. It is entered from the corridor by two pairs of folding doors, each 5 feet wide, and is amply lighted. The roof is partially open, the upper portion above the beams being finished in plaster panels, divided by moulded ribs of pitch pine, and the lower portion above the cornice being boarded. The walls are lined with a wood dado 6 feet high. The size of the hall is ample to seat 300. The decorations of the hall are simple but effective, and among them may be especially noted the tinted cathedral glass in the windows. The ventilation of the class-rooms is effected by a very complete system. Fresh air is admitted from the outside over hot-water coils placed in the window recesses, and in the rooms with fireplaces through fresh-air hygiastic stoves, which have air chambers behind and under the hearth, and a channel communicating with the outside admits fresh air under the hearth and to the back of the stove, where it is heated, and passes over the fireplace and into the room as warm fresh air. The foul and vitiated air passes out of the room by openings in the upper part of the walls, communicating with air-tight passages in the corridor ceilings, and is extracted by a pilot furnace fixed near the ordinary heating apparatus, and passes into the chimney ventilating shaft. The head-master's dwelling-house has been built at the east end of the main building, and the rooms for the accommodation of the boarders are all situated between the head-master's house and the class-rooms already described. The head-master's house is quite distinct from the boarding-house, although adjoining and communicating with it.

The contractors for the building were Messrs. Beatey Brothers, Carlisle, for the builder's work; Messrs. H. & R. Court, Carlisle, for the joiner's work; Mr. W. Anderson, Glasgow, plumber; Mr. T. Nanson, Carlisle, slater; Messrs. D. Stanfield & Son, Carlisle, ironfounders; Mr. R. M. Ormerod, Carlisle, plasterer; Messrs. Kirk & Robley, painters and glaziers. Mr. Thomas Allen was clerk of works.

The Bishop of Carlisle, in the course of an address on the occasion of the opening, said he should like to touch upon one or two points connected with the report which the architect had just read to them, and he could not do so without in the first place saying with full honesty and sincerity that he did congratulate the architect upon the work that he had accomplished; and he congratulated the people of Carlisle upon having had the services of so good an architect, more especially as he was one of their own citizens. When the designs for the building were first laid before the governors there was very little doubt that the drawings suggested by Mr. Oliver were the most satisfactory of those that were laid before them; and he quite anticipated that the building would be handsome, satisfactory, and convenient; but he was also able to say this, which one could not always say, that the result had entirely come up to his expectations, and he liked the building now even better than he did when he saw it only in ink and paper. The building was handsome, and what was quite as important, it was a convenient one. He had often looked over the building, and had been exceedingly struck by the manner in which every want had been attended to, and the complete way in which the school had been raised in such a manner as to meet all the most advanced educational requirements of the age. With regard to the beauty of the building he was exceedingly pleased with the exterior walls and the interior of the structure. There was only one regret that he had concerning it, shared by a great many persons and arising out of causes over which they had no control, and it was this, that this very handsome building did not form a more conspicuous object in the city of Carlisle than it did in the retired situation it now occupied. If one could have had one's wish, the building should have stood in a place where everybody could have seen it, and that everybody who visited Carlisle should have gone away and said, "What a remarkably handsome modern building the people of Carlisle have erected." When they instructed their architect they told him that the building must be one which could be erected for 10,000*l*. It had been erected for 10,000*l*. He entirely agreed with what was contained in the architect's report, when he spoke of the admirable manner in which the contractors had done their work. Several gentlemen had seen the building, and there had been no difference of opinion amongst them as to the amount of work which they had got for the money. The work was not cheap and nasty, it was cheap and good. It did great credit to the architect to have the work done for the money, and great credit to the contractors to have carried out his intentions and erected such handsome buildings as these for 10,000*l*.

### EGYPTIAN ANTIQUITIES.

MR. C. T. GATTY, curator of the Mayer Museum, Liverpool, writes: Amongst the antiquities in the Mayer Museum is the lintel, or false door, of an Egyptian tomb, which has recently created some interest among English Egyptologists.

The lintel is of the calcareous stone commonly used for the Egyptian sepulchral tablets, and measures 32½ inches by 25½ inches. The sculpture upon it is carved partly in low relief and partly in intaglio, and depicts the deceased person, seated on a stool, with a table of offerings before him, such as the surviving relatives were accustomed to offer in the ancestral tombs—a trussed goose, &c. Over this table is an inscription giving a list of offerings—"Libations of water, incense, and wine;" and below the table, "Thousands of oxen and geese, bread (and) vegetables." Over the head of the figure is a horizontal line of hieroglyphic inscription, stating that the deceased's name was Tetenankh, and that he was a "superintendent scribe and royal relation." In addition to these titles, he is said to be "Over the abode of . . .," or, according to De Rouge's translation, "Scribe of the house of the rural domain." The right-hand column of the vertical line of hieroglyphics speaks of "thousands of different fabrics of linen" and "abundance of linen." Mention is also made of two different kinds of vases, Ab and S's, "thousands" of which are asked for. A description of this tablet, and a rough woodcut, were given under No. 294 in the first edition of the catalogue of the Egyptian antiquities in the Mayer Museum. A similar account, without the woodcut, is in the present edition. The interest of this tablet lies in its great antiquity. Mr. William Flinders Petrie, who has kindly interested himself in comparing the tablet with similar works in Egypt, states in a letter to the writer: "I should not hesitate to ascribe it to a period before the fourth dynasty, or to the time of Seneferu, Khufu (Cheops, the builder of the Great Pyramid), or possibly Khafra, the three kings who begin the fourth dynasty, the earliest kings of whom any remains are known. It is probably older than anything else in England; in fact, nothing in Egypt could be proved to be older. I have examined every accessible tomb in the great Necropolis of the fourth and fifth dynasties of Ghizeb, and copied many of the inscriptions, and I can be certain that there is no such tablet visible. The tombs of Meydûm (lat. 29° 20'), of the time of Seneferu, at the end of the third dynasty, are more like it, having hawks and standards above the list of offerings as in the Mayer Museum tablet; but certain small rock-cut tablets that I found at Abusir (near Memphis) are most like it in the form

of the numerals in the list of offerings. These Abusir tablets I reckoned on being certainly of the third dynasty, or perhaps earlier. The tablet of Shera, at Oxford (said to be the oldest thing in England), has no such unequivocal signs of antiquity about it, and might belong merely to the fourth dynasty, though bearing the name of a king of the second dynasty. It is, therefore, not at all improbable that the Mayer tablet may be the oldest in England, and at least none but the Oxford tablet can dispute that honour with it. Among the definable evidences of the early age of the tablet, I would mention the simplicity and boldness of the work of the titles, the large simple figures, and the mixture of part relief, part intaglio, being like the style of the tombs of Meydûm under Lenefera, the earliest known remains." Dr. Birch, of the British Museum, the most eminent English, if not European, Egyptologist, has no hesitation in pronouncing the tablet "of very remote antiquity; certainly amongst the oldest." This interesting information is another valuable testimony to the historical importance of the Egyptian antiquities in the Mayer Museum.

### LOW CEILINGS.\*

BY JOHN HONEYMAN, F.R.I.B.A.

THE height of the ceiling affects both the owner and the occupier of a dwelling, but chiefly the occupier; for, whereas it affects the owner's pocket only, it affects both the pocket, the comfort, and the health of the occupier. If the owner is perfectly free, he will simply adopt the height of ceiling which he thinks will enable him to get the largest return from his property. It by no means follows that he will adopt a low pitch. But if the ground he builds upon is dear, and the demand for houses great, he will be tempted to make the storeys low and increase their number; and in so doing he will be doing what is at once best for himself, and also—unless he make the rooms small as well as low—what is best for the community.

But in most of our large towns and populous places a person about to build is not free. He must build in conformity with regulations limiting the total height of his building, and prescribing, among other things, the height of ceilings and the cubic capacity of rooms. Hampered by such restrictions, he cannot suit his houses to the requirements of the districts where they are wanted; he must make them as Parliament has been pleased to prescribe, however extravagant or unsuitable for the people who require them, and he must get a profitable return for his expenditure from these very people, who don't wish extravagance, and can't afford to pay for it, but who, in the circumstances, either *must* pay for it or do without dwellings. For example, if the Police Bill drafted by the Corporation of Glasgow became law, a man having land bounded by a new street 40 feet wide would not be allowed to erect a tenement of dwellings in that street more than two storeys high, with this necessary result, that his return for the cost of land and buildings must be got from two tenants instead of from four or six. If left to his own discretion he would, at a small additional outlay, make his buildings say four storeys high, and—profitably to himself—accommodate on the same ground twice the number of tenants at lower rents. Now, assuming in the meantime that the four houses erected in this way were as good as the two made in conformity with the Police Bill, it must be perfectly obvious that, whether the owner made more out of the transactions or not, the erection of the four would be distinctly most advantageous for the tenants, and therefore for the community at large; because in this way twice the number of people would get accommodation where they want it—not where the Corporation say they ought to want it—and they would get it at a greatly reduced rent, both, I submit, considerations of the very greatest importance, and having a direct bearing on sanitary questions of great interest. Of course, if it could be proved that high ceilings and low tenements were essential to secure healthy conditions, a great deal could be said in favour of compulsory sanitation in that direction, although even in that case I should be prepared to say a great deal against it; but it has been abundantly proved—and this was very clearly brought out at the Newcastle Congress—that there is no necessary connection between density of population and a high death-rate; and I may say that the very same statistics—namely, those of the various improved dwellings' companies—which most conclusively prove this as conclusively show that there is quite as little connection between low ceilings and a high death-rate, as in all these dwellings the ceilings are low and the storeys numerous. Most people, however, in this part of the country at all events—I may venture to say most sanitarians—still cling to the idea that, *ceteris paribus*, a room with a high ceiling is a more healthy dwelling than one with a low ceiling. Now, I wish to strike at the root of this prejudice, which as affecting legislation has had—and may, unless eradicated, still have—most pernicious results; and I hope to be able to prove that, other things being equal—that is, that, given two rooms of different heights but of the same capacity, having the same size of chimney opening, the same area of window,

\* From a paper read September 27, 1883, at the Congress of the Sanitary Institute of Great Britain, held at Glasgow.

door, and vent openings—the lowest will be the cheapest, the most commodious, the most comfortable, and the healthiest dwelling of the two.

I shall dwell chiefly on the sanitary aspect of the question, merely devoting a sentence or two to the other important points I have mentioned. One of these, the greater extent of floor area in a low than in a high room of the same capacity, is self evident, and the advantage of this to the occupant is equally obvious. The economy of the low pitch is not quite so readily understood. For the sake of illustration, I have calculated the rents which must be charged for houses of 2,000 feet capacity in order to yield 5 per cent., arranged in three different ways—first, in tenements of two storeys of ten feet; second, in tenements of three storeys of eight feet; and, third, in tenements of four storeys of eight feet; allowing a proportionate area of vacant ground in each case; and I find that in the first of these—the two-storey tenement—the rent would require to be 9*l.* 6*s.*, in the three-storey tenement it would be 8*l.* 5*s.*, and in the four-storey tenement, 7*l.* 14*s.*; so that the artisan contented with an eight feet ceiling might have a roomier house for 7*l.* 14*s.* than he can possibly get for less than 9*l.* 6*s.*, where restrictions already referred to exist. In other words, he is compelled to pay 2*l.* 8*s.* per annum, or fully a third more than might otherwise be required, and at the same time he must be content to occupy a smaller house in a less convenient locality, without one solitary compensating benefit, merely because some sanitarians, chiefly municipal, think such treatment good for him. To my mind it is unmitigatedly bad, and a very serious matter for our working classes. For observe, it is impossible to take this 2*l.* 8*s.* out of the owner's pocket; the tenant must pay every penny of it, as, of course, no builder in his senses is going to put up dwellings which will not yield him 5 per cent. at least.

But the important question remains—would the low house be healthy as well as cheap and roomy? In my opinion it would, and in a greater degree than the high house. The means of ventilation, which alone are admissible in such dwellings, being of the simplest possible kind, it will be found that it is easier to ventilate a low room than a high one by their agency. Practically, the ventilation must be effected by the admission of fresh air by doors and windows—or round these when closed—through the badly fitting joints of floors and skirting boards, or by special inlets not intolerable to the inmates (if such can be devised) and the extraction of air by the chimney. Such means have been found sufficient, except where apartments are overcrowded, that is, except where the chimney is insufficient as an extractor. We may take it that in any room having a door, a window, and an open fireplace, three or four people may sleep safely, and the condition of the air will depend not so much on the capacity of the room as on the area and draught of the chimney. Those who are familiar with the subject will, I trust, excuse me if I say for the information of others in this mixed audience, that even such a capacity as is prescribed in our Police Bill—400 cubic feet to each adult—is utterly insufficient unless we have along with that a constant and rapid change of air. But to effect this change so that the whole volume shall be kept up to a safe standard of purity, it is necessary that the fresh air should be properly distributed and permeate the whole apartment. This point I fear is sometimes lost sight of. For example, if we take a room of 2,000 cubic feet with five inmates, to keep the air, not as pure as we could wish, but in a tolerably healthy condition, at least 5,000 cubic feet of fresh air would require to be passed through the room per hour; and as an ordinary open fire will easily extract that quantity, there seems to be no great difficulty about it. But, observe, it is quite possible to pass all that quantity through the room without purifying the atmosphere in any appreciable degree; we may let it all in at one side of the room and up the chimney at the other, leaving the air breathed by the inmates impure and poisonous, perhaps fatally; so that the more complete the distribution of the fresh air, the more beneficial will the ventilation be. Now the facility of distribution will depend to a large extent on the form of the room. If the room (always bearing in mind that we are speaking of rooms of the same cubic capacity) be high in proportion to its area, and the fresh air be admitted in the usual way referred to, the lower part only will be ventilated, and a large proportion of its atmosphere will remain impure; whereas, if it be low in proportion to its area it will all be well ventilated, and the inmates will get the full benefit of the room's capacity. In the other case they would not, as a considerable proportion of the high room would remain stagnant and foul—a condition objectionable on other grounds.

But, it may perhaps be said, granting that the air in the upper part of the room, say a fourth part of the total volume, remains unaffected, and that the 5,000 feet per hour allowance is distributed in the lower part only, is that not exactly where the fresh air is wanted? Certainly, but fresh air is not *the only thing* that is wanted in an artisan's house. Warmth and freedom from draughts are only second in importance, if, indeed, they are second. There are delicate women and tender babes to be considered, as well as robust men, and our mortality tables painfully remind us of the fact that that consideration is far too much overlooked. No doubt by the passage of a given quantity of air through a room you can make a part fresher than the whole, but it is evident that as you

reduce the part affected you necessarily increase the velocity and lower the temperature of the current; indeed, you can, without difficulty, carry this reduction so far that with the aid of a good-going fire, you may obtain a very high standard of purity, and a cold draught, of perhaps 150 feet per minute, in the only habitable part of the room, that is in the only part where the air is fit to be breathed. Our object of course must be to make every part of a room habitable, and to leave not one stagnant corner in it. In this way alone can we secure in the highest degree both essentials of a healthy dwelling—pure air and warmth. Now, we shall find that the lower the ceiling the more easily can this combination be secured.

Let us look a little more particularly at the superior facilities which the low room offers. The top of the door, from which I think the greater part of the air required should come, is necessarily near the ceiling, and the current will therefore completely disturb the upper stratum of air. The air from the window will have the same effect in a smaller degree, and both currents will be warmed by contact with the ceiling. We need never look to the floor as an air-warmer, except to a limited extent near the fire; a much larger area of the ceiling is heated, and in a low room there is not only a much larger area of ceiling to heat than there is in a high room, but the radiant heat upon it being more intense, it becomes an air-warmer of immensely greater power; and, obviously, this extra power in a low room can be used either to raise the temperature of the room, or to raise a larger supply of air to the same temperature. Besides, if in this way we are able to admit more fresh air near the ceiling, we shall also, in like proportion, be able to reduce inlets at a lower level, and to that extent get rid of cold draughts. Practically the quantity which can safely be admitted is limited by the means of warming it—the more we can warm, the more we can safely admit. I insist very much on the importance—the absolute necessity—of this heating in connection with the ventilation of small houses. Some people seem to think that hot air and foul air are synonymous terms; it would be much more correct to say that cold air and foul air are synonymous. If we wish the occupants of small houses to admit plenty of fresh air, we must not only convince them that it is good for them; we must show them how to do it without sacrificing something else which is good also, which is even better in their estimation—namely, comfort.

In conclusion, I desire earnestly to invite the attention of Scotch local authorities to this subject. It is clear that, if I am right in the views I have advanced—if it is the fact that from a sanitary point of view, a low ceiling is as good as a high one—much more if it is better—municipal authorities are utterly wrong when they prevent by legislation (as some have done, and others wish to do) the erection of low-ceilinged houses. It simply comes to this, that by such regulations they wastefully increase the rents which the working-classes must pay for house accommodation, and thereby in the most direct manner encourage overcrowding with all its attendant evils; while at the same time they effectually prevent the erection of improved dwellings, such as are now common in London and elsewhere in England.

## THE CORINTH CANAL.

IN a report to the Foreign Office on the trade of the Piræus, Consul Meslin describes the Ship Canal through the Isthmus of Corinth, which was commenced in May last year, the first mine being fired by Queen Olga, in the presence of King George, the Diplomatic Corps, and the principal Greek Government officials. The actual length of the canal when finished will be 6,342 mètres; the entrances to the channel will be 100 mètres in breadth, diminishing to 22, and the depth 8 mètres. According to studies made by M. Gerster, the total quantity of material to be extracted will be about 9,835,000 cubic mètres. The nature of the ground through which this channel has to be cut is composed, according to the report of the engineers of the company, of three distinct kinds: Firstly, from the Gulf of Corinth, through a plain, consisting of sand and alluvial soil, for a distance of 1½ kilomètres; secondly, through a mountain range, varying in height from 40 to 80 mètres, of the length of 4½ kilomètres; thirdly, beyond the mountain range to the sea, in the Bay of Calamaki, the proposed canal will traverse a little plain of the length of 600 mètres, composed of alluvial soil and rocks. The excavation of those parts of the canal situated in the plains presents no difficulties; but this is not the case as regards the mountainous parts, where an enormous mass of 8,000,000 mètres of solid rock will have to be excavated and transported to a distance, which labour, according to the contract, has to be done within three years. The following plan of executing the work has been decided on by the engineers of the company, M. Gerster and M. Kausser: That part of the canal situated in the plains will be excavated by ordinary means—namely, hand labour, dredging machines, a railway, and sand pumps. This portion of the labour, it is calculated, will be finished at the end of the present year, 1883. At the same time as the above-mentioned work is in progress, the upper portion of the rocky crest will be excavated by

mines, and the refuse carried away by a railway, for which purpose four locomotives and 200 trucks will be employed. Towards the end of the year 1883 several large dredging machines, constructed on the most approved modern principles, will be delivered to the company. These machines will be capable of removing 5,500 cubic metres of soil in ten hours. They will be each of 300 horse-power. As regards the system of excavating the rock, M. Gerster's plan is to sink vertical shafts in the mountain, by means of perforating machines constructed expressly for the purpose, which shafts will be sunk to the level of the proposed canal, for which cartridges of dynamite will be employed at distances of two to three metres from each other, which will be exploded simultaneously. The execution of this enterprise has been confided to the Société des Ponts et Travaux en Fer (ancienne maison Joret et Cie.) in conjunction with L'Association des Constructeurs. These two companies engage to undertake the cutting of the canal for the sum of 24,600,000 frs., under forfeit if it is not completed within the prescribed time.

### GLASGOW ARCHÆOLOGICAL SOCIETY.

THE annual excursion of the Glasgow Archæological Society took place on the 20th inst. Following the precedent of former years, the members went somewhat far afield. In 1881 Dumfries and Caerlaverock Castle were visited, and last year Murthly Castle and Dunkeld Cathedral. This year the programme promised Doune Castle, the Roman camp at Ardoch, and the Leighton library and cathedral, Dunblane. At Bridge of Allan the members left the train, and drove thence to Doune Castle, which is at present under restoration by Mr. A. Kerr, of Edinburgh. An interesting paper was read by Mr. Dalrymple Duncan descriptive of the castle and illustrative of its history. The exact period of the erection of Doune Castle, he said, cannot now be ascertained with accuracy. Tradition ascribes its origin to the eleventh century, but there is no proof of this or of its having been the residence of the old earls of Menteith. With Doune Castle the historic name most closely linked is that of Robert Stewart, first Duke of Albany, Regent of Scotland from 1402 to 1419, who lived there frequently, as is proved by the fact that there are extant at least six charters under the Great Seal granted by him at Doune. The sixth of these is in favour of the famous Earl of Buchanan, the Wolf of Badenoch. The foundation of the castle is usually ascribed to Murdoch, the younger Albany, but it seems more reasonable to suppose that the work was undertaken by his energetic and strenuous sire. Doune was a favourite residence of Murdoch, and when in 1424 he was seized by order of James I. at a ford between Doune and Dunblane, long afterwards known as Menteith's Ford, it is probable that he was on his way to his stronghold of Doune Castle. The castle was seized by the king, who, finding there Albany's wife, imprisoned her in Tantallon Castle. Doune now became a royal possession, and was frequently settled upon queens and royal ladies as part of the bridal possession. Through Margaret Tudor's union with Lord Methven, the castellanship of Doune and stewardship of Menteith was bestowed upon Methven's younger brother, Sir James Stewart, of Beith. In later days the murder of the "Bonnie Earl of Moray" threw the glamour of ballad fame around the castle, where his consort so hopelessly awaited his return. In 1745 Doune Castle was garrisoned by a party of Jacobites, commanded by Stewart of Ballochallan. Sir Walter Scott, in "Waverley," names Doune Castle as the place to which his hero was conducted by Donald Bean, and the castle is further notable for the circumstance that Home, the author of "Douglas," and five other students of Edinburgh University, who had been captured by the Highlanders after the rout of Falkirk, were brought here as prisoners of war. They were lodged near the top of the castle, in a chamber still in good preservation, which was visited with much interest by the party of archæologists. The students made their escape, under circumstances of great peril, through a window. After the Jacobites quitted the castle the Government sent an engineer to survey it, but his report on its use as a fortress does not seem to have been favourable, and it has still remained a picturesque ruin.

From Doune Castle the members drove eleven miles further on to Ardoch House, where Mr. Matthew Bulloch entertained a large party to luncheon. Mr. John Honeyman and Bailie Wilson conveyed to Mr. Bulloch the thanks of the society for his kindness in welcoming the members, and the hospitality with which they had been received. Mr. Bulloch then conducted the party to the Roman camp, which was briefly described by the Rev. Mr. Macintyre. Owing to the lateness of the hour the greater number of the members were obliged to return to Bridge of Allan without visiting Dunblane Cathedral; but a small party, under the guidance of Mr. Honeyman, examined its many points of architectural interest. Thereafter the society dined together in the Queen's Hotel, Bridge of Allan, Mr. C. D. Donald, jun., F.S.A. Scot., in the chair.

The Site of the City of London School in Honey Lane Market has been sold for 61,750/.

### CHURCH BUILDING AND RESTORATION.

**Mursley.**—A new Baptist chapel has been opened here, to accommodate about 150 persons. It has a gabled front, a small vestry-room over lobby, built with dark red and blue bricks, with red string courses, stone heads and transoms to doors and windows, with stone coping and terminals to parapet walls, patent ventilators in roof, with provision in walls and windows to admit ventilators without downward draught. It has been erected by Mr. J. W. Ingram, builder, of Winslow, from the plans of Mr. Leete, of Luton.

**Southover.**—An appeal for funds for the enlargement of Southover church has been issued. It is proposed to build a chancel, extending the church eastward according to its former design, and to re-seat and generally restore it. The estimated cost of these alterations, which will be carried out from the plans of Mr. B. Ingelow (Messrs. Carpenter & Ingelow), ranges from 1,500/ to 2,000/.

**Leeds.**—The parish church has been reopened, after being closed during the last few months for the purpose of alterations. The alterations embrace the rebuilding of the organ, enlargement and erection of vestries, and the repainting and cleaning of the church. The internal arrangements have also been considerably improved. In connection with the old parish vestry, a large fire-proof safe, for the reception of the registers, has been built; it is lined throughout with glazed bricks, has iron shelves, and is fitted with one of Chatwood's doors. The clergy vestry has been enlarged to about three times its previous size, suitable conveniences added, and an entrance door provided on the south end of the church. The alterations have involved an outlay of 3,800/. The work has been carried out, under the direction of Mr. C. R. Chorley, architect, by Messrs. Dreyer & Co., painters, Hull; Mr. A. W. Blacker, Royal Marble Works, Torquay; Messrs. Franks & Evans, Leeds, contractors for the cleaning and scaffolding; Mr. Joe Lindley, plumber, Leeds; Messrs. Nelson & Son, Leeds, ironwork; and Mr. John Hall Thorpe, Leeds, joiner's work.

**Stranraer.**—The foundation-stone of a new church for St. Leuchar's Free Church congregation was laid on Saturday. The church, which is being erected in King Street, is in the Gothic style, and is estimated to cost a little over 2,000/. Mr. M'Lachlan, Edinburgh, is the architect.

**Burton-on-Trent.**—A new Baptist chapel has been opened, having been erected at a cost of about 5,000/. The building is designed in thirteenth century style, and in plan is cruciform. The total internal length of the nave is 90 feet, and the breadth across the transepts is 75 feet. Externally, the building is of red brick, with dressings of Ancaster stone and moulded brick, the roof being covered with Broseley tiles. The intersection of the roofs of the nave and transepts is marked with a *flèche* of wood and tile, rising to a height of 90 feet above the pavement. The work has been executed from the designs and under the superintendence of Mr. J. Wallis Chapman, of London, the clerk of works being Mr. Reading. Messrs. Lowe & Sons were the contractors, and associated with them were Messrs. Pickering Bros. for the plumbing, painting, and glazing, and Messrs. Mason for the woodwork.

**Horsham.**—The memorial-stone of a new Congregational church at Horsham was laid on the 18th inst. The building is designed in the Gothic style, and will cost about 2,200/1. Mr. W. Buck is the architect, and Mr. J. Longley, of Crawley, the builder.

### SCHOOL BUILDINGS.

**Bedford.**—The new schools belonging to the Wesleyan chapel, St. Paul's, have been opened. The building is Classic in style, in harmony with the surroundings. The materials used are Henlow red facing bricks, with Fareham brick rubbers to the pilasters, panels and reveals with Bath stone dressings and cornices. The basement contains a large kitchen, fitted with sinks, dressers, &c., room containing the boilers for the heating apparatus, together with store-room, &c. The ground-floor is entered by lobbies and corridors leading to a large infants' room, 30 feet by 20 feet, and fitted with gallery; a committee or Bible-class room 21 feet by 14 feet, five large class-rooms, ladies' retiring-room; on this floor are fitted lavatories, and offices for the children. The floors are laid with solid wood blocks, which materially add to the quietness and warmth. The large assembly-room, which is approached by two wide staircases, one at either end, and fitted with Hawkesley's patent noiseless treads, is 71 feet by 33 feet, the acoustic properties being good. The roof is open to height of purlins, and divided into panels by principals. The room is lighted by three large windows in front and fourteen at the sides. Special attention has been given to ventilation, fresh air being admitted by Tobin's tubes and the foul air extracted by Boyle's air-pump ventilators. A lift is fitted from the basement to both floors. The building has been carried out from the designs of Messrs. Usher & Anthony, architects, St. Paul's Square, and under the personal superintendence of Mr. Anthony. The contractors were Messrs. Warton & Walker

for the bricklayer's and plasterer's work, Messrs. Jarvis & Son stonemasons, Mr. H. Adams the carpenter's and joiner's work, plumbing, glazing, and painting by Mr. Bull, gas fittings and smith's work by Mr. E. L. Moulton, all of Bedford. The lift was fitted by Messrs. Waygood & Co., of London, and the heating apparatus by Mr. A. Marriott, of Higham Ferrers. The total cost was 2,500*l*.

**Freckleton, Preston.**—A new Wesleyan chapel, school, and class-rooms are about to be erected at Freckleton from the plans of Mr. David Grant, architect, Preston.

**Wycombe.**—The new grammar-school buildings erected at Wycombe, from the designs of Mr. Arthur Vernon, have been opened. The buildings, which have an extensive frontage, are in an Early English style, with indications in the semicircular arches, dog-tooth and zigzag enrichments, of a semi-Norman character. The façade is of white Gault bricks, relieved by dressings of warm red brickwork, of local manufacture, and the roofing is of Broseley tiles. The general entrance is by a porch under a turret. Passing through a large hat and coat lobby, a spacious corridor is reached, which runs through the centre of the whole building. A schoolroom 50 feet by 20 feet, designed to accommodate 100 boys, is at one end of the corridor, and adjoining on the other side are class-room and master's room, the latter capable of use as a small class-room, if desired. A large lavatory for the use of either boarders or day scholars, with provision for play-boxes, boots, and shoes, &c., adjoins the garden lobby, which gives entrance to the grounds in the rear. In front there is a common hall or dining-room for the use of boarders, 30 feet by 18 feet. On the floor above, approached by a fireproof staircase, are three dormitories, lavatory, master's bedroom, bath-room, &c. The master's house is divided on both floors from the schoolroom proper by folding-doors in the central corridors. On the ground-floor of this private part of the building are an entrance vestibule, hall, library 18 feet by 14 feet, dining-room 18 feet by 16 feet 6 inches, drawing-room 21 feet by 15 feet, butler's pantry, lavatory, lift, &c. The first floor contains five bedrooms, dressing-room, linen-room, &c.; the second floor, two bedrooms, and an isolated sick ward.

### GENERAL.

**The Liver Sketching Club, Liverpool,** opened its eighth annual exhibition of pictures on Saturday last. The number of works exhibited amount to 296.

**An Oil Painting** has been found rolled together behind the wainscot in the little country house of Blankenheim, in Rhenish Prussia, which is supposed to be the Raphael which belonged to the Düsseldorf Gallery about one hundred years ago, and was lost on its way to Munich about the year 1805.

**Mr. J. Honeyman, F.R.I.B.A.,** has been appointed architect for the new parish church of Lochgilphead, N.B.

**An Association** has been started under the title of the Art for Schools Association, under the patronage of Lord Aberdare, Mr. Mundella, Mr. Forster, Mr. John Morley, Sir Frederick Leighton, Mr. Matthew Arnold, and Mr. Robert Browning, to bring within the reach of pupils in Board and other schools such a measure of art culture as is compatible with their age and studies.

**The Second Place** in the competition for the Infectious Hospital, Newcastle-on-Tyne, has been given to the design marked "Isolation A and B," which is the joint work of Messrs. Mark J. Lansdell and J. H. Leverton.

**The Archbishop of York** and Miss Thompson have presented the newly-built parish church of Whitehaven with a handsome stained-glass memorial east window, the work of Mr. W. F. Dixon, of London.

**The New Chancel** at the Priory church of Upholland, near Wigan, erected from the designs of Mr. Basil Champneys, was opened on Monday.

**A Tower** is proposed to be erected to St. John's Church Accrington.

**A Pulpit,** designed by Messrs. Medland & Henry Taylor, and executed by Mr. Thomas Scott, has just been erected in St. Paul's Church, Oldham Road, Manchester.

**Dr. Schliemann,** who, with his family, has made a short stay in England, in connection with his forthcoming book on the larger city of Troy, has left England again *en route* for Athens.

**Nether Court Hall.**—In the description of this work, published last week, the owner's name should have been Mr. Henry T. Tubbs.

**At the Industrial Exhibition** which will take place at Turin next year, there will be a Mediaeval castle and village, reconstructed by local artists after studies made of the venerable and picturesque ruins that exist at Canavese and in the valley of Aosta. The castle and village, the foundations of which already begin to appear on

the left bank of the Po, will represent a page of the civil and military life of Piemonte in the fifteenth century. At that time Turin was very small, counting scarcely 10,000 souls. The city of the Toro owed its relative greatness and prosperity to the victorious enterprises of Emanuele Filiberto, the greatest of the Savoy princes, who first made Turin a royal residence, and embellished and fortified the city.

**The British Association,** which concluded its congress on Wednesday, will meet next year at Montreal, on August 27.

**The Brighton Corporation** opened their tenth annual exhibition of modern paintings on Wednesday. Nearly 500 works are exhibited.

**Works of Restoration** on a scale of magnitude are to be commenced at the Royal Palace of Laeken.

**The New Post Office and Bank at Leiston,** erected from the designs of Mr. Coe, architect, of London, have just been completed.

**Mr. H. W. Pendred** will read a paper on "Designs, Specifications, and Inspection of Ironwork" at the ordinary meeting of the Society of Engineers on Monday next.

**Sir John Steel's** reproduction in bronze of his group of *Alexander and Bucephalus* is proposed to be erected within the enclosure of St. Andrew Square, Edinburgh, at a point where it would look along George Street, and be seen in profile in approaching from North or South St. David Street.

**Messrs. Ives & Co.,** of Shipley, the builders of the proposed new post-office at York, have commenced operations for clearing the site in Lendal.

**Mr. C. H. Lowe,** surveyor to the Hampstead vestry, reports that the length of roads, &c., under the control of the vestry is 39 miles 366 yards. The number of newly-inhabited houses during 1882 was 369.

**A Meeting of the City Commissioners of Sewers** was held on Tuesday at the Guildhall, when the report of the committee on electric lighting was adopted, recommending that certain experiments be made at a cost of 200*l*, with a view to determine the best distribution of incandescent lamps of the proper intensity of light, so that the companies tendering might have before them definite figures to guide them in fixing their prices.

**Sir J. A. Picton** has just issued a volume entitled "Notes on the Regalia and Plate belonging to the City of Liverpool." Sir James states that the plate has been again and again melted down and made afresh into new patterns to suit the taste of the authorities of the day. It is impossible now to say how much of this old plate was of a kind that would have been worth keeping.

**The Arlberg Railway Works** are being carried out with rapidity. The tunnel is now within 1,180 metres of completion, and the boring will probably be finished by the end of October, and the line opened for traffic in the course of 1884. The total length of the great tunnel will be 10,270 metres—nearly six and a half miles.

**A High Level Bridge,** crossing the river Aar, and connecting the existing town of Berne with the district known as the Kirchenfeld Lindenfeld, was opened on the 24th inst. The land thus connected with the old town of Berne has been acquired by an English company, and is being laid out for building purposes. It comprises about 200 acres, and commands magnificent views of the Bernese Oberland.

**Subscriptions** are being made for protecting and preserving Nevill's Cross, near Durham. The remains of the cross still existing consist of a rubble foundation, supporting a large stone, square at the base and octagonal at the top, and having at the angles of transition four sculptured heads representing those of the evangelistic symbolic figures. The base originally carried the shaft of the cross, the socket for which now contains a rude upright stone.

**The Manchester Corporation** have made a gross profit on the year's gas working of 99,489*l*, and after paying interest on loans and cost of lighting the streets, are able, by taking 12,000*l* from the reserve fund, to make a grant of 52,000*l* towards the cost of public improvement.

**The "Panama Star and Herald"** says that a head taken from a monolith at Tiahuanaco has been erected in La Paz, Bolivia. Some time ago General Ballivian attempted to transport the monolith intact, but, after removing it some distance, the work was found to be difficult, and the effort was given up. This stone is eight metres in length. The head which has been taken to La Paz weighs 2,700 lbs. It must be remembered that the ruined city at Tiahuanaco is celebrated for the massive nature of the stones employed in the erection of its temples, fortresses, and houses. In one of the walls there is a gigantic mass of rock which has been carefully measured and proved to weigh 250,000 lbs., or 125 short tons. Who were the builders and how they contrived to handle these enormous masses of rock remain enigmas to the present day, although fancy and tradition have been busily employed endeavouring to solve them. Tiahuanaco is situated in Bolivia on the south shore of Lake Titicaca, the largest and deepest

# ARCHITECT

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, SEPTEMBER 29, 1883.

### TENDERS, ETC.

*\* \* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*\* \* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—“Contract Supplement to THE ARCHITECT.”*

### TO AMERICAN SUBSCRIBERS.

*All subscriptions are payable one year in advance, and may commence at any date.*

*The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.*

*Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED to GILBERT WOOD, 175 Strand, W.C., London, England.*

*In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—*

*To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order.*

### COMPETITIONS OPEN.

**BIRKENHEAD.**—Dec. 1.—Plans are required for Laying-out Bidston Hill for Building Purposes. Premiums of 100 guineas and 50 guineas, and four of 15 guineas each. Messrs. Davies & Stephen, Estate Agents, Mollington, Chester.

**BRISBANE.**—Nov. 30.—Plans are invited for the Erection of a Town Hall. Messrs. Gordon & Gotch, 15 St. Bride Street, E.C.

**CAPE TOWN.**—Jan. 30.—The Town Council of the City of Cape Town invite Plans and Specifications, accom-

panied with approximate estimate of cost, of a System of Drainage. Selected Plans and Specifications to become the absolute property of the Corporation. All others will be returned free of expense. Premium of 250l. A plan of the City, with levels, may be seen, and further information may be obtained, on application to the South African Loan, Mortgage, and Mercantile Agency, 9 King William Street, London, E.C.

**LONDON.**—March 1, 1884.—The Commissioners of H.M. Works and Public Buildings are prepared to receive Designs for New Buildings proposed to be erected in Whitehall for the Admiralty and War Office. Mr. A. B. Mitford, Secretary, H. M. Office of Works, 12 Whitehall Place, London.

**NORTHAMPTON.**—Dec. 1.—Designs are invited for the Erection of a Board School, with Class-rooms and Out Offices, to Accommodate 1,150 Children. Mr. John B. Hensman, Clerk to the School Board, 4 St. Giles's Street, Northampton.

**OLDHAM.**—Oct. 1.—Plans for Schools for the Union, to Accommodate 120 Boys, 120 Girls, and 60 Infants. The building to be a separate one, in an enclosed area, to contain three schoolrooms, dormitories, baths, kitchen, with cooking arrangements; dining-hall to hold 500 persons, to be arranged so as to be usable for religious service; and four sitting-rooms and four bedrooms for officers. Mr. J. W. Mellor, Oldham, Clerk to the Board.

# LINDSAY'S

## IMPROVED PATENT REVERSIBLE TREADS & LANDINGS

### FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

In Hospitals, or places where it is desirable to be free from dust, the blocks can be placed close together, not leaving any cracks, so that the treads or landings can be swept or washed quite clean; also, if it be necessary to get light under a Staircase or Landing, rough glass blocks can be fitted in the Iron frames, side by side with the wood, and a subdued light thus obtained.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be re-filled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works,

13, 14, & 15 SOUTH WHARF, PADDINGTON, LONDON, W.

# The Architect.

## THE ADMIRALTY AND WAR OFFICES COMPETITION.

OW that the conditions of the Government competition of designs for the intended building in Whitehall are fairly before the architectural profession and the interested public, and, we may suppose, accepted for good or ill by all concerned, it may be interesting to consider, amongst other questions, what effect the competition may

probably have on the professional world. We do not propose to enter once more upon a discussion of the abstract principles of such a contest, nor to speculate upon the character of the designs which will be submitted; but one thing well worth contemplating is the circumstance, as we take it, that the present contest will be chiefly a struggle of nameless men for a name.

All great competitions, it is now pretty well understood, are accomplished at a great expense to the competitors. The present case is as fair an illustration of this as could be found. The Government require to build certain Public Offices, and the first impulse of those in authority has probably been to place the matter in the hands of the architectural staff of Her Majesty's Office of Works. But instead of this simple course of proceeding being adopted, a competition has been instituted, we shall say for two reasons. In the first place there is no doubt a feeling entertained in some quarters, or at least a hope, that a better plan may be procured from outsiders of more ambitious pretensions. Secondly, and more unquestionably, there is an earnest demand on the part of such outsiders—whose name at the present moment is legion—for permission to submit designs at their own risk, everyone in anticipation of being possibly enabled to establish for himself, on the ground of either chance merit or skill, a claim, if not to take the prize of employment, at all events to rank as a highly meritorious architect at the command of the public. A large number of competitors will thus enter the lists, of whom each one will have to spend money and money's worth perhaps much more freely than in previous cases has been ever done. The aggregate of this expenditure will therefore be large; and thus, as we have said, the benefits of the contest, whatever they may be, will be secured at a great cost to the competing architects.

It is satisfactory in a certain sense to be able to reflect that in this competition the advantage may be considered to attach to the competitors rather than to the promoters; that is to say, the expectation of the Government that a more serviceable design will be obtained than the Office of Works could produce is, as matter of fact, probably very small, whereas the hope of securing fame of a high order which animates a very considerable number of able and deserving professional aspirants is great. But those who are to look on must be prepared for a long and tedious struggle. Judging by universal analogy, this is what will happen. A hundred architects—perhaps many more—will first put themselves, at their own cost, through the whole process of devising as many elaborate solutions for an enormously extensive and intricate problem of expert design. Of these all but a handful will be at once choked off. The selected few will then virtually devise everything anew in still greater elaboration. Then one of them may be pronounced the winner without reservation—which is, however, very unlikely; or two may be bracketed as equal; or a still wider difference of opinion upon the merits may, more probably, be developed. In any case a contest of claims will inevitably arise which may speedily become a personal wrangle. Popular opinion (if it can be excluded from interfering in the preliminary encounter) now comes in like a flood; the designs are exhibited and commented upon, and all the *pros* and *cons* of merit and of authorship are vigorously debated. Parliament is also appealed to, and we all know what that means: Parliament, of irresponsible and omnipotent authority; Parliament, of inscrutable

and inaccessible mind. Everything must now depend upon what, to the trembling candidate, is as good as accident. Years have elapsed since the beginning of the adventure; years still have to elapse. Ministries come in and go out; great legislative problems elbow such small proposals as new buildings promptly out of their way; in every respect there is nothing, as Lord BEACONSFIELD put it, so certain to happen as the unforeseen. At last—no one knows when, and no one knows how—something, and no one knows what, is suddenly settled, and, in all probability by a fluke, somebody finds himself unexpectedly landed, if in the possession of honour and profit combined so much the better, but if in the enjoyment of profit only, and perhaps questionable profit, so it must be. Then, bit by bit, the building is erected year by year, and, probably, when some ten or twenty years have passed from our present year of grace 1883, the good people of the Admiralty and the War Office are at last ensconced in their rooms, at once to begin a course of grumbling destined never to cease. Of the architect's 25,000*l.*, meanwhile, although it sounds so large, one-half has been expended in office charges, and the other half he has had to live upon; and, what is the oddest part of the whole affair, it is by no means certain that this particular architect was even one of the competitors!

Nevertheless it is not to be disputed that such a competition is a great opportunity for those architects who are conscious of possessing ability and impatient of the slow pace of a private career; and no doubt this consideration will be found, as we have said, to induce a large number of skilful men to encounter with hope the series of uncertainties we have indicated. Who, then, are to be the competitors? It is pointed out, in a characteristic article which our contemporary the *Saturday Review* has published on the subject, that of those who engaged in the Government competitions for the great building at Downing Street in 1857, and the Law Courts and National Gallery since, almost all the more conspicuous have passed away—SCOTT, STREET, BURGESS, EDWARD BARRY, DIGBY WYATT, and several others;\* from which the conclusion seems to be drawn that only a lower class of architects must be expected to come forward now. But this, we beg to submit, is far from being a correct view of the case. It must be borne in mind that in 1857, and even at the later date, such men as those above named were not the distinguished personages they subsequently became. There were dignified seniors in those times, just as there are now; and they left the competition to the juniors, as will be done now. We do not expect to find the very leading men of the profession taking the trouble to compete in the present case; with them there is not much to gain, whether in purse or in pride, and there is a good deal to lose, if only in repute. But, for every second-rate architect who came to the front in 1857, we may safely say there are a good half dozen of much superior men now by whom this opportunity for asserting their claims to distinction may fairly be accepted. What is more, it is probable that these competitors will come boldly from all parts of the country, and not by any means from London alone, as has on former occasions been so much the rule.

But, looking at the competition as we are now doing, as a contest for celebrity, chiefly, on the part of a large body of impatient artists who have not yet made their mark, the question is—Will it be allowed to answer their purpose? The recent Glasgow competition seems to have answered no one's purpose, except that the successful competitor has received employment. The designs not having been exhibited (except in a partial and parochial way under the express discouragement of authority), the unsuccessful men have been put in the mere position of tradespeople whose tenders were declined. This is one of the weak points of the "preliminary sketch" system. In the case now in hand it is to be so far insisted upon that, for the sake of fair play amongst the selected ten, the rejected ninety are virtually forbidden to exhibit their productions. In other words, as the exhibition of the rejected sketches without the accepted ones after the preliminary selection would be of no service to anyone, so also the exhibition of all together after the final decision would be almost quite as useless, except to the authors of the selected ten. How far, then, will the advertisement of the merits of the ten satisfy the purpose with which a hundred or more will enter at such great expense into the competition? We are in hopes

\* The name of Mr. Garling, the first prizeman for the War Office in 1857, is included with the rest; but this is happily a mistake, as Mr. Garling is still not only a living man, but a man in middle life.

that, with a little generous consideration on the part of the representatives of the Government, more may be done in this way than appears probable. Indeed, we are inclined to think there may be two opinions upon the primary question whether or not to exhibit without reserve the whole of the sketches before even the selection of the ten is made. On the one hand there is the risk of plagiarism, no doubt; but on the other there are the much larger interests that are bound up in publicity of administration, and all the personal benefits of advertisement besides. Why should not a little ingenuity be brought to bear upon these considerations amongst others? If the principle should be strictly acted upon by which a sort of universal acquiescence in the ultimate decision is obtained by force of arbitrary authority—as was done, some allege, in the Glasgow case, and as it is easy to do through the artifices of official reticence and red tape—then the opportunity of acquiring credit in return for the outlay on rejected designs will no doubt be almost entirely lost; and the competitors as a body, if they could so act, would do well to take this into account at once. Commercially the Government are to pay 5,400*l.* for some ninety-nine rejected designs, which will cost their authors probably not less than three times as much money; and it will be indeed a pity if nothing beyond rejection, pure and simple, is to be had in return for the sacrifice.

### ENGLISH SCHOOLS.

THE endeavours which have been made to bring education within the reach of the humblest classes are creditable to the people of this country. Twelve years ago the schools in England and Wales could accommodate no more than 8·75 per cent. of the population; in 1882 it was found that there were schools for 17·24 per cent. In other words, schools for about two millions of children have been erected since the passing of the Education Act. The cost of the effort to provide school places may be inferred from the fact that the Education Department has sanctioned loans amounting to 14,721,650*l.* Already about two millions of money have been paid to the Public Works Loan Board for interest.

It is assumed that school seats should be provided for one-sixth of the estimated population, which in 1882 might be calculated as amounting to 4,387,562. The actual supply is in excess, as the returns show that provision has been made for 4,538,320 children. But the supply is not distributed evenly over the country; and while in some reports the erection of additional schools is urged upon the authorities, in others it is suggested that there are more seats than scholars. In the Blackburn district the number of school places is nearly equal to one in four of the population; in the Boston district there are 27,000 seats for 17,000 children. But there are towns which show a great deficiency of accommodation. Folkestone, for example, is said to be worse off for schools than almost any town of its size and importance in England.

The blue-book on Education is now one of the largest that is issued, but the restriction of the inspectors' reports to a limited number of pages has had the effect of excluding those remarks upon the arrangement of the school buildings which were a feature in former reports. This is to be regretted, for occasionally an useful suggestion was to be derived from the official criticism. In the Blackburn district two schools are selected by the inspector as models of what schools should be, viz. the Hurst Green Roman Catholic School and Thornley School. The latter was built by Lord DERBY, and is said to be the best bit of school architecture in the district. The inspector for the Salford district writes:—

There has been a great improvement going on in the buildings and premises of schools, but it must be borne in mind that at the inspection of returns in 1871 the standard set up in such matters was not a high one, and that, where the defects are radical, the inspection is practically powerless to effect improvement. In these cases it would much strengthen our hands if your lordships would, upon the inspector's report, require plans to be laid before your own architect, and fix a limit of time beyond which grants must not be looked for. At present, too, managers alter or enlarge schools, just as they fancy. It would be no hardship if all alterations of premises had to be submitted, if small, to the inspector of the district, and if large to your lordships' architect. Perhaps the most general fault of the schools in this district is their want of light. Our skies are not naturally bright and sunny, and art has come in with volumes of smoke to aggravate the defects of nature. But in spite of this the windows, which in

most schools are far too small, have been glazed with thick semi-opaque glass which, especially when dirty, reduces the light still further. Of course I see that it breaks less easily and saves blinds, but, while it must largely increase the gas bill, the consequent pollution of the air, and the prison-like depressing gloom which it produces in the school-rooms, must tell heavily upon teachers and children. In many cases I have got managers to replace broken panes with common clear glass, but this is at best a slow process.

In the old days, mixed schools—that is, schools in which boys and girls were taught together—were common enough in this country. It is a school of this kind that is depicted in MULREADY's picture *The Last In*, and, looking at the charming scene there represented, it is not surprising that there should be managers who are in favour of reviving the old-fashioned system. There are rural districts which seem hardly able to support a boys' school and a girls' school, and in such cases mixed schools become almost inevitable from financial causes; but the question to be considered is, Are they adapted to places where there is a large number of children? One of the principal arguments urged by the advocates of mixed schools is that the presence of girls has a beneficial influence, making boys more gentle, considerate, and polite. But, unfortunately, everyday experience does not support this theory; and in those schools, as afterwards in life, the weaker sex is made to be the "bearer of the burthen." One inspector says that in mixed schools he constantly sees "the girls waiting upon the boys, instead of the boys upon the girls, in the moving of desks and benches, in the collecting of books and slates, and in other work connected with the daily routine of school-life, which ought to be done by boys." Managers must be as well aware as are the inspectors of what occurs in those schools, and it is therefore absurd to support them as if they were schools of deportment. It would be more honest to say that the schools find favour because it is cheaper to build and to control one school than two. In some places where there are separate schools for boys and girls, the playground is common, with what results may be seen from the report of the inspector for part of the Middlesex and Surrey district. He says:—

Circumstances have led me of late to see more clearly than ever the momentous part played by the playground in the formation of character. It is there, between school-times, that the influence of children upon children—the effects of which can scarcely be over-estimated—is brought into play. In the school they are fed, it is in the playground that they ruminate; that is the sowing, this the growing time. And separate playgrounds for boys and for girls is a point of as great moment, and as strictly insisted on by your lordships, as a playground at all. At Mitcham boys and girls have been used, from time immemorial, to play together on the village green. How injurious such an arrangement would be to the morals and manners, of the girls especially, may be easily imagined. Not to mention the obvious objections to it, boys are apt in their play hours to treat girls as if they were other boys. They hit them. They kick them. They knock off their hats and tear their dresses. The feminine character of their amusements is an annoyance to them. Their habit of joining hands and swaying about contentedly in a ring for an hour at a time provokes them to fury. The separation of the sexes in their play time is a measure so obviously to be recommended, that it is strange to find objections so often taken to it, and these objections invariably proceed from members of the male sex. In one place, where I had twice in the annual report urged the allotment of a separate playground to the girls, without success, I inquired of the chairman of the managers what his motive might be for desiring to keep the boys and girls together, and his answer, from the point of view of the interests of the stronger sex, was conclusive: "It refines the boys."

Without this belief in the refining influence of women, dame schools would not be supported to the extent they still are throughout the country. At one time the schoolmasters in the army were sergeants who were incapacitated for ordinary duties, and the mistresses of the majority of dame schools might be placed in the same category, for they have adopted the teacher's profession because it is supposed to require little vital force, and no preliminary training:—

In one of the most important centres of the fishing population on the south coast of Devon I was informed a few years ago (says Mr. Burrows) that according to popular custom of long standing the widows of the men lost at sea usually opened small schools, and that this had long been regarded as their natural means of subsistence. It mattered not that the worthy dame was in such cases illiterate; her domestic misfortune was considered to be a perfectly sufficient qualification for her new duties, and her neighbours held with Dogberry that "to write and read comes by nature."

It has been calculated that about 780,000 children are "taught" in dame schools, which in 99 out of every 100 cases are grossly inefficient. The schools correspond with the teaching. In one Kentish private school the inspector says the ceiling was so low that, in order to stand upright, he had to place his head between the beams; in another the stench from a neighbouring slaughter-house was overpowering; in a third there were only 360 cubic feet of space per child, instead of 800. Why schools of the kind should be patronised is difficult to understand, and the conclusion arrived at by one of the inspectors is "that there must still be a large number of our fellow-countrymen who like to show their independence by doing things in their own way, and prefer to send their children where they like rather than to a school selected for them by others." Another inspector recommends, as the only means to remedy the evil, that all the private elementary schools in the kingdom of the class we are considering should be assumed to be inefficient, and be dealt with accordingly. In some exceptional cases the teacher might not be useless, but it would be difficult to find a dame school which was not unfitted for the reception of children. If these worthless schools were abolished, we should hear less about the superabundance of new Board schools.

## AN IRONMASTER'S HALL, YORKSHIRE.

[BY A CORRESPONDENT.]

LAST week, in connection with the proceedings of the Iron and Steel Institute in Cleveland, we illustrated Marton Hall, Middlesbrough, the residence of Mr. CARL F. H. BOLCKOW, J.P., D.L. We propose now to notice the principal art treasures which it contains.

Entering the spacious hall, the first object that presents itself is an old Roman mosaic, forming a portion of the floor, that was brought from Alton Towers. Nearly one-half has been restored, but the remainder is just as it existed so many hundred years ago. Let into the walls are four white marble medallions in *alto relievo*, representing the *Rape of Proserpine*, also from Alton Towers. In the hall are eight columns, and as many pilasters of *rouge impériale*, which was very difficult to match when the alterations were made. Over a handsome chimneypiece in Sienna marble, with sculptured white marble panel, is a minute modern mosaic, by RINALDO, of the ruins of Pœstum. There are six white marble busts, by WYATT, of the following engineers: *George and Robert Stephenson, John Fowler, Rendel, Hawkshaw, and Nicholas Wood*. Busts of the *Queen* and late *Prince Consort*, by MAROCHETTI, are replicas of those in the possession of HER MAJESTY. Near *The Wounded Fawn*, sculptured in white marble by TADOLINI, are two large vases elaborately carved, and having triangular pedestals. The hall also contains copies of well-known statues, two porphyry vases, a very old inlaid table entirely composed of various Italian marbles, and two old Venetian chairs of ebony inlaid with ivory. An imposing staircase in two flights leads to a gallery running round the hall, and leading to the various apartments. The steps are of veined white marble, with balusters of grey marble, while the pedestals at the base are of serpentine. On the upper floor are eight columns of Sienna marble, with arches of white-veined marble, the spandrels being filled in with alabaster, forming an alcove. LANDSEER'S *Braemar* is placed on the landing of the staircase. It was too large to be removed so as to form part of the representative exhibition of the artist's works that was organised shortly after his death, and it has never been seen in public. On one side of it is a bust, by STEVENSON, of the late *Mr. Bolckow*; and on the other a bust of the *Duke of Connaught*, which was finished by the Princess LOUISE, and bears the words, "Princess LOUISE, sculpt.".

Leading from the gallery surrounding the hall is the Prince's Boudoir, so called from its having been occupied by Prince ARTHUR on the occasion of his opening the Albert Park, which was presented to Middlesbrough by the late Mr. BOLCKOW in 1868. This room is entirely hung with water-colours of great value. The principal work is *The Horse Fair*, by ROSA BONHEUR, who, having already painted a replica of her well-known picture, could not paint a third in oil. This drawing, however, signed and dated 1867, is a more pleasant-looking work of art than the original painting. Another

water-colour by ROSA BONHEUR, of a *paysage* with water and sheep, is signed but not dated. *Portsmouth and Tynemouth*, by TURNER, are in his early and best style; they are really finished drawings, in which nothing is left to the imagination, as in his later and more ambitious works. *Waiting*, by MEISSONNIER, also a water-colour, represents a trooper doing "antechamber," as the French call it, in anticipation of an audience. In this room are also *Tivoli*, by DAVID COX; *An English Landscape*, by THOMAS CRESWICK; *On the Shores of the Adriatic*, by BARRATT; and drawings by STANFIELD and COPLEY FIELDING.

A boudoir is also hung with water-colours, six of them being by TURNER—viz., *Eridge Castle*, with a beautiful effect of the sun's rays; *St. Agatha's Abbey*, with a fine reflection in the water; *Sidmouth*; *Wensleydale*; *Cassibury Park*; and *Llangollen*, in the latter of which are seen indications of the artist's later and misty manner. Here is also the original drawing by SAMUEL PROUT of *The College at Heidelberg*, with its fine architectural details, and *Beauvais Cathedral*. There is an effective sketch of *Bringing a Lugger on Shore*, by W. BEVERLEY, the scene-painter. *The Raising of Lazarus*, by CATTERMOLE, is highly finished and very striking. There are also *Too Hot*, by HUNT; *An English Landscape*, by JAMES LINNELL; *Deer Stalking*, by COX; and *The Chamois Hunter*, by CARL HAAG. Owing to the fact that Captain COOK was born at Marton, great pains were taken to secure two medallion portraits of him by WEDGEWOOD, which are placed in this room. There are also some medallions, and a tazza in Limoges enamel, the arrangement of colours being highly artistic; a vase in *cloissonné* enamel, and a salver of copper painted in oil. Nearly all the furniture in this room is ancient, being actually of the Louis XV. period, with its original *repoussé* work; and the upholstery of the chairs consists of Amiens silk.

On the walls of the gallery, beginning on the same side as the two boudoirs, are three oil paintings of Venice, by E. W. COOKE; they afford views of Santa Maria della Salute, St. Mark, and the Piazzetta. A striking picture is *The Abandoned*, by SCHREYER, which gained the gold medal at the Paris Salon in 1867. It represents an ammunition waggon, to which two grey horses are harnessed; but one has been shot in the battle, and the other, full of terror, is fixed to the spot by the harness and his dead comrade. There are also *Old England*, by CRESWICK; *A Highland Lot for Sale*, by R. ANSDALL; *The Broken Violin*, an Italian scene, by FEYAN; and *A Happy Family*, by SONDERLAND.

In the alcove communicating with the other side of the gallery is a picture of additional interest since the late earthquake, viz. *The Shipwreck*, by WEBB, introducing the Castle of Ischia. *Among the Fells*, a scene in East Cumberland, and *A Summer Sunny Afternoon*, are characteristic paintings by SIDNEY COOPER. *Excelsior*, by SANT, illustrates "Hark! 'tis the lark, the herald of the morn." CHARLTON has painted the portraits of three favourite dogs of the late Mr. BOLCKOW; and *Waiting for the Herring Boats*, by JOSEF ISRAELS, introduces some gaily dressed Scotch fishwives. *The Subsiding of the Nile*, by GOODALL, is a magnificent picture. There is here a splendid example in oil of ROSA BONHEUR—*Deer in the Forest of Fontainebleau*. JOHN PHILLIPS is represented by *A Castagnette Player of Seville*. There is fine expression in *The Reprimand*, by E. FRÈRE, whose *Wood-gatherers*, a small but effective picture, is also included in the collection. *Forbidden Fruit*, by SCHLOESSER, is a humorous German scene in which some schoolboys are caught smoking by the master. There is also a little gem by P. F. POOLE, *The Sisters*, representing two fisher-girls, one dark and the other fair, performing their toilet on the sea beach. A cabinet containing valuable specimens of Dresden china, formerly belonging to one of the doges of Venice, faces a table covered with china in WEDGEWOOD'S first style.

Descending again to the ground floor, we first enter the morning-room, in which there are two columns in *rouge royale* marble, and two chimneypieces in a very rich, deep red marble. Over one of them is a large enamel by LEPEC, a French artist of Spanish origin, showing a life-size bust of *Clemence Isaura*, the early patroness of French art, surrounded by a shield with elaborate Arabesque ornament, and bearing the motto "Poesim pictura celebrat." This lady, of high birth and celebrated for her beauty, offered floral prizes, composed of precious stones, for excellence in the arts. She is represented life-size and in profile, the intellectual beauty of the face being set off to great advantage by the artistic arrange-

ment of the costume and the harmonious treatment of the borders.

Opposite this rare work is a copy in white marble of CANOVA's statuette of *Hebe*, flanked by a pair of black Wedgwood vases. The room contains another gem, *The Stirrup Cup*, by MEISSONNIER, placed above *A Country Fête*, by WATTEAU, which is authenticated. There is an example of W. MÜLLER—one of his best—in *Ancient Tombs and Dwellings in the Rocks, Lycia*. There are also STANFIELD's *Tronsberg in the Tyrol*, JOHN PHILLIP's *Scotch Lassies*, and FAED's *Homeless*. *The Interior of a Spanish Hostelry* is by RUIPEREZ, a Spanish painter who died young about ten years ago, but who, it is thought, would have become a second MEISSONNIER had he lived. In *The Eastern Woman*, by GÉROME, there is a marvellous effect of a green veil. *The North-West Passage*, by MILLAIS, contains a portrait of the late JOHN TRELAWNEY, illustrating the sentiment, "It might be done, and England should do it." A good example of the English school is *Robbing the Orchard*, by G. MORELAND; and *Going to Market*, by L. PERRAULT, represents a Norman peasant girl in white *bonnet* and *sabots*, with a white fowl. *The Eve of Saint Agnes* is a characteristic work by DANIEL MACLISE. *News of our Wedding*, by TISSOT; *The Déjeuner*, by C. MOREAU, and small works by PHILLIP and DÜVERGER, here find a place. This room also contains a cabinet full of Wedgwood pottery, forming the most complete collection of Wedgwood ware that exists.

Over the side-board in the dining-room is an immense glass, with carved oak frame by ROGERS, representing, in high relief, game, fish, fruit, and musical instruments. The side-board itself was successfully made to match by Messrs. GILLOW. There is a good example of the earlier period of MILLAIS in *The Love of James I. of Scotland*. *La Falaise*, by SCHLESINGER, represents a fisher-girl; and *Going to Market*, by MORELAND, introduces a white horse. A white horse is also a prominent feature in the well-known picture by J. F. HERRING, that has frequently been engraved, the same artist being again represented by *Labour and Rest*. *Pepys's Introduction to Nell Gwynne*, by A. L. EGG, is an interesting example of character painting. *The Intruding Puppies*, with monkey, by LANDSEER, is also a wonderful bit of character. The countenances of master and pupil in *Both Puzzled*, by ERSKINE NICOL, form a study, as they are cudgelling their brains on the proposition, "If once naught be naught, twice naught must be something, for it's twice what once naught is." A fitting companion is *The Hedge School*. *The Result of Intemperance*, by WEBSTER, is a humorous picture of a village episode on Sunday morning. A drunkard, in the stocks, is being tickled by an urchin with a straw, while the majestic beadle turns a deaf ear to the supplications for his release by his wife with several children round her. The envy of one of them is roused by a boy taking home a dish of baked meat, while the mother of the latter is coming after him with the stick for loitering. *Grand-mother*, also by WEBSTER, is supposed to be a portrait of the artist's own mother. The old lady is peeling a potato, and the details are worthy of the Dutch school. He is again represented by *The Dame's School*. There are two examples of THOMAS FAED, *The Silken Gown* and *Baith Faithier and Mither*; while JOHN FAED is represented by a *Pedlar Reading a Ballad to an Old Lady and Two Scotch Lassies*. There is a valuable painting by WILLIAM COLLINS, *The Skittle-Players*, perpetuating one of those scenes in village life that do not now often recur. *Launce and his Dog* is an original by CALLCOTT. *After the Battle*, by CALDERON, represents some English soldiers, after the war in La Vendée, finding a little boy seated on the side of an overturned cradle. *Rembrandt Entering the Anatomical Museum*, by C. BISSCHOP, the grand Flemish painter, is very strong in light and shade; while *Le Cuisinier Flamand*, by TENIERS, is noticed in SCHMIDT's "Catalogue Raisonné." *Kate Nickleby*, by FRITH, was purchased from the collection of the late CHARLES DICKENS. In *Hagar and Ishmael*, by MERLE, the countenance of the bondwoman is intensely expressive of both grief and indignation. *Jacob's Servant and Rebecca*, by GOODALL, came direct from the Academy. *The Interior of a Stable*, by VERBOECKHOVEN, is one of the hundreds of such scraps that are scattered over the whole world. *Cattle and Sheep* are in SIDNEY COOPER's early and best period. In this room are also *Shepherd, Sheep, and Dog*, by ANSDALL; *On the Scheldt*, and *The Steeple Rock*, Kynance Cove, Lizard, Cornwall, by COOK, and the *Ecole Communale des Filles*, by E. FRÈRE.

In the drawing-room there are a pair of Egyptian marble

columns, with beautifully-worked capitals. The two chimney-pieces are of white marble, delicately sculptured. *The Syrian Slave*, by TADOLINI, is a statue finely executed from a pure bit of white marble. *The Return from Pasture* is a Hungarian scene with cattle, cleverly painted by ROSA BONHEUR. There is one example, *Art and Liberty*, of GALLAIT, the Belgian painter, whose fiftieth anniversary of winning his first medal has lately been celebrated, with great enthusiasm, at his native town of Tournai. *Prayer in the East* is a masterly painting by GÉROME. There is a replica of FRITH's picture, in the SHEEPSHANKS collection, of *Honeywood introducing the Bailiffs as his Friends*. *Rachel* is a highly-admired work by GOODALL. *The Bay of Naples* is a well-known painting by W. MÜLLER. There are two examples in this room of DAVID COX, *Driving Home the Flock*, which is one of his best, and *Counting the Flock*, a lovely picture. *Old London Bridge* is in TURNER's best style; *Noonday Rest* is by J. LINNELL, sen., the best painter in this style, who died last year. STANFIELD is represented by a very fine specimen, a sea-piece, with marvellous waves. In *The Water-Cart*, by C. TROYON, there is a delightful chiaroscuro effect, nature being represented in by no means her brightest mood; while *The Song of the Troubadour*, by P. F. POOLE, is attractive from the reflection in the water. *The Meeting of the Avon and Severn* is a minute painting of a scene at Penpole Point, near Bristol, by P. NASMYTH. *A Jewish School at Cairo* is one of those representations of Eastern life painted by HENRIETTE BROWN (Madame DE SEAU), who accompanied her husband into Syria when he was appointed Minister Plenipotentiary. The list of pictures in this room is completed by H. MERLE's *Holy Family*, BOUGUEREAU's *Day Dreams*, and JOHN PHILLIP's *Spanish Ladies*. Mention must also be made of a very fine "cabaret," or tea and coffee-service, in china, of the Marcolini period, the salver beautifully painted with a copy of GUIDO RENT's *Venus and Cupid*. An ancient vase of Vienna china, with cobalt ground and minute Pompeian decoration, bears a representation of *The Judgment of Paris*. A pair of vases, also in Vienna china, possess not only an artistic but also a historical value, having been presented by FRANCIS I. of Austria to a well-known diplomatist on the occasion of the peace of Vienna being signed. The drawing-room is rich in china, there being also a pair of Oriental, a pair of Worcester, a pair of old Sèvres, and a pair of Dresden vases. A rare curiosity is an old timepiece in Louis XV. style, bearing the maker's name, "BAILLON, à Paris," in white Sèvres china, with ormolu mountings. The hand, wrought in diamonds, is fixed, while the horizontal dial revolves. An old German carving in ivory, partly relieved with black, represents Father Time cutting the thread of life; and an old rock crystal cross was obtained from a church at Saragossa.

The drawing-room communicates with a conservatory, adorned with a beautiful fountain and rare tropical plants, and the conservatory with the fernery, tastefully laid out with rock-work. On the occasion of the *conversazione* given to the members of the Iron and Steel Institute, both the conservatory and the fernery were illuminated with twenty-two SWAN incandescent electric lamps, supplied by FAURE-VOLKMAN storage batteries, sent down charged from London by passenger train the previous day. The work of laying the wires was begun and completed the same day by Mr. T. SMITH, engineer to the Hammond Electric Light Company; and this formed one of the chief features of the evening. It may be mentioned that there are private gas-works attached to Marton Hall.

The library contains many valuable works, including a volume with some of Sir WALTER SCOTT's manuscripts, a Latin Bible, some illuminated missals dating from 1400, as well as copies of FROISSART's "Chronicles," and of GOULD's "Birds of Europe." In this room is a portrait of Captain Cook, while his log-book is carefully preserved, in company with a copy of his work on the circumnavigation of the globe. The great navigator was born in a cottage which was unfortunately demolished when Major RUDD erected his mansion in 1786. The present hall stands on the same site; and a pump which belonged to the cottage is still preserved in the garden, while a granite fountain marks the site of Captain Cook's birthplace. The register of Marton parish church contains the entry of his baptism, as follows: "Nov. 3, 1728, JAMES, ye son of JAMES COOK, day labourer." A black marble tablet in the sacred edifice bears the inscription, "To the Memory of Captain JAMES COOK, navigator, who was born in this parish October 27, 1728, this tablet was erected by the parishioners of

Marton, A.D. 1812." Moreover, an obelisk in his honour crowns the summit of Eastby Bank in the neighbourhood, while a memorial school has also been erected in the village.

### PARIS NOTES.

A NEW regulation of the Paris Municipal Committee of Public Inscriptions will necessitate a considerable increase in the size of the sign-plates throughout the old quarters of the city. The committee desire to promote among the Parisians an interest in historic topography by inscribing on the sign-boards some details which will indicate the main features and arrangement of old Paris. A commencement will be made by marking the positions of the three boundary walls that have surrounded the city at different epochs, the earliest of which extended from the Butte Saint-Gervais to the present site of the Pont-Neuf; the second from the Ave-Maria Market to the Institute; and the latest from the Tour de l'Arsenal to where the Pavillon Lesdiguières now stands. Students of archæology will be grateful when all the proposed inscriptions have been set up, and the example might be imitated in other cities with advantage.

An important work of restoration is about to be undertaken in connection with the church of Val-de-Grâce, one of the most remarkable buildings in Paris. Fifteen years ago the dome of this edifice—which is, after those of the Panthéon and the Invalides, the highest in Paris—received a new roof, the main entrance being restored at the same time. Unfortunately the great frescoes on the interior of the dome were left untouched, and are now found to be in such a condition that the greatest care and skill will be requisite for their restoration. The Direction des Beaux-Arts has entrusted several eminent artists with the execution of the work, the cost of which is estimated at upwards of 40,000*l.* These frescoes were painted by Mignard, and represent *The Reward of the Blessed*. The Val-de-Grâce was built by Anne of Austria for a Benedictine convent, from the plans of François Mansard. Court intrigues prevented the celebrated architect from superintending the execution of his own designs, which were carried out by Le Muet and Gabriel le Duc, the work being commenced in 1645, and finished twenty years later. Since the Revolution the main building has been used as a military hospital, and contains no less than 1,500 beds; the church, which was secularised during the Reign of Terror, reverted to its original purpose in 1826.

The above-ground portions of the Tuileries Palace are now entirely demolished, and, after the ground has been cleared, the basements and cellars will be attacked. Considerable curiosity exists as to whether the contractors for the demolition will be lucky enough to find in this part of the old building any of the treasures alleged by popular rumour to have been concealed therein at various periods.

The Paris Municipal Council lately voted the large sum of 1,200,000 frs. for the purchase of the ground in the Rue Monge under which lie the remains of the Arènes de Lutèce. It has already been decided to turn this ground into an open space similar to the Square Cluny, and for this purpose a further amount of 300,000 frs. will be required. At the request of several members of the Arènes Preservation Committee, M. Jules Ferry has decided to recommend the Chambers to vote a contribution of 100,000 frs. in aid of this project.

One of the most out-of-the-way corners of Paris—the Place de la Salpêtrière—is about to receive a sculptural group thoroughly in keeping with the genius of the place, and erected in honour of the famous Dr. Pinel, the great lunacy doctor. The monument has been executed by M. Durand, at the joint expense of the Government and the Municipal Council. It consists of two figures: Pinel, holding in his right hand a mass of broken fetters, stands with a female crouching at his feet, as if still chained down, but looking up at her deliverer with an expression of gratitude and awakening intelligence. The physician is represented in the dress of the Directory, and the group is considered a very fine one, the supposed expression of the faces having been portrayed with great success.

There has lately been discovered amongst some old papers at the Louvre a list of sums expended by the Superintendent of Royal Buildings from 1699 to 1704. Among other entries, there is one of 32,000 livres (about 1,300*l.*) for the two blocks of white marble

out of which Guillaume Coustón sculptured the *Chevaux de Marly*, now erected at the entrance to the Champs Elysées. These groups were the last work of the great artist, who died at Paris in 1746. The marble was brought from Carrara, and as each block contained 400 cubic feet (French, 13 inches), it is seen that Carrara marble was, even at that time, worth no less than 40 frs. per cubic foot.

M. Jules Dalou's bas-relief of *The Republic*, which gained the Prix d'Honneur in this year's Salon, and has been purchased by the City of Paris, is placed for the present in one of the rooms of the new Hôtel de Ville. It has not yet been decided whether it shall be executed in stone or marble. Near it are two of the four enormous paintings that were ordered at the commencement of Louis Philippe's reign for the decoration of the Throne Room: *Les Vainqueurs de la Bastille*, by Paul Delaroche; and *La Prise de l'Hôtel de Ville*, by Schnetz. The third, *Bailly*, by Léon Cogniet, is in another part of the building; while the fourth—which, though ordered of Drolling, was never painted—was to have represented *General Lafayette at the Hôtel de Ville*.

At the last sitting of the Academy of Fine Arts, a paper on the Life and Works of M. Henri Lehmann, a member of the painting section of the Academy and professor at the Ecole des Beaux-Arts, was communicated by Vicomte Delaborde, the permanent secretary. It will be read during the annual public sitting to be held on the 20th inst. On that occasion the prizes of the year are solemnly distributed, the three chief laureats for this year being M. Baschet, pupil of MM. Lefebvre and Boulanger, the Prix de Rome in painting; M. Lombard, pupil of M. Cavelier, the Prix de Rome in sculpture; and M. Redon, pupil of M. André, Prix de Rome in architecture.

The annual exhibition of Incoherent Art, the first of which took place last year, will open on the 20th of this month, in the Galerie Vivienne. A great number of painters and sculptors are sending in works, amongst them being Messrs. Pille, Lepic, Haquette, L. Loir, G. and H. Cain, Geoffroy, Corcos, Cartier, H. Gray, L. Dorville, Somme, Caran d'Ache, Ferninand, Roinaud, and Willette. A very curious section of this exhibition of eccentricities will be the room which has been dubbed "Salon de l'Art rétrospectif incohérent," and will contain authentic drawings by Moreau le jeune, the Comte de Chambord, Louis Philippe, Baudelaire, Mérimée, Léopold I. of Belgium, and others of the illustrious dead.

### LORD REAY ON SCIENCE AND ART.

THE prizes gained by the students of the Science and Art Classes in Hawick were distributed by Lord Reay on Saturday last. His lordship said it was not in vain that science and art had been coupled together. There was not the slightest doubt that all their science education should have at its basis a good and sound elementary education in drawing. He could not lay enough stress on the great importance, if they were to succeed with their science education, of drawing being well taught in the primary schools, and he must say that he thoroughly agreed with the committee when they made the bursary given by the manufacturers and by the Government dependent on the obtaining of two certificates in drawing. When they spoke of these art classes they very often forgot that the object of them was not alone that they should form artists and painters, though he must say that, living in a country like theirs, where, when they left the town and walked about, nature by its beauty seemed to be claiming the artist at every turn, it was undoubtedly a very great mistake they made in not obeying the commands of nature, and in not making more of art than they had done. He might be inclined to grow eloquent on that subject, because he had just been having as his guest a man who had done more than any other man to make the public in England appreciative of art—he meant John Ruskin. He could only say that when these art classes were started, as he was sure they would, because in Hawick he knew that when they once started a thing as a rule they succeeded, and did not give it up, the works of John Ruskin would certainly be amongst those which they would read with the greatest delight. He might be allowed to add that there was a claim which John Ruskin had on their respect, and that was his intense admiration for Walter Scott. When he took Mr. Ruskin to see Laidlawstiel, where the genius of Sir Walter Scott was first developed, it was quite remarkable to see the veneration with which he looked at the spot; it was remarkable to see how John Ruskin tried to inspire himself with the whole surrounding scenery; it was remarkable to see with what youthful freshness he imbibed, as it were, the beauties of the scenery between Laidlawstiel and Traquair, and with what interest he took a sketch of the house of Traquair, after, of course, he had

seen the bears on the avenue. All he (Lord Reay) hoped was that the students who should go to these art classes would, when they had attained the age of John Ruskin, by the sense of art which they would have gathered at these schools, have secured to themselves a happy old age. He might also add that if there was anything which it was sad to see, it was when they saw two great men who disliked each other, or who seemed not to be inspired with cordial feelings of admiration for each other. There it was his delight to witness how one great man perfectly worshipped the genius of another great man. He should only mention one of the fine arts which would at once show them how the connection of science and art was established—he meant architecture. He did not believe they could have a good architect who had not scientific culture as well as artistic culture. In their dwellings it was extremely important that a sanitary principle should be perfectly observed, and that a house should be made to be perfectly suitable to their everyday wants—such as the climate and other things indicated—that the architecture should be suitable to the district where the house was to be planted. At the same time, there was not the slightest doubt that they might put art in the midst of the smallest cottage they built without adding anything to the cost of that cottage. That was why these art classes, considering the amount of building which went on in the country, had not only an element of beauty, but had in them essentially an element of great usefulness. The Government coupled science and art, and they in Scotland had got hold of the same idea by calling the body which looked after art in Scotland the Board of Manufacturers.

### THE GERMAN NATIONAL MONUMENT.

ON September 28 the national monument on the Niederwald, overlooking the Rhine, was unveiled by the Emperor of Germany. The idea of such a monument was, says a correspondent of the *Times*, mooted to Prince Bismarck by Count Eulenburg so early as the day of the signature of the Peace of Frankfurt. Warmly approved by the Chancellor, the project soon after passed into the hands of an executive committee, which converted it into a resolution that received support throughout the nation. In the spring of 1872 the artists of all Germany were invited to send in models of a monument that would best express the idea and object of its erection; but though three of the twenty-six competitors were awarded prizes of honour, the jury declined to adopt any of their sketches. A second competition had no better result; but at last, in April 1874, the jury expressed themselves thoroughly satisfied with the architectural and sculptural plan of Professor Johannes Schilling, of Dresden, who was thereupon authorised by the grand committee, under the presidency of Herr von Bennigsen, chief of the National Liberals, to proceed with its execution.

The cost of the monument, which is not expected to exceed the estimated sum of 1,100,000 marks, or 55,000*l.*, has been covered partly by public subscription and partly by Parliamentary aid. As much as 240,000 marks had been collected by 1874, but there was a falling-off in the contributions in the reactionary era ensuing on the *Gründerzeit*, or time of rash and not over-honest commercial speculation prompted by the receipt of the French milliards; and though by 1878 the above sum had increased to 665,000 marks by the accumulation of interest, the sale of photographs, and collection lists of schools and veteran societies (*Krieger-Vereine*), the Reichstag in the following year saw itself compelled to vote a subsidy of 400,000 marks in order to insure the completion of the enterprise. In 1876 the necessary ground was purchased; in September of the following year the foundation stone was laid; and now the finished monument stands flashing high and far "on free hilltop by German stream" in all its proud and noble beauty.

The tourist as he passes up or down the river cannot but be struck with the shining monument away up on the Niederwald brow, but it is only when he has toiled up to it that he can take in all its expressive character and truly beautiful proportions. A colossal statue of *Germania*, said to be an idealised copy of the artist's own daughter, clad in a flowing girdle-bound robe, her left hand resting on the hilt of a drawn but laurel-sheathed sword, and her right holding high a laurel-wreathed Imperial crown—that is what surmounts the huge statuary edifice and first fetters the eye. Beneath her mantle, which is richly embossed with historic symbolism, can be seen a coat of chain mail, over that being a steel breast-plate blazoned with the Spread-eagle, and she is standing before an Imperial or curule throne or chair. Underneath, on the pedestal, is the inscription, "In memory of the unanimous and victorious rising of the German people and of the restoration of the German Empire, 1870-71." On the one side of the pedestal are the names "Weissenburg, Wörth, Spicheren, Courcelles, Mars-la-Tour, Gravelotte, Beaumont, Sedan;" and on the other, "Strassburg, Metz, Le Bourget, Amiens, Orleans, Le Mans, St. Quentin, Paris." A succession of well-laid-out terraces and flights of steps lead up to the foot of the monument, the front basement of which presents two very large and finely-sculptured recumbent figures—the Rhine and the

Moselle—the former in the shape of a Father-Neptune-looking old man offering a cornucopia to his companion, a lovely nymph with an oar or rudder in her hand. Above that on the first socket is a magnificent relief group representing "Die Wacht am Rhein," flanked at the corners by two outstanding figures, *War* and *Peace*, each about six mètres high—the former, an allegorical character, partly Mercury, partly mediæval knight, with blastful trump in one hand and sword in the other; the latter, a mild and modest angel maiden, holding out an olive branch in one hand and the full horn of peaceful blessings in the other. Between the two is the front façade, representing the "Watch on the Rhine"—a faithfully and splendidly executed relief group. In the centre is the Emperor William on horseback against a background of the banners of the chief German cities, flanked on either side by the chief princes and generals, corps and divisional commanders, and statesmen—nearly two hundred in number—who helped by word or deed or counsel to found the Empire. The Kings of Saxony and Bavaria, the Crown Prince, Prince Frederick Charles, Bismarck, Moltke, Roon, and all the rest of the kaisers, princes, knights, and paladins are there—true to the life in breathing bronze; a rich store-house and infallible standard in every respect; an Elgin marble slab, so to speak, of the German nation. In the corner of the façade relief next the figure of *War* is a group of combatant German soldiers, while on the other side, near *Peace*, warriors are shown in their career of victory. Beneath the group are inscribed five verses of the "Wacht am Rhein"—happy and thrice-to-be-envied poet to have his verse thus immortalised in bronze!—with the refrain in larger letters in one line under the whole:—

Lieb' Vaterland, magst ruhig sein,  
Fest steht und treu die Wacht am Rhein.  
(Dear Fatherland, thou needst not fear,  
Stands firm and true thy Rhine-watch here.)

On one side of the socket which bears the above described front façade another magnificent relief group represents the departure of the soldiers for the war, and their affecting leave-taking of parents, wives, and children; while on the other side is a similar portrayal of the return home of the laurel-crowned warriors. Above the Emperor, and in front of a second socket, sits perched a huge eagle—nearly 2½ mètres high—with outstretched wings and the Imperial shield on breast, while round the socket are hung the arms of all the chief States of Germany, above them being the iron cross, with various sorts of wreaths and garlands; and surmounting all, the colossal far-flashing statue of *Germania*—powerful, victorious, and proud. From the socket to the crown the monument measures about 25 mètres. The *Germania* itself has a height of nearly 12 mètres, and weighs 700 cwt. Its little finger can be spanned by two adults only; its thumb-nail is 9 centimètres broad and 11 long. A man can creep through the hollow of the wrist, and inside the lower part of the body ten couples can conveniently dance. The sword is 8 mètres long, and weighs from 5 cwt. to 6 cwt. That the monument should have been devised and completed in all its parts within eight years is justly regarded as a brilliant proof of German industry and perseverance. The technical and architectural difficulties to be overcome were immense. For the building of the lower part of the edifice stones of immense weight—some of them all the way from the Leutoburger Wald, weighing 900 kilogrammes—had to be dragged up the Niederwald slope by teams of a dozen and eighteen horses. For the modelling of the various parts of his masterpiece, Professor Schilling, of Dresden, had to erect huge scaffoldings; and when finished they were distributed among various German foundries to be cast. The moulding of the *Germania* fell to the lot of Herr von Miller, of Munich, and when triumphantly turned out, like Schiller's "Bell," the question was how to transport it to its destination—by road or rail? The latter method being eventually chosen, the various portions of the statue were conveyed with laborious precaution as far as Rosengarten, opposite Worms, where legend fables the Nibelungen Hoard to lie embedded in the Rhine's pellucid depths, and there "the epic in bronze and stone" was confided to the river. Ringing cheers and salvos of cannon greeted the huge barge and its precious burden all down the Rhine to Rüdesheim, where it safely arrived and was gradually hauled and pushed up the Niederwald slope by strenuous and sweating teams of men and horses. But would the scaffolding bear the weight of the colossal metal fragments that had to be hoisted aloft? This was first successfully tested by the swinging up of 11,000 kilogrammes of iron rails, then the main portion of the *Germania*, weighing 8,500 kilogrammes, was carefully elevated; and within a month of their removal from Munich, all the pieces had been triumphantly raised on high and fitted together. Though attended with great difficulty and danger, the laborious enterprise was accomplished without any loss of human life, the only serious mishap that marked its progress being the overthrowing of a heavy scaffold crane by a thunderstorm.

Such is a brief sketch of the work, but brief as it is it will speak volumes for the workman who will henceforth take rank with the world's greatest masters of plastic art. Professor Johannes Schilling, of Dresden, the Florence of the North, is a Saxon by birth, and was born in 1828. After studying with Rietschel he made his *début* as a sculptor in 1851, with a beautiful group—

*Amor and Psyche*. Working then at Berlin with Drake—the artist of the Victory Column—he produced a pair of relief medallions, *Jupiter* and *Venus*, which procured him a travelling scholarship; and the result of the two years' residence in Italy which he was thus enabled to spend, were his *Wounded Achilles* and his *Centaur and Venus*. Returning to steady industry at Dresden, he turned out in rapid succession a variety of high productions; and on the death of Rietschel undertook the execution of the city of Spiers figure for the Luther monument at Worms. Tourists will remember with equal admiration his *Four Seasons* on the Brühl Terrace at Dresden, his Schiller statue at Vienna, his Maximilian statue at Trieste, and his War Memorial at Hamburg, not to mention other creations, which have now all been surpassed and crowned by his Niederwald monument—a work which will immortalise its author as it will perpetuate the memory of the events whereof it is the record in eloquent marble and breathing bronze.

### THE BALFOUR MEMORIAL CROSS.

THE Kildalton Cross—of which a cast is in the Edinburgh Antiquarian Museum—is about to be reproduced in stone, as a memorial of Lieutenant-Colonel Balfour, who died of wounds received at Tel-el-Kebir. It will be erected in Markinch Cemetery. While one recognises, says the *Scotsman*, a certain fitness in the selection of a type of monument which seems to have been associated not so much with suggestions of the Passion as with the ideas of Christian hope and triumph, the example chosen as a model has the special recommendation of being one of our finest and most interesting relics of early Celtic art. From the defaced and weather-worn condition of the original, the task of restoration was one of no little difficulty; and the manner in which it has been carried out by Mr. Sydney Mitchell, architect, shows that the taste for Celtic studies which in that gentleman's case may be considered hereditary, must have been assiduously cultivated. As may be seen from the cast above referred to, the details of the old cross are in some cases completely obliterated, in others so blurred by weathering as to leave more or less room for conjecture with regard to their original appearance. Whatever could be clearly made out has been faithfully reproduced—not, indeed, with any attempt at mere mechanical exactness, but by careful drawing and modelling of the forms, and not without occasional rectification of defective workmanship. Where, on the other hand, there were only imperfect indications to go by, Mr. Mitchell, following the method of the true restorer, has brought to bear his general knowledge of the style, and made skilful use of suggestions derived from the study of Celtic manuscripts and of other sculptured crosses. The success attained in deciphering obscurity and in seizing the general spirit of the designs has been such as to win the commendation of those best qualified to judge. So closely has the original character of the work been adhered to, that a difference of style, observable between one side of the cross and the other, has been heedfully retained. In regard to dimensions there could, of course, be no doubt; and these have, accordingly, been exactly reproduced as follows: Height of cross, 8 feet 9 inches; width across arms, 4 feet 8 inches; diameter of circle, 2 feet 4 inches; width of shaft at base, 1 foot 4½ inches; at top, 1 foot 2½ inches. With the addition of an appropriate base, the monument will stand about 12 feet high. The designing of this addition was one part of the work in which Mr. Mitchell had to fall back on his own resources. The base of the Kildalton Cross is supposed to have been lost, and, as now seen, the shaft is let into a rough mass of stone. But the Irish crosses, on which this example was apparently modelled, are all found to have bases in the form of a truncated pyramid, and this form has, therefore, been adopted for the present restoration. Measuring 2 feet 11 inches in height, the block tapers from 4 feet 8 inches at the ground to 2 feet 5 inches at top, where it carries a plinth, with sides of corresponding slope, which gives an additional height of 5 inches. On the side answering to the front of the cross, the base shows a panel intended to receive the inscription, the enclosing margin being filled in with a combination of the Celtic fret with interlaced ornament. The opposite side has the central space treated with interlaced ornament of intricate design, so devised that, as frequently occurs in old work, the interspaces take the shape of a cross, while the border is enriched with an arrangement of bird forms, worked out from suggestions found in old manuscripts. This latter ornament reappears on the front of the plinth, its rearward face repeating the Celtic fret, and the two remaining sides, both of plinth and base, being left plain. In dealing with the front of the cross, Mr. Mitchell found it expedient to replace the undecipherable reliefs of the four central panels with new figure subjects of his own designing, representing the Ascension. In the upper panel is the effigy of the ascending Saviour enclosed in a vesica; while those occupying the arms of the cross show each two adoring angels; and in the lower panel there appears the Virgin, with St. Peter and St. John, looking upward. The four panels, although separated by the ornamental work at the intersection of the cross, are thus happily combined in the representation of one subject. The remaining details on this side have been

reproduced so far as possible, the patterns of bosses and tracery, where entirely lost, being restored in accordance with the general character of the work. Similar treatment has been applied to the rearward face of the cross. The chief difficulty here met with was as to the character of four animal figures surrounding the central boss. Mr. Mitchell has made them lions, on the ground that this type was used in ancient times as a symbol of the resurrection. Altogether, it seems hardly too much to say that this restoration will approve itself as something unique among Scottish monuments, and a work well fitted to foster the taste for pure Celtic art. The cross is to be carved in hard red sandstone by Mr. Alexander Rhind, sculptor, who, it should be mentioned, has tastefully modelled the reliefs of the Ascension from Mr. Mitchell's drawings.

### OWENS COLLEGE, MANCHESTER.

THE half-yearly meeting of the Court of Governors was held on Tuesday last, when the reports of the council were presented. In their half-yearly report, presented on April 3, the council stated that Mr. Waterhouse's plans for the new natural history and geological museum and laboratories had been completed and adopted, and that the architect had been instructed to cause the quantities to be taken out, and to invite tenders for the work. Estimates were accordingly in due course invited, and on August 3 the contract was let to Messrs. Southern & Sons for the sum of 66,375*l*. The contract includes the erection of the museums and laboratories in Coupland Street and along the northern half of its frontage in Oxford Road, and of a lofty entrance tower, which will connect the museums with the library and public hall, which are destined to occupy the southern portion of the Oxford Road front. The fund being raised by the joint committee mentioned in the last report for the erection of the new museums has now reached the sum of 27,541*l*. Although the committee has been so far successful in its canvass as to justify the council in proceeding with its task, a large addition to the amount subscribed will be necessary in order to the completion of the works now undertaken. The new Medical School buildings are at length completed, and will be entered upon forthwith. Their erection was called for not only by the great and rapid growth of the school—the number of our medical students having nearly doubled since 1874, when the school was removed from Faulkner Street to the present building—but also by the necessity of providing ampler means of teaching those branches of medical science which have been so greatly developed in recent years—physiology, pathology, and *materia medica*. It is believed that the series of laboratories, museums, and lecture-rooms which the school now contains will bear no unfavourable comparison with those of any medical school in England. The erection of the new building has been executed by Messrs. Southern & Sons; the cost, inclusive of the expensive fittings of some of the rooms, will not fall short of 10,000*l*.

The Chairman offered his congratulations to the medical professors and students on the completion of the extended buildings of the medical department. He believed the accommodation afforded for that department would now compare favourably with that of any medical school in the country. The extension was the more important and welcome as the question of medical degrees was now, he hoped, very near to them. There was another matter of public interest which it was well he should name—that the council had entered into a contract for the commencement of the museum buildings. This did not mean that they had got all the money they required—they required a great deal more yet; but they had got so much that the council thought they were justified in commencing proceedings.

### THE MERSEY TUNNEL.

THE last week has been the most successful of all similar periods hitherto in the progress made under the river, no less than forty yards advance having been achieved. Of these, thirty were on the Birkenhead side with the Beaumont machine (which now seems thoroughly adapted to the precise quality of rock to be dealt with) and ten by hand on the Liverpool side. There now remain 523 yards between the two extremities of the headings. The main tunnels are, of course, being proceeded with with all possible speed, and are following up the headings rapidly. In the course of about another month they may be expected to reach the points where the main tunnel and the drainage headings meet and become one. By that time, therefore, the two ends of the main tunnel will be within 400 yards of each other. At last week's rate of progress the heading would be completed by December 31. Taking the average rate of the last seven weeks—namely, 32½ yards—it would be through before the end of January.

An Exhibition of Works of Art, which are to be exclusively Italian, is to be opened next year at Buenos Ayres.

## NOTES AND COMMENTS.

M. QUANTIN, the Paris publisher, has been enrolled among the Legion of Honour, and artists and amateurs in France will be gratified by the selection. Among the great publishing firms of Paris that of A. QUANTIN et C<sup>ie</sup>. holds a distinguished place. In art literature it would be difficult to name one which is higher. From M. QUANTIN's house in the Rue Saint-Benoit have been issued those splendid volumes containing reproductions of the works of REMBRANDT, HOLBEIN, DA VINCI, MILLET, and other artists, which are everywhere esteemed as treasures. Works on architecture, decoration, metal work, and archæology of a standard character, have been published by the firm, and from the first their names have been associated with the *Revue des Arts Décoratifs*.

THE REV. GEORGE AYLIFFE POOLE, M.A., who died lately at Winwick Rectory, gained some reputation as a writer on architecture. He was the author of "The History of Ecclesiastical Architecture in England," "The History and Architecture of Lincoln Cathedral," "Character of Church Architecture," besides other works, which, if not profound, were agreeably written. At one time clergymen were distinguished for their interest in subjects connected with architecture, but their intellects are now apparently absorbed by other things. Mr. POOLE was almost the last of the clerical amateurs who exercised so much influence on church architecture in this country.

PUBLIC improvements are as difficult to be carried out among the patriots of Dublin as in any town in England or Scotland where the pursuit of wealth is supposed to be paramount. Everyone who has visited the Irish capital knows the steep incline near the Castle which is called Cork Hill. It entails so much strain on horses that the Society for the Prevention of Cruelty to Animals for a time kept a horse to assist others in the ascent. At length the Corporation have undertaken to improve the approach. The house property that is required is not of much value, but the claims of the different owners amounted to about 100,000*l*. An arbitrator was, however, appointed, and according to his award the value of the houses is 47,000*l*. This sum is very high considering the character of the houses, but it is less than one-half the original demand.

THE success, financially, of Mr. HENRY TAYLOR'S "Old Halls of Lancashire and Cheshire" is insured, for the four hundred copies in the edition have been subscribed for within a week after the publication of the prospectus. The subscribers have depended altogether on the faith of the author and publishers. The drawings have been prepared, but not one of them has been photolithographed, and there is not a page of the letterpress ready. But Mr. TAYLOR has taken so much interest in the old halls of the Lancashire district, the character of his book might be assumed without difficulty.

THE judges have made their awards on the various objects shown at the Sanitary Exhibition in Glasgow. Messrs. DOULTON & Co. have obtained certificates of merit for their silicon tread for stairs, flush-out closets, trough closet with automatic flush tank, anti-percussion high-pressure valves, and ventilating tile stove. Three certificates have been awarded to Messrs. SHANKS & Co. for Eureka spray and plunge baths, cast-iron baths, and porcelain lavatories with movable caps. The Pennycook Patent Glazing and Engineering Company have secured a certificate for glazing. The conical ventilators and radiator ventilators exhibited by Mr. G. E. ELLISON, of Leeds, and the noiseless breast ventilators and wall-inlet ventilators of Messrs. KITE & Co. were also selected for certificates.

A REPORT has been prepared by the sub-committee appointed by the Sanitary Institute to investigate the composition and properties of non-poisonous white paints. Three varieties of the paints have been examined, and although all the paints were found to be practically free from lead, two out of the three driers supplied with them contained lead in large quantities. The manufacturer's instructions are that the driers

should be used in the proportion of about 7 or 8 per cent.; but the committee say that in practice the driers are mixed with the paints to a very much greater extent. That it is practicable to obtain driers from which lead is absent is well known, and in the experiments by the sub-committee it was found that when "the paint and driers were both free from lead, the result obtained in the trials made to ascertain the comparative merits of the different paints for decorative purposes was superior to either of the others." The report will do good in supporting against trade prejudice the manufacturers of non-poisonous paints, who are as willing to eliminate lead from the driers as from the paints.

THE national German monument has cost 59,600*l*. The principal expenses were as follows: Site, 5,650*l*; custodian's house, 990*l*; garden, 1,750*l*; pedestal, 16,750*l*; candelabra and inscriptions, 450*l*; models, 10,500*l*; statue of *Germania*, 8,787*l*; *War and Peace*, 3,000*l*; Rhine and Moselle group, 1,750*l*; escutcheons, 544*l*; eagle and wreaths, 1,347*l*; large relief, 2,565*l*; small reliefs, 1,065*l*; supervising architect, 1,550*l*; competition, 1,350*l*; and administration, 1,550*l*.

THE address which was delivered by Sir RICHARD TEMPLE before the Social Science Congress at Huddersfield on Wednesday has a passage that is worth noting. "Art-culture," said the president, "has always been advocated by this association as a fitting crown to the educational system. It is naturally much needed in the colonies, young, bustling, pre-occupied communities, where no classes have leisure. It has in the East presented problems as yet unsolved. The Asiatics have an indigenous art, which, though not scientifically directed, is yet, in genius, in perception, and in sentiment, peculiarly their own. This exceeding merit arises from the hereditary character of Eastern art, from the transmission of qualities from father to son, through many generations of artists. If we were to teach our art to the natives exclusively, they might be in danger of losing their own, which, so far as it goes, is better than that which we can teach them, and which is indeed to be reckoned among the beautiful possessions of the human race. Still we can teach them one thing, which through all the preceding ages they have never learnt, namely, drawing objects correctly, whether figures, landscape, or architecture. Such drawing tends to rectify some of their mental faults, to intensify their powers of observation, and to make them understand analytically those glories of nature which they love so well." Unfortunately the authorities have not acted on this principle. Young men who happened to possess a few certificates from the South Kensington Schools have been sent to teach art in India, and the result is to be seen in the crude colours which are found in so much modern Indian work.

THE modelling of the new candelabra at Charing Cross is by Mr. MABEY, the sculptor. In works of this kind about London effect is sometimes produced by several sprawling figures, or by ornament which appears to be "stuck on." But in the new candelabra the design is consistent throughout, and, while occupying as little space as possible, the figures are graceful and the contours are pleasing from every point of view. The modelling of the forms is masterly, and the candelabra are the best that have been erected in the metropolis.

It is reported that a well has been discovered under the flagging at the Petty Sessions Court, Carlisle, which is of historic interest. According to a legend, St. CUTHBERT, while looking into a Roman well of wonderful masonry, saw a vision, and was able to announce the defeat of the English army at Nechtansmere. Mr. R. S. FERGUSON, who is now Mayor of Carlisle, says that if the newly-discovered well is of Roman masonry, "it is likely to be the well to which St. CUTHBERT was conducted, and an opportunity should be given for examining it carefully. The notion that treasure might be found at the bottom of it is not absurd. In 1804 from a long-covered up and forgotten well in Sewell's Lane, Scotch Street, of the depth of 27 feet, were taken two most beautiful bronze Roman vases, covered with bas-relief illustrations of sacrificial rites. These were actually sold for eighteen pence as old brass, but escaped the melting-pot, and are now in the British Museum."

## ILLUSTRATIONS.

HARRINGTON GARDENS, SOUTH KENSINGTON.

WE have already illustrated some of the houses in Harrington Gardens, by Messrs. ERNEST GEORGE & PETO, and we now give another portion of the group by those architects. The houses all differ in size and in their arrangement, as well as in their treatment, but there is a unity about this picturesque composition. It is seldom that architects have the opportunity of bringing clients together so that their works, instead of being isolated, have harmonious surroundings.

The most complete internally of these houses is that for Mr. W. S. GILBERT. The porch and lobby lead into a spacious entrance hall, 22 feet by 20 feet, panelled with oak up to the top of the doors, with beamed ceiling and an ingle nook. The drawing-room, facing the garden at the back, 40 feet by 18 feet, with large mullioned bay windows, is panelled with solid rosewood, and has an alabaster hooded chimneypiece, carried up to the ceiling at one end of the room. On the right of the hall is the dining-room, which has a ceiling of curved beams. The lower portion of this room is richly panelled with oak, with stamped leather above same. The very handsome oak staircase, with moulded steps out of single blocks of oak, gives access off the first half-space landing to a boudoir, which has an oriel window looking down into hall, as well as one into the street. On the first floor is situated the billiard-room and oak-panelled study, with large bay windows, and also a very complete suite of bedrooms, dressing-rooms, bath-rooms, &c. Two of these houses are being carried out by Messrs. STEPHENS & BASTOW, of Bristol, and the other two by Messrs. PETO BROS., of London.

STOODLEIGH COURT, DEVON.

THIS house, which is now building for Mr. T. CAREW DANIEL, is most picturesquely situated among the fine rolling hills of Devonshire, about six miles from Tiverton. The house is arranged in the form of the letter L, and is built of stone quarried on the estate, with mullions and dressings of Ham Hill stone. The roofs are of red tiles. The hall, 60 feet by 26 feet, with open oak roof and large hooded fireplace at one end, and an arcaded gallery (giving access to the bedrooms along two sides), forms an important feature, and has a large bay in one corner, somewhat after the manner of the old college halls. Grouped round this hall are the drawing-room, 50 feet by 20 feet; morning-room, library, dining-room, &c., the billiard and business rooms occupying the corner between reception-rooms and offices. The kitchen, scullery, larders, &c., are arranged round a separate courtyard. The archway shown on the right of the picture gives approach to the stables. The contract for this work has been taken by Messrs. PETHICK BROS., of Plymouth.

NEW SCHOOLS, PEEL, MANCHESTER.

THESE schools, which are about to be erected at Peel, near Manchester, will take the place of an older building, which has become inadequate to the increasing population of the district. The new building will be of brick, with stone dressings, some parts being finished with timber framing. The roofs will be covered either with red tiles or with green, north country slates. In addition to the principal rooms the plan provides five class-rooms. The accommodation provided is for 618 children, and the estimated cost about 2,250*l*. Mr. R. KNILL FREEMAN, F.R.I.B.A., of Bolton-le-Moors, is the architect.

FONT AND COVER, ST. MARY'S CHURCH, WATFORD.

WHEN the parish church of St. Mary's, Watford, was restored, in 1869-71, by Mr. JOHN T. CHRISTOPHER, a new font was erected, the panels being left for future carving. This font has just been completed by the addition of a cover of elaborate design, carved in oak, and suspended by an ornamental chain working with a balance-weight enclosed in a corona, the whole of wrought iron and richly gilt. A kneeling-stool also carved in oak has been fixed to the steps. The font has been surrounded by a brass railing, and the old stone paving round the base has been removed, and encaustic tiles have been substituted. The eight panels in the upper part of the font itself have been filled with figure subjects in high relief, emblematic of baptism. The cost of these panels has

been borne by individuals interested in the church. The general expenses have been raised by public subscription. The sculpture and the cover and kneeling-stool have been executed by Mr. FORSYTH, of Finchley Road, who carried out the original work to the font. Messrs. HART, SON, & PEARD supplied the wrought iron and brasswork; Messrs. SIMPSON & SONS, the tiles; and Messrs. WATERMAN, of Watford, the necessary builders' work. Messrs. JOHN T. CHRISTOPHER and E. EMLYN WHITE, of Bloomsbury Square, are the architects.

## LONDON DWELLINGS.

THE subject of the address delivered by Professor T. Roger Smith as president of the Engineering and Architectural Section of the Sanitary Congress at Glasgow, was "London Dwellings." At the outset the clayey nature of the London soil was noticed. Combined with the large surface of water in the river and the docks, it rendered the London climate a decidedly damp one, notwithstanding the moderate rainfall. A most noteworthy idea of that dampness occurred in the famous November fogs, the worst of which produced a gloom worse than anything since the plague of Egypt. Perhaps the most strongly-marked London peculiarity was the desire to live, or to seem to live, in a house of one's own. One result of that was, that there was very little demand as yet for high houses, and that vast spaces of land were occupied by houses of two storeys high. Another peculiarity—in which, however, the Londoner only shared the national prejudice—was the universal use of open fireplaces. The result was of great advantage to each individual, but of serious detriment to the community. Every room had a ventilating tube, of a rough construction, of about one hundred inches sectional area, more or less, and that tended to secure a large amount of change of air in every room of every house; but the smoke from the fires which were lit in those countless fireplaces polluted the air, and made the London atmosphere unhealthy. There was also an universal prejudice in favour of the sash window, sometimes playfully called the guillotine, as compared with the casement window, which was equally universal in France. The sash was decidedly more advantageous for a damp climate, and was a better ventilator, whenever it was desirable to open the window a little way. Many, at any rate, of those who resided in the outskirts were remarkably ready to migrate from one quarter to another, so much so that not a few systematically changed their dwelling every three years. The result of that was that much less care was taken in the selection of a house, much less money was expended in remedying defects, and many more serious evils were patiently put up with than would be the case were persons more in the habit of living long in one house; in fact, but for that custom a great many serious defects, sanitary and otherwise, would hardly, he thought, have become quite so gross and serious as they actually were. The third element in determining the conditions under which the metropolis was built was furnished by the Acts of Parliament that regulated buildings and streets and drains, and the official administration of those Acts. His own impression was that in the parts of London within the metropolitan area legislation went as far, or nearly as far, as it could be usefully carried. But there were many points in which Acts of Parliament, however good, and however well enforced, failed, and must fail to secure the public against the effects of their own apathy in everything that related to the healthiness of their houses, combined with those due to the ignorance and cupidity of builders, who had no desire to do their work well, and little acquaintance with their duty. Legislation, he pointed out, could only require a certain minimum of excellence, and that which was just good enough to evade the penalties due to a breach of an Act of Parliament might yet be far enough from what it ought to be, or would be, if the public were at all critical as to the sanitary condition and general soundness of their dwellings. It was not the custom in London to buy freehold land for building purposes, unless it was for a public building. Land for dwelling-houses was always taken on lease. The usual term was far shorter than he believed was customary in the North. Eighty years was looked upon as a very long term indeed. Sixty years was a very usual term; but fifty, or even forty years were not unusual terms. Building leases rarely contained any provision for renewal or extension of the term; so, as a rule, the transaction amounted to this, that the freeholder lent his land for, say, sixty years on the conditions that he received an annual rental, that buildings such as he approved were put up, and that at the end of sixty years the land, with the buildings on it, reverted back to him. There were also usually covenants that, whatever was erected, shall be kept in repair by the person building. The rent charged for the land was termed a ground-rent. It varied according to the situation, between the extremely wide limits of half a penny, or less, to half a sovereign, or more, per superficial foot per annum; but in ordinary practice, for dwelling-houses it was about one-sixth to one-eighth of the rental which would be obtained for the house from an occupier, and it formed a first charge on the house, so that, if it be left unpaid, the freeholder could seize the house. As a consequence,

ground rents, being very amply secured, usually commanded a high price in the market. But there was absolutely no one whose permanent interest it was that the buildings should be sound, sweet, and safe to occupy. The original landlord was sure of his ground rents, and had no further interest; the middle-man, when he existed, and the builder, at any rate, sought to release themselves from any connection with the property at an early day; and the unlucky tenant, still more unlucky if he had bought the lease of his own house, found that there was no one to whom he could turn for any redress or remedy whatever went wrong. There was, indeed, one advantage which, on estates when landlords had a sense of public duty, the system of building leases did possess, and it was this. The landowners could lay down the conditions under which alone buildings should be put up, and could enforce them; but for one who did so in the interests of the public health and the welfare of the future occupiers of the houses, ninety and nine only framed such regulations as conduced to the benefit of their own pockets, and were careful to shackle the speculating builder with few or no conditions of a character which he might consider onerous, and which might, consequently, induce him to transfer himself and his building operations to some neighbouring estate. It might, perhaps, be asked where in that system did the architect come in. His answer was, nowhere. The bulk of London houses were not designed by architects, and not superintended by them. Describing London dwellings, especially those that had been some time built, he condemned the general sanitary arrangements in them, from the houses of noblemen to those of the very poor. If the model by-laws of the Local Government Board were uniformly adopted and efficiently carried out a great deal of good would be done. The public, however, had the remedy very much in their own hands if they only could be awakened. In short, the true cure for many of these evils was to be sought in the operation of an enlightened public opinion. Good was being done by the erection of houses in flats, though their advances had been less rapid than had been hoped by those who, like himself, advocated the movement in its early days. That began with buildings for labourers' dwellings, and had now extended to the middle-class and even to highly-rented dwellings. He had no hesitation in saying that the occupants of well-built flats were, on the whole, in much better sanitary circumstances than the majority of their neighbours in adjoining streets, who occupied rows of ordinary dwelling-houses. If it were possible to bring in the custom for leases for long terms, and to make landowners sensible of the responsibility which really rested upon them in respect of the houses they allowed to be built on their land, and if, in addition, they could induce capitalists to build as an investment, so that they would have a direct interest in the solidity of what was put up, then surely they might hope that what remained to be built or rebuilt in London would be better fitted for living in than the houses hitherto erected. Referring to the houses of the working classes of London, and the manner in which large areas were cleared for improvement, he said his opinion was, that even the tenements built by the Peabody Trustees, and unquestionably those built by most of the societies, were too good for the very poor, and that from those two causes, though no doubt they were improving London, they were not improving the condition of the labouring and poor inhabitants of the very areas which were dealt with. In conclusion, Professor Smith said London afforded now, and must for years to come afford, an ample field for the energies of those who devoted themselves to the pursuit of sanitary science, the diffusion of sanitary knowledge, and the performance of sanitary work.

A vote of thanks to the president was moved by Dr. Richardson, and seconded by Professor De Chaumont.

### SANITARY ASPECTS OF HOUSE CONSTRUCTION.

A PAPER entitled "Some Sanitary Aspects of House Construction" was read at the Sanitary Congress, by Dr. William Wallace, president of the Philosophical Society of Glasgow. He said that, granting that a house was well-drained, and that the plumber work was properly trapped and ventilated, what was wanted to make it a healthy residence was that it should have plenty of light, and that it should contain at all times air pure and dry, or at least as pure and as dry as may be possible. The subject of light might be dismissed in a few words. The importance of having larger windows was perfectly understood, and so far as isolated buildings were concerned it was unnecessary to say anything. But as regarded street architecture, it was of the utmost importance that houses should be built of a height bearing a direct relation to the breadth of the street in which they were situated. Hence the paramount importance of having enacted by Parliament rigid building regulations for cities and towns, in order to prevent the erection of tenements of such a height in proportion to the breadth of the street that the windows in the lower storeys got little or no sunlight. This was a subject which had been thoroughly discussed in this and other cities, and he hoped

that in course of time more stringent rules than we at present possessed would be enacted. A fair proportion in this latitude was that the house should not exceed in height two-thirds of the breadth of the street; thus giving three storeys in height for a street of 45 to 50 feet wide, and four storeys for one of 60 to 70 feet. As regarded the direction of a street, he should prefer to live in one placed as nearly as possible north and south. In this case, and taking the west side of the street as an example, the sun shone from morning till mid-day in the front, and from mid-day till evening in the back of the house. But in a street running east and west, the houses on the south side got scarcely any direct sunlight—in winter none at all—in front; while those on the north side were equally unfortunate as regarded the back rooms. No apartment could, in his opinion, be considered a perfectly wholesome one which did not enjoy direct sunlight during some part of the day. But if an apartment must be so situated that it could not have sunlight, it was some compensation that it had very large windows, so that it might get as much diffused daylight as possible. Purity of air could not be maintained in a house unless it were thoroughly dry. It was a common occurrence for the ends of joists built into porous stone to become affected by fungus vegetation; and it was frequently seen in pulling down old tenements that the ends of the joists were quite gone, and that probably for many years the joists had been resting only on the plaster cornices of the rooms. The remedy was the use of "shoes" of glazed fire-clay or other material, which was built into the wall, and into which the ends of the joists were placed. The porosity of building stone and brick was such that a cubic foot would absorb from 5 to 9 lbs. of water, or from half a gallon to nine-tenths of a gallon, while it permitted the passage of air or other gas by transpiration and diffusion. If, however, the stone or brick was saturated with water, the porosity was, for the time being, destroyed; or if there was any air diffused at all it would be loaded with watery vapour, and therefore of less value, in a sanitary point of view, than it would be with only its normal proportion of moisture. Besides that evil, there was the more serious one of the water actually reaching the joists and other wood, such as "dorks" and wall plates and straps, and causing those to decay, and so interfere with the stability of the structure. Coating the stone with oil, paint, silicate of soda solution, or other means of rendering it impervious to water, prevented the absorption of rain; but it also, at the same time, destroyed the valuable property of diffusing pure air into and impure air out of the house. The only way that he knew of for securing the advantages of the porosity of the stone and preventing the injurious action to which he had referred was to have double walls, with a space of a few inches between, into which air was freely admitted by openings in the wall at top and bottom, placed in such a manner that rain would not enter by them or lodge in them. It was a common observation that, in spite of every care being taken in the construction of a building, the joints of the stone were often imperfect and admitted water freely, especially when the rain was accompanied, as it often was, by high wind. To prevent the rain penetrating it was customary in some districts to build, not on a flat bed, but one sloping slightly upwards. That was a system highly to be commended; and if it was objected to on the ground of giving less stability to the building than working upon a perfectly level bed, that objection might be overcome by making the greater part of the bed level, with about two inches of the stone on the exterior side of the wall slightly bevelled. In the case of rubble walls the best that could be done, probably, was to point them with a mixture of Portland cement with twice its bulk of sand, taking care that the sand was not too fine, and then to whitewash the entire walls with Portland cement—a process which might be repeated with advantage. But the pointing should not be done until the walls had had a summer's sun and were practically dry; otherwise the greater part of the water in the walls would evaporate inwards—that was, into the house—and so keep the atmosphere damp for a longer time than was actually necessary. As regarded the interior of houses, plaster, whether on brick or lath, was exceedingly porous, and permitted of a ready diffusion of gases; and a wall merely whitewashed or coloured with distemper was better in a sanitary point of view than one that was covered with oil paint, which became by that process practically impervious to the passage of gases. Wall papers were probably not so bad in that respect as oil paint, but were certainly inferior to distemper or whitewash. The most perfect foundation upon which a house could be built was a solid platform of concrete, extending over the entire area of the building, and from 2 feet to 3 feet in thickness, according to the height of the walls, and coated over on the top with nearly pure cement. The sleeper joists should be placed at a sufficient height to obtain ventilation of the space below the floor. Another system which would probably prove equally good was to build the foundation walls and dwarf walls up to a certain level, fill in the interior spaces with broken material to the same level, and cover the whole surface with a layer of Portland cement with two parts coarse and three inches thick. Another system still was to place a damp course of slate or slaty stone, bedded in Portland cement, on the whole of the walls; fill up the whole foundation to the same level with broken material, and cover that, but not the walls, with asphalt. With regard to the ventilation of the

space below the basement floor, it was a safe rule to have gratings all round the building, if it was a detached house, not more than 10 feet apart; but if it was in a street where ventilation could be obtained only in front and back, the gratings should be not more than 5 or 6 feet apart, and should be of ample size, say 10 inches by 6. It might be objected that such ample ventilation as he had indicated would make a cold basement storey; but the simple remedy was to put ashes, with or without lime, below the floor, in the same way that deafening was applied to the upper floors. In a wet climate such as ours, in which it was a not uncommon occurrence to have half an inch of rain falling in a single day, it was a proper thing to cover the chimney-tops in order to prevent rain from coming down and keeping the gable walls to some extent constantly damp, and it was a good thing to combine with the cover a means of preventing down-draught in the chimneys during high winds. The cover which he recommended was one having a flat top with a section of a cone below, the whole chimney-top and cover being constructed of galvanised iron. All chimneys should be lined with fire-brick cylinders, very carefully jointed, otherwise a great deal of watery vapour from the combination of the coal would find its way into the gable walls, and there might be trouble also from smoke. In this brief sketch he had taken up only one branch of his subject, and he did not propose to deal with others, such as the ventilation of dwelling-houses and public buildings; but he should merely notice, in conclusion, an exceedingly simple means of ventilating apartments, which he found gave excellent results. It was to put in every window in a house a series of perpendicular holes, one inch in diameter, in the lower frame of the top sash of the windows. The holes may vary in number from three to six, according to the breadth of the window, and he might say that he had not found it necessary, even during the prevalence of the highest wind or during the coldest weather, to close any of these orifices.

### IRON CONSTRUCTION.

AT a meeting of the Society of Engineers held on Monday evening, October 1, 1883, in the society's hall, Victoria Street, Westminster—Mr. Jabez Church, M.Inst.C.E., F.G.S., president, in the chair—a paper on "Designs, Specifications, and Inspection of Ironwork," by Mr. Hamilton W. Pendred, was read, and of which the following is an abstract: Although engineers and contractors approach each other in knowledge more nearly now than formerly, the engineer possessing more practical and the contractor more theoretical knowledge, each has even yet a good deal to learn of the other; the engineer, however, having in many cases most to learn of the other; and hence a good deal of needless friction often exists between contracting parties. The first object of the engineer is to obtain a lasting and sound piece of work, while of necessity the contractor has to study the least expensive methods of putting work together. Very often contractors can and do give engineers useful practical hints and suggestions, which, however, are not always taken in a friendly spirit. Drawings ought to be as complete and to as large a scale as possible, and some extra days spent on perfect drawings saves weeks of work and much correspondence, mistakes, and heart-burning afterwards. Wherever possible all the design ought to be perfected at once, leaving nothing to be subsequently done, for contractors have a reasonable objection to having the work hindered; and this does happen often if parts of designs are left over for further consideration. With regard to details, iron ought to be worked by the smith as little as possible, as every heating and hammering injures the fibre. Angle irons are often bent without any adequate need for it, and the straighter all the parts of an iron structure are, the easier to rivet up soundly. Joint covers are often carelessly designed and badly fitted, yet they are very important items. Specifications sometimes have badly-worded clauses, and demand things utterly impracticable, such, for example, as stating that all the parts shall be drilled in the position they will actually occupy in the finished structure, and contractors read such specifications with contempt. Another absurd stipulation requires that all the plates shall, as soon as they are rolled and sheared, be dipped while hot into oil. No mill with which the author is acquainted has any appliance for such oiling. The oil, too, where applied, makes a dirty scum hard to scrape off, and, being sandwiched between the plates, prevents sound, tight rivetting. In respect of rivets, specifications demand that they shall be made of iron capable of enduring a tensile strain of so much. This is not wise. The proper thing is to demand that all rivets shall be capable of being bent quite round and closed down cold under a hammer without cracking. As regards methods of work, every contractor has his own method, and the engineer had better leave this to him. As to fastening the cross girders to the main girders, in some cases they rest on main angle irons at one side of the main girder, and are rivetted to the side web—this tends to cant over the main girders. Underhung girders are free from this, but they must be very carefully bolted and rivetted, as bolts and rivets are the only support. In the author's opinion, fish-bellied girders are not advisable—the shape is more troublesome than the plain, straight girder. As to rivetting,

machine rivetting, wherever it can be resorted to, is best; but the work must be most carefully bolted up for rivetting, otherwise the rivets will be left loose. The heads of rivets (either machine or hand) ought to have their ends snapped to a sufficient depth, and the workmen must be carefully watched as to this, for it is easier for them to rivet short rivets than full ones. The words "no drifting will be allowed on any account" in a specification are absurd, it being wholly impossible to put work together without it; but the drift is often recklessly used. As to cast iron, this material seems to be going more and more out of favour—undeservedly so, the author thinks, for some purposes; but castings are often badly designed, the metal not being disposed to the best advantage, and the material is blamed for the faults of the designer. Lugs cast on columns are not good, and the Tay Bridge disaster proved this. Columns, too, are often carelessly cast, and fail as a consequence; and no part of a contract demands more attention from an inspecting engineer than the casting of these columns. In conclusion, the author invited discussion upon what is called the dispute clause of a specification, which constitutes the engineer sole and absolute judge, from whom there is no appeal. This clause contractors frequently repudiate, as being unjust and illegal.

### LOW CEILINGS.

THE paper by Mr. Honeyman on "The Advantages of Low Ceilings in Small Houses," which was read at the Sanitary Congress, gave rise to more discussion than any other paper.

Dr. Simpson said that Mr. Honeyman's paper struck at the very root of the principles of sanitary science, as he would have them to build streets in which the houses were to be only 20 feet wide and seven storeys in height. Now this was just going back to the old evil which it was thought they had experienced quite enough of. Dr. Wallace's paper very effectively replied against that system, as he had shown that with such houses the street below seldom or never got any sunlight, which was necessary for human existence. Nothing was more depressing than want of light, and it was known that when it was desired to quiet a lunatic he was just put into a dark place and it quieted him soon enough. The narrow houses advocated by Mr. Honeyman would lead to overcrowding, and this, coupled with want of light, would lead to many difficulties.

Professor James Thompson said Mr. Honeyman's object was to give more floor accommodation by reducing the height of the ceilings, and thus getting a larger number of people to live in a limited space in large towns. When it became necessary to pack people closely together, it became desirable to make the most of a small space. Personally he would advocate to the very utmost that political economists and the corporations of towns should aim above all things at avoiding and preventing overcrowding, and creating as many open spaces as possible. Anyone could see while walking along the streets of Glasgow that the children of the working classes had no place where they could go to play but the pavements. It was all very well to say that it was desirable to have open spaces for playgrounds, but, on account of the cost, it was difficult to get them; yet the idea was not such a hopeless one as many people supposed it to be. Mr. Honeyman's recommendations were in a great degree of some account as to making the most of small spaces. It was certainly unwise to aim at having a high ceiling with a large portion of cubic space kept only for the accumulation of vitiated hot air, allowing the air for ventilation to flow along the floor about the people's feet and legs before finding its way into the fireplace. The warm air generated by the fire or gas, and more or less vitiated, was breathed by the people, and any person could test it for himself by getting up on a table or ladder near to the ceiling.

Mr. E. C. Robins held that overcrowding had been proved to be unhealthy, but it was still possible to crowd healthy houses together, such as had been done in the case of the artisans' model dwellings. He criticised adversely the manner in which Mr. Honeyman proposed to provide for ventilation, and suggested that in such houses fresh air might be introduced at the back of the fireplace, and heated before it was allowed to pass through the rooms.

Dr. Sutherland maintained that Mr. Honeyman's paper struck at the very root of sanitary science. Mr. Honeyman had made the statement that he had seen in a street twenty feet wide an admirable tenement of artisans' dwellings seven storeys in height. That meant a wall of 56 feet high, with people from the basement to the top who would be deprived of sunlight during the greatest part of the day. He hoped the Institute would not allow it to go to the public that they encouraged such tenements. They should rather welcome such restrictions as were imposed by the authorities in regard to the height of tenements in various streets. If the attention of Parliament had not been directed to the admirable tenement Mr. Honeyman had mentioned, the sooner that was done now the better.

Mr. G. W. Muir said he approved of the style of room indicated by Mr. Honeyman, and remarked that the healthiest room he had ever lived in was one 7 feet 3 inches in height. Although

sunlight was a very good thing, it was not the only thing that had to be considered. He was not aware of any street in which it was not the case that the sun did not shine during some part of the day. This house of seven storeys in a street of 20 feet width might be a much more healthy house than a one-storey cottage in the same street. Crowding was quite consistent with the maintenance of health, provided attention was paid to ventilation.

Mr. Honeyman said he could only partially reply to the remarks made on his paper. There seemed to be a good deal of misapprehension regarding what he aimed at. His object in bringing up the subject was that it might be the means of preventing overcrowding, which to a great extent was due to the raising of rents. Nothing more certainly led to the kind of overcrowding which resulted in a high death rate than high rents. During the depression in trade which followed the City Bank disaster, many people could not keep houses for themselves and went to stay with relatives, but they again took houses when trade got better and enabled them to do so. If the people could be healthfully housed in high tenements it gave larger spaces round about the houses. Instead of a dingy range of houses, with a meuse lane running up between them, he would build say three blocks on the space, and leave large spaces between them. As to the tenement that had been referred to, it was in Gray's Inn Road, London. He had never seen anything better in the way of dwellings, as the houses were perfectly cleanly, bright, and airy in every respect. As to ventilation, he did not advocate the use of a ventilator at all. He would take a little bit off the top of the door, which the people would know nothing about. If a ventilator was put, the people would be sure to close it up. He had made experiments, and found that there was always more heated air in the room with the higher ceiling.

The President (Professor T. R. Smith) said he had had to do with the administering of an Act of Parliament while acting as a district surveyor in London, and it struck him that the less restrictive any legislation could be made the more likely were the Acts to be of service. They were beset with very great difficulties in dealing with the problem of how to house to the best advantage the poor in large cities. One would like to see them in the best possible dwellings, but these cost a great deal of money. They were compelled to provide a dwelling within the reach of the wages the people could earn, and Mr. Honeyman was evidently aiming at attaining to that.

Lord Provost Ure, at the evening meeting (after a lecture by Dr. Richardson), referred to the same subject. He said they had been told that to pack the population closely together was not likely to increase the death-rate. His own experience had been very different from that, and so were his views. He had found that in their great towns, when they packed one place with people it did a great deal to increase the death-rate. He could not conceive that the breathing-space that one man needed should be curtailed, and that a dozen men or women should be made to live where only one should be. That could not be good for the people. They had also been told that it would be to their advantage to have four-flat houses rather than houses with only one, and that it was possible to put upon a square acre of ground upwards of a thousand people, all of them living, and living in good health. He denied that. With their model buildings in London they might so pack the people, but they would have to see that it was model people they were dealing with. There would have to be no drunkenness, or anything to disturb the equanimity of life, but, on the contrary, all things would have to move with the most perfect regularity. They might then in that way have a good deal of health about the place, but they must have an enormous amount of open spaces surrounding it. If they had not open spaces the thing would not do, and it was well enough known that in all Scotch towns they had not got such spaces. They had, on the contrary, got into the system of building their houses in flats, and it was with the greatest bitterness and sorrow that he saw springing up in the southern towns buildings of the same sort. Depend upon it, the cottage system of dwellings, which they possessed in England, was the right one, both morally and physically.

Mr. Honeyman, in a letter to the Glasgow papers, writes: I regret very much that the Lord Provost should have renewed the discussion on my paper last night, when I was debarred from replying or offering one word of explanation, and I also regret that he and others should so far have misunderstood the purport of my remarks as to imagine that my object was to advise, as a matter of general expediency, the erection of lofty tenements in narrow streets. What I did attempt to prove was that, other things being equal, and altogether apart from the question of free spaces, a room with a low ceiling is superior to a high room of the same cubic capacity, in these respects—1st, extent of floor space; 2nd, comfort; 3rd, purity of air—all directly affecting the health and "felicity" of the occupants; and lastly (where it is permissible to have high tenements), cheapness, more than anything else the preventive of overcrowding. Now, I am prepared to name scientific men of the highest eminence, some of whom are members of this Congress, who agree with me in this; and if the Lord Provost will name one who, after discussing the matter with me, will maintain the contrary, I shall for ever hold my peace. That, I think, is a sufficiently distinct issue. Unquestionably the

more free space we can secure without making rents an intolerable burden the better; but there are circumstances, as I endeavoured to show, which justify the erection of tenements as high, and with as great a restriction of free space as experience has proved to be consistent with healthy conditions; and this length I go for the very purpose of preventing that worst species of overcrowding which certainly results from high rents. I referred to what has been accomplished in this way elsewhere under many disadvantages, not because I wish to see defects imitated, but only to emphasise the absurdity of regulations which would prevent the erection of such tenements here even in streets 60 feet wide, and with acres of free space around. No doubt the Lord Provost is right when he says that the blocks of improved dwellings in London are to a large extent occupied by a superior class of artisans, and that their very low death-rate is partly due to that circumstance; but let it not be forgotten that these healthy dwellings have to a large extent taken the place of the most wretched insanitary hovels, and are still surrounded by the miserable abodes of the very poorest; and it must surely be obvious that they are not merely a blessing to those who occupy them, but to the districts in which they are situated, standing out as a protest against sanitary abuses still unreformed, and planting amid their infelicitous surroundings an element of order, sobriety, and good living, the influence of which cannot fail to be altogether beneficial and wholesome. If the citizens of Glasgow understood this matter aright they would, I am convinced, join with me in demanding that our authorities should state at least one good reason why the erection of such blocks of dwellings here should be absolutely prohibited.

## HITTITE ANTIQUITIES.

A PAPER was read on Tuesday at the Church Congress, Reading, by Sir C. W. Wilson, R.E., under whose direction the survey of Palestine was conducted for some years. In the course of it he said:—

Little is known of the Hittite power in Asia Minor; it was probably at its height in the fourteenth century B.C., but must have been profoundly shaken by the great victory of Rameses II. at Kadesh, which, according to the striking epic of the contemporary court poet Pentaur, broke "the back of the Khita for ever and ever." The tendency of such a defeat must at any rate have been to weaken the influence of the Hittites over the Mysians, Lycians, Dardanians, and other tribes of Western Anatolia, who fought with them on that occasion. It would appear, from the Assyrian records, that the Hittites gradually split up into a number of independent tribes or states, such as the Cilicians, Moschians, Tiberenians, Comanians, the people of Commagene, and others, who are mentioned in the annals of the wars of Sargon and his successors; the final extinction of their power, however, appears to have been due to the inroads of the Cimmerians and Scythians, and they afterwards formed part of the Median empire, which extended to the Halys. So complete was their overthrow that even their distinctive name was lost, and they appear in Herodotus and Strabo as Leuco-Syrians, Cappadocians, Cataonians, &c. The widespread influence of the Hittites may, however, be gathered from their monuments; the inscriptions on the monument at Karabel, the Sesostris of Herodotus, on the old road from Sardis to Ephesus, and near the Niobe in the Valley of the Hermus, show that they penetrated to the Ægean, and there are certain indications that Sardis was once in their hands. The next monuments are those at Giauour Kalessi, between Sivrihissar and Angora; and then follow the interesting remains at Boghazkeui, near Yuzgat. The ruins at Boghazkeui, of which Herr Humann, so well known from his excavations at Pergamos, made a plan last year, are quite unlike those of an ancient Greek city; they cover a wide extent of ground, and have more in common with cities like Babylon and Nineveh than with the typical Greek city gathered round its acropolis. The walls are still standing to a considerable height, and there are underground means of exit which offer several interesting features; there are also the foundations of a large temple, constructed of massive stones jointed together in a peculiar manner; and a long inscription in which, though almost obliterated, several Hittite symbols are distinctly visible. The rock sculptures, of which casts were taken by Herr Humann, are a series of religious representations, with Hittite symbols above the gods and goddesses. The majority of the figures are female, and amongst them are twelve of the armed Amazons who played such an important part in the religious worship of Asia Minor. In one figure can be recognised the "effeminate character, the soft outlines, the long sweeping dress, the ornaments of the eunuch high priest of Cybele;" and in another the warlike goddess Cybele. Not far from Boghazkeui are the ruins of Uyuk, with the curious sphinxes which, though made after an Egyptian model, differ widely from the Egyptian type. Uyuk is interesting as the only instance of what may be called a Hittite mound building in Anatolia, and shows us that, contrary to the practice in Assyria, the Hittites placed their sculptures so as to face outwards. To this peculiarity of construction is probably due the almost universal

selection of trachyte or basalt for the sculptures instead of a softer stone; the only exception is, I believe, at Jerablûs, where some of the slabs are of limestone. In Pontus there are traces of Hittite art in two small slabs, which I found at Kaisariyeh, but which came originally from the neighbourhood of Amasia. At İflâtûn Bûnar, near the Lake of Beischeher, there is a large monument of Hittite origin; and at Ivriz, near Eregli, there is a well-preserved, rock-hewn monument, representing a thanksgiving to the god who gives fertility to the earth. "The god is a husbandman, marked as giver of corn and wine by his attributes; and the gorgeous raiment of the suppliant priest, praying for a blessing upon the country and people, is purposely contrasted with the plain garments of the god." The god wears the very dress still used by the peasantry of Anatolia; the high-peaked cap is still in use among some of the Kurdish tribes; the tunic fastened round the waist by a girdle is the present loose garment with its *kummerbund*; and the tip-tilted shoes are the ordinary sandals of the country, with exactly the same bandages and mode of fastening. The sandal is very like the Canadian mocassin, and the long bandage wound round the foot and ankle is the equivalent of the blanket sock; it is the best possible covering for the foot in a country where the cold in winter is intense, and the snow lies on the ground for a long period; and as it appears on all Hittite monuments, I think it is an evidence of the northern origin of the Hittites. It is interesting also to notice that some of the patterns on the priest's dress have not yet gone out of fashion amongst the Cappadocian peasantry. At Bor, between Eregli and Nigdeh, Mr. Ramsay, whilst travelling with me last year, discovered a new inscription which, unlike all other Hittite texts hitherto known, is incised and not in relief; near the silver mines in the Bulghur Dagh is another inscription, and at the mouth of a curious gorge close to Gurun, near the head waters of an arm of the Euphrates, I found two others. It is, however, south of the Taurus, between that range and Aleppo, and eastward to the Euphrates, that the most numerous traces of the Hittites are to be found; near the eastern extremity of the Bagtché Pass, by which Darius crossed Mount Amanus, when he came down in rear of Alexander's army before the battle of Issus, I visited a large mound on which a long row of Hittite sculptures, representing a hunting-scene with great spirit, was standing *in situ* here as at Uyük facing outwards; a few miles beyond, on the road to Aintab, I saw other sculptures taken from one of the mounds. The district between the Giauour Dagh (Amanus) and the Kurt Dagh contains a large number of mounds; in a small area I counted eight, which I feel sure would well repay excavation. The slabs are all small, and could be easily conveyed to the coast; but, unfortunately, the British Museum has not seen its way to excavate, and the question is now, I believe, being taken up by the Germans. At Marasch, near the foot of the Taurus, several Hittite slabs have been found, and between Aintab and Aleppo, and towards the Euphrates, there are many large mounds, evidently of Hittite origin, including Tell Erfad, Arpad, and Azaz, the Khazaz of the Assyrian monuments. Several slabs have reached this country from Jerablûs, but the excavations at that place, owing to want of skill and inexperience, have not been so fruitful in their results as might have been expected. Jerablûs is generally identified with Carchemish; but unless a distinct statement is found in the Assyrian inscriptions that that city was on the Euphrates, I would place it at Membij, the ancient Hierapolis, a site which impressed me more than any other I visited west of the Euphrates. Hittite inscriptions have also been found at Aleppo and Hamath, and I think the slab obtained for the Palestine Exploration Fund from Tell Salhiyeh, near Damascus, is also Hittite.

A few words may now be said of the origin, religion, language, &c., of the Hittites. I fully agree with Professor Sayce in considering that the Hittites of Northern Syria and Palestine were intruders, and that they came from the Anatolian plateau east of the Halys, which was occupied by Hittite tribes from the Black Sea to the Mediterranean. This view of their northern origin is supported by their physical appearance, as depicted on the monuments, by the mocassin sandal already noticed, and by the fingerless glove, which is still commonly used by the peasantry, and is found in all cold countries. The sculptures show that the Hittites did not belong to a Semitic race. The features are rather those of a northern people, and on the temple of Abusimbel the Khita have a very Scythic character, with shaven hair and a single lock from the crown. This peculiarity in the mode of dressing the hair is not seen on the Hittite monuments; but at Karnak and Thebes I noticed figures with the same type of feature as those on the monuments in Anatolia. It would be very interesting, and I hope it may be done some day, to obtain casts of the various types of face represented in the war pictures of Rameses II.; they are very varied, and a careful comparison could not fail to be of value. Amongst some pottery dug up at Tarsus about thirty-five years ago is a head which seems to have been a likeness of a Hittite, as it gives the full lips and the large thick nose, with a sharp curve at the end, which is found on the monuments. The type, which is not a beautiful one, is still found in some parts of Cappadocia, especially amongst the people living in the extraordinary subterranean towns which I discovered last year

beneath the great plain north-west of Nigdeh. The religious belief of the Hittites, and its influence on the people of Western Anatolia, and through them on the Turks, has been described, as far as it is known, in papers by Professor Sayce and Mr. Ramsay. I would only suggest now, as a subject for examination, how far the peculiar religious rites and observances at the two Comanas were of Hittite origin; at each place the priest was at least co-ordinate with the king in rank and religious power, as appears to have been the case with the Hittites; and at Amasia the most magnificent tomb is that of a high priest. I do not know whether there was any peculiarity in the faith professed by the early Christians of Cappadocia, but it may be more than a mere coincidence that the country between Boghazkeui and Comana Pontica is inhabited by an indigenous people who, nominally Moslems, profess a religion which, as far as I could learn, approaches more nearly that of the Ansariyeh than any other. That the Hittites had made considerable progress in art is attested by their monuments, and we may infer from the fact that before the Cimmerian invasion Sinope was one of the principal outlets for the produce of the East, that they were a commercial people; the trade route seems to have passed through the Cilician gates to Kaisariyeh, and thence by Boghazkeui to Sinope. It would appear from the proper names on the Assyrian and Egyptian monuments, that the Hittites did not speak a Semitic language; the language was probably that of the Leuco-Syrians and Cataonians, and allied to the "speech of Lycæonia," which was in use, in the time of St. Paul, and it possibly lingered on until the complete Hellenisation of the people under the Byzantine Empire. Little progress has yet been made in deciphering the inscriptions, but there is every reason to hope that success will attend the efforts of Professor Sayce and other workers in that direction, and we shall then have a flood of light thrown upon a people with whom the Israelites at one time intermarried, whose religion some of them adopted, and with whose history that of the Jewish monarchy was, on several occasions, intimately connected.

#### SMOKE ABATEMENT.

A PAPER was read by Mr. W. R. C. Coles at the Sanitary Congress on "Smoke Abatement." It was, he said, desirable to consider the actual cause of the evil and the probability of its abatement. As smoke was but the expression of defective heating processes, by its production these processes stood condemned. They must be improved. They must face the true issue. The production and application of heat must become raised to the level of a recognised and rewarded art and industry before the ultimate success of the smoke abatement cause could ensue. The very term "smoke abatement" was in a sense misleading, for it pointed but to an expression of evil—not to its cause. "Heat cultivation" would more correctly indicate the underlying and governing principle on which thought and action must be based if they would intelligently address themselves to rid the atmosphere of smoke and secure the advantages attaching to that great object. In a broad sense it had been hitherto, and still was, the practice to obtain heat merely by heaping crude coal on a fire, regarding little the true character of the fuel, the apparatus in which it burned, or the duty actually required. So long as there was heat enough for the purpose in view that was deemed sufficient. The strictly exact and beautiful natural process called "combustion" would not submit to such usage, and it punished man in purse and in person to teach him to use his intelligence and amend his ways. The greatest barrier to legislative reform was the manifestly unfair basis on which smoke law had hitherto always stood, namely, that it had been levelled against certain trading classes of the community also. As a rule they looked upon the smoke laws as an irksome and unfair restriction on trade; and so long as they could by any means avoid penalties, they practically did no more to advance the object of the legislation. It seemed to have been generally accepted in the past and to remain now a fixed idea, that the smoke from domestic chimneys could not be checked or dealt with at all by legislation. It would be wholly unreasonable to consider even the possibility of passing an immediate law to absolutely restrain smoke from private houses now existing. Were it even to be passed it manifestly could not be administered. But the late Home Secretary (now Lord Aberdare) said: "Supposing it can be shown that grates as cheap or cheaper than the present ones have been invented and could be applied, and that the result of using them would be an economy of fuel, we have then to consider whether the foundation has not been laid for the gradual application of compulsion." These words were worthy of consideration. In the case of new houses, at any rate, a great check might readily be imposed by the united forces of public opinion and suitably restrictive legislation. The Government had set the example in the abatement of smoke by announcing that tenders for the new Admiralty and War Offices must provide for most improved heating arrangements. Regarding the possibility of carrying out the reform in a thorough and practical way, they might be encouraged by the success which had already followed the efforts put forth. It might be accepted as a fact that the attention which

had been directed to the subject had resulted in a large extension of knowledge and marked improvements in all classes of heating apparatus. It was generally admitted that our heating processes were, for the most part, primitive and unsatisfactory, and cheaper, less cumbersome, and more readily manipulated methods of applying heat are becoming more and more essential in all domestic and industrial operations. The official reports of the Smoke Abatement Committees of London and Manchester were highly instructive and suggestive. For instance, it was shown that some domestic grates burn three times as much coal as others do, and produce six times more smoke; that some gas stoves burn nearly three times more gas than other stoves, and that some steam boiler furnaces burn more than twice as much coal as others for equal work; and that while some produce a great deal of smoke, others are practically smokeless. So far as the use of gas could be made available for reduction of smoke at Glasgow there was an encouraging prospect, for the name of Mr. Foulis stood high in the gas world as an admirable manager of gasworks; and under his scientific development of gas manufacture the well-known system of heating the retorts, invented by Sir William Siemens, had been introduced on a larger scale than at any gasworks in the kingdom. Moreover, the coal of the country was suited to gas-making, and the manufacturers of gas apparatus in Glasgow were among the largest, if not actually the largest, in the kingdom. The review of heating systems had already led to the discovery or recognition of various collateral advantages being associated with changes tending to the prevention of smoke. Among them might be mentioned that in the manufacture of coke a saving of several millions sterling could be effected by the collection and condensation of the volatile constituents of coal, now poured into the atmosphere in the form of smoke; the development of furnaces suited to utilising inferior coal and gaseous fuel, and the introduction of appliances for labour saving.

Dr. Carpenter said there was no reason why the chimneys of manufactories should send out smoke. It was a matter which the people themselves could settle. With regard to domestic chimneys, there was a difference of opinion. It was quite certain that they could not indict the whole people, and therefore he would press on the Congress a point that he pressed on the Society of Arts three years ago, but which did not meet with much favour. Still he considered it was the right one. The large proportion of smoke in large towns—and this interested not Glasgow alone, but also London, which from its large extent was becoming a forest of houses, or, as one gentleman had called it, a desert of houses—tended to produce fogs, and he believed these were sometimes more dense in London than they were even in Glasgow. How was that to be done away with? His impression was that if the Legislature gave the local authority power to license chimneys to discharge smoke into the atmosphere, and let the produce of the licenses belong to the local authority for the purpose of reducing the cost of sanitary operation in the particular district, he thought they would soon find the smoke nuisance would be very materially abated. They would also find that the appliances which science had brought out, such as stoves and warming apparatus, would soon get rid of a very large amount, say four-fifths, of the smoke that arose from the domestic chimneys. They would also provide a source of profit to the local authority from those who liked to have their open fire, and have the privilege of poking it. That to some extent was one of the sources of smoke, and it would be more beneficial and less costly to the owners of poor property to have smoke-consuming fireplaces, or that cooking should be carried on by gas. They would then have a very large amount of that smoke removed from the atmosphere without any of those various changes which had been suggested—that of laying on very heavy penalties against the offenders and preventing people having a fire to look at if they liked. He thought the plan he had suggested would be found in the end to abolish the smoke nuisance more effectually than any others they could think of.

Dr. Angus Smith said what they desired most in nearly all the branches of sanitary inquiry was a proper series of experiments, and these, he believed, were all carried out for small fireplaces by the Smoke Abatement Committee. Larger experiments, which were very expensive, could perhaps only be made by those who had large works, and were able to spend a considerable amount of money upon them. There were different kinds of smoke—black and grey smoke—and as the colour was different the composition was different. In house fires the combustion was not sufficiently strong, the oleaginous matters were not sufficiently heated, and the smoke of a black colour was produced. Any method which increased the heat of combustion would enable them to get rid of this black smoke. He found that in most towns those who were entrusted with the duty of putting down smoke were smoke consumers themselves, and it was, therefore, difficult to get these Acts put into operation. He looked more, however, to invention and to the spread of knowledge amongst the people than to legislation for improvement in this matter.

The Sheffield School of Art still requires 150*l.* to make up the 1,000*l.* for which an appeal was issued in May.

## LEGAL.

Hereford County Court.—Sept. 25.

(Before Mr. ROGERS, Judge.)

WELSH v. EVANS.—WILLETT v. EVANS.—EVANS v. WILLETT.

These cases related to the same work. In the first case one builder brought an action against another for balance of account for erecting a house. On February 25 a certificate was given that the house which plaintiff built for defendant was finished. When plaintiff asked for his money, defendant pleaded shortness of money, and continued to do so until the action was brought. An order had been signed fixing the back work at 15*l.*, and the only items now in dispute were 26*l.* 0*s.* 4*d.* and 5*l.* 5*s.* 9*d.*

Mr. Parker, the city surveyor, to whom the matter had been referred, reported that he had had to decide whether the cellar was or was not within the contract, and as to the price of certain cupboards. He considered that one cellar only had been intended, as set out in clauses 3, 6, 19, 23, 35, and 51 of the specification. It was clearly specified, but not shown on original drawings. The additional cellar under parlour was neither shown nor specified. On the contrary, sections 3, 23, 35, and 51 pointed clearly to the intention to provide one cellar only, and that one under the kitchen. And clauses 6 and 9 referred to "cellar" in the singular, and not in the plural number. A written order to provide an extra cellar had been signed by the defendant. Mr. Evans admitted he had given a verbal order for the two cupboards. He (Mr. Parker) estimated the value of the cellar under the parlour at 26*l.* 6*s.* 6*d.*, and that the plaintiff was also entitled to 5*l.* 5*s.* 7*d.* for the cupboards. It was pointed out that Mr. Parker's award was 6*s.* 2*d.* more than the amount claimed in the one instance and 2*d.* less than the other. In reply to His Honour, Mr. Parker said he had no knowledge of the case or communication with the parties.

Defendant's solicitor said the work had not been done as he had wished, and he was now saddled with a debt of something like 300*l.* The work ought also to have been done in the specified time, and Mr. Welsh had agreed to forfeit 2*l.* a week for any time he was over the time, which he had not done. Defendant had paid 250*l.*, and still been kept out of the house. Mr. Willett, the architect, had retained the drawings, refused to give them up, and had, he understood, actually given them up to Mr. Welsh. So that the defendant had been kept in the dark, and had had nothing to show what he owed.—Plaintiff's solicitor said the defendant had had everything made clear to him, and the only excuse that he had had for not paying was that he was short of money. The statement about the drawings was incorrect. There were two sets of drawings, as there should be, the working set given to Mr. Welsh, the builder, and the other set retained by Mr. Willett to see that the work was properly carried out, and those drawings had never been out of his hands.—Defendant said that Mr. Willett employed Mr. Welsh. The first agreement was for 214*l.*, and then it was found there was only one cellar.—His Honour said that if defendant had displayed any ignorance, it really did not affect this matter. Plaintiff had claimed less than Mr. Parker had allowed, showing that defendant had already paid something on account of these extras. Judgment was for 23*l.* 5*s.* 4*d.*, the amount claimed, and usual costs.

The action was next heard which was brought against Mr. Willett, the architect, by Mr. Evans, for 5*l.*, special damages caused by detention of the specifications, plans, and drawings, and 4*l.*, their value. Also an action brought by Mr. Willett against Mr. Evans for 14*l.* 3*s.* 6*d.*, being 12 guineas, 5 per cent. on the 252*l.* for which the cottage had been built, 10*s.* 6*d.* for preparing agreement, and a guinea for preparing copy of drawings for the Corporation, less the value of some potatoes on the land where the house was built. Mr. Willett, who conducted his own case, said he had given Mr. Corner and his client every opportunity to come to his office and examine the plans, and he had once taken the plans to Mr. Corner's office for him to see.—His Honour: It is quite clear that the plans are the property of the person who employs you.—Mr. Willett: Yes, but I am answerable for the drawings until the work is settled for between the parties. Suppose Mr. Corner had destroyed them after I had given them up to him.—Mr. Corner: He is our servant.—Mr. Boycott pointed out that at the bottom of the specifications was a clause that the architect's decision in all points of dispute should be binding and final on all parties.—Mr. Corner argued that the clause was inoperative because it was not signed.—Mr. Willett said it was only the agreement that was usually signed, and that was signed in this case.—Mr. Evans, examined, said that Mr. Willett agreed to receive 5*l.* for his share of the work, and the work was to be done for 100*l.*; he had never agreed to pay him 5 per cent. When the house was put up there was no stairs, and when they were put up they were only 4 feet 6 inches high; and was present at Mr. Corner's office when Mr. Willett demanded 17 guineas for the plans. Mr. Willett refused to accept the 17 guineas when it was offered to him.—Cross-examined by Mr. Willett, Mr. Evans said they first talked about building two houses for 300*l.*; Mr. Pantall took them both up to the place.—Mr. Willett said the reason he declined to give up the

drawings was because he considered he should have done wrong to let them out of his custody until the matter was settled, and he took legal advice of Mr. Knight, solicitor, upon the point.—His Honour said it was quite clear Mr. Willett was entitled to his 12 guineas, which he believed was the usual fee of 5 per cent. for builder's work. He was also entitled to keep those plans until the account was paid up. His Honour also drew attention to the clause as to the architect's decision in all points of dispute, and said it seemed to him that the architect could not decide if he gave up the drawings. Judgment was therefore for Mr. Willett for the amount claimed, and Mr. Evans was non-suited in his action.—Mr. Welsh asked to be allowed to say a word, in exculpation of himself and Mr. Willett, about these stairs.—His Honour said he could not allow it. It was not necessary.

## CHURCH BUILDING AND RESTORATION.

**Aberaman, South Wales.**—This church, which is situated near Aberdare, and has been erected at the sole cost of Sir George Elliot, Bart., M.P., as a memorial to Lady Elliot, and for the benefit of his employes (about 400 of whom it will accommodate), was opened by the Bishop of Llandaff on Saturday last, the 29th ult. It consists of nave, 63 feet by 28 feet, with north porch, 9 feet square; chancel (with semicircular apsidal ends) 35 feet by 22 feet; and two transepts, each 14½ feet square. The sloping character of the site has been utilised so as to provide three useful rooms beneath the chancel and transepts, these floors being supported on iron girders and white brick arches. The general style of architecture adopted is the one that prevailed during the fourteenth century. The pitch pine nave and transept roofs are open to the ridge, and plastered beneath the rafters, and the chancel has a waggon-boarded ceiling. The coping and other dressed stone came from Messrs. Pictor's Westwood Quarry, and the carving in imitation of natural foliage and fruit has been executed by Mr. G. F. Herridge, of Cardiff. The pitch-pine seats in the nave are of the usual open description, and the chancel-stalls, reading-desk, lectern, communion table, and pulpit are in carved pitch pine, the latter resting on a Bath stone corbelled base, the font being in similar stone, its circular bowl being supported on four small detached columns. The wide passage up the centre of the church is laid with wood blocks in patterns, with an ornamental encaustic, glazed zigzag tile bordering, while the chancel and sacarium have Maw's encaustic tiles. The wrought-iron and brass work, including all the gas fittings, came from Messrs. Brawn's Birmingham Art Metal Works. The heating is by means of hot-water piping, carried along the walls and passages. The glazing of the windows, supplied by Ben. Gay, of Bristol, is cathedral rolled in variegated tints, but the glass in the chancel lancets is by Mayer, of Munich. Mr. C. Shepherd, of Cardiff, was the contractor, and the architect, Mr. E. H. Lingen Barker, of London and Hereford.

**Bolton.**—A new vicarage is shortly to be built for the parish of St. Mark's, Bolton, from designs by Mr. Marshall Robinson, architect, 19 Acresfield, Bolton. The character of the building is to be Early English, and the cost about 2,000*l*.

**Edinburgh.**—The new Greyfriars church improvements having been completed, the building has been reopened. The works have been carried out by Messrs. G. Beattie & Son, under the superintendence of Messrs. Hardy & Wight, architects, at a cost of 780*l*.

**Glasgow.**—The copestone of the new spire of Camphill United Presbyterian church was laid on Saturday last. The spire is about 200 feet high. It was included in the original plans when the church was built in 1875-76, but for various reasons has not been erected till now. Besides the church and spire, the plans, as now carried out in their entirety, include a large hall, and the total cost of the buildings has been a little over 17,500*l*. An illustration of the church has appeared in *The Architect*. The works have been carried out by Messrs. Morrison & Mason, under the direction of the architect, Mr. William Leiper, F.R.I.B.A.

**Loanhead, N.B.**—A new Established church has been erected in the Loanhead district. It is designed in Gothic of the Early Decorated period. The plan is laid out with transepts, of shallow depth, which can be used for future extension, and the interior with an end gallery which accommodates 500 sitters. An octagonal vestry is added near to the west transept, and the hall, constructed of larger size than an ordinary session chamber, is placed behind the church. Messrs. Hardy & Wright, Edinburgh, are the architects.

**Northampton.**—The church of St. Katherine has been reopened after alteration and repairs. The works have been carried out by Mr. E. H. Jackson, contractor, Horsemarket, Northampton, under the direction of Messrs. Ingman & Sons, architects, Northampton. The colouring has been executed by Mr. Banks, of Abington Street, Northampton.

**Nottingham.**—A new Roman Catholic church, dedicated to Our Lady and St. Patrick, has been opened. The style is Early

English of the Lancet period, the materials red brick with stone dressings, and the plan includes nave and two aisles, with sacristy and vestries for the priests and choir. The nave is 70 feet by 25 feet, and 60 feet high to the ridge, and the aisles are 66 feet by 13 feet. There is a gallery at the east end for the accommodation of the organ and choir, and the church, including gallery, will accommodate about 600 people. The altar and reredos are of carved oak. In the panels of the reredos are figures of Our Lady, St. Patrick, St. Joseph, and St. George, the whole surmounted by a carved canopy decorated with the figures of angels. The benches are open, and the church is paved with red quarries. The contractor is Mr. Henry Vickers, and his sub-contractor, Mr. Raworth, has fitted up the heating apparatus. The gas-fittings have been provided by Mr. Rhodes. Messrs. Farmer & Brindley, of Westminster Road, London, executed the reredos and altar, and Messrs. Burlison & Grylls, of Newman Street, London, are the painters of the panels. Mr. Robert Speed was the clerk of works, and the architects were Messrs. Evans & Jolley, of Nottingham.

**Orwell.**—The noble chancel of Orwell parish church, Cambridgeshire, has been reopened after repair. The fabric of fifteenth-century date was in an almost critical state from the decay of the roof, and spreading of walls. The roof has been reinstated in oak, only a few small portions of the old material being available for the purpose. Some of the old oak-boarded ceiling remained behind the later boarding, and has been made good with its traceried cusped ribs. At the intersections of the ribs was an interesting series of shields, painted in distemper, with the coats of arms of many of the principal county families, but almost obliterated. A faithful record of these had been preserved in a manuscript history of Cambridgeshire, preserved at Wimpole Hall; and from this, by the aid of the few traces still remaining on the shields, they have been recoloured. The work has been carried out under the direction of Mr. William White, F.S.A., 30A Wimpole Street, W.

**Rochdale.**—Steps are to be taken for the restoration and improvement of the parish church, Rochdale, plans for which have been prepared by Mr. J. S. Crowther, architect, of Manchester. They embrace a ground plan of the chancel and elevations showing the east wall and south side of the church. On the south side a clerestory is shown from the eastern end of the nave, extending from the east arch to the wall of the sacarium. It is proposed to extend the chancel aisle by two lights on the exterior. The south chancel aisles and the Trinity Chapel will remain undisturbed. The elevation of the north is of similar design. The longitudinal section shows three new arches with fluted columns on both the north and south sides of the interior. It is proposed also to replace the present roof of the church with a double hammer-beamed roof of the Perpendicular period.

**South Molton.**—A Wesleyan chapel, lately erected, has been opened. The building is of local stone, with Douling and Ham Hill stone dressings. The interior is arranged to seat about 350 people. A vestry and school-room, with large class-rooms, are provided at the back. The contractors were Messrs. Sanders & Son, Mr. Comins doing the plumbing, glazing, and gas-fitting, and the decoration of the organ. The architect was Mr. A. Lauder, of Barnstaple.

**Wotton-under-Edge.**—The chancel of the church at Wotton-under-Edge, which has been remodelled and restored, has been reopened. The east window, which was blocked up for a considerable distance by stone work, has been restored and filled with stained glass of rich design, the gift of the Rev. W. Cooper, rector of Frettenham, Norwich, in memory of Dr. John Cooper and others. The new choir and clergy stalls are of English oak. The carving has been executed by Mr. Frith, of Gloucester. The work of restoration has been carried out under the direction of Messrs. Waller, Son & Wood, the diocesan architects, Gloucester.

## SCHOOL BUILDINGS.

**Claughton.**—St. Michael's Schools, Christchurch, Claughton, lately erected, have been opened. Accommodation has been provided for 976 children, the whole of the class-rooms being on one floor. A tower and spire rise near the organ-chamber to a height of 70 feet above the roadway. There is a covered playground for the children. The cost has been about 4,200*l*. The architect was Mr. A. Bleakley, of Birkenhead and London, and the contractors were Messrs. Bleakley & Son, Birkenhead. The heating and lighting were carried out by Messrs. Barratt & Russell, Leeds, and the lead-light glazing by Messrs. J. A. Forrest & Son, Liverpool.

**Mexborough.**—The new Board school in Garden Street Mexborough, built to accommodate 287 boys and girls, has been formally opened by the chairman of the board. The school adjoins the infants' school. A large schoolroom is arranged fronting Garden Street, 77 feet 6 inches by 20 feet wide. There are three class-rooms. The work has been satisfactorily completed by Mr. F. Newsum, of Mexborough. The plans were prepared

and the works carried out under the direction of Mr. H. L. Tacon, architect and surveyor, of Rotherham. The total cost, including furnishing and fittings, is £1,344 17s.

**Warrington.**—The foundation-stone of new schools for Sunday and day purposes has been laid. The building will be of brick, with pressed brick and stone dressings. Two kinds of stone will be used in the dressings, namely, that from the Rainhill quarries and Ringley, which is a costly light yellow, procured from quarries near Halifax in Yorkshire. The internal joinery work will be pitch pine, stained and varnished. Including the furnishing, the cost will be about 2,000£. Messrs. Wm. Gibson & Son, builders, Church Street, Warrington, are the sole contractors, with Mr. Edward Gettins, stone-mason, Orford Street, as sub-contractor. Mr. Owen is the architect.

### NEW BUILDINGS.

**Goole.**—The foundation-stone of a sailor's institute at Goole has just been laid. The piece of land on which the new institute will stand has a frontage of 54 feet, and is 100 feet from front to back, containing 600 square yards or thereabouts. The plans of the building were prepared by Mr. W. A. Gelder, of Hull, and were selected in a limited competition. The contract is being carried out by Messrs. Jackson Bros., Goole. The style of the building is Tudor, to be built in red stocks, with stone dressings. The elevation is broken up so as to form a tower at the west angle of the façade. The main central entrance is approached by steps, owing to the north side of North Street being low. The vestibule is 8 feet by 5 feet, entering to a corridor 4 feet 6 inches wide. The accommodation is as follows: Ground floor—library, or committee-room, reading-room, recreation-room, kitchen, cloak-room, with a room to hold 100 persons. The mission hall is on the first floor, and is reached by a main staircase 4 feet wide, landing on the vestibule at each side; also a private staircase 3 feet wide. It is lighted on all sides. The roof is open, with dressed timber. A large platform is provided, also tea table closets at the side. It will accommodate 350 persons, and is to be heated by one heating apparatus. The scullery and heating vaults are approached by subway.

**Harrogate.**—A cottage hospital, erected in Victoria Park, has been opened. The hospital is arranged on the pavilion system, the main wards being placed so as to be nearly isolated from the main block, in order that light and air may enter from all sides. In point of dimensions, the building has somewhat overstepped the lines of a "cottage" hospital. The principal entrance is placed in the centre of the administrative portion, giving access to the hall and wards and to the out-offices, which are carefully isolated from the main building by ventilated lobbies. The staircase is also placed in a central position, so as to be easily and conveniently worked. It is estimated that the total cost of the building, furnishing, enclosure walls, palisades, gates, and site will be over 5,000£. Mr. John Adams, of Harrogate, is the architect.

**Manchester.**—Plans have been prepared by Messrs. Pennington & Bridgen, architects, for the erection of a new Royal Eye Hospital. The building is to accommodate 100 in-patients, and will have arrangements for 400 out-patients. The administration will contain suites of apartments for the resident medical officers and matron, board-room, secretary's room, and rooms for medical staff, with spacious dining-hall. The out-patients' department has a waiting-hall, registration-hall, examination rooms, and a dispensary. Wards, on the pavilion principle, will accommodate sixty males and forty females, with all the requisite nurses' rooms, baths, &c. Isolated wards are provided for infectious cases, and spacious day-rooms arranged contiguous to the wards, with airing ports available in fine weather. The building has been designed in a simple style of free Classic. The structure will consist of red brick with red-tiled roof, and sash windows with transoms and movable fanlights. Toned glass will be adopted in all the rooms used by the patients.

**Public Halls, Stirling.**—The new building in Albert Place has been opened. It contains two halls, a large hall and a lesser one, which have independent entrances, and can be used simultaneously without in any way interfering with the proceedings in either. The large hall is seated for about 1,300, and the small one for about 300. Both are well lighted, and the floors have been laid with polished pitch pine for dancing. The heating and ventilating are on the same system as that which has been successfully applied in the fine St. Andrew's Halls in Glasgow, a water-engine pumping hot or cold air into the halls as required, and having ample power to keep the temperature to any degree wanted. The means of exit are so numerous that it is calculated the large hall could be cleared within eight minutes. The hall, having corridors on three sides, will be free from draughts, and no effort has been spared to make it comfortable as well as safe. The large hall is adapted for a theatre. The scenery can be taken up to the flies, and the stage ceiling closed, so that no appearance of theatricals will be visible when the hall is used for other purposes.

The back of the platform has been specially constructed for the reception of the organ now being built by Mr. Willis, of London. The building was erected from plans by Mr. W. Simpson, junr., architect, Stirling.

### ARCHÆOLOGY.

**Late Excavations in Egypt.**—The excavations made by M. Maspero during last summer in Egypt were as follows: He began to clear the great Temple of Luxor from the buildings erected within its precincts. In the court of the temple there were from forty to forty-five houses and a mosque. About twenty-seven of these houses are now removed, and a large part of the temple walls are laid bare. In Carnak the doorposts of the Temple of Horns have been excavated, and it has been found that the temple was built of the material of an older one, ascribed to Amenopsis IV. On the stones is engraved the list of the northern nations conquered by Armais. On the left bank of the Nile excavations have been commenced at Deir-el-Bahari, with a view to finding graves of the old kingdom. The tomb of Horoptn and the Queen Tmou have been found, and sent to Bulak. On this occasion not only long inscriptions (some of them more than two hundred lines) have been discovered, but also graves built of brick, with regular vaults. Until now it was believed that the arch was unknown to the more ancient Egyptians.

### GENERAL.

**Mr. E. C. Robins, F.S.A.**, has been elected an honorary member of the Association of Public Sanitary Inspectors.

**The Receipts** of the Loan Exhibition of Historic Portraits and other Paintings, which closed in Edinburgh on Saturday last, amount to 1,500£, and are more than sufficient to cover the expenditure.

**Mr. John Wallace** read a paper on "Modern Work in Glasgow," at the meeting of the Glasgow Architectural Association which was held on Tuesday.

**The Durham Architectural Society** paid a visit last week to Redmarshall and Sedgfield, in the parish churches of which the old wood-carvings, brasses, monumental figures, &c., were inspected with interest.

**A Reredos**, designed by Mr. E. Law, of Northampton, has been erected in the church of St. Giles in that town. The reredos is of Caen stone with alabaster and coloured marble, the style being early fourteenth century.

**A Pier**, estimated to cost 20,000£, is to be constructed at Ventnor.

**Mr. L. M. Fitzgerald**, of Lismore, has obtained the prize of 50£, offered by Mr. Villiers Stuart, M.P., for a design for a labourer's cottage.

**The Birmingham Town Council** on Tuesday referred a proposal to erect assize courts at a cost of 80,000£ to the General Purposes Committee, which has power to approach the Government on the question.

**Messrs. Padbury**, of Scarborough, have taken the contract for the restoration of the chancel of Hemingbrough church, near Howden, under the direction of Mr. Ewan Christian.

**Peterborough Cathedral.**—The whole of the condemned portion of Peterborough Cathedral having been demolished, the foundation-stone of one of the new piers was laid on September 28 in concrete on solid rock. It is feared the two western piers will also be condemned, as the old foundations were laid in loose earth four feet above the rock.

**The Foundation-stone** of the new Sheriff Court House buildings, the erection of which is estimated to cost about 15,000£, was laid on Saturday last at Paisley. The architects are Messrs. Clark & Bell, of Glasgow.

**The Tees Conservancy Commissioners** have recovered from the river, in the course of dredging works, 134 heavy trees, varying from 10 to 40 feet in length, which probably belonged to the forest existing in the locality in remote times.

**The Vestry Hall of St. James's**, Westminster, in Piccadilly, has just undergone complete redecoration by Messrs. M. & W. Fleming, of 4 Pall Mall Place, S.W., from the designs and under the superintendence of Mr. Bernard Dicksee and Mr. Arthur Dicksee, the partners in the firm.

**A Carved Pulpit** has been erected in Pelsall church, near Walsall, by Messrs. Jones & Willis. It is of Caen stone, with marble columns.

**The National Smoke Abatement Institution** has received 100£ from the Gas Light and Coke Company, and 100£ from the South Metropolitan Gas Company.

**Messrs. Robert Boyle & Son**, of 64 Holborn Viaduct and Glasgow, have been adjudged for their patent self-acting air-pump ventilators the first prize (silver medal) by the Mining Institute of Cornwall at their conference recently held at Redruth. The firm has also been awarded the first prize medal at the Cork Exhibition, where their system is used for the ventilation of the exhibition buildings.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, OCTOBER 6, 1883.

### EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

### TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*\*\* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—“Contract Supplement to THE ARCHITECT.”*

### COMPETITIONS OPEN.

**BIRKENHEAD.**—Dec. 1.—Plans are required for Laying-out Bidston Hill for Building Purposes. Premiums of 160 guineas and 50 guineas, and four of 15 guineas each. Messrs. Davies & Stephen, Estate Agents, Mollington, Chester.

**BRISBANE.**—Nov. 30.—Plans are invited for the Erection of a Town Hall. Messrs. Gordon & Gotch, 15 St. David Street, E.C.

**CAPE TOWN.**—Jan. 30.—The Town Council of the City of Cape Town invite Plans and Specifications, accompanied with approximate estimate of cost, of a System of Drainage. Selected Plans and Specifications to become the absolute property of the Corporation. All others will be returned free of expense. Premium of 250*l*. A plan of the City, with levels, may be seen, and further information may be obtained, on application to the South African Loan, Mortgage, and Mercantile Agency, 9 King William Street, London, E.C.

**LONDON.**—March 1, 1884.—The Commissioners of H.M. Works and Public Buildings are prepared to receive Designs for New Buildings proposed to be erected in Whitehall for the Admiralty and War Office. Mr. A. B. Mitford, Secretary, H. M. Office of Works, 12 Whitehall Place, London.

**NORTHAMPTON.**—Dec. 1.—Designs are invited for the Erection of a Board School, with Class-rooms and Out Offices, to Accommodate 1,150 Children. Mr. John B. Hensman, Clerk to the School Board, 4 St. Giles's Street, Northampton.

## SANITARY PROGRESS.

UDGING by the noise of conflict, we should be justified in supposing that the armies of the cause of domestic sanitation are making rapid strides towards the conquest of Great Britain; and accordingly, when we look over the reports of what has been doing at the meetings of the Sanitary Congress at Glasgow which had to do with building matters, we

may reasonably expect to find some signal evidences of a general progress. But one of the chief characteristics of the advancement of the public welfare in whatever form invariably consists in the exceedingly leisurely pace at which it proceeds, and we need not be surprised after all if in the present case, as in others, the race should not seem to be to the swift. Perhaps in the end the battle may be to the strong—and to the slow.

Amongst the formal communications which were presented to the Congress in this department, there appear, however, to have been several which are of some force. For example, Dr. HUMPHREY thinks the time has come for the people of this country to require the appointment of a Minister of Sanitation; Mr. ROBINS claims a better position for inspectors of nuisances; Mr. COLES has something to say about smoke prevention, which brings out, if nothing more, a shrewd practical suggestion from Dr. CARPENTER; Mr. HONEYMAN sets forth an ingenious and novel argument—not the less likely to be sound because it was earnestly contradicted—on the question of low ceilings for rooms *versus* high ones; Professor GAIRDNER and Mr. MUIR discuss on experimental ground—that of Glasgow itself—the actual results effected by sanitary legislation; and Professor ROGER SMITH, Mr. BURDETT, and Mr. WALLACE take up in turn the state of things sanitary in London town, a subject always fertile in interest. We shall only be able on this occasion to touch upon two or three of these points.

Mr. HONEYMAN's doctrine appears at first sight to the careless reader to be something like the advocacy of low ceilings, for their own sake, as a universal rule of building; but we hope the time has not come quite yet when a member of the council of the Royal Institute of British Architects, even a provincial one, is to be found so exceedingly frank in the expression of courageous opinions. What Mr. HONEYMAN actually says is rather to this effect: that in rooms of ordinary proportions, when fully occupied, there is a certain amount of space towards the ceiling in which, as he affirms, a volume of vitiated air is kept in a stagnant condition, because of the circumstance that the atmospheric circulation within the room, so far as ordinary ventilation goes, does not require to disturb it, and in fact does not disturb it; for which reason he would prefer to see the total of cubical area distributed over a larger floor-area with a lower ceiling height. To come to particulars, let us take a room (assuming dimensions for ourselves) 14 feet square and 10 feet high, in which five poor people sleep, and compare it with a room 14 feet by 17½ feet and 8 feet high (affording the same cubical area), occupied by the same five people; then the lower and larger room is preferable, says Mr. HONEYMAN, because the air will keep in motion throughout the whole, or nearly the whole, of its height of 8 feet, whereas it will stagnate in the uppermost two feet of the ten, and so leave available for respiration in the smaller and loftier room only the smaller extent laterally with the same 8 feet vertically, the uppermost 2 feet being, in fact, waste height. Now the best way to treat this suggestion is to magnify the contrast. Let us therefore take a room, on the one hand, 10 feet square and 20 feet high (these dimensions giving the same cubical area as before), and compare it with a room, on the other hand, only 7 feet high but very nearly 17 feet square; then which of these two rooms would best accommodate the five sleepers? The rule adopted (following precedents) by the municipal authorities of Glasgow, Mr. HONEYMAN points out, would peremptorily reject the large low room and promptly accept the small lofty room; and the object which he has in view is the perfectly straight-

forward one of throwing discredit therefore upon the too mathematical and not sufficiently practical bent of the municipal mind of his native city. Of course the whole controversy must eventually turn upon the one question—What is the exact limit at which the alleged stagnation of air by superfluous height commences? Let this question be scientifically answered, and Mr. HONEYMAN begins to be in the right at that precise limit. There are many sanitarians of the blindly enthusiastic school who will simply refuse to allow the matter to be discussed, disposing of the whole affair with the dogmatic exclamation—We cannot have our rooms too high, and there's an end of it! But calmer intellects will rather invite Mr. HONEYMAN to condescend upon the facts; and what he then says is sensible enough. Poor folks, he says, want all the house accommodation they can get at the least possible expense, and this means a maximum of floor area with a minimum of sufficient height—such minimum being determinable by the simple considerations which arise out of the height of the human frame, and the height of doors, windows, and fireplaces as so many artificial agents of ventilation. Confessing, as we do, to a prejudice in favour of somewhat lofty rooms, we really cannot deny that there is here a palpable element of common sense, and we cannot blame Mr. HONEYMAN for urging his doctrine so far as it may reasonably go, as a perfectly legitimate question of progress, even if in an unexpected direction.

Dr. CARPENTER's piquant suggestion with reference to smoke abatement is one that is easily overlooked in reading the discussion that followed the paper of Mr. COLES on that important subject; but it is distinctly a new move in the way of progress. He would no longer, if we rightly understand him, authoritatively prohibit the smoke nuisance; but he would sarcastically license coal fires after the manner of a sort of state regulation of vice. "His impression was that if the Legislature gave the local authority power to license chimneys to discharge smoke into the atmosphere, and let the produce of the licenses belong to the local authority for the purpose of reducing the cost of sanitary operations in the particular district, they would soon find the smoke nuisance would be very materially abated." In this way, instead of "preventing people from having a fire to look at if they liked," he would simply make them pay for the enjoyment of it, which, he thinks, they would then speedily consent to dispense with as a costly luxury. Thus we may imagine a gentleman of pensive habits turning over in his melancholy mind during an economical fit whether to knock off the smoke of his fire or the smoke of his cigar, seeing that he could not afford both; or whether to come down to a gas stove or change his tailor, as the less irksome mode of making both ends meet. We can even imagine the wife of his bosom in the fulness of her affection offering up a sacrifice of a shilling a yard on a new silk in order to preserve for her lord "the fire he likes to look at." Indeed we might go on imagining a great many things; but we must confess that we cannot imagine any sane man in the House of Commons voting—if Dr. CARPENTER be really as serious as he seems to be—for the proposition to which he thus attaches his eminent name. Such a step in the development of sanitary wisdom is, in short, not a step in the right direction, or, so far as we can see, in any direction at all.

Mr. ROBINS, in his essay under the fragrant title of "The Disabilities of Inspectors of Nuisances," is apparently a little disabled himself by an amiable habit which he has of calling a spade something else than a spade—a trowel, perhaps, or a pickaxe, or a pound of tenpenny nails. Who are "their superior officers of health," by whom "the support they have a right to expect" is "oftentimes grudgingly given" to these examiners of our dustbins? Not the doctors, surely. Why not hit straight and from the shoulder at those ill-conditioned superiors of both doctors and inspectors, the class of self-protecting vestrymen, who are well known to procure election as public administrators for the mere purpose, amongst the rest, of preventing interference with the unsanitary condition of the "tenement property" from the farming of which they derive the shabby means of living in idleness? To do this, if Mr. ROBINS pleases, would be an act of progress indeed; for here lies the very root of the unwholesomeness of what may be called half the rotten house property in some parts of London.

Dr. HUMPHREY, as befits his position as the president of the Congress, is bold enough in his opening address to declare for "the institution of a Sanitary Department in our Legislature, distinct from the Local Government Board, and under the

direction of a Minister of Sanitary Affairs." This department would enjoy more or less control over the Registrar-General's work, the Ordnance Survey, the Geological Survey, and the business of the Meteorological Office, and "the Sanitary Institute would be a valuable handmaid," and so on. Here is another doctor as wild as Dr. CARPENTER. Such romanticism of science, may we say? does no good, and perhaps much harm by bringing into ridicule the more sober endeavours of practical men. Reticence in advocacy is, as the world goes, as important in sanitary matters as in many other things. Human nature has amongst its weaknesses a disposition to be frightened off from the most excellent reforms by exaggerated argument. Sanitary reform especially has in these days an uphill conflict to conduct, and the leaders can scarcely cultivate patience and moderation too much. At the same time, however, we do not wish to deny the too palpable fact that, in these busy and noisy days of ours, perhaps the only way in which Wisdom can make herself heard at all is to cry very loudly at the corners of the streets—indeed, perhaps, to blow her own trumpet with no uncertain sound.

### ART EXHIBITION IN DUNDEE.

LIKE its predecessors, the seventh exhibition in Dundee owes to the ready sacrifices of time and patience on the part of the organising committee the distinction which it enjoys in comparison with the exhibitions of pictures now common in most towns of any pretension. It is not, of course, a rival to Edinburgh, or nearly so. For instance, it is far less select in admitting large numbers of pictures which cannot be described as worth more than the modest prices attached to them in the printed catalogue. The committee are far too good judges to accept such productions as works of art. They are meant, apparently, to swell the number of prizes to be distributed at the close of the exhibition. Whether this is the best way to encourage art may be questioned; but it is one to keep exhibitions going. In Edinburgh, again, it is possible to meet some sudden revelation of unusual talent or genius, and it is always impossible not to find many examples of high ability on view for the first time. In Dundee there are not a few instances of very high ability; but works of the first order are not many, and of these the best have already been seen in public and become more or less familiar. It is true that they are pictures which cannot be seen too often; and there is this to be said for them also, that, though familiar to many, they are yet works of quite recent date. So that the Dundee committee cannot be charged with combining old masters and new, as is frequently the case elsewhere.

Mr. ORCHARDSON, R.A., is represented by the *Queen of Swords*, a picture very finely characteristic of his manner a year or two ago, and by *Armed Neutrality*, a good example of his present style. Both have been seen in London. *Armed Neutrality* is the picture of a boy standing stubbornly to the front, with his toy sword clasped behind his back with both hands. In the *Queen of Swords*, Mr. ORCHARDSON'S originality is displayed perhaps as well as in any work from his hands. It is an originality that amounts to a phenomenon in art, not in the ordinary sense of being striking or impressive, though it is that too in its way, but from the fertility of invention which attends the working out of his conception through all its innumerable details. It is an originality which appears to have increased and flourished under the laborious acquisition of technical skill which so effectually nips in the bud that specious originality not uncommon among young and aspiring painters. Take, for example, the subtle differentiation of character in the ladies in the *Queen of Swords* and the varied harmony of grouping in the gallants—not to speak of the tone and conception of the whole. Nature and artistic necessities are equally observed, and equally treated to justice. In his most recent work Mr. ORCHARDSON has, we think, displayed more power and breadth, and of this *Armed Neutrality* may be taken as a fair, but by no means a great example.

The owner of *The Queen of Swords* (Mr. KEILLER) is also the owner of a good work by Mr. PETTIE, R.A., *The Jester's Merry Thought*, which was in this year's exhibition of the Royal Academy. The jester lies on his back, foreshortened with all the skill and force which Mr. PETTIE loves to lavish on foreshortening. Perhaps we are wrong in saying that he has in reality any such love, since he has shown repeatedly that he can paint excellently without it. But somehow

he has produced an impression of having a favour for foreshortening in his figures. His work is always powerful in the true sense of a cumulative, not a striking, power, combined with refinement of execution and a poetic love of technical details, which has brought about a rare mastery over them. The scene with the jester is full of these qualities, with the additional charm of geniality in the conception.

In his *Portrait of Herr Joachim* Mr. JAMES ARCHER, R.S.A., has challenged a comparison with the portraits of the violinist by others who work in a different manner, as, for example, Mr. WATTS. There is no need to decide between them; there is room enough for both manners at present. But there is this to be said for Mr. ARCHER, that, though he also aims at breadth and largeness of style, it is not to the exclusion or suppression of every detail of costume that would seem to make against that effect. On the contrary, he courts such details, subduing them into perfect subordination. At least he has done so in his *Portrait of Herr Joachim*, which is indeed a very beautiful piece of work all round. He has succeeded also admirably in his *Portrait of Mrs. Stratton Tweedie*. It is one thing, however, to paint a lady whose natural appearance and dress lend themselves favourably to Mr. ARCHER'S manner, and to paint Herr JOACHIM in the completeness and simplicity of his aspect; but it is quite another thing to paint the portrait of a deceased nobleman (the late Lord KINNAIRD) from such materials as were at hand, and to paint it in the usual form of a presentation portrait. Mr. ARCHER should have seen Lord KINNAIRD busy in his great farming operations, and should have painted him in the dress he used to wear then. As it is, he has not been able to subdue the commonplace costume into artistic subordination. Still it is a work which no doubt will be welcome to the people of Dundee, to whom Lord KINNAIRD was probably more familiar in the aspect in which he is here painted. Mr. ARCHER contributes also a large landscape, the *Moor under Ben Vrachie*, true to the sentiment of loneliness which the high moors convey, to those at least who do not visit them for sport, but with a mind open to natural effects. These moors are like the sea in their wide undulating expanses, and like it also in hiding beneath the surface the varied forms of animal life which people it. The growths of nature are there humble and uniform. Yet the whole scene exercises a fascination to a contemplative mind. Mr. ARCHER'S mind must, we suppose, have such a turn. He is not like Mr. MACWHIRTER, A.R.A., who prefers scenes which owe their formation to violent conflicts of nature, or which still are visited by storms and rude forces. His *View from the Summit of Goatfall* is mild enough for the moment, but we can easily imagine—indeed we cannot look at it without imagining—a wild tempest raging over it. This picture was shown, if we remember rightly, at the last exhibition in Edinburgh.

Among the more strictly Scottish landscape painters, Mr. McTAGGART, R.S.A., occupies perhaps the most honoured position. A fair average of his work, unambitious but true to a simple poetic conception, are his *Sea-birds' Eggs*—an old fisherman in the stern of his boat seated with a child on his knee and a basket of eggs at his side—and his *Message from the Sea*—some children digging on the sands of a sea-shore and finding a message in a sealed bottle. This last picture has been presented to the permanent collection in Dundee by its munificent citizen, Mr. ORCHAR. Mr. McTAGGART contributes two other landscapes and a portrait of a lady, *Mrs. Lawrie*, in which there is perhaps more of the landscape than the portrait painter, particularly in the treatment of her dress. Mr. LOCKHART'S *Gil Blas relating his Adventures* we noticed at the time of its exhibition in Edinburgh. It is an extremely able work in many ways. Of Sir NOEL PATON'S *Oberon and the Mermaid* it is needless to say that it is entirely in his usual manner, and that a manner which does not commend itself to the fashion of the present day. Mr. J. E. HODGSON, R.A., sends a characteristic sketch of a marine *Off Duty*. Mr. ERSKINE NICOL, A.R.A., aims, as usual, at pathos in a scene of simple life. This time the picture is entitled *The Empty Frock*; but the poor mother is really ghastly, and not all the skill of brush which this painter commands can rescue the work from its want of true poetic feeling. Mr. R. W. MACBETH, A.R.A., is eccentric in the choice of his subject, *Phyllis on the New-made Hay*. We look down across the back of a cart-horse drawing to the front a load of hay, on the top of which is PHILLIS, enjoying the admiration of two swains lying sunk in the hay beside her. The figures are, of course,

beautifully conceived and painted. Indeed, the whole work is finely executed; but though the artist has done everything possible to reduce the apparent size of his load of hay, it still looms far too large. Mr. HUGH CAMERON is another of the Scotch academicians who never fails to present us with a modest, well-conceived, and simply-treated subject. We may instance his *Mother's Quiet Hour, At Her Toilet*, which is rather sketchy, perhaps; *A Scotch Lassie, Spring and Autumn*, and *Playmates*. Along with Mr. CAMERON'S work we may study the *Crab Fisher's Bairns*, by Mr. R. G. HUTCHISON. Mr. JOHN BURR has a different manner, though selecting the same class of subjects. His *Wayside Flower*, a girl standing in front of the edge of a cornfield, the straight stalks of which form a background to her, is skilfully conceived and painted. His *Boys Going Unwillingly to School* is clever in idea, and treated with a fine sense of harmonious colouring. Mr. GAVIN, R.S.A., by whose death the other day the Scottish Academy has lost an able member of its body, is noticeable by his *Flower Mission*, representing two young girls visiting a child's bedside in the bare ward of a hospital, and taking with them flowers to the patient. For the sake of art we could heartily wish the young girls with their flowers to be out of the picture. They are too fashionable to be in keeping with the scene, and in truth they are not at all well conceived or treated by the painter. But his bed and patient, and the bare hospital walls, are rendered with true poetry of conception and great technical skill.

Amongst other paintings that are marked by good workmanship, and more or less of poetic conception, we may mention *Crail Harbour*, by Mr. JAMES S. ORCHAR; *A Summer Breeze*, by Mr. D. FARQUHARSON, A.R.S.A.; *On the Banks of the Spey*, by Mr. BEATTIE BROWN, A.R.S.A., and *Rough Weather*, by Mr. JAMES CADENHEAD.

Water-colours form a considerable section of the exhibition, and include a fair number of really good works. Where only a somewhat hasty inspection was possible it may seem invidious to single out some for praise. But as it happened we were struck in passing with, among others, Mr. HERMANN TENKATE'S *Gamblers* and his *Refighting his Battles*, both treated in the hereditary Dutch manner. The *Gamblers* appeared to us the better of the two in the idea and general plan. *Christmas Time*, by MARIE TENKATE, is another good picture. Next to it hangs Miss CLARA MONTALBA'S *Choir of St. Mark's, Venice*, a somewhat sketchy performance; and *A Venetian Girl*, by Miss ELLEN MONTALBA, a good and characteristic piece of work. Miss LINNIE WATT has sent several coast-scenes, which will amply maintain her reputation for thoughtful, careful work devoted to scenes selected with fine feeling. See, for example, her *Breezy Day* and *Charmouth Beach*. GIUSEPPE FERRARI has a clever sketch of *A Neapolitan*. Mr. F. LOCKHART'S *Cambuskenneth Abbey* is good in many points, though we could have wished to see the river in the foreground better painted. On the whole, taking water-colours and oil pictures together, we may conclude that the people of Dundee are again fortunate in having secured for their gratification so good an exhibition.

#### M. RYDBERG ON CLASSIC ART.

A GREAT work of art is not intended to give delight to one age or to one people, and there need be little surprise when a Swedish journalist is found investigating the character of ancient sculpture. A man of that class is not likely to be fettered with conventional rules as to what is good in art, and whether he is right or wrong in his conclusions there is a chance of hearing something from him that will express the impressions which are made on an intelligent mind. M. VIKTOR RYDBERG made his first visit to Rome in 1873, and he spent several months in studying the sculpture. It is not perhaps surprising that the busts and statues of the emperors should become more attractive than works of a higher class to a writer who has a deep concern in political institutions which, although existing in the far north, shows signs of the influence of old Rome. A large part of M. RYDBERG'S work is devoted to a consideration of the character of some of the emperors, and it expresses the thoughts which are suggested by the imperial portraits. This part we shall not consider at present. In addition to the portrait sculpture, M. RYDBERG selects a few ancient statues as subjects for the exercise of his speculative talent.

The first is the *Venus of Melos*. He enters at some length into the history of the discovery of the statue in 1820 in the garden of JORGOS, and of the proceedings through which the Louvre was enriched by one of the greatest of the surviving Greek works. The narrative suggests the difficulty of obtaining accurate observation—a difficulty of which law courts have constant experience. The statue was seen by several people soon after it was exhumed from the niche, but there is much discrepancy between their descriptions. LOUIS BREST, the consular agent, who was the first Frank that saw the statue, and, in fact, negotiated its purchase, always said that when the statue was found the left arm existed; that it was slightly raised, and held an apple. According to another account, BREST said that the left arm was outstretched, while the right arm followed the contour of the body and caught the drapery, as if to prevent it from falling. So much interest was taken by BREST in the statue, which was secured by him for France on his own responsibility, that it might be assumed the details of the figure would be indelibly engraved on his memory. His description was partly confirmed by the son of the discoverer, who lately informed M. JULES FERRY that when JORGOS found the statue it stood upright, with the left arm outstretched, and an apple in the hand; but the son was uncertain about the right arm. M. DUMONT DURVILLE, a *savant* engaged in an exploring expedition, who saw the statue within a month of its discovery, records, in a description which he wrote in 1821, that the left hand held an apple, and the right grasped a garment which fell carelessly from the hips to the feet. But he acknowledged that both the arms had been removed. His companion, a major of marines, however, maintained that it was erroneous to say that both arms existed, for the right forearm was broken at the elbow, and the forearm was not visible. According to the major, the left arm was raised in the air and held an apple. It will be evident from the preceding statements that there was more or less agreement about the left arm having been attached to the body, and that it held an apple. But a letter has been preserved in which BREST announced the discovery of the statue, and in it he states that the arms of the statue were broken, but that in the niche, among other fragments, were a piece of an arm and a mutilated hand, which held an apple. It was afterwards concluded, after a special investigation, that the arm and hand could not have formed part of the statue in its original state.

On the strength of such evidence it would be unsafe to conclude that the sculptor of the Melos *Venus* represented the Deity holding the apple which was adjudged to her by PARIS; and it might be added that not one of the various proposed restorations has been able to secure general acceptance. Whether it was a VENUS that appealed to soldiers, and held a lance, an helmet, or a shield, or a VENUS that had become an historian, and was inscribing the names of brave men upon a tablet, a boudoir VENUS admiring herself in a mirror, or whether it was not a representation of some other being more noble than VENUS is likely to remain a subject for speculation which will engage many a student besides M. RYDBERG. His hypothesis is akin to that of Dr. MILLINGEN, who was the first to suggest that VENUS was holding the shield of MARS, which theory was afterwards modified so as to make VENUS be engraving warriors' names upon the shields. M. RYDBERG supposes that the statue refers to an action which might have taken place immediately afterwards. Let us suppose that the names have been cut upon the shield by VENUS. It would then be appropriate enough for the goddess to raise the shield, and turn the face outwards in order that the record might be visible to the Melians. The figure would thus become an incentive to the patriotism of the islanders. But for the acceptance of this hypothesis it is necessary to consider one action in connection with another. We must have what the lawyers call a condition precedent, and admire the statue, not only for the skill with which the shield is displayed, but for the subtlety with which the act of writing the names is suggested. The goddess no sooner completes the list of the warriors than by a sudden impulse she raises the shield, and in the excitement of the moment is indifferent to the *négligée* folds in which her drapery falls. It raises a large question as to how far a statue that was incomplete unless something was granted would be in accordance with the practice of the Greeks. If VENUS had been described as writing on a shield there would be reason in the pose, but in any case it is difficult to understand why VENUS was in so great

a hurry to show her writing that she could not find a moment to arrange her drapery. M. RYDBERG'S theory is ingenious, but it is not more likely to prevail than others which are more prosaic.

M. RYDBERG next endeavours to explain the sadness of countenance which characterises the statues of ANTINOUS. Was it suggestive of the melancholy of a youth who knew he was doomed to an early death, or has it more to do with the expression of some legendary myths in the form of ANTINOUS? The key to the mystery is supposed to be found in a group which is now in the museum of Madrid. It represents two youths near an altar looking intently downwards, as if an abyss were before them, and one of them had been summoned to enter. TIECK, the sculptor, interpreted the figures to be ANTINOUS and HADRIAN, and he was followed by Professor FRIEDRICH, and to some extent by BOTTICHER. M. RYDBERG gives to the figures a more ideal character. According to him, it is not merely the emperor and his favourite that is represented. The ANTINOUS, he believes, is suggestive of NARCISSUS, and thus indicates a soul that contemplates the mystery of life, while the companion figure may be a symbol of death or of immortality. It is related that ANTINOUS drowned himself in order to avert some calamity from the emperor. He would thus become a type of self-sacrifice. RAPHAEL was moved by the legend; and some say it is ANTINOUS which is commemorated in the figure of *Jonah* that is seen in the Chigian Chapel in the church of S. Maria del Popolo in Rome. The ANTINOUS of art, according to M. RYDBERG'S interpretation, would be the embodiment of a greater variety of character than is commonly found in man. Beauty and vigour are combined with mysticism, and youth has the gravity of a philosopher. When masquerading as BACCHUS, he recalls HAMLET. ANTINOUS is far removed from the manliness that is seen in the Parthenon friezes and in the best works of Greece, a manliness that did not trouble itself with speculations on the uses of this world. That it was possible to create so strange a type is evidence of the influence of a different ideal of life. A figure of this kind may be said to correspond with much that is expressed in modern poetry and philosophy, and pessimism can find something congenial in the contemplation of the statues of ANTINOUS.

#### PARIS NOTES.

IMPORTANT changes are about to be made in the organisation of the Ecole des Beaux-Arts. Henceforward all students, no matter to what particular branch of art their attention is specially directed—whether painting, sculpture, or architecture—will be obliged to gain a certain amount of knowledge in the other two. As to the question of the *ateliers*, which has lately given rise to discussions of a very lively nature in the press as well as in art circles, it has been decided to maintain them. In addition to the regular courses of lectures delivered by the professors in the Amphitheatre, there will be eleven studios, three each for painting, sculpture, and architecture, and two for engraving. The Superior Council charged with the superintendence of the school is likewise to be reconstituted, and will henceforth consist of the director, five members—either painters, engravers, sculptors, or architects—named by the Minister of Fine Arts, and five of the professors freely elected by their colleagues in general meeting.

The Municipal Council is earnestly carrying into execution its great and worthy scheme for the creation of technical schools in the Paris metropolis for the principal branches of industry. The next to be opened under its auspices will be one in the Rue de Reuilly, devoted to furniture and cabinet-making; while another for affording instruction in work of a precise and delicate nature—or in what are well termed by the French *industries de précision*—such as optical and mathematical instruments, telegraphic apparatus, fine machinery, watch and clock making, surgical instruments, &c., is being installed in the Passage Saint-Pierre. Finally, the City authorities have lately purchased an extensive plot of ground lying between the Avenue d'Italie and the Rue de Gentilly, upon which it is intended to construct a great block of educational buildings, including an infants' school, an elementary school for boys, another for girls, and two technical schools—one for each sex. That for the youths will, like the one already opened in the Boulevard de la Villette, be devoted to giving instruction in the varied iron and wood industries. It will take in every branch and

application of these trades, including the cutting, distribution, and use of materials, and will thus form an invaluable nursery for practical builders.

The vacant frame of one of Meissonier's pictures at the Triennial Exhibition in the Palais de l'Industrie has now been filled up. It is entered in the catalogue under No. 501 as *The Arrival of the Guests*, and represents the courtyard of a Louis XIII. château with about twenty figures, some on horse-back and others alighting from carriages, with the host receiving them on the top of a flight of steps.

M. Auguste Arnaud, an artist who at one time enjoyed considerable celebrity, has just died suddenly in Paris. He will be chiefly remembered for his *Vénus aux Cheveux d'Or*, and for the statues of an *Artilleryman* and *Light Infantry Soldier*, erected on the Pont de l'Alma.

Owing to the decision lately taken by the Municipal Council, that the new Hôtel de Ville shall be lighted throughout by electricity instead of gas, as originally proposed, much labour and money will be absolutely thrown away. The meters, pipes, &c., for gas have, unfortunately, been already laid down almost throughout the immense building. These will not be removed, being left as a reserve in the event of anything happening suddenly to the electric light, but the floors all have to be taken up again in order to lay down the wires, for which also channels must be made in the thickness of the walls and arches. The system of electric lamps adopted is particularly convenient, inasmuch as each globe can be moved a distance of 6 feet 6 inches in every direction without interfering with the distribution of the light. To allow of this a coil of the conducting wire is wound round the foot of each lamp.

M. Ferdinand de Lesseps, acting, of course, on behalf of the Panama Canal Company, has hit upon a novel and ingenious way of bringing that gigantic undertaking clearly before the Parisian public, to whom he looks in great part for the necessary funds to carry it into execution. Some time ago he commissioned MM. Rubé & Chaperon to paint a panorama of the proposed canal and the country through which it will pass. The work is now finished, and has been erected above the offices of the Canal Company. The opening ceremony took place last week, when M. Dingler, the chief engineer in charge of the works, delivered a lecture explaining the plans and method of working adopted. The panorama is pronounced by competent critics to be a very faithful representation of the course of the canal, and is, moreover, well executed. It is to be open free to the public, and will doubtless in great measure fulfil the expectation of M. de Lesseps, by popularising the idea of the interoceanic waterway, to the realisation of which the great projector is now devoting his energies.

In accordance with a resolution passed in July last by the Municipal Council, the Director of Public Charity (de l'Assistance Publique) has just purchased for 12,000*frs.* the château and park of Brevannes, in the commune of Limeil (Seine et Oise). This property, which contains about 19 acres of fine park-land, is to be turned into an asylum for the aged of both sexes. The accommodation thus provided will set free 250 beds in the various Paris establishments of the Assistance Publique, whose means of usefulness will thereby be enormously increased.

At the quarterly general meeting of the Institute, held last week, the great biennial prize of 20,000 *frs.* was awarded to M. Meyer, Director of the Ecole des Chartes, by 48 votes against only 7 obtained by M. Maspero, Director of the Boulak Museum at Cairo. The successful candidate had been nominated by the Académie des Inscriptions et Belles-Lettres; to whose turn it fell this year to recommend a recipient.

#### ART EDUCATION IN ENGLAND.

AN address was delivered by Sir Rupert A. Kettle, as president of the Art Department of the Social Science Congress at Huddersfield, in which the progress of education in art in this country was reviewed. Sir Rupert said that art education had been under discussion for the last fifty years, but we had not arrived at a consensus of opinion as to the best mode of establishing a national system. Fifty years ago we spent more money in purchasing works of art than any other nation, and at that time the popular taste was only just beginning to rise from its very lowest level. The enormous increase of national wealth which followed the introduction of the steam-engine produced great changes in

the state of the arts, for as men grew rich they surrounded themselves as their predecessors in estate had done with works of art and art work. Though some of the achievements of our native artists ranked among the finest productions of any age or country, the works of foreigners were preferred. Of pictures alone more than 1,000 were annually entered inwardly at our Custom House in the ten years after 1835; while the sales at the Royal Academy Exhibition produced in each of these years not so many hundreds of pounds as they now produce thousands. As the supply of genuine objects was exhausted, the trade of imposition set in. This even would not have aroused public opinion in favour of art education had not we been dependent in those manufacturing trades in which the elements of taste entered upon foreign designers for patterns. In the course of time foreigners sent us the manufactured articles instead of the patterns, and it was not a year too soon when, in 1835, Parliament tried to extend the knowledge of the arts and principles of design among the people, and especially the manufacturing population of the country.

With the Great Exhibition of 1851 began our present comprehensive system of art training. We have as part of our ordinary system of elementary education in our voluntary and Board schools, each year, no less than 600,000 young persons of both sexes under instruction in drawing. This includes between 12,000 and 13,000 pupil-teachers. The pupil-teacher, when he has served the requisite time under a certified master, passes on to a training college, where drawing is continued. To obtain a certificate as a class master, a candidate is required to be much more advanced in art than an ordinary schoolmaster—he must pass a much more severe examination. The masters of the art schools are subjected to a much longer and much higher training than certified class teachers. To the large number who learn drawing in our ordinary elementary schools must be added at least 200,000 pupils each year under more or less advanced art education. Of all classes there were upwards of 800,000 pupils under actual instruction last year. The direct payment out of public funds was 53,441*l.* and 39,198*l.*—less than half a crown per annum per pupil. Of course these payments are supplemented by private contributions and school fees. There is no considerable town in England now without a school of art, and in almost every large village there is an art class. Having perfected his knowledge and skill in what is strictly school work, the pupil has acquired the art of freehand drawing. So far his progress is imitation, without invention—without imagination. This is the end of the elementary part of his art education, and the foundation upon which all true art training must be based. Freehand drawing, then, is an art, although not of that class which is called a fine art. It is the rudiment of pictorial art, and, to a certain extent, of plastic art also—the two important branches of the fine arts. A man who has been trained in freehand drawing, when he wishes to describe any object, can pictorially represent that object. In a manufacturing country, the advantage of this, both to employers and workmen, cannot be over-estimated. We are every year giving this faculty, in a greater or less extent, to upwards of half a million of our working classes. This benefit is, of itself, worth all the money expended upon it. More failures than we might expect occur in the higher departments of study. Failures may arise from pupils going up too early, or the examinations being too stiff. This state of things does not affect the result of our substantial success in teaching freehand drawing. It is much to be regretted that the first impression of the public, when national schools of design were opened, was that it would be possible at once to teach design, without going through the laborious and somewhat dilatory process of thoroughly learning freehand drawing.

There is educational use in our museums and galleries. General art culture is a direct mode of creating a pure public taste. The trained weaver will know artistic metal work when he sees it. The potter who has learned to love his beautiful vases and plaques will see when a chair is graceful or a wall-paper appropriate. There was, and is, the great public to be taught to appreciate art so far as to be able to select that which is beautiful, and to reject that which is ugly. Beauty has an almost infinite variety of phases, and does not present itself to all observers in the same kind or in the same proportion. If a hundred or a thousand persons see a beautiful object, they know it is beautiful. Difficult to describe concisely, it is almost impossible to communicate a knowledge of it orally. A critical knowledge of beauty can only be taught by example. Hogarth first laid down his "line of beauty," and then made his graphic illustrations in conformity or contrast with it. South Kensington has been subject to merciless and persistent jeers and scoffs. But it has grown beyond the reach of satire. Occasional mistakes may have been made. The general result is a triumph to its founders. Broken up and sold at Christie's, the articles bought with public money would realise a total sum more than double their cost. The donations and bequests of Dyce, Forster, John Jones, Ellison, and Sheepshanks gave evidence of the approval of, not only competent, but eminent judges of art of the institution. If the museum has done nothing else, it has certainly created a sounder knowledge and fostered a better taste among our wealthy middle class. It is, in connection with the art college that its educational influence is most directly felt. There is not a designer in any branch of trade, who has mastered the

principles of freehand drawing, but can find in the museum an exemplar to guide him in his work. It is inevitable that rival artisans from abroad derive their inspiration from South Kensington equally with our own countrymen. Ample provision is made for the exhibition of examples in the great seats of industry in the country as well as within the stationary museum in London. Loans of objects for one year, changeable periodically, are made to permanent museums established and controlled by municipal corporations. By the National Gallery (Loans) Act, 1883, the trustees of that institution have now power, under certain restrictions, to lend pictures for the purpose of local exhibition. We have also always open among the silk-weavers in the poorest part of London the Bethnal Green Museum. Our great provincial towns, too, have given to their art schools the aid of museums of examples and picture galleries. Enough, then, is being done to educate the public taste. The highest object of study is pure art, the production of works intrinsically beautiful or beautiful by association, apart from any special purpose they are to serve or use to which they may be applied. In cases where it is wise to train pupils in the highest department of art, our Government college cannot give the best training. The system of the South Kensington institution seems more adapted to applied than to pure art—to what are called the decorative, the ornamental, or, lower still, the industrial arts. The *genius loci* calls up an indistinct idea of an indefinite something which draws the mind from the art itself to its saleable value. The Royal Academy has of late years carried on a most important educational work at Burlington House. Many students prefer the Royal Academy to South Kensington. The Academy—a private corporation—does for this country what is done in France by the Ecole des Beaux-Arts, a State-supported institution. It also does much work that is done, upon payment of large premiums, in the *ateliers* of foreign artists. At the present time there are 413 students on the books—22 sculptors, 176 architects, and 215 painters. The Academy spends of its own money nearly 7,000*l.* a year upon its schools. South Kensington should draw the line more distinctly between art pure and applied art. The latter is a work quite as onerous, and, all things considered, more extensively useful than the former. Pure art and applied art should be kept distinct, as far as is convenient in practice, and always in thought. If the distinction suggested were now carried out, we should expect to find among the gold medallists of the department—as being probably the most competent pupils—a greater proportion of designers and fewer drawing pupils than among the silver medallists, and so among the silver over the bronze. But what is the fact? In 1882 there were ten gold medals awarded, four only for design work proper. There were forty silver medals awarded that year. Of these, one-half only were for design. One work for which a bronze medal was awarded was for studies treating natural objects ornamentally. Almost all artisan pupils desire to become painters. Many a good art workman is lost without being replaced by an artist. Our local schools of art receive annually large contributions. A part might be usefully devoted to forming special classes in which artisans who had mastered the elements of art knowledge, and acquired skill in execution, could be taught the practical application of their knowledge to trades. They are so taught in other countries. This can be best accomplished by dividing the subjects into classes. They may be classed as—1, pictorial; 2, plastic; 3, textile. These can be subdivided according to their uses. Art objects are either decorative or decorated. Decorative objects should be intrinsically ornamental, self-contained, and complete, not dependent upon extraneous aid for their effect, but beautiful in their own form, colour, and sentiment. Decoration is something applied; the object to be decorated is the first consideration. It is in teaching the designer to conventionalise natural forms that the aid of the trained eye of the master is required. The institutions founded by the great chartered companies of the city of London seem admirably suited to carry on this work. Since 1851 we have made most satisfactory progress in all those staple industries which require taste and art knowledge for their success. We are producing not only the best decorative ceramic ornaments but the most beautifully decorated useful pottery in the world. Our metal work, from cathedral screens to domestic brasses, is a manufacture of which we may be proud. Without speaking of the special manufacture revived in Venice, no country has at any time produced such pure, brilliant, flint glass as the English makers now give to the world. As to design, whether in cut, engraved, or moulded glass, whether in rock crystal, or cameo work, no such art glass was ever before seen as that which is now being produced in England. The work of English artists has wonderfully improved in drawing and in careful attention to accuracy of detail; and this has been effected without impairing the boldness and perfect freedom of touch which is characteristic of the best masters of the English school. This improvement is due to the fact that so many of our best painters have been pupils at Burlington House. The progress in refinement and purity of taste among the general public during the last forty years has not been so satisfactory as the improvement among the professors of the different branches of art. The impediments to progress in the former case have been greater, more obstinate,

and more difficult to assail. When the attack upon vicious taste began, King Sham and his kinsman Rococo had long been in possession of the field—they were firmly established. Vested interests die hard. Even down to our own day the forces opposed to good taste have considerable vitality, and, by accidental accretion, occasionally form themselves into something like organisation. They erect a barricade of fashion, and defend themselves behind it. At one time it is the reconventionalised hyper-conventionalism of the Japanese that is brought into fashion. At another time work in genuine old Dutch taste, corrupted, is called "Queen Anne." The revived taste for church ornaments is pushed into ecclesiasticism. By the hold which historical associations always has upon English sympathies, the taste of the middle ages is inflated into mediævalism. And now a weedy variety of conceit run to seed is called æstheticism. True taste will not always yield to the breeze—literally the puff—of fashion. By vigorously pursuing the course upon which we have entered, and closely attending to directness of aim and object, we shall in time found upon a true standard of beauty and fitness a distinctly national and pure style of decorative art.

### ITALIAN SCULPTURE AT SOUTH KENSINGTON.

A DESCRIPTION of some of the examples of Italian sculpture lately secured by Mr. J. C. Robinson for the South Kensington Museum has been contributed by that gentleman to the *Times* :—

It will be convenient, he says, in some cases, to take specimens together, whether obtained for South Kensington or Birmingham—that is, when the objects seem to illustrate each other. Thus, one of the most notable works obtained for South Kensington in 1881 is a marble frontal of an altar or shrine, which there is every reason to believe is nothing less than the original front of the shrine of the famous mediæval saint, Santa Chiara (Clara) of Assisi; and one of my recent acquisitions for Birmingham is a Greek marble sarcophagus of the ninth or tenth century, of great size, which I think also will be found to have been a shrine for the relics of a saint rather than an ordinary sepulchre. If this be so, it will be the third monument of this nature which I have had the good fortune to bring to this country. The other example is the sarcophagus shrine of Santa Giustina, of Padua, an authentic work of the immortal Donatello, which was obtained in the neighbourhood of Padua in 1879.

In mediæval periods the shrines of saints were sometimes monumental structures, standing detached and complete in themselves, and sometimes they were enclosed within or actually formed the body of altars—often the splendid high altar of the church built in honour of the saintly personage. Very few examples of either kind of these shrines have come down to us in their original unaltered state. The influx of wealth from devout worshippers, and the never-ceasing desire to do greater honour to the saint, in nine cases out of ten caused the primitive structures to be remodelled, added to, and embellished, or even reconstructed from age to age, on scales of ever-increasing magnificence. Thus the earlier or primitive receptacles provided for the saintly remains were more often than not, in the long run, discarded. Stone and marble were replaced by bronze, silver and gold, florid metal work, marble inlays, mosaics, gems, and enamels. This was doubtless the fate of the three monuments now in question. As regards two of them, indeed, their exact place and position in former times are known, and not improbably further research will reveal the original *provenance* of the third. A word or two more about mediæval shrines, and a reference to examples still to be seen *in situ* will assist your readers in forming a clear idea of the nature of the monuments in question. In this country we have two ancient detached shrines of great archæological interest—King Edward the Confessor's shrine in Westminster Abbey and the recently-discovered and reconstructed shrine of St. Amphibalus at St. Albans. Of the one paramount structure of this kind, which once adorned this country, the shrine of St. Thomas at Canterbury, the wonderful descriptions are all that remain to us. The Arca di San Domenico at Bologna, and the famous shrine of St. Antonio at Padua, are perhaps the most sumptuous and admirable of the detached shrines now extant; while the Roman churches supply some notable examples of shrine-altars, if I may so call them. In that most Catholic country, Spain, I can call to mind only one notable mediæval detached shrine—that of San Vicente at Avila. Donatello's sarcophagus shrine of Santa Giustina, already alluded to, after having, in all probability, for more than two hundred years contained the bones of the sainted princess and patroness of Padua, was summarily discarded as a rough, old-fashioned, and unworthy receptacle, utterly regardless of the infinite beauty stamped upon it by the genius of the peerless fifteenth-century sculptor. Early in the seventeenth century—the age of florid decadence—a huge and costly high altar of precious marbles, gilded metal, and mosaics rose above the spot it had occupied; Donatello's work was doubtless sent as useless rubbish to the mason's yard, and probably it is only by some mere accident that

it escaped being sawn up and used again as waste marble. In any case, it was found only three or four years since in a vineyard without the walls of Padua, with its sculptured face hidden against a wall, and doing duty as a horse-trough. The marble frontal of Santa Chiara, on the other hand, was obtained in 1881 from a Florentine dealer, who had recently found it in the possession of a marble mason in the neighbourhood of Assisi, and the real nature and origin of the work were unsuspected until it fell into my hands. The world-renowned mediæval ascetic, St. Francis, founded his community at Assisi early in the thirteenth century. His teaching and example inspired with the like religious fervour a noble young lady of the district, by name Chiara, destined also to obtain the honours of canonisation, and to become the founder or patroness of a religious order. As I am writing in the country, without any means of reference at hand, I must beg to be excused if there should be any slight inaccuracies in my facts and dates; but I believe Santa Chiara died some time before the middle of the thirteenth century, shortly before her patron and instructor, St. Francis. The rapidity with which the doctrines of St. Francis made their way throughout the civilised world, and the fervent enthusiasm which caused the immediate construction of the magnificent church dedicated to him at Assisi, are well-known facts of history. Everybody knows that the famous monastery speedily became a very temple of the arts, and that immediately, and for a century or two afterwards, the contributions of myriads of pious devotees, freely expended on frescoes and sculpture, attracted to Assisi the services of the most eminent painters, sculptors, architects, and other art-craftsmen of Italy. I am under the impression that St. Francis himself began the building of a church at Assisi to the memory of his friend and pupil; at all events, the church of Santa Chiara in that town, which still exists, though much altered and modernised, was completed in 1253. The architect was Fra Filippo di Campello. The body of Santa Chiara was placed under the high altar, where, I believe, it still lies, and in all probability the shrine frontal now in question was designed, and perhaps even actually executed, at the time by Fra Filippo himself.

I have not been able to visit Assisi to verify the present status of the altar-shrine, but I believe the original receptacle and its surroundings have been done away with and replaced by florid seventeenth-century work. There is no record as to when the present slab, which doubtless formed the side or front of the high altar, within or under which the body of the saint was deposited, was removed, but that such was its original place is sufficiently indicated by the following inscription, cut in finely-formed Longobardic characters on a band or fascia along the upper edge of the slab :—

Vita præclara  
Refulges nomine Clara.  
Norma reclusarum;  
Speculum sine tæbe clarum!  
Inclita cunctarum  
Christi jacet hic famularum.

The sculptured decoration, in bold relief, consists of an arcade in eight compartments, five of which are filled in with beautiful foliage, springing from vases and birds, the other three with figures of six-winged seraphim standing on flowering plants, and with the symbols of the Evangelists St. Mark and St. John. In the upper part the spandrels of the arcade are filled in with seated figures of winged angels. The work is highly finished and masterly, and the foliated ornamentation is of most elegant and original design. Reminiscences of the Classical acanthus type are apparent, and the manner in which the vertical foliated stems spring from vases and animal forms shows a clear affinity with earlier types in the mosaics of Ravenna and other Romanesque sources. Nevertheless, new and vigorous motives and style are still more obvious. The *genius loci* had evidently stimulated a new enthusiasm in art as in religion. Apart from its archæological interest, then, this work has a high value as an authentic evidence of style in Italian ornamentation of a definite period and locality. The sarcophagus recently obtained for the Birmingham Museum is an older work, I think not later than the eleventh century, and it may be much earlier. It was obtained in Venice, almost at the moment of my departure, so that I had no opportunity of examining it with sufficient attention, nor of transcribing a Latin inscription, which in deeply-cut Longobardic letters, 3 inches or 4 inches high, runs along the upper margin as in the previous example, but extending in the present work all along the four sides. This sarcophagus, in large grained Greek marble, may be described as a massive rectangular or altar-shaped trough, hollowed out, the cavity capacious enough to contain the body of a man; its shape is thus similar to the shrine of Santa Giustina, already described. The four sides are finely sculptured with foliated and interlaced ornaments, of Romanesque or Byzantine type, and in general style and appearance the work somewhat resembles the very ancient well-head from Murano, obtained the year before for South Kensington. There was some mystery as to the exact *provenance* of this sarcophagus. It is understood to have been acquired at Torcello; there can be no doubt, in any case, that its original place was somewhere in the immediate neighbourhood of Venice.

Somewhat similar in style to the ornamentation of the Santa Chiara frontal are two beautiful portions of shafts of twisted

columns, richly sculptured with foliage and boy angels. These were obtained in 1881 from Pisa, and they were said by the vendor to have formed portions of a monument, originally extant in the cathedral, of the class and character of the famous pulpit, the work of Nicola da Pisa, which is one of the chief glories of that famous church. I am not aware if any authentic record exists of the existence, at a former period, of any such structure in the cathedral, but it is by no means improbable. Certainly no respect for art or antiquity would have weighed with the ecclesiastical Vandals of a century or two ago, any more than with modern "restorers," if the place occupied by any ancient monument of obsolete use were required for some new purpose or more showy erection. From a careful consideration of these shafts, and judging from various indications, I come to the conclusion that they were portions of the supporting columns of a baldachino or altar canopy, such as may be still seen at Sant' Ambrogio at Milan, St. Mark's in Venice, and, more familiar still, in Bernini's celebrated bronze baldachino over the high altar of St. Peter's in Rome. The supporting columns of the latter work, it will be remembered, are twisted and wreathed round with foliage, &c., doubtless in imitation of earlier types, such as the present specimens. Although the boy angels or *amorini*, to be seen playing among the acanthus foliage, which runs spirally around these shafts, have unusual life and freedom of movement, and at first glance have a somewhat modern aspect, I do not think the work is later than the first half of the fourteenth century. This advanced style, in fact, is an evidence of the remarkable revival of art based on direct imitation of the antique, brought about at this early period, by Nicola Pisano and his immediate scholars. That the sculptor of these fragments was a great master of his art is patent; it would be no unlikely conjecture, indeed, to ascribe their authorship to Andrea Pisano. Spiral or twisted shafts and columns are characteristic motives of Italian architecture and ornamental design, at nearly all periods, and they are familiar to the traveller in hundreds of examples of varied application; but it should be noted that this favourite motive is mainly confined to Southern Italy and Sicily, and that, except as regards the late florid adaptations of the sixteenth and seventeenth centuries, it is seldom to be seen in Italian architecture north of Florence. Rome was probably the original seat of inception of the idea, and the earliest examples of twisted columns are to be sought in debased Classical work of the Lower Empire period. A curious chapter might, indeed, be written upon twisted columns. In Spain, for instance, during the sixteenth and seventeenth centuries, a positive mania arose for this sort of column, then commonly known as "pilares Salamonicas," and they were regarded as a specially ecclesiastical and sanctified type, from a strange notion that Solomon's Temple at Jerusalem was adorned with them. That this idea also prevailed in Italy is evidenced by the fact that Raphael, or rather Giulio Romano, has introduced splendid twisted columns as the chief decoration of the "beautiful gate" of the temple in the well-known Hampton Court cartoon.

Two other examples of twisted shafts were among my gatherings in 1881. The more notable of the two is a very elaborate and beautiful column of white marble, the spiral convolutions elaborately moulded with reeded and channelled work. This shaft, which is about 6 feet high and 8 or 9 inches in diameter, is complete with the exception of the capital. I found it in a stone-mason's yard outside the walls of Rome, and I believe that it was originally a detached column or candelabrum, to support the Paschal candle, in one of the old Roman basilicas. Although of fine execution, the work is of early period, dating, perhaps, as far back as the eighth or ninth century.

Undoubtedly the most important of my recent gatherings is the sculptured pediment or *tympanium* from the great western doorway of the now desecrated Abbey of La Misericordia at Venice, a masterpiece of the famous Venetian sculptor Bartolommeo Bon, the author of the capitals of the Ducal Palace. This church, to the discredit of the Venetian Municipality, is now being destroyed piece-meal.

### THE ROYAL SCOTTISH ACADEMY.

ON Saturday last Mr. Perigal, R.S.A., responded to the toast, "The Royal Scottish Academy," at the luncheon which followed the opening of the Dundee Fine Art Exhibition. The Royal Scottish Academy was, he said, founded fifty years ago, and was now in a very prosperous position; very different, indeed, to what it was in early days. Contrasting their present galleries with the modest rooms in Nicholson Street, where the first exhibition was held, they felt they owed a deep debt of gratitude to the first members, and to the artists, and to the friends of art who assisted them in founding the Royal Scottish Academy, such as the late Mr. Hamilton, architect; Mr. Nicholson, then the secretary; and others. When he looked back on those days and compared the state of art in Scotland some forty or fifty years ago with its condition now, they had indeed good cause to be proud. The present generation of artists were as clever comparatively, and the prices they obtained for their works were very many times greater.

The Royal Scottish Academy had done, and was doing, good in diffusing the love for the fine arts, and elevating and improving the tastes and morals of the people. They supported a school for study from life free of expense, awarded prizes besides, and gave the students such an art education as could not be had elsewhere in Scotland, and hitherto without any aid from Government grants. The fruits of this scheme were now seen in the number of annual exhibitions of pictures in provincial cities, and they were justly indebted to their wealthy merchants in the purchasing of their works. In this respect Dundee held a very prominent place, and he congratulated many of the leading men on the fine collections they had formed. The Scottish school of painting deservedly held a very high place indeed, shown by the strong mark made by so many Scottish artists in the Royal Academy of London. Still they had some left to sustain the credit of the Scottish Academy. They were most fortunate in having such efficient office-bearers in their worthy president and secretary, and others, who, he regretted, were not present that day. He was very glad to see the fine collection of works of art in the Albert Hall, which fully sustained the reputation of Dundee. He had just returned from a two months' tour in the south of Europe, and had seen many of the exhibitions of modern schools of art in Munich, Brussels, and other Continental cities, and he thought our Scottish and British schools compared most favourably with the present state of art on the Continent, especially in landscape painting. And this was somewhat to be wondered at, considering the magnificent collections of the old masters of the Venetian, Spanish, Flemish, and Dutch schools there. Scotland possessed grand and varied scenery, peculiarly fitted for the landscape painter; and the Scotch, besides being a very practical people, were really a very poetical people, and had a fine appreciation of what was good in art and poetry, so there was little fear of the future of art in this country.

### BUILDING IN GLASGOW.

AT the termination of his year of office, the Lord Dean of Guild in Glasgow reviewed the work of the court for the year, which ended on August 31. His lordship said: A year ago I had occasion to point out that from 1876 there had been an unbroken decline in the amount of work sanctioned by the court until in 1881 the report showed only a total valuation of 307,640*l.*, but that 1882 had seen the turn of the tide, the aggregate being 378,690*l.* I am glad now to be able to say that the rise has been continued, the amount in the year just closed being 594,443*l.*; and if the Municipal Building plans (which have been considered by the liners, and come before the court to-day for final decision) had been included, their valuation being 250,000*l.*, the total for the year would have been swelled to 844,943*l.* As might be supposed from the fact that a year ago 0.86 per cent. of dwelling-houses in the city were standing empty, the increase in new work this year has not been in that department. On the contrary, the dwelling-houses sanctioned in the year just closed only number 391, containing a total of 995 apartments, equal to an average of 2.55 apartments to the dwellings, as compared with 512 houses, containing in all 1,282 apartments, or an average of 2.5 apartments to the dwelling, in the previous year. It may be remarked in passing that this year's number of dwelling-houses sanctioned is the lowest yet reached since the city was so greatly overbuilt in this respect, but it is a cheering circumstance that, simultaneously with this prudent limitation of building, there has occurred an increased rate of growth in population, so that the excess of dwellings is being absorbed rather more quickly now. A year ago I could only report an addition of 1,909 to the occupied houses; but from figures kindly furnished by Mr. Nicol, city chamberlain, I find that this year the increase is 2,813. The result is that, while the unoccupied houses twelve months ago amounted to 11,804, equal to 9.86 per cent. of the whole number then in existence in the city, it is now reduced to 9,421, or 7.84 per cent. of the present dwellings—the loss of annual rental from this cause being reduced from 118,833*l.* to 100,244*l.* The lowest rented houses—say those under 4*l.* rental—appear to be most in excess of the requirements, no less than 15.4 per cent. of them being returned as empty; while of those of 4*l.* rental and upwards, the percentage empty is only 7.2. The greatest advance in the year's linings is under the head of warehouses, stores, and workshops, the valuation of these being 291,832*l.*, compared with 154,755*l.* in the previous year—showing a difference of 137,077*l.*, which may probably be fairly regarded as an indication of a sound state of business generally in Glasgow. Under the heading of "public buildings" may be mentioned the Clyde Trustees and Inland Revenue offices, 44,000*l.*; baths (three establishments), 55,000*l.*; church halls, 2,700*l.*; Roman Catholic college, 12,000*l.*; two Board schools, 20,500*l.*; and sundries, 3,800*l.*—making together 138,000*l.*, against 62,295*l.* in the previous year, or an increase of 75,735*l.* The additions and alterations sanctioned are a little higher than in the previous year, but do not call for special notice.

The New Streets, completed at a cost of nearly 100,000*l.*, were opened on Wednesday in Newcastle-on-Tyne.

## NOTES AND COMMENTS.

SIR RICHARD TEMPLE, who has presided over the Social Science Congress at Huddersfield, followed a common practice in endeavouring to bring architects into disrepute. In architecture, according to Sir RICHARD, the want of a truly artistic education was conspicuous. In whatever department of art the architect was engaged he wanted sound instruction: first, in what was known among artists as composition and effect; and, secondly, in chromatic skill and arrangement of colour. This was said after hearing a paper on "Oriental and English Art," by an architect; and it would suggest that Sir RICHARD was judging Western work by an Eastern standard. English architecture may have its faults, but would Sir RICHARD TEMPLE like to live in a house in this country which had been designed for him by an Indian?

THE usual autumn black and white exhibition has not been held in Glasgow, because it was found that last year's exhibition was not appreciated by the public. The sales of the spring exhibition of the Institute of Fine Arts were, however, satisfactory, amounting to 5,454*l*. A demand having been made by the trustees of the late Mr. A.B. STEWART for the repayment of a sum of 2,000*l*. lent by him to the Institute, the council have been compelled to sell the Institute pictures.

A PAPER on the "Sculptured Stones of Scotland," by Mr. THOMAS ARNOLD, architect, was read to the Gaelic Society of London on Wednesday evening. The writer, besides describing the general interest attached to these stones, dwelt on the Celtic art they exhibit, the indications of date from the costumes of the figures, &c., and the clear evidence of the Christian faith, not only in the Cross, but also in the groups of figures frequently associated with it. A large portion of the paper was taken up by an interpretation of the "symbols," which have heretofore been a mystery to Scottish archaeologists. Mr. ARNOLD's explanation, which applies to every known example, is very simple, and in that respect contrasts with all former theories. These symbols, as he showed, are representations of the arms, armour, and ornaments of distinction worn by chiefs, and are disposed in groups according to a kind of primitive heraldry. The principal emblems or symbols he explains thus: 1, "the crescent ornament," orbicular shield; 2, "V ornament," short pike or sword, shown as an emblem of death, if broken; 3, "Z ornament," the lance, shown broken. (In the V and Z ornaments the points and hilts are invariably very clearly distinguished.) 4, "spectacle ornament," double fibulæ to fasten the mantle of the chief; 5, "oblong figure," tunic or hauberk; 6, "the elephant figure," a conventional rendering of the lion of Scotland. Mr. ARNOLD concludes that these stones were erected during the tenth, eleventh, and twelfth centuries, and believes they mostly commemorate chiefs who have fallen in the battles with Norse invaders.

THE Paris Works Department has just published a statement of its expenditure during the ten years 1872-1881, upon public works of every kind—roads, paving, drains, water-supply, lighting, parks, promenades, and new buildings (exclusive of the sums devoted to university and college extension). In this return out of a total of 654,000,000 frs. (26,160,000*l*.) works classed as new amount to 398,000,000 against 256,000,000 spent for maintenance and repairs. The former category may be analysed as follows: Construction of new streets, 230,000,000; water-supply and drains, 47,000,000; lighting, 3,000,000; public promenades, 7,000,000; and new buildings, 110,000,000; while the repairs, &c., are divided under the heads of—maintenance, cleansing, and watering of the streets, 139,000,000; water-supply and drains, 8,000,000; lighting, 78,000,000; keeping up parks and promenades, 3,000,000; repairs to buildings, 29,000,000. In the ten central arrondissements of the city 246,705,107 frs. 62 cents was expended on new works against only 150,662,735 frs. 9 cents in the other ten outlying arrondissements, a difference of more than 96,000,000. This is, however, more than accounted for by three great undertakings—the Hôtel de Ville, the Avenue de l'Opéra, and the new portion of the Boulevard St.-Germain, which may be considered of general rather than local interest. On the other hand, under the head of repairs,

the outlying districts took rather more than the central ones, the respective figures being 131,784,897 frs. 23 cents against 123,697,595 frs. 39 cents. The new streets constructed within the boundary line of the fortifications, during these ten years, have a total length of 25,761 mètres (about 16 miles), the arrondissements most favoured in this respect being the 20th, with 4,128 mètres; the 13th, 3,693 mètres; the 18th, 3,469 mètres; and the 14th, 2,180 mètres. In the 9th no new thoroughfare was made, and in the 3rd only a small street 60 yards long.

THE Towns Improvement Committee of Newcastle-on-Tyne have been examining the public buildings in the city, in order to report upon the means of egress. Eighty-one buildings were visited, and it would appear that in the opinion of the committee there were defects in all of them—a statement which is almost incredible. Particulars of suggested alterations were sent to the persons who are responsible for the condition of the buildings, and in many cases the suggestions have been adopted.

A PARLIAMENTARY Report has been issued which shows that the advantages of water carriage in this country have been latterly ignored mainly through the influence of railway companies. The total length of canals in England is 3,085 miles. Of this only 1,445 miles are worked by purely canal companies and independent, 119 miles are turned into railways, 1,383 miles are guaranteed or owned by railways, and 188 miles are completely derelict. There are also 927 miles of waterway (principally improved rivers) held by public trusts. The subject was also treated in a paper which was read at the Social Science Congress. It was shown that in Belgium a quantity of iron can be carried for 6*s*. that in England would cost 15*s*. Steel wire is brought by water from Antwerp and delivered by a through rate in Birmingham, a distance of 313 miles, for 16*s*. 8*d*. If the waggon containing it were shunted and sent to London the charge would be 28*s*. 4*d*., although the distance is only one-third. These figures are eloquent in favour of the Manchester Canal, and there are many other towns which would be improved if the inhabitants would give attention to the old-fashioned method of communication by means of canals.

THE School of Art-Wood Carving, Royal Albert Hall, has reopened after the usual summer vacation, and we are requested by the chairman of the committee, Colonel Donnelly, R.E., to state that some of the free studentships both in the day and in the evening classes, which the committee are able to offer in consequence of the aid afforded to the school by the City and Guilds of London Institute, are at present vacant. Orders for carving are executed at the school, designs and estimates being supplied, and the committee would be glad to co-operate with architects in the execution of designs for internal decorative wood carving, a branch of the art which they especially desire to develop. The school is open to amateurs, as well as to those who intend making wood carving a profession. To those amateurs who are unable to attend the classes information can be given by letter and examples supplied. All necessary information, with forms of application and prospectuses of the school, may be obtained by personal application or by letter addressed to the manager.

A PAPER was read at Huddersfield which advocated the compulsory erection of art galleries and museums as well as free libraries. But it did not meet with approval. At present it is optional whether libraries are founded, and there is no authority for applying the rates in towns to museums. In consequence, there are very few free libraries, and when there are museums in provincial towns they are generally useless. At the same time, both libraries and museums can be made to add much to the advantage of the community. Anyone who has paid a visit to the Mitchell Library in Glasgow, or the Free Library in Manchester, will be able to testify to the crowds of people who are to be found there in the evenings. A good museum, like those in Exeter and Edinburgh, is also certain to attract a great number of people. When this is the case, it is unreasonable to suggest, as was done in Huddersfield, that the advocacy of those institutions means nothing but communism.

Our Architect, Oct. 13<sup>th</sup> 1883.

WIGMORE STREET.

## ILLUSTRATIONS.

STOODLEIGH COURT, DEVON.

THIS house, which is now building for Mr. T. CAREW DANIEL, is most picturesquely situated among the fine rolling hills of Devonshire, about six miles from Tiverton. The house is arranged in the form of the letter L, and is built of stone quarried on the estate, with mullions and dressings of Ham Hill stone. The roofs are of red tiles. The hall, 60 feet by 26 feet, with open oak roof and large hooded fireplace at one end, and an arcaded gallery (giving access to the bedrooms along two sides), forms an important feature, and has a large bay in one corner, somewhat after the manner of the old college halls. Grouped round this hall are the drawing-room, 50 feet by 20 feet; morning-room, library, dining-room, &c., the billiard and business rooms occupying the corner between reception-rooms and offices. The kitchen, scullery, larders, &c., are arranged round a separate courtyard. The archway shown on the right of the picture gives approach to the stables. Messrs. GEORGE & PETO are the architects. The contract for this work has been taken by Messrs. PETHICK BROS., of Plymouth.

NOS. 42, 44 &amp; 46 WIGMORE STREET, W.

ANOTHER example of Messrs. GEORGE & PETO's work is the building in Wigmore Street for Messrs. A. B. DANIELLS & SONS. This is built in red brick and buff terra-cotta dressings; the latter by Messrs. DOULTON. The lower or shop storey is arcaded. All the ornament is in low relief of the Early Renaissance period. In execution this building makes a remarkably effective structure. It was carried out by Messrs. WALL BROS., of Kentish Town.

ENGLISH CHURCH, TARASP.

THIS church has been erected for the benefit of the many English who frequent the baths of Tarasp. It is in a beautiful position on the mountain side. The walling is of stone quarried on the site, the mullions and stone dressings being of the hard tufa brought from the hill-tops. The tower, with gable and saddle-back roof, and with the *flèche* above, is a thoroughly Swiss feature. The building was designed so as to be in harmony with the place. The pulpit, of oak, is the work of Mr. FORSYTH. The builder, who has done his work well, is M. MICHEL, of Sûs, in the Lower Engadin.

Lady ASHBURTON contributed largely to the building of the church. The undertaking was set on foot and carried through by the late Rev. STENTON EARDLEY, by whose zeal for the church and the Engadin the English church at Tamaden was also built, from the designs of Messrs. GEORGE & PETO. Mr. EARDLEY did not live to see his work completed.

YACHT, "CUHONA."\*

THIS luxuriously-fitted boat has just been completed for Sir ANDREW BARCLAY WALKER. The purely nautical part was designed by Mr. ST. CLARE J. BYRNE, of Liverpool, and all the internal arrangement of rooms and decorations were designed by Messrs. ERNEST GEORGE & PETO, who are also carrying out the works at Sir ANDREW WALKER's mansion at Gateacre Grange, near Liverpool. The principal saloon, 24 feet by 20 feet, is richly panelled with dark oak; the panels above dado line are carved in wood, and lacquered a dull gold colour, each panel being separated from its neighbour by a fluted and carved pilaster. The ceiling was painted by Mr. G. F. MALINS. A rich curtain divides this room at will into a drawing-room and dining-room, the side facing the former being of maize brocade, and the latter of stamped velvet. The sideboard, piano, writing-tables, chairs, &c., are all in keeping, every detail, down even to the wine-glasses, having been specially designed. The sofas are covered with antique Persian rugs. The state-rooms are all treated differently in decoration, the ladies' rooms having the upper parts covered with cretonnes, with walnut dados below, and the other rooms being panelled up to ceiling. The entrances to the berths are arched, and are hung with Japanese silk curtains. On deck are the chart-room and entrance lobby and boudoir. The lobby is panelled with solid rosewood up to ceiling, with a beautiful cabinet filled with old Rhodian china. Perhaps the most perfectly finished

of any portion of this boat is the boudoir, of which the lower portion is panelled with rosewood, and, above same, the walls are hung with *velours ciselé* in pale terra-cotta and maize colour. The ornaments in this room are all old carved ivory figures and old coloured Oriental porcelain. This yacht was built by Messrs. EARLE'S Shipbuilding Company, of Hull, who also did the work to state-rooms; but the beautiful panelling and cabinet-work we have been describing is from the shops of Messrs. HOWARD & SON, of Berners Street, W.

*Harrington Gardens.*—The bricks for these mansions have been supplied by Messrs. T. LAWRENCE & SON. The facing bricks were No. 4 pressed, and the moulded work No. 9 rubbers.

## INDUSTRIAL ART SCHOOLS.

A PAPER was read by Mr. R. W. Edis, F.S.A., at Huddersfield, on Tuesday, entitled, "How can a School of Art, as applied to Textile and other Manufactures, be best supported and utilised, with a view of meeting Foreign Competition?" Mr. Edis said: In promoting some schools for the improvement of art and technical knowledge applied specially to textile fabrics, with which Huddersfield and the district are particularly associated, it seems to me essential that the art teaching of your school should be associated with practical or technical teaching in its largest sense, and with the special object of elevating the defined branches of industry from which the workers of both sexes more especially obtain their livelihood. A competent and sufficient staff of teachers, who shall devote their whole time to the work before them, should start on a basis entirely different to that promoted generally in the present schools of art. A proper programme of preliminary and advanced teaching, theoretical and technical, should be insisted upon, somewhat similar to that carried out in weaving schools at Verriers, Mulhouse, Crefeld, Ghent, Rouen, and numerous other places. That after the first preliminary course of drawing the students should be taught freehand from natural flowers and objects as far as possible, and to arrange the grouping of natural objects conventionally or naturally in design for various tissues; competent masters should be engaged capable of teaching not only the theory but the practice of weaving, dyeing, and chemistry as applied to various colours, their fixity and durability, with short practical lectures showing by experiments the different arrangements of colours, and pointing out the various combinations and differences effected by the placing in juxtaposition of various colours. The art teaching should be by progressive stages. The technical instructor should teach the students how to apply to practice and to utilise the scientific and artistic knowledge derived from the teaching in the classes for drawing and design. Dexterity of hand, with a habit of rapidity of practical execution, should be sought for rather than the stippling and excess of shading which is now generally taught. The pupils should be taught in a common sense manner—each professor or teacher should endeavour to adapt his teaching to the capacity of the pupils; he should strive to place under the eye of the pupil the objects of which he is speaking, and to satisfy himself by frequent questions that his pupils have understood him. The progressive advanced course should include the elements of industrial mechanics and of chemistry, with special reference to its application to local industry; the various processes of weaving, and all connected with it; the theories of tissues, their classification, manufacture, composition, and analysis; the theory of colours, their contrasts and combinations; ornamental design, comprising the drawing of flowers from nature; the composition of groups of ornaments and flowers, and other natural objects applied to textile fabrics of all kinds, together with instruction needful for their application to the looms, and general industrial design. As far as practicable, foremen of the principal factories should be induced to ally themselves with you, and be paid for short courses of simple lectures; or, still better, conversational discussions, aided by practical teaching with materials, setting forth all the preliminary operations of weaving, such as winding the bobbins, preparing and mounting and rolling up the warp; of the various apparatus, &c., employed in these operations for hand and power-loom weaving—the preparation of the weft, winding, dressing, &c.—of the setting of patterns, and of general weaving. The pupils should then be taught to set their own designs and to practise themselves in the technical work under the foreman or teacher, and explanation should be given in every branch in a systematic manner in all the operations connected with weaving, from the design to its execution on the loom, and, if possible, this teaching should be assisted by periodical visits to the various factories where the work could be explained in a more practical way. The pupils should also be taught to analyse and reproduce themselves, in woven fabrics, all kinds of specimens of stuffs, from the most simple to the most complicated, and thus to acquire a thorough artistic and technical knowledge of

\* See *The Architect*, October 6.

everything relating to the production of textile fabrics. I believe such a system as this, as practically carried out in the school of Ghent, would lead to the vast improvement of all textile work, and the pupils thus trained would naturally find employment in the factories at remunerative wages, and the improvement in all work would, I believe, tend materially to improve the trade of the district and to satisfactorily meet foreign competition. Attached to each school should be a well-selected library of works pertaining to ornamental and other design, together with all the best works on applied sciences, and periodical publications illustrating the various inventions and artistic designs of other countries, which such people as might be recommended by the teachers should be allowed to have on loan for a certain period. If this could not be arranged, the library should be made free to all, and pupils encouraged to use and study in it, while occasional short lectures might be given on special subjects, made as interesting as possible by drawings on the blackboard, or with examples borrowed or provided for illustration. Interest the students by every means in your power. Point out to them in an intelligent manner the difference between good and bad ornament. Show them how to group different forms, to make various combinations. Teach them harmonies of colouring, and exemplify this teaching by surrounding them as much as possible with good specimens of textile fabrics. Have beautiful things about them, for remember if you surround your workers with all that is mean, hideous, and commonplace in design, no teaching in the world will be of any lasting service. It seems to me that the question of the proper support and keeping up of these special schools, in which the artistic and technical teaching should be made especially applicable to the particular trade of the district, is one in which each municipality or local district authority should have a special interest, and that they should be directly supported by the district quite as much as the preliminary or Board schools; for surely it is as much a matter of interest, from a purely commercial point of view, that our workmen and workwomen should receive an education fitting for the carrying out of the trades of the country, and to meet the ever-increasing improvement in artistic and scientific productions throughout the world, and to hold their own against the art industries of other nations, as to insist on a general compulsory primary education of the children of the masses. The promotion of a system of what I may call industrial education, which shall best enable the individual to follow his or her particular trade with advantage to the State and profit to the individual, is surely one which demands State recognition as much as primary education in reading, writing, and casting up accounts, as each district is likely to reap the benefits directly of improvement in its particular trade, by improved education of the workers, and through them of the higher artistic and commercial value, whether directly by higher price or by increased demand. Each district should pay a proportion of the charges for that educational system by which it will particularly reap the profit and advantage. It is unfair, however, that the State should leave the whole cost of this education to the town or district; in all other countries the educational system is properly organised and supported by the State and various local authorities as being of paramount importance to the manufacturing interests of their respective countries. Why should not a similar State education, assisted by local subsidies, be organised and supported in this country?

Mr. G. Marchetti also read a paper on the same question. The author said we must not regard what we have done as being sufficient for at least our own generation, but rather as an incentive to press forward and do more. This can be accomplished in great measure by our schools of art; but, to render them efficient and popular, we must help and patronise them to the utmost of our ability. We must urge the young to attend them, we must all of us do our best in every way to enable them to multiply and prosper. It is therefore necessary that schools of art be supplied with every means for ensuring the successful training of students, and for enabling them to acquire that experience that is necessary for keeping at least abreast with their Continental brothers. Manufacturers and merchants should, however, not lose sight of the fact that, in supporting schools of art, they further to a great extent their own interests. No success can be obtained by the former if English manufacturers do not possess the required artistic value, and such value cannot be arrived at unless we support those schools where art is taught.

Mr. Clay, sen., denied that English art was behind Continental art. Frequently in the manufacture of trousers, he said, local men led the trade in regard to design, and French makers often came to this country and either purchased our designs or copied them.

Mr. Whiteley Ward said he had been engaged until within a few years past in carpet-making, and so far as his experience was concerned English carpet designs were generally as good as and oftentimes better than those he had seen on the Continent. The question between home and foreign manufacture was simply one of price, the foreigners being enabled, by means of cheap labour and working longer hours, to undersell home manufacturers. The London market was generally flooded with Continental goods, but they were invariably of a low order as regarded quality, and were inferior in design. In most respects, however, our foreign com-

petitors had the same advantages that we possessed; they had machinery similar to home manufacturers, and they bought their raw material at the same rate.

Mr. Stopford said that when he went to Halifax some years ago he found that nearly all the best positions in the designing departments were filled by foreigners. Matters, however, had since been reversed, and as the result of art teaching Englishmen now occupied these appointments. He could not understand how it was that we spent enormous sums of money in the erection of palatial buildings for the purposes of elementary education, while technical instruction was left to the benevolence of the country.

Mr. Rathbone said that the promoters of schools of art addressed themselves to the wrong side of the question. He feared they were now bringing out a lot of second-rate artists, instead of a number of first-class designers.

Mr. J. W. Davis said that some of the employers in Halifax obtained their designs from France, either directly or indirectly. The primary question was how a good art school could be established, and next how it could be supported.

Mr. Cockram said that designs purchased outside the home manufactory were very often of no service, for frequently the whole of the details in them had to undergo recomposition. Our fabrics were, as a whole, superior to those of Continental make, but we could not beat Continental manufactures in the market because of prohibitory tariffs and the cheap materials of which their fabrics were composed.

### MOSAIC WORK AT AIX-LES-BAINS.

THE committee of the Casino at Aix-les-Bains have exhibited to the public a fine piece of mosaic work executed by Dr. Salviati, of Venice, viz., the decoration of the large cupola in the grand hall. It is one of the most extensive mosaic decorations of modern times, covering an area of 3,500 square feet. The work has been executed under the superintendence of the architect, M. A. Boudier, after a cartoon by M. Lameire, in the short time of six months.

The ceiling is divided into a large central cupola surrounded by four smaller ones below it. The subjects represent symbolical signs of the zodiac and of the four seasons, and the details of each subject are plainly visible without interfering in the least with the elaborate ground which they seem to be placed over. Upon the shield which each figure holds are written the names of the architect, painter, and mosaicist. The four elements are represented in the four small cupolas by boys mounted on various symbolical animals. Different shades of gold and many new tints representing various precious stones are introduced, giving to the *tout ensemble* an effect which is compared to a graceful work of lace interspersed with gold and gems. Dr. Salviati declares that he has never had so favourable an opportunity of making a display of all the resources of the mosaic art. H.R.H. Princess Beatrice of England, with her suite, and many distinguished personages were present at the opening ceremony, and honoured Dr. Salviati with their warm congratulations upon his splendid work.

### THE LATE MR. ROBERT GAVIN, R.S.A.

ANOTHER Scottish Academician, says the *Scotsman*, has been removed by the death of Mr. Robert Gavin, which took place on Friday evening, the 5th inst., at his residence, Cherry Bank, Newhaven. For the past three years Mr. Gavin had been in delicate health; but, though he has had frequent illnesses during the present year, his condition did not assume a serious aspect until shortly before his death, the cause of which was weakened action of the heart, probably induced by an attack of rheumatic fever in youth. The second son of the late Mr. Peter Gavin, merchant, Leith, the late academician was born in that town in 1827; and was educated at the Leith High School. He early manifested a taste for art; and when about twenty-one years of age, he entered the School of Design under the late Mr. Thomas Duncan, and had as his fellow-students Sir William Fettes Douglas, Mr. Thomas Faed, Mr. Alexander Fraser, and other artists who have risen to eminence. Devoting his entire attention to the development of his talent, he painted a large number of fancy pictures which became very popular, and were eagerly bought up by a London dealer. His earlier works were regarded as partaking a good deal of the style of the late Sir George Harvey, and were characterised by good colour and broad painting. A few of his more attractive productions were engraved in chromo-lithograph, and in this form attained a large sale. His *Reaping Girl* and *Phoebe Mayflower*, for example, were well known and generally admired. In 1855 Mr. Gavin was elected an associate of the Royal Scottish Academy. Some three years later, having apparently become a little dissatisfied with his progress in art, he entered into partnership with a wine merchant, but he only continued his business connection for about a year, and then returned to the more congenial work of the studio. Fully ten years ago he made a tour in America, where he prosecuted

his art with zest, painting several pictures in which appeared negroes and other figures met with in his travels. He then returned home, and after a short stay proceeded to the Continent, and finally settled at Tangier, in Morocco, where he painted numerous Moorish subjects. Returning to this country three years ago, he was elected an academician, and produced as his diploma picture *A Moorish Maiden's First Love*, which represents an Eastern damsel caressing a beautiful white horse. Latterly, his works have been mostly reproductions of oriental studies; and although they have shown a tendency to become mannered in subject, as well as somewhat heavy in colour and leathery in texture, they have never failed to find numerous admirers. The deceased artist, who had attained his fifty-sixth year, was unmarried.

#### NORTHERN ARCHITECTURAL ASSOCIATION.

THE annual meeting of members of the Northern Architectural Association was held on Tuesday, in the library of the Castle, Newcastle, under the presidency of Mr. J. Tillman, Sunderland. The hon. secretary (Mr. W. H. Dunn) read the annual report of the committee, which reminded the members that the association had now reached its silver wedding, it being twenty-five years since the members joined hands together for the elevation of the profession and the establishment of a uniformity of practice. The attention of the association was called to the action of the governors of the North-Eastern Counties School. It appeared that in the proposed erection of a large block of buildings at Barnard Castle, notwithstanding that the money had been collected from the counties of Northumberland and Durham and the North Riding, only three architects had been selected to compete, viz., Mr. R. J. Johnson, Newcastle; Mr. Armfield, Whitby; and Messrs. Giles & Gough, London. Some correspondence took place, but the governors would not extend the competition. The following resolution was adopted: "This association regrets that a more open competition to the practising members of the profession in the three counties had not been adopted." At the quarterly meeting held in February the general rules of the Royal Institute relating to competitions were adopted by this association, and 500 copies were printed. A copy was sent to each member of the city council with a request that they would adopt the same for future architectural works. Two public buildings had since been submitted by the corporation to competition, viz.: Police barracks and fire brigade station in Westgate Road, and infectious hospital at Heaton, wherein the general regulations were adopted. In conclusion the committee drew attention to a subject which was some years ago discussed by the association, viz., the offering of a medal to articulated pupils in the offices belonging to members for measured drawings of old buildings. It would not only give an interesting impetus to the pupils in studying the many rich architectural remains that existed in the neighbourhood, and for which the counties of Northumberland and Durham were so famous, but also tend to give the association a more practical and beneficial character to the younger members. The financial statement made up to December 31, 1882, showed a balance in favour of the society of 12*l.* 18*s.* 8*d.* On the motion of Mr. Oswald, seconded by Mr. F. W. Rich, the report was adopted. Subsequently Mr. F. W. Rich was appointed president; Mr. W. H. Dunn, vice-president; Mr. T. Oliver, hon. sec.; and Mr. W. L. Newcombe, treasurer.

#### ROMAN LANCASHIRE.

AN address was delivered by Professor Boyd Dawkins at the first ordinary meeting, on the 5th inst., of the Lancashire and Cheshire Antiquarian Society. The president said he had thought it desirable to put before them what he took to be the especial work of that society, which really and mainly consisted in collecting local materials for history. They had to look around upon the district of which they were the centre, and of which they were living in the natural capital, and see what they could do in the way of reconstructing the old history of that part of the world—a history which all would admit to be at present exceedingly imperfectly known. They knew that from documentary evidence very little was known about the Roman occupation of this country, but day by day, and year by year, isolated explorations here and there, the work of the pickaxe and shovel, were revealing the true nature of that occupation. From the beginning of the fifth century down to the close of the sixth—speaking in round numbers from the year 400 to something like A.D. 650—we knew scarcely anything, and he wished to point out how discoveries, some of which had been made in this very district, when brought into relation with other discoveries, had thrown considerable light upon those dark times. Professor Dawkins proceeded to explain how discoveries which had been made in caves at Buxton, Settle, and elsewhere of articles of domestic use, weapons, coins, and ornaments, together with the remains of domestic and wild animals, fragments of charcoal, &c., furnished evidence that the caves were inhabited by a fugitive people, who were proved to be Roman from the fact that

similar remains were discovered in the Roman villas and towns. The Roman civilisation of Britain was, he said, one of exceedingly high character. When they conquered this country they introduced their language, their arts, their literature, their system of agriculture, and they also introduced their roads. Just as Englishmen were the great railway makers of the world, so the Romans were the great road makers of the world. A great deal of the well-being of this country was due to the Roman roads, for they had remained ever since the great arterial lines of communication. Under the Romans the people were practically reduced to the condition of slavery, but in course of time came retribution. About the close of the fourth century the Germanic tribes made their way across the Rhine, poured into Gaul, and fought their way steadily southward and eastward, causing what had been termed a wedge of heathenism between the Roman province of Britain and the governing centre of Rome. Later, the last Roman legions garrisoned in this country were recalled, and we soon had a picture of a country which was formerly united under the strong hand of the Roman, divided into a series of weak communities, warring more or less with one another. Therein lay the great cause of the destruction of Roman civilisation. Professor Dawkins proceeded to show how the Picts and Scots, the Angle and the Saxon, assisted in the work of exterminating the power and civilisation of the Romans in Britain, and pointed out, in opposition to the theory of some that the Romans were all destroyed, that numerous ethnological and physiological evidences existed that the characteristics of the Roman people were to be found amongst us at the present day.

On Saturday a party of the members visited the Roman Road at Blackstone Edge. A part of the road was exposed showing the central line of stones, both where it is a deep and well-defined groove and where it is even with the rest of the pavement. On the eastern slope of the hill, where the pavement is called the "devil's stones," a section of some thirty or forty yards in length of the pavement was found to have been very recently removed, and the stones applied to repairing a watercourse. The question was raised whether these ancient remains were not of sufficient value to merit protection under Sir John Lubbock's Act.

#### WINCKELMANN.

AN introductory lecture to the session of 1883-84 was delivered by Dr. Karl Dammann at the Mason College, Birmingham. The subject was the life of Johann Joachim Winckelmann. Dr. Dammann pointed out that among the agencies which affected the German mind during the reign of Frederick the Great, and which brought about the great regeneration of German literature, were especially four: The personal character and influence of Frederick himself; the liberal ideas spread by the writings of Jean Jacques Rousseau; the study of Shakespeare, opened to the German people by Wieland; and the insight gained into the Greek mind, and especially to Greek art, by the labours of Winckelmann. Without Frederick, a Lessing would hardly have been possible; without Winckelmann, Lessing could not have produced his *Laokoon*; without Lessing and Winckelmann, we cannot conceive a Goethe such as he was. Johann Joachim Winckelmann was the only child of a poor shoemaker of Stendal, in the Altmark, Prussia, born December 9, 1717, and was assassinated at Trieste June 8, 1768. His early struggles through poverty and want were truly great. But the young student was filled with an insatiable thirst after learning, and especially sought for an introduction to a world of beauty, which there was no one to open to him, the entrance to which he must conquer, step by step, by his own effort. He worked hard at the grammar-school of Stendal, and especially devoted himself to the study of Greek. Then he went to the Kölnische Gymnasium of Berlin, and afterwards matriculated at the University of Halle, in his twenty-first year. His poverty was so great as to oblige him to give private lessons, in order to enable him to live during his years of study. At last he was appointed librarian to the Reichsgraf von Büna, in Nöthenitz, on the Elbe. This brought him to Dresden, and introduced him to those friends and patrons who afterwards gave him the funds to visit Rome, and to study quietly there those art treasures which he had dreamed about during so many years. The King of Saxony and his brother were his true friends; and in Dresden he became acquainted with the chief artists of their age. In his thirty-eighth year he gave the world his first essay, "On the Imitation of Greek Art in Painting and Statuary;" and by eloquent words he endeavoured to break the spell which till then had blinded the minds of the world against the true meaning of antique art, whose image, in its simple, restful beauty, rises supremely over all the pretty conceits of the Rococo period. The king, on reading his treatise, said, "This fish shall have his proper water," and allowed him a pension to study antique art in Rome itself. There, truly, Winckelmann was in his own sphere at last; and after mastering all the treasures of ancient art, especially Greek art, he began to write his great work, "The History of Ancient Arts," which immediately rivetted the attention of the great minds of his age, and by which he produced an entire change in the conception of art for all future times. The rich

inheritance which he has left the world consists not only in the framework of the new science thus raised up by his labours and researches, but also in the example of his own life, which not only allowed him to behold and understand the true and beautiful in ancient art, but enabled him to give an educational force to the spirit of art, which penetrates beyond the world of form and colour, and reaches the creative mind and the soul-inspiring idea, the very nature of which lies in beautiful form, pure action, and truthful thought. In 1772 Winckelmann's bust was placed in the Pantheon at Rome, and a bronze statue in his native town; and Goethe, in his celebrated essay, advised the immediate publication of Winckelmann's complete works, exhorting the world to celebrate from time to time the memory of such men as Winckelmann, who have left us inexhaustible and imperishable legacies.

### THE GLASGOW MUNICIPAL BUILDINGS.

THE foundation-stone of the new municipal buildings, in Glasgow, was laid on Saturday by the Lord Provost. A banquet followed, at which "The Architect and Contractors" was proposed by Sir James Bain.

Mr. Young, in replying, expressed his thanks for the kindness he had always received from the lord provost, the magistrates, and members of council, and the city officials generally. He desired specially to thank Mr. Carrick, their eminent and worthy city architect, to whom he was indebted for the general scheme of the plan of the new buildings, besides many valuable suggestions. It was now twenty years since he left Glasgow with the object of trying to forge his way in the great metropolis of the south. At that time and at the present moment he could wish for no success which he would prize so highly as to return to Glasgow with a wider and more matured experience, and to have the privilege and the honour of taking a part in carrying out one of the many great works for which their city was distinguished.

Councillor Laing proposed "The Referees in the Designs Competition." It had given the corporation of Glasgow very great pleasure indeed to have been honoured that day with the presence of Mr. Barry to witness the ceremony of laying the foundation-stone of their municipal buildings. When the building committee met to consider the selection of a gentleman to act as referee in the matter, it gave them no little concern, as their great anxiety was to find one not only acceptable to themselves, but one who would command the confidence of every competitor. Amongst others, Mr. Barry's name was mentioned and unanimously accepted; and when they received his reply, agreeing to their request, they felt relieved and thoroughly satisfied that the selection was safe in his hands. Mr. Barry stood pre-eminent in his profession as an architect, as a man of business, and as a sound adviser. Mr. Carrick, Mr. Barry's co-referee, was a gentleman known to and esteemed by them all, and by none more than by the corporation itself. They knew his great value to them as their city architect, as their burgh engineer, and as their general adviser in all matters, and had the most implicit confidence in him. When he gave an opinion on a subject he was listened to with the greatest attention, and his suggestions invariably acted upon. Mr. Carrick, during his long public career, had oftentimes had very difficult and delicate duties to perform on behalf of the corporation, but these he had performed to the satisfaction of all. Mr. Carrick was well known not only in Glasgow and the various burghs in Scotland, but his opinion and advice was often sought and freely given to corporations both in England and Ireland. He had now been upwards of forty years in Glasgow acting as burgh engineer, and during all that time had had the modelling of the city very much in his own hands. Many, very many, were the improvements he had carried out; and were he to publish a history of the city as it was when he began his labours—the improvements effected, and the necessity which existed for these improvements—it would be of great use to future town councils. The municipal buildings would not be complete, unless they had Mr. Carrick's statue in front of them in George Square; but it was to be hoped that he would long be spared to adorn the profession in which he held so high a position.

Mr. Barry replied. He took occasion to refer to the importance of the work which had been done that day, and mentioned that the competition which had taken place among the architects had resulted in the city of Glasgow obtaining a magnificent pile of municipal buildings. The system which had been adopted by the town council of Glasgow in instituting the competition had up to that time been unknown. The conditions were carefully considered by the lord provost and the town council, with such assistance as Mr. Carrick and himself could give them, with the object of securing the best result for the public, and of being entirely fair to those who were asked to compete. It would be some little satisfaction to the lord provost and the council to know that the conditions of the competition, which had resulted in the ceremony of that day, had become more or less a model throughout the kingdom. The Royal Institute of British Architects, of which he had the honour to be a member, had adopted them as their model, and the Government, in the erection of new

offices which were now proposed, had adopted them in part. He had little hesitation in saying that they would yet come to be almost universally adopted. That, he thought, was a matter of very great satisfaction to the town council of Glasgow.

### ARAB ART IN EGYPT.

A REPORT has been prepared for the Society for the Protection of Ancient Buildings upon the measures adopted by the Government of Egypt for the preservation of monuments of Arab art in that country. The report states that on December 18, 1881, a decree was signed by the Khedive instituting a committee composed of high officials, under the presidency of Mohammed Zeki Pasha, Minister of the Wakûf, with a view to the preservation of those monuments. The duties of the committee were—(1) to make an inventory of the Arab monuments in Egypt possessed of artistic or historic interest; (2) to watch over their maintenance; (3) to see to the execution of proper repairs; and (4) to insure the preservation in the archives of the Ministry of Wakfs of plans of all work executed, and to indicate to that Ministry the fragments of monuments which ought to be transferred to the National Museum. The first meeting of the committee was held on February 1, 1882; but, owing to the disturbed state of the country, there was no second meeting until December 16, 1882. At the first meeting two sub-committees were appointed to carry out the objects in view. As a result of the labours of the first sub-committee, a list, dated June 9, 1883, has been made, comprising 664 monuments, consisting of mosques, tombs, drinking-fountains, and schools, all situated in Cairo and the neighbourhood. This list includes monuments of world-wide celebrity, such as the mosques of Amru, of Tulun Al Azhar, of Al Hakim, Sultan Hassan, and Al Ghuri, but does not omit small and obscure buildings of more or less modern date and of wholly subordinate interest. The report, however, mentions several monuments of much interest not included in the list, such as the four ancient gates, the Bab Zuweyleh, Bab en Nasr, Bab el Futuh, and Bab esh Sharieh; the remains of the ancient crenellated walls built by Saladin; the building used for the Makamah or Kadi's court, a beautiful and invaluable specimen of Arab mediæval domestic architecture, and many others. The report also points out that the tomb mosques of the Malik al Ashraf Inal, and of the Amri Yusuf, forming part of the tombs of the caliphs, are used as powder magazines, to their own imminent danger, and that of the remarkable and invaluable monuments in their immediate neighbourhood. The second sub-committee has addressed five written reports to the general committee, the last dated May 14, 1883. These reports are stated to be exceedingly interesting, and show that valuable service has been already rendered.

### STREET PAVEMENTS.

A MEETING of municipal and sanitary engineers was held lately in Carlisle, when Mr. McKie, the city surveyor, read a paper on "Tar Macadam and Concrete Macadam Pavement for Roadways, and Tar Pavement and Cement Pavement for Footways." The author said that, taking the cost of other things into consideration, he did not recommend concrete macadam for street formation. With regard to tar macadam for carriage-ways and footways, he thought the full consideration of the subject well worthy of attention.

Mr. Gordon, of Leicester, said tar paving was all very well in the quiet quarters of a large town, and he thought it would be very good for a place like Carlisle, where there was not much traffic, but they had to guard against the excessive use of it. The great point in favour of tar pavements was their noiselessness. They called it in Leicester the "silent macadam"; it was softer than even asphalt or wood paving, because there was an elasticity about it, and it gave a certain spring to the road. This pavement was in great demand in Leicester for those streets in which doctors, solicitors, architects, &c., resided, and they had now many thousand yards of it laid down. The cost of tar macadam for roadways was from 2s. 5d. to 3s. 0½d. per square yard, and that did not include the cost of forming the foundation, but this they had only found to cost about 4d. per yard, so that the cost per square yard might be taken at 3s. 4d., including the foundation. Recently a very good artificial asphalt had been devised at a cost of 3s. 4d. to 3s. 6d. per yard, which had just the same appearance as real asphalt, and would last equally as well. The advantages he should claim in favour of tar macadam were these: it was less noisy, less dusty, and cost less to cleanse it. It was an improved form of macadam roadway, and they must not lose sight of that; while the cost of repairing tar macadam would be found to be much less than ordinary macadam, even on the heaviest roadways. He strongly approved of the system of wood paving introduced recently into Norwich. The borough surveyor there, Mr. Marshall, had had the courage to adopt an entirely new system of wood pavement. He had tried the plan of sawing ordinary Memel

planks up into blocks and placing them like ordinary paving cubes on a gravel foundation. And he had succeeded in carrying out that work at prices ranging from 5s. 8d. to 7s. 7½d. per square yard, and during the past few years over 70,000 yards of this pavement had been put down, and had been found to answer admirably. He himself had gone over the city and found that the work which had been laid down three years did not seem any worse than that which had been down twelve months, while the council had petitions in all directions to extend it. He did not think this Norwich wood pavement was sufficiently known. If it were they would hear less of the elaborate systems in London and other towns. Mr. Marshall had told him that they had actually saved 1,000% a year in the cleansing of the streets. They were much better satisfied than they were before. When the blocks were worn away on one side, Mr. Marshall proposed to turn them upside down, and so form what might be called a new street with the old material.

Mr. Laws said they had tried it for one or two years in Newcastle, but only on the most expensive system they could adopt, and it did not answer well. He had noticed in London that when blocks were taken up they seemed completely knocked to pieces. In Newcastle they had tried the experiment of scattering small gravel on the wood pavements. It was at once forced into the wood, and for months they had never seen the surface of the road, while the horses got a firm footing.

### SIENESE INLAYING.

A REPORT has been prepared by Consul-General Colnaghi on the trade and commerce of the province of Siena. In describing the present condition of the industrial arts the author says: The celebrated marble pavement of the Duomo of Siena was commenced in the fourteenth century, the patterns being originally indicated in simple outlines *a graffio*. In process of time the work was perfected by Beccafumi in the first half of the sixteenth century, the pavement being inlaid with marbles of various colours in chiaroscuro. The constant need of restoration has made this art hereditary among Sienese artists, and, at the present day, it is well carried out, not only as regards the repairs of old work, but in new compositions. In the workshops of the "Opera del Duomo," or Cathedral Board of Works, the artists employed are allowed to execute private orders on their own account. The works at the cathedral are being actively carried on, owing to a legacy left by a late rector, under the superintendence of the present administrator, Cavaliere Rubini. Of late years the whole pavement of the Duomo has been restored, and large figure pieces have, in addition, been executed after the designs of Professor A. Franchi, with ornaments by Signor L. Maccari.

This marble inlaying, as carried out at Siena, is peculiar to the city. It is executed with large or small pieces of marble, as the design may require, which are then outlined *a graffio*, the lines being filled in with a resinous composition. The backgrounds are formed of white marble. To carry out the compositions, grey, red, green, and yellow marbles, in various gradations of tint, are employed. The marbles used are all quarried in the provinces of Siena and Grosseto. The architect of the Opera del Duomo is the Cavaliere Partini; the director of the sculpture the Cavaliere Sarocchi, a pupil of the late Professor Dupré. Signor L. Maccari, with four apprentices under him, superintends the ornamental work. A foreman stonemason with seven, and a foreman mason with five workmen, complete the ordinary staff of the Opera, other hands being taken on temporarily, as occasion requires. All kinds of work are executed, including Roman and Venetian mosaics, the first materials for which are procured from Rome and Venice. M. L. Maccari has also a private workshop of his own, employing two sculptors, two stonemasons, and two polishers. He works on commission, and keeps in stock fireplaces, small columns, tazze, &c., for sale at moderate prices. A similar establishment is possessed by the Fratelli Mazzini.

The same causes which made the school of decorative sculpture in Siena famous have acted on that of wood-carving, of which Antonio Barili, who worked at the end of the fifteenth century, is the most celebrated representative. Two styles of wood-carving are practised in Siena—the one highly-finished work of great delicacy and beauty, which is employed for frames or furniture of the highest class, and which, from the time it takes to execute, must necessarily be expensive; the second, which may be termed commercial, though in its way equally artistic with the first, is bolder and less finished, struck out for effect, and allowing commissions to be taken on a large scale for decorative purposes at moderate prices. The style of carving in vogue is, generally, in imitation of fifteenth and sixteenth-century work, but the imitation is by no means servile, nor does it exclude original design. The principal wood-carvers of Siena are Signori Guidi, Gosi, and Querci, who are admired for the delicacy of their work; Cavaliere A. Rossi, Signor A. Lavagnini (who also sells furniture), Signor Barbetti (who gives employment to some thirty hands), and Signor Carlo Cambi.

Signor Cambi has in permanent employ 25 hands (15 carvers and 10 carpenters), whose numbers are more than doubled in case of need. The wages paid vary from 2 lire and 3 lire to 6 lire and 7 lire, and 10 lire for artistic wood-carvers per diem. From the end of 1880 to the beginning of 1882 Signor Cambi received orders from Messrs. Caird, of Greenock, for wainscoting, in carved wood, the saloons of four vessels built by the firm for the Peninsular and Oriental Steamship Company. The fittings are entirely in walnut, the carvings varied and tasteful, and the whole work effective and executed at moderate prices. The contract was, I understand, carried out to the entire satisfaction of Messrs. Caird. Signor Cambi has received commissions from England and elsewhere for carved furniture of various descriptions, and he has also worked at the British Embassy in Rome.

In the art of inlaying in wood the Cavaliere A. Rossi has succeeded in imitating the antique, having taken for his model an old door in the Palazzo Pubblico, which was inlaid with various geometrical figures. Inlays in wood and ivory are well executed in Siena by Signor Rossi, mentioned above, and by Signori Barni, Corsi, A. Lavagnini, Guidi, Gosi, and Querci. It is to be regretted that the works of these artists often remain on hand for want of purchasers.

### UNIVERSITY COLLEGE, DUNDEE.

THE new University College, Dundee, was opened on the 5th inst., and is an important addition to the educational establishments of the North. The existence of the college is due to the liberality of Miss Baxter and the late Dr. John Baxter, who contributed about 150,000*l.* for that purpose. It will be essentially an industrial college (having, however, professorships of classics and English), and the arrangements for the science classes are remarkably complete. The site selected is on the Nethergate, and has an area of about three acres. Upon the ground were four dwelling-houses and a church. The latter is to be the college hall, and the houses have been transformed so as to form commodious class-rooms. They are connected by a corridor, which is 165 feet in length and 10 feet wide. At the back a large chemical laboratory has been erected. The following description of the science department has been prepared by Mr. David MacLaren, the architect:—

#### Mathematics and Natural Philosophy Department.

The department of mathematics and natural philosophy has allotted to it House No. 2, which affords two laboratories, special rooms for optical and spectroscopic work, and battery stores. Additions have also been made in the form of a handsome lecture theatre, a preparation-room, and a photographic-room. The whole department is lighted by the electric light by means of Swan's incandescence 20-candle power lamps, which are so arranged that any portion can be separately illuminated. The electricity is supplied by a Siemens' shunt-dynamo machine driven by a 6 horse-power Otto & Crossley's gas engine.

One of the most prominent features in the laboratories is the remarkable facility given for experimental work in electricity. Leading wires carry the main current through all the larger rooms, while along the walls at suitable intervals are switches arranged for diverting the whole or portion of the current in any required direction; while besides the leading wires from the dynamo machine special sets of wires, to be used separately or simultaneously, are carried from the battery stores and from the accumulators beneath to the lecture-table, the laboratories, and the preparation-room.

If we take the department in order, we must first notice the cellars, where batteries are kept in special chambers supplied with flues for allowing any gases to escape from the building, and thus avoiding injury to the costly and delicate apparatus in the rooms above.

On the ground floor we find Laboratory No. 1—a room specially arranged for experiments requiring great steadiness and freedom from vibration. These are secured by means of stone tables (one of which, for large experiments and class demonstrations, measures 6 feet by 4) averaging 4 feet by 2, and raised from solid stone foundations, so arranged as not to be in contact with the floor. There are also two stone pillars extending from floor to ceiling, half embedded in the wall; these are for use in measuring the extension, torsion, and breaking strength of various wires, &c., and also for the arrangement of a cathetometer, that will be used in measuring heights to within the one-thousandth part of an inch. In this room will also be the dividing engine, an instrument used for graduating scales and thermometer tubes, and which will measure short lengths to within the ten-thousandth of an inch. Next to this laboratory is a small workshop, with blow-pipe, bench, and ordinary tools for small repairs, and for the use of students who join the practical class in order to make instruments for themselves. Next to this, again, is the professor's private room, containing some of the more delicate apparatus, amongst which may be mentioned a balance that will indicate the millionth part of the greatest load in either scale, and a polariscope second to but one in the kingdom. Opposite to this room, across the corridor, is the new lecture theatre, a handsome room seated for 100 students, and containing every convenience for lecture purposes. The table is

worthy of particular attention. It measures 15 feet 6 inches by 4 feet by 3 feet high, and is supported on a solid foundation free from contact with the floor, thus enabling it to be used for the most delicate operations as well as for lecture experiments.

There are pipes connected with it giving hot and cold water and gas, and also arrangements for exhausting the air from or blowing air into any place where it is needed; the former result being attained by a water-pump fixed in the panelling of the room. In front there is a tank, 8 feet long, with plate-glass sides and ends, intended for experiments in light, wave motion, and vortex motion. It is so arranged that the course of rays of light under water is distinctly visible, and the lessened effect of lenses in a denser medium rendered clear to the whole class. It can also be illuminated from behind. It is hidden from view when not in use by a series of fielded panels. Behind this there is ample room for keeping gas bags for oxygen or hydrogen. There are arrangements for supporting heavy models, &c., on iron pillars from the table, to which, as well as to the gas-pipes, water, &c., access is obtained by raising small covers, which lie when closed flush with the teak top of the table.

The electrical arrangements here are very interesting. Two long copper strips, bedded in paraffine and kept from dust by sliding pieces, run the whole length of the table; and in these holes are drilled, to admit of proper electric contact being made, by binding screws at any point on a moment's notice. These are again connected with switches that at once enable the lecturer to obtain at his table the whole current from the dynamo machine, or the current from Grove's cells in the battery store, or from any similar source in the preparation-room.

Above and behind the lecture-table are four large blackboards, diagram-frame, and case for lantern-screen; while at the very top of the room is a large Atwood's machine, giving a fall of 18 feet, which, it is hoped, will give results in the examination of the acceleration of gravity much superior to those obtained by the ordinary small instruments.

The room is lighted at the will of the lecturer by the light from one or both of two large sun-burners, one carrying twelve gas-burners, the other twelve incandescence lamps. Next to the lecture-room is the preparation-room, with suitable arrangements for preparing experiments. This room also contains a large diagram-case. Proceeding upstairs, we come to Laboratory No. 2, the larger of the two. Though it is generally considered a disadvantage for a laboratory to be anywhere except on the ground-floor, on account of the impossibility of otherwise procuring an isolated foundation for the tables, yet it is hoped that this arrangement here will secure freedom from vibration. They are supported on heavy stone brackets, built into the wall; they are eight in number, and two of them are the galvanometer stands. These last are of a somewhat novel kind. They consist each of two small slate slabs, strongly supported on stone brackets let into the wall, at a height of about 4 feet 6 inches and a distance of about 4 feet. One of these is to support the reflecting galvanometer or quadrant electrometer, with its delicate mirror suspended by a single thread of cocoon silk; the other is for the lamp and scale. By this means these delicate instruments are kept in one place, and never removed when once fixed there, while other necessary appliances, as shunts, keys, &c., are placed as wanted on the table below the stands. Next door is a room for specially accurate observations in light or electricity. It, as well as the laboratory and lecture-room, can be completely darkened. In it is a stone table with another pair of galvanometer stands, in which the high-resistance instrument invented by Sir W. Thomson will take up its permanent abode. In it, in a space not larger than the hand, are four coils of copper wire, silk-covered, making some 10,000 turns.

#### Engineering Department.

The engineering department occupies the eastmost house. The ground-floor, with the exception of an entrance lobby, is converted into one large and well-lighted room, forming the drawing-office. Here each student is provided with a separate drawing-table. Free use of the more expensive kinds of drawing apparatus is allowed by the college, and a collection of these is kept for the purpose; but each student is expected to provide at his own cost the more ordinary instruments of his craft. A store of these is kept in the office, from which students may purchase what they need at cost price. Upstairs is the lecture hall, a room of moderate size, but probably sufficient for the needs of the class; the professor's private room, and a room in which the surveying instruments are kept, which form the material for the summer operations of the engineering class. The collection comprises theodolites, levels, plane-tables, prismatic compasses, chains, staves, and all the usual implements of the civil engineer.

Going downstairs again, we enter the electrical engineering laboratory, a new building thrown out at the back of the house, and fitted with all the appliances required in practical electrical testing. A number of massive stone piers, built up from the ground and completely clear of the floor, serve as supports for the delicate galvanometers and electrometers, in the use of which a complete freedom from shaking is essential. Large tables standing on stone bases and stone slabs projecting from the walls carry other instruments. The apparatus includes a dynamo, motors, lamp, batteries,

resistance coils, magnetometers, electro-dynamometers, and all the electrical measuring instruments used in electric light engineering, in the transmission of power by electricity, and in telegraphy, both land and submarine. A large basement, extending under the whole house, forms a supplementary laboratory. One of the basement rooms is given over to electrical batteries, whose currents are carried to the laboratory above by a system of insulated conductors.

A set of thick copper aerial wires connects the Electrical Engineering Laboratory with the workshop, which is an isolated new building of two storeys standing a little way behind the college buildings. These wires bring over the strong currents afforded by a Siemens dynamo-electric machine, which stands in the workshop, and is driven by a 6 horse-power Otto gas engine. The same engine drives a row of shafting, from which a screw-cutting lathe and several other machine tools derive their power. An instrument-maker, a foot-lathe, a forge, and a considerable assortment of hand tools complete the equipment. The upper storey of the workshop forms a carpenter's shop and store.

The laboratory and workshop have been fitted up to enable Professor Ewing to give a special course of practical instruction in electrical engineering. This forms a novel feature in Scottish college teaching. In the workshop the services have been secured of a skilled mechanic, whose time will be divided between the Professors of Engineering and Natural Philosophy.

(To be continued.)

#### RUARDEAN CHURCH, GLOUCESTERSHIRE.

THE members of the Bristol and Gloucester Archaeological Society lately visited Ruardean Church, where the following paper was read by Sir John Maclean:—

Before entering the church I would call attention in the first instance to the figure over the door of the porch, which would seem to represent the head of the Blessed Virgin Mary, and more especially to the very remarkable sculpture in the tympanum over the south door. It appears to be of the date of about the middle of the twelfth century, and would seem to have some influence upon the date of the church. It is almost identical, as regards the treatment of the subject, with a sculpture in the tympanum over the door of Brinsop Church, in Herefordshire. That church is dedicated to St. George; but Ruardean Church is now understood, I believe, to be dedicated to St. John the Baptist, though this also probably in ancient times was dedicated to St. George. At all events the figure over this door is a representation of St. George, though some persons have supposed it to be that of St. Michael. Few will, however, upon a careful inspection, perceive that the flowing sculpture from the shoulder of the figure is not a wing but a mantle. The head-piece is of the form called Phrygian, and is exactly like that which appears on the monumental effigy of Geoffrey Plantagenet, Earl of Arigon, father of Henry II., and like those on the great seals of King Stephen and Henry II. The tunic and mantle also resemble those on the effigy of the said Geoffrey, who died in 1150. The tunic, you will observe, fits closely about the body, and is apparently belted at the waist, whilst the skirt is open at the side. Over this is the flowing mantle above mentioned, which is fastened in front by a brooch. The prick-spur has a recurved point without any neck. There is a *portraile* around the breast of the horse, and a high cantel to the saddle. The rude manner in which the drapery is treated by parallel lines is in conformity with several examples in Herefordshire. It is of Norman work. On entering the church you will find that it consists of chancel, nave, western tower, a south aisle, divided from the nave by an arcade of fine bays, and a large south porch. Let us look at these parts severally, but in the first instance it may be desirable to direct your attention to the arcade. It would seem to be of late transition Norman character, merging into Early English. The capitals of the columns are very peculiar, and have been evidently tampered with, but to what extent it is difficult to say. The columns would seem to be of fifty years later date than the south door, which would, therefore, indicate that the latter belonged to an earlier structure, but as the south wall has been entirely rebuilt we have no assistance from it in fixing the date of the aisle. The manor of Ruardyn at the earlier period at which I have found any evidence was held by the family of Alba Mara, or Albemarle. William de Alba Mara died seized of it in 1255. How long his ancestors had held it previously I know not, but I think at least for two or three descents. He died without issue, and his nieces, daughters, and his brother Robert Hathewy, and their issues, were found to be his heirs, and all of full age, except William, son of William Hathewy, by Agnes Albamaru, deceased, who was only eleven years old, among whom it fell into a partition of four parts. I am, therefore, inclined to conclude that the original church, and the extension indicated by the south aisle, were built by nine members of this family.

We will now proceed to the chancel, which I consider, so far as any of the original work remains, to be one of the Decorated period—say between 1300 and 1370. At this period the manor was held in coparceny by Thomas, son of Thomas Deverty,

Knt., and Annora de Albemarle, for whom the Bishop of Bath and Wells was guardian, and William Hathewy. In 1302 Robert Ving paid a fine of ten marks for his pardon, for acquiring from the Bishop of Bath and Wells the manor of Ruardyn without the king's license, and in 1305 Alexander de Bykenor paid a fine of 10*l.* for a like transgression in acquiring the same lands from Robert Ving; and in 1310 Edmund Langley sold to Geoffrey, son of Alexander de Bykenor, the manor of Ruardean. Alexander de Bykenor, who was a man of some consequence, treasurer for Ireland, had acquired a large share of the manor, and in the year last mentioned had license from the king to crenellate his mansion, or in other words, to castellate it. This was probably the origin of the castle remains which exist in the field adjoining the churchyard. It would seem to be probable that he re-edified the chancel, and that the Decorated founder's tomb in the south wall of the nave was prepared for him. This is now the most striking object in the church. I found it blocked up by a few rough boards, and the rector, at my request, has kindly opened it. There is only one other instance in which I have found any mention of the castle, and I may as well name it here and have done with it. When Joseph Baynham, of Westbury, in 9 James I., settled his estates on the marriage of his son and heir, Alexander Baynham, among the lands so settled he names the castle and manor of Ruardene. These Baynham were not those of Clowerwall, who afterwards held the Hathewys Manor in Ruardean, but the elder branch of the family. I might say much more relating to the manor, but this is not the time or place. Apologising for this digression, I will return to the chancel of the church. The east window is a modern insertion of Perpendicular character. The elegant window in the south wall is an original one, of the Decorated period, and of the date of the first quarter of the fourteenth century. A third of the lower part has been walled up. The north window is of Perpendicular date—perhaps 150 years later. In the south wall is a very pretty piscina. There does not seem to have ever been a chancel arch. The doorway to the rood-loft staircase remains, but the staircase itself has been walled up, though traces of it still exist. The roof is of Decorated date, and a good example. Of the founder's tomb in the nave I have already spoken. The north wall has been much pulled about, some of it rebuilt. The north door is walled up, and so are the ancient windows, and new ones inserted. The font deserves special notice, not from its beauty, but it bears the date of 1657, and I need not say that the erection of a font during the period of the Interregnum is a rare event. Possibly it was through the influence of John Vaughan, then lord of the manor, and a resident in the village, who, though a Roman Catholic, seems to have attended the church, for his pew remains at the foot of the pulpit-stairs, bearing his name and the date 1649, in December of which year he died, in the fifty-sixth year of his age, and without issue. He was grandson of Johanna, daughter and co-heir of Thomas Baynham, of Cloweswal, and wife of another John Vaughan. They were strict Romanists, and suffered greatly on account of their religion. Joan Vaughan in 1641, being then a widow, was arrested and committed to Gloucester gaol for affording shelter to a priest, then a capital offence. There is a tradition in the family that she was hanged, but I think that in consequence of the political disturbances of the period she escaped that fate.

The tower is of the Perpendicular period, and you will observe the very lofty and fine arch with continuous mouldings, which should connect it with the church, and which is now obstructed, not only by a singing gallery, but also by a false floor set in the tower for the purpose of making a vestry, concealing also the vaulting of the roof, which is deserving of notice. The singing gallery was erected by subscription of the inhabitants towards the end of the last century, upon the plea that there was not sufficient room in the chancel for the "company of singers," as it was called. The chancel, however, if properly arranged, would accommodate a large choir, and whenever the church is restored the whole of the erections I have mentioned will, I hope, be cleared away, the tower thrown open to the church, and the "company of singers" remitted to their proper place in the chancel.

There are six bells in the tower, all modern. The oldest was cast in 1705, and the others in 1866, when the Rev. John Burden, late rector of English Bicknor, and in many ways a great benefactor to this church and parish, with greater liberality and zeal than judgment, spent large sums upon the repair of the church. A great portion of the walls were rebuilt by him, and the upper portion of the elegant spire renewed. He is also responsible for the flimsy flying buttresses and pinnacles on the tower, and probably for re-making the font.

As a parish church this edifice has no history. From a very ancient date almost to the present day it continued a chapelry to the parish church of Walford, which we propose to visit presently and the vicar of Walford provided for the ministrations.

**A Memorial Bust of the late General Sir George Pomeroy Colley** has been fixed in the hall of the Staff College at Farnborough, of which institution he was a professor. The sculptor is Mr. H. P. McCarthy.

#### Non-poisonous Paints and Driers.

SIR,—Having for some time past watched with considerable interest the production of non-poisonous paints, and noticing the remarks made by two of the committee in connection with the Sanitary Institute of Great Britain, I think it only fair to the firms referred to that a better explanation should be given to the public with respect to the driers mentioned.

The firms mentioned manufacture and sell perfectly non-poisonous substitutes for white lead, thereby preventing the many diseases which arise from the latter pigment, alike to those who make it, those who use it, and those who are subjected to its ill effects after application.

They do make and supply a leadless drier, and strongly recommend its use with their patent whites; but as it is more expensive than the ordinary "patent drier," the decorator often prefers to use the cheaper article. The ordinary patent driers contain sugar of lead in proportion, say, of four ounces to eight pounds. We will, therefore, suppose that they prefer the latter. Eight pounds of driers is sufficient for one hundredweight of patent white. One hundredweight of this white will cover about 900 to 1,000 square yards. Now, what I want to know is, how those gentlemen make out that there is any danger in the use of three or four ounces of lead in such a space. It is perfectly true, quite apart from the sanitary aspect of the question, that the admixture of even this very small quantity of lead is objectionable, because it is sure to cause discoloration in time, in the presence of sulphuretted hydrogen and other gases; and the manufacturers urge this as one very strong reason for using the leadless driers with their pigment, in place of ordinary patent driers or terebine. The many tons of non-poisonous white that these firms are turning out daily tend to show how popular they have become, and how efficiently they prove a complete substitute for white lead.

Yours truly,

FRANK WILKINS, Decorator.

32 Fulham Road, South Kensington.

#### CHURCH BUILDING AND RESTORATION.

**Dundee.**—The new chapel in Hilltown was opened on Sunday, the 7th inst. It has been designed by Messrs. C. & L. Ower, architects, Dundee. The style is French Gothic. The principal front has a large gable, with lancet windows continued through two flats. Small pointed windows are in the top of the gable, which is finished with a stone cross. The long windows have drip mouldings resting on capitals, and shafts carried to the whole height of the windows, with capitals and moulded bases. The entrance doorway is moulded, and has shafts with moulded bosses and capitals. Carved bosses finish the drip mouldings of the doorway and the smaller windows. Over main doorway a tower is carried up, with a belfry. The tower forms a stair for access to the keeper's house and ringing chamber. On entering, a staircase on the right leads down to a hall for male teachers. On the left is the ladies' room, for Dorcas and other meetings. At the end of the entrance passage is the chapel, which will accommodate about 450 children. The schoolrooms are also connected with the chapel, and the accesses are provided with double doors, so that the noise from the schoolrooms may not interrupt the services. To take full advantage of the slope of the ground, the schoolrooms are approached from the level of the platform. A spacious platform has been erected at the west end of the chapel, and is approached by two stairways. The schools are separated by a sliding partition. The walls of the chapel and schoolrooms are decorated with appropriate texts, with coloured cornices and lines. An open wooden roof with ceiling lights has been adopted in preference to windows in the sides of the building, as it has been found that the noise from the street in similar buildings disturbed the work of teaching. The whole of the building, with the exception of the keeper's house, is to be heated by hot-water pipes.

**Bexley.**—The church of St. Mary has been reopened after restoration, which has been carried out from the designs and under the superintendence of Mr. Basil Champneys, architect, by Messrs. Bell, of Saffron Walden and Cambridge, Mr. Standing, of Bexley, being the clerk of works. Among the works were comprised the stripping of the roof and walls inside and out, the retiling of the roof, the restoration of the oak roof beams throughout, the insertion of panelled ceilings in chancel, nave, and aisle, the rebuilding of the east and north walls of the chancel, the restoration of all the tracery of the windows, the construction of two new east windows in the chancel and north aisle, in accordance with the original windows, the remains of which were found broken up and buried in the walls; the restoration of the original arcade of the sedilia, the removal of the galleries, the

closing of all graves or vaults beneath the church, covering of the entire floor with concrete, &c. Stained glass windows have been inserted in chancel and nave, and one of the windows, *The Kings*, represented by figures of David and Hezekiah, is given by Mrs. Spottiswoode, in memory of her husband, Mr. William Spottiswoode, late president of the Royal Society. The cost of the restoration has been upwards of 7,000*l*.

### SCHOOL BUILDINGS.

**Sheffield.**—The memorial-stones have been laid of new schools and class-rooms in connection with the Ebenezer Wesleyan chapel. The architect of the schools is Mr. C. Gibson, St. Philip's Road, Sheffield. Mr. J. White, Penistone Road, is entrusted with the masonry, and Messrs. J. & H. Wheen, of Porter Street, with the joiner's work. The new pews, which are to be of pitch pine, are supplied by Mr. Loxley, of Corporation Street.

**Leighton Buzzard.**—The memorial-stones of the new buildings for Pulford's school have been laid. The buildings will consist of boys' and girls' school, each measuring 50 feet by 24 feet, with a master's residence. The material employed will be for the most part local sandstone, with white brick facings and Bath stone dressings. The total accommodation will be sufficient for 300 children. The rooms will be lofty and well ventilated, conveniently fitted up, and furnished with suitable apparatus for teaching purposes. Mr. Frederick Gotto, of Leighton Buzzard, is the architect, and Messrs. Edwards & Yarrell are the builders. The cost will be upwards of 1,700*l*., exclusive of commission and school fittings.

### NEW BUILDINGS.

**Sheriff Court House, Paisley.**—This building is in course of erection in St. James's Street. The front elevation, which is nearly 100 feet long, shows two wings, with a recess in the centre, having on the ground-floor a colonnade of Doric columns, resting on a low stylobate, enriched above with an elaborate entablature and balcony, while on the upper storey is a range of boldly-moulded windows. The main cornice of this elevation rests on carved double trusses, with panelled work between and surmounted by vases. The projecting wings of the building have rustic work at each end, enriched at the angles by four sets of coupled Ionic pilasters, the whole crowned by an entablature and dented cornice with a parapet. The principal entrance pierces the recess of the front elevation, and passes through a central vestibule and large hall, giving access to all parts of the buildings. In rear of the building is placed the court, 70 feet long, 35 feet wide, and 30 feet high. Retiring rooms are provided for judge, jury, and bar, separate rooms being also supplied for male and female witnesses. The front of the building on the ground-floor contains sheriff's private room, room for taking proofs, and a room for the sheriff-deputé. The sheriff-clerk's office, also on the ground-floor, is furnished with a public room, private room, and clerk's room, having in connection four fireproof record rooms. On the upper floor are placed the procurator's library and retiring room, procurator-fiscals' office, which includes public, private, productions, and clerks' rooms, the remaining portion of the flat being occupied by a dwelling-house of five apartments for the keeper of the building. The architects of the building are Messrs. Clarke & Bell, of Glasgow.

### SANITARY WORKS.

**Carlisle Public Baths.**—The foundation-stone of the Carlisle public baths was laid on September 4, by Mr. R. S. Ferguson, M.A., F.S.A., mayor of Carlisle. The cost of these baths is being defrayed out of the profits derived from the gas works, and the plans have been prepared by Mr. J. Hepworth, A.M.I.C.E., engineer and manager to the gas and water committee of the city of Carlisle. The entire area to be occupied by the baths is 1,378 square yards. The outer dimensions of the building are 126 feet by 100 feet, the latter measurement being the frontage to James Street, and the former the frontage to Wood Street. The walls are of red brick, relieved with red stone dressings and terra-cotta panels. The principal entrance to the building is from James Street. An ascent of a few steps brings the visitor to the entrance hall, which is 20 feet by 11½ feet, and 16 feet high. Round the walls of this hall is fixed a panelled and moulded dado 4 feet high. The ceiling is boarded and moulded, and the floor laid with tiles. Into this hall opens the ticket-office window. From the entrance hall the several groups of baths are approached. In the first group is a first-class swimming bath, 60 feet long, 30 feet wide, 3 feet 6 inches deep at one end, and falling to 7 feet at the other; there are seventeen dressing boxes, foot and shower baths, four first-class private or slipper baths, and a Roman bath, with shower, spray, and vapour baths. The second group includes six second-class private or slipper baths, shower and vapour baths, swimming bath, 65 feet by 30 feet, 3 feet 6 inches

deep at shallow end, and falling to 7 feet at the other with twenty nine dressing boxes, above which is a balcony with balustrade (approached by stairs) for use when swimming competitions are being held. In the third group accommodation is provided for ladies. This includes a swimming bath, 29 feet by 16 feet, 3 feet deep at the shallow end, falling to 5 feet at the other, with six dressing boxes and a waiting-room. There are also four private baths and a Roman bath, fitted with shower and spray baths. The swimming baths are to be lined with white glazed tiles, and the private baths are to be of porcelain. All the swimming baths are to be lighted from the roofs, which are of iron of a light design and ornamental character. The heating and ventilation of the building have been carefully attended to. At the rear of the building is a boiler-house, fitted with two Cornish boilers, each 16 feet by 5 feet; also a laundry and store-room. There is also room reserved for a Turkish bath, should one be required. The whole building is fitted up on the most approved system. The following are the several contractors for the work, together with the amounts of their respective contracts: Messrs. Beatty Bros., masons and bricklayers, 1,580*l*.; Messrs. Batey & Forster, carpenters, 1,070*l*.; Mr. R. M. Ormerod, plasterer, 59*l*.; Mr. R. L. Lowe, concrete work, 749*l*.; Mr. C. J. Nanson, slater, 209*l*.; Messrs. Kirk & Robley, painters, 192*l*.; Messrs. D. W. Stanfield & Son, ironwork, 207*l*. The total amount of all the contracts is 4,066*l*., but in addition there will be an expenditure of about 2,000*l*. for plumbing, engineering, and tiling work. The work is now being rapidly proceeded with, under the supervision of Mr. H. Higginson (assistant to Mr. Hepworth), and is expected to be finished in April next.

### GENERAL.

**The Glasgow Institute of Fine Arts** held its twenty-second annual meeting on Tuesday, when Sir P. Coats and the Lord Provost Ure were elected respectively president and vice-president.

**A Director** for the Fitzwilliam Museum, Cambridge, to succeed Professor Sidney Colvin, is to be elected on November 10.

**Mr. William Morris** will deliver a lecture on "Art and Labour" to the members of the Leeds Philosophical and Literary Society.

**A Spire** is to be added to Poynton church in memory of the late Lord Vernon, from designs of Mr. Crowther, architect, of Manchester, at a cost of 1,200*l*.

**A Model** has been completed by Mr. W. G. Brooker for the group which is to be memorial of the disaster at the Victoria Hall, Sunderland, by which 186 children were killed. The model represents a mother with her dead child upon her knee. The cost of the statue, which is to be eight feet high, will be 500 guineas. It will be of white marble upon a Sicilian pedestal, and is to be placed in the hall of the free library and museum.

**The Foundation-stone of the Birkenhead Town Hall**, which is to be erected at a cost of about 70,000*l*., from the designs of Messrs. Ellison & Son, was laid on Wednesday.

**Mr. John Jaffray**, of Birmingham, has offered to erect a hospital for chronic cases in the suburbs of the town.

**Mr. R. Q. Lane**, of the Ann Street Iron Works, Belfast, has been commissioned to design the certificate of merit for the Cork Exhibition, which closes to-day. The certificate will correspond with the prize medal, which has been already designed by Mr. Lane, and the best Celtic examples will be followed for the ornament. It is to measure about 20 inches by 17 inches.

**M. Caspar Fossati**, architect, died lately at Morcote, Ticino, at the age of 74. He studied his profession at Milan, Venice, and Rome, and while yet very young he betook himself to St. Petersburg, where he planned and carried out several important public buildings. In the year 1836 the Russian Government sent him to Constantinople to build the new palace of the Russian Embassy at the Porte. He thus became known to Sultan Mahmoud, who charged him with the restoration of St. Sophia, and he was engaged for several years in the erection of public buildings at Constantinople.

**Calcutta Exhibition.**—The commissioners have commanded that the colours, paints, enamels, &c., used on the exhibition buildings are to be exclusively of Messrs. J. B. Orr's (The Silicate Paint Company) manufacture. Messrs. J. B. Orr & Co. have built on their own premises at Charlton a show-case, some 6 feet square and 15 feet high, for the Calcutta Exhibition. It is prepared from the bare wood, and represents their Charlton White Duresco Enamels, &c.

**The Shoreham Harbour Trustees** at a special meeting on Wednesday decided to promote a Bill in the ensuing session of Parliament, conjointly with the promoters of the Eastbourne line, for power to construct a line of railway to be called the London and Southern Railway. The general course of the line will be from Shoreham Harbour towards Hove, having stations at West Brighton, and thence by way of Lewes to Uckfield, joining the line from Eastbourne, thence to London, and joining the London, Chatham, and Dover Railway at Bickenham.

# SUPPLEMENT

TO THE

# ARCHITECT

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, OCTOBER 13, 1883.

### TENDERS, ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Supplement to THE ARCHITECT."*

### TO AMERICAN SUBSCRIBERS.

*All subscriptions are payable one year in advance, and may commence at any date.*

*The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.*

*Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED to GILBERT WOOD, 175 Strand, W.C., London, England.*

*In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—*

*To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order.*

### COMPETITIONS OPEN.

**BIRKENHEAD.**—Dec. 1.—Plans are required for Laying-out Bidston Hill for Building Pupos. Premiums of 100 guineas and 50 guineas, and four of 15 guineas each. Messrs. Davies & Stephen, Estate Agents, Mollington, Chester.

**W. H. LINDSAY & CO.,**

PADDINGTON IRON WORKS, LONDON, W.,

AND SANDYMOUNT FOUNDRY, LLANELLY, CARMARTHEN.

**PATENT WROUGHT-IRON SASHES AND WROUGHT BOSSES**

SPECIALLY ADAPTED FOR WAREHOUSES, SCHOOLS, AND PUBLIC BUILDINGS.

CABLE LIGHT

The Patentee begs to call particular attention to the great strength of this construction. The Bars and Bosses, being of malleable wrought iron, form an exceedingly firm joint at the intersection of bars. They are durable, and of light appearance, the Bosses being small and not unsightly. They can be made at very short notice, and at the price of an ordinary cast iron sash.

PRICES UPON APPLICATION.

CABLE LIGHT.

CLOSE BAR SASH (obviating use of Window Guards.)

ORDINARY WAREHOUSE AND SCHOOL SASHES.

Back view of Boss, full size.

Section through Boss, full size.  
These can be glazed flat, like ordinary wooden sashes without the corners of the panes being chipped off.

Front view of Boss, full size.  
Obscuring no appreciable light.

## ON COMPREHENSIVE ARTISTIC TRAINING.

THE Ecole des Beaux-Arts, as we informed our readers last week, has declared in favour of the principle of teaching the artist all the arts. In the words of our "Paris Notes," "Henceforward all students, no matter to what particular branch of art their attention is specially directed—whether painting, sculpture, or architecture—will be

obliged to gain a certain amount of knowledge in the other two." In our own Royal Academy the idea underlying this rule has long been recognised. As students of the Academy well know—and some of them, perhaps, a little resentfully—pupils in each division are ordained to attend the professorial lectures in the others. The complete circle of the academical arts in London, we need scarcely add, as in Paris, is composed of the same three constituents, painting, sculpture, and architecture.

Now, in so far as the principle is concerned, if it be a true principle, the question suggests itself whether it ought not to be carried further? That there are other arts besides architecture, sculpture, and painting, everybody has thoroughly understood for any length of time. Poetry and music, for instance, have taken their places for ages in our very school-books in the modern commonwealth of the *Five Fine Arts*. Not only so, but, as the practical influence of the artistic element is extending and expanding in these present days, we perceive more and more plainly that there are any number of other arts *in esse* and *in posse* which may claim the same honourable appreciation. Art is in its way almost infinite, and if Academies fail to recognise the fact, so much the worse for the Academies.

The doctrine that a painter should know, and indeed practice, as much as he is able to learn, not only of sculpture and architecture, but of poetry and music, has been acted upon with excellent effect in many historical instances. The sculptor has no less been expected to prove himself at least a masterly draughtsman, and to profess a little poetry in spirit if no more; to him also, even more than to the painter, a smattering of architecture has always been useful; and music of course will be his delight, if so it can be. The architect, again, when of any academical pretension, has quite as often professed to be acquainted, critically if not otherwise, with a circle of arts of any diameter that might be required; and in our own day there are few artistic architects who fail to manifest a pretty shrewd appreciation of most of the art work that is going. Of the poet and the musician, if we cannot say so much, we may at any rate suggest that, the more accomplished they are as men of artistic sensibilities, the wider will be their acquaintance with everything that is of artistic character. It is only fair, however, to admit that the poet and the musician are somewhat restricted in their practical sympathies; and if this consideration serves to bring into more substantial form the closer relations which no doubt exist between painting, sculpture, and architecture, the conclusion need not be unwelcome. But at the same time the case is thus rendered all the stronger in favour of the proposition that any intercommunion which may be advocated for these three arts ought to embrace in other directions other arts that are kindred to these. Indeed, this is only one of many forms of the general question which is now becoming every day more urgent in a practical nation like ours, that the so-called minor arts, as compared with the academical, have the same essence and the same importance, possibly sometimes even a greater importance, if value is to be reckoned by extent of beneficial influence.

The rule, therefore, which is laid down in our Royal Academy, and now in the French *Ecole*, may be put in this way—that the arts of the pencil are so far mutual aids and accessories to each other, both in principle and in practice, that it is advisable for the specialist student of one branch to acquire to some extent an appreciative knowledge of all other branches. But we must at once repudiate the limitation of this doctrine

to the traditional circle of "the three arts." It cannot be too often repeated that this restricted scheme of art is merely a dogma of the Renaissance, now superseded by a broader and more liberal *régime*. Even at the time of the Renaissance, it must not be forgotten, there were arts quite beside the three, which in the person of such a man as BENVENUTO CELLINI were most notably recognised and abundantly admired. Without going too much into particulars, we may freely admit, nevertheless, that there were points of etiquette then, and that there are the same now, whereby even a BENVENUTO CELLINI must be placed in one category and a MICHAEL ANGELO in another; but it is happily coming to pass that the distinction is disappearing; and when Mr. SEYMOUR HADEN, for example, claims the admission of a new class of artists of his own into the ranks of the Academy, is it not really the case that he is the unconscious representative of a whole outside circle of arts supplementary, all of which are equally entitled to full artistic recognition? How far, then, ought the students of the Academy to be instructed in the entire scheme of art, and how far ought this scheme to be considered for that purpose to extend?

The answer is surely not difficult. Take a typical case. The young painter of what is called the true English school is very often disposed to think—and naturally enough—that to paint a picture of the particular order which he favours is a thing quite by itself; and that the artist, therefore, whose happiness it is to achieve such a task with success, amply fulfils his vocation as regards study when he overtakes all that belongs to the direct production of the kind of work for which nature has adapted him. But this is a narrow view, not only of his personal function, but of his individual genius, and much more of the scope of his obligations to the cause of art. True, by the rule of the division of labour, it is well for every worker to confine himself chiefly to his own specialty. To have too many irons in the fire is proverbially unwise, and to be jack of all trades and master of none is equally well understood to be the upshot of cleverness too extensively applied. But all this is matter of degree, and we have only to allow that every man's capacity must be fully taken into account as the measure of his versatility and we relieve the principle before us from all further doubt. To confine one's attention, for the sake of perfection, to a limited field of exertion and exercise, may still be a rule of expediency; but there is another rule of expediency which is equally sound, namely, to extend one's purview, for the sake of that breadth of comprehension which may be called artistic magnanimity, as widely as shall be reasonably possible and in all directions whatever.

Strange to say, it is the practitioners of the minor arts—the outsiders in the sight of the academical men—who seem to stand foremost just now in the appreciation of this comprehensiveness of artistic study. A designer of glass-painting, for example, a carver, or a decorator—of course of the highest order—may be actually found any day in possession of an amount of knowledge of figure-drawing, landscape, modelling, architecture, colour, costume, furniture, metal work, textile work, fictile work, and indeed all kinds of historical, national, and characteristic ornamentation, which not only is much more than a mere critical acquaintance with the generalia of those subjects, but will certainly extend in some departments as far as manipulative skill, and in all to the full limit of experienced directorship. Perhaps the architects come next in order; but it is only because of their having lately assumed the function of designers in the minor arts. Painters and sculptors will say that they hold themselves aloof; but at any rate there are so few of them who can pretend to go any considerable way beyond the work of their own studios, that, as practical leaders of public opinion in artistic affairs at large, they are undeniably little better than amateurs. The new rule of the Ecole des Beaux-Arts suggests to us the hope that this backwardness in respect of the public usefulness of professed artists of high class may come to be modified, in so far as it is due to personal reserve, by a recognition of broader views of artistic duty, and, in so far as it may be traceable to defective acquaintance with the wider fields of criticism, by a direct application of the principle of comprehensive academical education. May we say without offence that the execution of pictures for sale, even when on the very highest artistic ground, is but the "trade" of an artist, and that it is his earnest study of the underlying principles of art, of all other art as well as his own, and his active exercise of the intellectual qualities of the practical

artistic exemplar and leader, which alone can entitle him to regard himself as one lifted above this level? In another generation, when the Royal Academy of Arts has become developed into a council of all artists, although part of the number may doubtless continue to be the great workmen of the studios, caring for nothing but the work they do of themselves, the majority, it is to be expected, will assume the true character of Masters of the Guild, skilled in all that is beautiful, and authoritative therefore in everything that belongs to the whole science of the arts.

### THE ROMAN EMPERORS IN MARBLE.

IN our last number we noticed some of M. RYDBERG'S articles on Greek sculpture, and we now propose to glance over those which have the statues and busts of a few of the Roman emperors for their subjects. His endeavour has been to discover how far the portraits afford evidence of the characters of the emperors which is given in history. But M. RYDBERG does not write as a physiognomist merely. He is a student of the minds and manners of men, and he evidently believes that the sculptors were like himself, and therefore were able to give revelations of the thoughts which inspired the emperors. His "Roman Emperors in Marble" thus becomes a counterpart to the analyses of the characters of CÆSAR, AUGUSTUS, TIBERIUS, CALIGULA, CLAUDIUS, and NERO which have been attempted by so many ancient and modern writers, and, for all we know, the Swedish journalist may be as near the truth as SÜETONIUS or GIBBON.

When one speaks of Imperial Rome, the thought of the mighty JULIUS naturally first comes to the mind. To him rather than to any of his successors the maxim of the old lawyers is applicable, *Ubi Cæsar, ibi Roma*. His history fills the world, and so much has been written about him we seem to know something of the man himself. But it is remarkable that the sculptor's art has preserved nothing for us of CÆSAR, as he appeared in the days when he was best known in Rome. There are busts and statues like that in the British Museum (and which probably are not all imaginative portraits), which suggest the dictator, who knew too well that he was surrounded by mortal enemies; but the young CAIUS CÆSAR, that was supposed to contain within him many a MARIUS; the dare-devil that, when a prisoner among pirates, told his captors he would one day hang them all; the sceptic that was Pontifex Maximus; the dandy, whose thoughts appeared to be absorbed by his ambrosial locks—all these phases of character are not represented in art. The statue of CÆSAR which is in the Capitol does not suggest the genius who conquered continents, but was afraid of his creditors, the orator who excelled CICERO in style, the idol of the golden youth of Rome. What we have, says M. RYDBERG, is the shrewd calculator who was able to turn the vices as well as the virtues of his countrymen into an advantage for himself. The arrangement of certain other works near that statue in the Conservator's palace forms a commentary on his career. It is flanked by colossal heads of OTHO and DOMITIAN; opposite is a lion bearing a horse, which might symbolise the destruction of the Republic; and at the side is a relief in which are represented barbarian prisoners, with hands hewn off, and who are a consequence of the imperial system.

Very different in character is the bust of the young AUGUSTUS which was found by Consul FAGAN at Ostia, and is now in the Chiaramonte Gallery. There is something Hellenic in the contour, as there well might be, for his family were supposed to have been derived from Greece. But the questioning look of the eyes, and the expression of power which is given to the face, would not be found in the representation of a Greek god, much less in one of a mortal. The sculptor of the Chiaramonte bust must have guessed that the day was not far distant when the handsome fellow who sat to him would become the ruler of the world. Accordingly he made it clear to the Romans that the gods had set their seal upon the youth to give assurance of a king. Many an artist since those days has acted on the same principle. There is a portrait of AUGUSTUS at a later period in the Braccio Nuovo of the Vatican. This is a noble figure, with one arm outstretched, as if calming tumults, while the other holds the sceptre. In a bust in the Capitoline Gallery we see him in his latter days.

What do we learn about AUGUSTUS from the various por-

traits which are seen in Rome? It may be said that they do not uphold the opinion concerning his career which has been generally held by scholars. Sir WILLIAM JONES (and as he lived in the eighteenth century he could not have suffered from the emperor's misdeeds) surprised people by the antipathy which he expressed for OCTAVIUS, for he declined to recognise his title of AUGUSTUS. GIBBON goes so far as to say that even in his vices AUGUSTUS was artificial—that he had a cowardly disposition, an unfeeling heart, wore the mask of hypocrisy, and was at first the enemy of the Roman world. Both those characters are derived from the study of books. But M. AMPÈRE, who looks to sculpture for evidence of Roman history, follows GIBBON, for he says that it is plain from the portraits that AUGUSTUS was a hypocrite, and that intrigues and lies, with the fear that comes from guilt, are stamped upon his face. M. RYDBERG derives another conclusion from the portrait busts. AUGUSTUS was, he says, an admirer of the old Roman ways, but he was shrewd enough to see that the people who were around him were unlike their ancestors. His own life had a good deal of republican simplicity. It was his boast that he found a Rome of brick, and left one of marble. But he built no palace for himself. The little house on the Palatine Hill, in which he lived for forty years, belonged to HORTENSIVS, the orator. The colonnade in front was of common tufa, the least esteemed of materials; the interior was devoid of statues, mosaics, or costly furniture. In such a house AUGUSTUS ruled the empire, and taught his children; there his wife and sister spun and wove the stuff he wore in his garments. But this simplicity is considered by M. AMPÈRE to have been one of the political ruses which were easy to AUGUSTUS. It was craft, we are told, which inspired the building of the new Forum and the Temple of Apollo; and when he bought off the opposition of property owners to his new market he was acting as the enemy of the people. If AUGUSTUS were a schemer of this kind, some suggestion of his defects must have appeared in one or other of his numerous portraits. All the sculptors could hardly have been united in a conspiracy to represent him as better than nature and his own actions had made him. In his last hours AUGUSTUS is said to have asked for the approval of the bystanders (*vos plaudite!*); some say that in death as in life he was acting; but on the other hand it may also be assumed that he sought for that recognition of success which a man who had fulfilled most difficult duties was entitled to expect.

M. RYDBERG fancies he sees some resemblance to AUGUSTUS in the busts of his successor and stepson TIBERIUS. But he says it would be necessary to have a series of busts placed side by side in order to understand the retrogression of TIBERIUS. The smile which is stereotyped on his statues does not appear to be sincere and is at variance with the coldness of the eyes, and the profligacy of his old age in the Campania is foreshadowed in one of the Capitoline busts. But as they omitted the boils which disfigured his countenance, the artists may have also ignored traits of character which were patent to their eyes. When TIBERIUS was most tyrannical a statue of him was carved, and an ear was placed at the foot in order to suggest that there was a god in Rome by whom all things were heard. M. RYDBERG cannot, however, believe that even TIBERIUS was without some goodness. If he did evil deeds, he may have suffered terribly in expiation. In his old age the gods had, he said, consumed him with tortures, and in his punishment, as in his life, there is much that is Titanic.

CALIGULA, who was the third emperor, during the four years of his reign acted like a very wicked boy. One of his "fads" was gigantic buildings and structures, and many an unfortunate architect may have suffered for failing to do impossibilities. He ordered a bridge to be constructed across the Bay of Puteoli, a distance of about three miles. After he passed over a couple of times, the people were permitted to walk upon the bridge, and then, it is said, they were thrown into the sea. This was a specimen of his practical jokes. He built houses for himself in absurd fashions. His palace was on the Palatine, and he ordered a bridge to be constructed which should connect it with the Capitoline, where JUPITER had a temple, in order that he might commune with his fellow divinity. He removed the heads of many statues of the gods and substituted for them likenesses of himself; and he destroyed the statues of the Romans which had been preserved by AUGUSTUS. After his death the statues of CALIGULA were ordered to be destroyed in a night, and looking at the

few examples which have survived, the loss need not be deplored.

A statue of TIBERIUS CLAUDIUS, who reigned between 41 and 54 A.D., is to M. RYDBERG suggestive of HAMLET, and he believes that SHAKESPEARE must have been reading about the emperor before he wrote the tragedy. If anything British could have a resemblance to CLAUDIUS it would be JAMES I. They were both students, one taking up theology and the other Etrurian and Carthaginian chronology; both, in spite of their learning, were considered blockheads; both were gluttonous, nervous, and ungainly. A statue of CLAUDIUS was dug out at Civita Lavigna in 1865, which corresponds with what is recorded of the emperor. He does not seem to threaten and command but rather to explain and excuse. CLAUDIUS looks as if it needed some strain to make him assume an heroic pose. In one respect he was, however, like HAMLET, for he was not equal to the position which was thrust upon him.

Of late days attempts have been made to whitewash some of those persons who for generations were supposed to be infamous. JUDAS, CATILINE, LUCREZIA BORGIA, HENRY VIII., have had their apologists. It is now the turn for NERO, who finds a defender in M. RYDBERG. NERO is described as being an artist in soul, and the deeds which have made many generations stand aghast are all said to have had their origin in a desire for the promotion of art. NERO's tutor, SENECA, like many Romans, believed that painting and sculpture were hardly worthy of hands which could grasp the sword and rule a world. This talk, says M. RYDBERG, irritated NERO, because it revealed the existence of the barbarian within the Roman, and the young NERO was convinced that his mission was to drive out the barbarian. His ambition was to Hellenise Rome, and make it a second Athens. The Roman plays and dances which were coarse in character were supplanted by Greek tragedies, and Pyrrhic and other dances by Grecian youths. The gladiatorial combats were transformed into sportive contests, in which senators and knights took part. NERO was an amateur who could paint and carve, the historian says, with no small success. His skill in music will never be forgotten, for it is related that he fiddled while Rome was burning; he was a poet and an actor. As regards the allegation of NERO being an incendiary, M. RYDBERG is incredulous. Rome was at that time full of priceless statues and paintings, and their destruction would be a disaster to a man of NERO's mind. For the cruelties which were afterwards inflicted on the Christians, the blame is ascribed to TIGELLINUS, who was the master of the revels. DE QUINCEY says that in the fire historic Rome, with its ancestral and heraldic honours, went to wreck for ever. But an opportunity was then given to NERO to carry out his plans for a new and more magnificent Rome. He set an example to the nobles in his own golden house, with its fields, lakes, and woods. The descriptions are almost incredible. The walls are said to have been inlaid with gold, precious stones, and ivory, the floors were of mosaic, and the ceilings were covered with plates of ivory. The colonnade measured a thousand feet, and was adorned with a statue of *Nero Apollo* 120 feet high.

NERO believed that in such a palace he would be able to live. But it was found to be impossible to keep out NEMESIS and the Furies with the costliest walls and doors. NERO suffered remorse, and it was then M. RYDBERG believes he directed the statue now known as the *Apollo Belvedere* to be wrought specially or copied from some Delphic model. APOLLO, it was recorded, had descended to the aid of ORESTES: might he not also be disposed to succour another matricide? CARL BOTTICHER maintained that APOLLO held in his right hand the Delphic lustral whip which was the symbol of the atoner of blood-guiltiness, while the left arm was outstretched in protection or in wrath; and this theory is accepted by M. RYDBERG. Whether right or wrong, it gives another opportunity for controversialists to discuss the meaning of the statue.

Messrs. Robert Boyle & Son announce that they have made arrangements which will enable them to reduce the price of their Patent Self-acting Air-pump Ventilators, in order that they may be available for buildings of all classes. It will henceforth be unnecessary to employ on ordinary buildings an inferior description of ventilator, since Messrs. Boyle & Son's Air-pump Ventilators will be the cheapest in the market.

## PARIS NOTES.

THE work of unearthing the ruins of the old Arènes de Lutece, the site of which has been acquired by the City of Paris, is being rapidly proceeded with. The main approach, descending to the arena by a pretty stiff incline, 35 mètres long by six in width, has already been cleared, and it is now possible to judge of the view that will be presented by the ruins as a whole when they are completely freed. The chief entrance, above referred to, takes the form of an imposing passage, bordered by walls nearly 13 feet high. To the left on entering the main area will be seen the remains of the rows of seats, rising tier above tier to the level of the Rue Monge; in front is the semicircle formed by the enclosure wall of the arena, and, to the right, in the direction of the Jardin des Plantes, the stage will be clearly outlined by its foundations and substructures; under these pass the pipes used for carrying off the rain-water, which would otherwise have accumulated in the arena. In the public square, which it is purposed to create on this spot, will be erected the columns and other sculptured fragments of the arènes now deposited at the Carnavalet Museum, and it is thus hoped to give a fairly correct idea of this, the most ancient relic of old Paris, dating, as it does, from the reign of Hadrian. Hitherto no antiquarian remains of particular interest apart from those appertaining to the building itself have been discovered.

When the demolition of the Tuileries Palace was undertaken a special committee was appointed to see that the work was duly carried out as specified in the contract, and to select such fragments of architecture as it should judge worthy of preservation. Now that the ruins of the palace have been entirely cleared away, it remains to arrange and classify the various fragments thus laid apart, and distribute them among the various city and state museums. These last relics of the old abode of French royalty—columns, capitals, cornices, bas-reliefs, pedestals, &c., to the amount of at least fifty waggon loads—are now lying in what was formerly the central court of the building. After an inventory has been taken, the committee will proceed to determine what pieces shall be handed over to the City of Paris, and then classify and distribute the remainder, according to epoch, nature, and school of architecture, among the state museums—the Louvre, Cluny, St. Germain, &c.—most fitted for their reception.

A few weeks ago passers-by might have observed the erection of scaffolding in one of the courts of the Grand Opéra, that known as the *Cour du Pavillon des Abonnés*. It was in connection with the decoration of the two extremities of the *Grand Foyer*, which had been suspended owing to the fall of the empire. Everyone acquainted with the promenade-hall known as the *Grand Foyer* will remember the two monumental chimneypieces, one at either end, the caryatides and figures of which are due to the sculptors MM. Carrier-Belleuse and Cordier. Behind these the Foyer extends in both directions—on the left into what is intended for a smoking-gallery, leading to what were to have been the private apartments and box of the emperor; and on the right into a gallery which communicates with the rotunda. This latter gallery, as well as the rotunda itself, have never been decorated, and remain as the masons left them, with bare stone walls and ceilings. The work in progress comprises panelled and vaulted ceilings, wood carvings for the wall-panels destined to receive paintings of allegorical subjects or the mirrors that have been already ordered from the Saint-Gobain manufactory, flooring in Italian mosaics, &c. When completed this part of the building will be devoted, as originally intended, to refreshment-rooms. The central room of the rotunda, which will be known as the ice-room, is to be decorated with landscapes by MM. Harpignies and Thomas. The decoration of the smoking-gallery and other rooms to the left of the *Grand Foyer* will be commenced directly the refreshment-rooms are out of hand, and are expected to surpass all other divans in luxury. The only mementoes of the original design for the decoration of this section of the building are eight superb columns of Tarbes marble intended for the Grand Salon of the rotunda. It is understood at least 7,000,000 frs. (280,000*l.*) will be required for the fitting up and decoration of the two wings alone.

Last week the scaffolding was removed from the lower storeys of the three façades of the new Hôtel des Postes, so that an idea may now be formed of the effect of the building as a whole. Exteriorly it is decidedly severe and even plain, possessing scarcely any decorative work; this severity is, however, somewhat relieved by a row of projecting columns, resembling buttresses, which run all round the immense building and tend to

give it an imposing aspect. Another year or eighteen months will be required to complete the building for public use.

On Monday last the school year commenced at the Ecole des Beaux-Arts, and nearly eight hundred students are found to have entered their names. Almost simultaneously with the reopening, the *Journal Officiel* publishes a decree, embodying the new regulations referred to in last week's *Architect*, which occupy no less than thirty columns of the Government organ, and reorganise the whole system of instruction. The course will in future comprise:

(1) Oral teaching, consisting of classes of general history, anatomy, perspective, mathematics, descriptive geometry, stereotomy, drawing plans, legislation concerning buildings, the history of architecture, decorative drawing and design, the history of the arts, æsthetics, &c.; (2) Practical studies after an examination as to capacity, in the course of which prizes and diplomas will be given; (3) Work in the studios or *ateliers*, of which there are three each for painting, sculpture, and architecture, and one each for the three kinds of engraving, line, medallion, and gem. In future, a pupil who within two years shall not have obtained a prize of some sort in his special branch of art, will be excluded from the *ateliers*, unless he obtain a special permission from the Superior Council of the school. Students must be between fifteen and thirty years of age on their admission, and foreigners will be admitted on presentation of a letter of introduction from their ambassador, minister, or consul-general, and a certificate that they are qualified to pass the preliminary examination required from all pupils.

The Triennial Exhibition of Painting and Sculpture at the Palais de l'Industrie was visited on Sunday last by 19,000 persons, and on the previous Thursday, which was also a free day, by 8,317. Some time ago it was proposed to prolong this exhibition until November 20, and the idea was very favourably received by the press and the public. It was found, however, that the cost of establishing a system of heating for the vast building would have been so costly that the committee have been forced to abandon the idea. The Triennial Salon will, therefore, close as originally proposed, on 31st of this month.

### NEGLECTED PICTURES.

A MEETING of the Manchester Literary Club was held on Monday. Mr. George Milner presided.

Mr. T. C. Horsfall read a short paper, entitled "The Manchester Art Gallery: Neglected Pictures." In this he referred in terms of high commendation to a number of the pictures now in the City Art Gallery, and proceeded: "But though every year has given Manchester people the chance of seeing some good pictures, very few of them have made use of the chance. The attendance at the Royal Institution was always extremely small. This year the transfer of the institution to the town council and the enlargement of the gallery have made more persons think about the place than have thought about it before. This year also the autumn exhibition contains a larger number of good pictures than any previous autumn exhibition, and in it there are some pictures of exceptionally great interest. Mr. Millais's *Grey Lady* proves his possession of other great powers besides those which he has hitherto shown. *Beatrice Cenci* is the only other picture which seems to me to belong to the same class. Is it a ghost we see or a living woman? We feel as little certainty as we should do if we saw that beautiful face and form gliding noiselessly along the corridors of an old crime-stained house at midnight; but we feel at least certain that here is such stuff as ghosts are made of. The sense of hopeless sorrow caused by some terrible wrong or loss could not be felt more keenly in the darkness of a haunted room than before that picture. Then there is Mr. Watts's beautiful *Love and Life*. Was a poet's healthy criticism of life ever more beautifully expressed than in that picture where the tender girl gains from the firm grasp and the smile of love, strength, and courage to pass with defenceless feet over the sharp rocks of life towards the bleak ridge of the future? It seems to me that that picture helps one to feel the high value of kindness; that the old truth which the picture tells gains power to influence life from the beauty in which Mr. Watts has clothed it. A third picture that I should like to mention is Mr. Burne Jones's *Cupid's Hunting Ground*, which also contains a poet's beautiful and thoughtful criticism of life. Any one of these three pictures, or the other pictures without any one of these three, ought to fill the galleries. But though the attendance is this year larger than it has ever been before, it is still very much smaller than one would wish it to be. The general neglect of our picture gallery seems to me to be regretted for many reasons. No class among us, as a class, can be supposed to be fully provided with wholesome occupation for its leisure hours, and looking at pictures is at lowest a

perfectly innocent way of passing time." Mr. Horsfall proceeded to make some suggestions which he thought would increase the usefulness and popularity of the gallery. One was that frequent social meetings should be held in the gallery, and that those who had the leisure should make a point of visiting it upon some particular day. Music would also be an excellent adjunct, and attract many who at present are not seen at the exhibition. What is wanted is a system of training people to look carefully at pictures with the settled purpose of getting enjoyment from them. We need every year a series of lectures dealing in the simplest way with the elements of the subject and delivered in front of the pictures referred to. A handbook containing notices of a few of the best pictures in each of the autumn exhibitions, and sold at a small price, would be most useful. Could not the Literary Club undertake both these kinds of work?

The Rev. W. A. O'Connor said that there was an especial need of explanations being given of pictures of an allegorical character. Critics sometimes found wonderful things in them, but the artist's own meaning was sometimes forgotten. The late Bishop Lee once observed to him in reference to a difference of opinion as to the meaning of a certain passage, "You are thinking so much of what he meant that you forget what he said." That was true also of painters and the critics.

Mr. H. H. Hadfield, referring to the many conjectures as to the meaning of the *Grey Lady* of Millais, said that in reality it was merely a study of a staircase in the Tower, made when the artist was getting material for his picture of the *Princes in the Tower*, and the figure was entirely an afterthought.

Mr. Howorth thought that some of Mr. Horsfall's suggestions were very practical, but he did not think that the mere assembling of a large number of people in a large room containing many pictures would lead to an increase in the love of art. He was strongly of opinion that copious explanations should be given, and he would apply to pictures the remark of Dr. Birch as to antiquities under his charge in the British Museum—"We cannot label too much."

Mr. Mortimer thought that the increased price charged for season tickets was a mistake, and had deterred a large number of those who had been habitual visitors in previous years.

Mr. Bennett endorsed this view, and further thought that the diversity of opinion shown in the criticisms that did appear was a sufficient indication of the difficulty of the task suggested by Mr. Horsfall.

Mr. Axon said that any one who visited the Liverpool Art Gallery must be struck by the crowds that thronged it. So far as the working classes were concerned, the present arrangements practically debared them from seeing the pictures which Mr. Horsfall had so warmly and deservedly praised.

Mr. Milner cordially joined in the suggestion that the gallery ought to be open in the evening, and at a price within the reach of all.

### THE VATICAN LIBRARY.

THE letter recently addressed by Pope Leo XIII. to three cardinals, in which appeal is made to the full study of historical knowledge, has, says a correspondent of the *Glasgow Herald*, been the subject of much comment. The determination of the Pope, expressed in that letter, to open to the perusal of students the documents contained in the jealously guarded Vatican Library and Archives, has naturally drawn public attention to these storehouses of select and valuable materials of history. The Vatican is generally known as a museum. There the masterpieces of Græco-Roman and Roman art are gathered together and arranged in magnificent halls. There the traveller beholds "Laocoon's torture dignifying pain;" or delightedly views the beauties of the world-renowned Apollo, "the lord of the unerring bow, the god of life, and poesy, and light;" or Raphael's last work and masterpiece—*The Transfiguration*—with "those forms divine that lived and breathed, and would live on for ages;" or perhaps, grandest of all, the ceiling of the Sistine, on which Michael Angelo depicted in majestic manner the various phases of the world's history previous to the coming of the Redeemer.

To scholars more than to the general public the library of the Vatican is as a paradise from which, to a great extent, they are excluded; but to which, if there be virtue in the Pope's letter, they may hope to be admitted in the near future. Visitors to the Vatican Library are more likely to carry away a memory of splendid halls adorned with bright frescoes, and rich marbles, and columns, and vases, than a recollection of many books. In fact, there is at first view no book visible. It is only when the elegant wooden cases in these magnificent halls are opened by the keeper that the literary treasures of the place are displayed. Then books are shown which are not readily forgotten, either through the merits recognised in them by the visitor, or because of the enthusiasm they have inspired in the greatest scholars. The famous Vatican Codex is a document of the very highest interest, which you look upon with a special awe and veneration. It is in Greek, and, in the opinion of scholars, surpasses in value and antiquity all other copies of the Scriptures. It is known as the

Alexandrine Codex, from the name of the city in which it was written. It dates from the fourth century according to the general opinion, and it is believed that it is one of the copies which Constantine caused to be made upon superior parchment, by the best copyists, for the use of the chief churches in the east. The script, in which all the letters are capitals, resembles that of the *papyri* found at Herculaneum, and now in the National Museum at Naples. Very few words are abbreviated and the work is remarkable for the purity and simplicity of the characters used in it. The material of which the leaves are composed is said to be the dressed skin of the Egyptian antelope. The whole manuscript has been published. Its completion as a publication dates a few years back.

An interest of another kind is awakened by the "Virgil of the Vatican," dating from the fifth century, illustrated by miniatures which were engraved by Pietro San Bartolo, in forty-nine plates, in 1677. This also has a portrait of Virgil, which, in all probability, has furnished the model to most of the likenesses and busts which we now see. Another Virgil, or rather the fragments of a Virgil, as the former is, is also found here. In one of these copies the four verses at the beginning of the *Æneid*, "Ille ego, qui quondam gracili modulatus avena," &c., are to be found.

In the great hall, where these works are preserved, there are also the Acts of the Apostles, written in letters of gold; a Codex, given by the Queen of Cyprus to Pope Innocent VIII. (1484-1492); some Greek fragments on purple-tinted parchment in silver lettering; "The Chase with Falcons," by the Emperor Frederick II.; "The Life of the Countess Matilda," written by Donizzone, and adorned with miniatures; the New Testament, adorned in like manner; and the "Gesta" of Guidobaldo II., Duke of Urbino, with miniatures by Giulio Clovio. In another case are "The Divine Comedy" of Dante, with miniatures by Clovio, who has drawn those in "The History of the Dukes of Urbino" (two volumes), as also those which illustrate the "Cortigiano" (Courtier) of Castiglione. Amongst other curiosities are two signatures of St. Thomas Aquinas—one in shorthand, and the other in a mixture of long and shorthand; a "Martyrology of a Monastery at Benevento," written in the Longobard character; "The Chronicle of Santa Sofia," near Benevento; "The Lives of the Fathers," by St. Jerome; the "Liber Pontificalis" of Boniface IX.; the "Menologion," or Greek Calendar, of the Emperor Basil; the Breviary of Matthias Corvinus, last King of Hungary; "The Natural History of Decembrio Candido," with drawings on the margins, of which some, it is thought, are by Raphael; "Dante," copied and commented on by Boccaccio; and some chants in the Japanese language and character. Here, also, are the autograph manuscripts of Petrarch and Torquato Tasso; a "Pontifical," illuminated by Pietro Perugino, the master of Raphael; many letters written by Anne Boleyn to Henry VIII.; the work of the same Henry against Luther, for which the title of "Defender of the Faith" was given him by Pope Leo X., with his manuscript inscription to this Pope at the end of the book; the famous *palimpsest* (or parchment twice written upon) discovered by Cardinal Angelo Mai, containing the "Republic" of Cicero and the sermons of St. Augustine on the Psalms, fragments of Dion Cassius in uncial characters, fragments of the plays of Terence of the fourth century (believed to be the most ancient manuscript in existence), and the plays of the same author, with figures, of the eighth century. These are some of the choice works contained in the great hall.

However interesting these may be as manuscripts and rare curiosities, and they are chiefly celebrated as such, their value to history is but slight in comparison with that of other documents collected here. All the collections united together contain, according to Signor Angelo Mazzoni, one of the most recent writers on the subject, the respectable number of nearly 220,000 printed volumes and 25,600 manuscripts, of which 19,641 are in Latin, 3,613 in Greek, 609 in Hebrew, 900 in Arabic, 461 in Syriac, 79 in Coptic, 1 in Samaritan, 71 in Ethiopian, 65 in Persian, 13 in Armenian, 64 in Turkish, 24 in Indian, 20 in Slav, 2 in Iberian, 10 in Chinese, and some in Sanscrit.

The general contents and arrangements of the archives, known but to few, are correctly described in a recent number of the *Paris Figaro*. Formerly this rich collection of documents was housed in the upper part of the papal palace—"La Specola," as it was called—to which a gently-sloping staircase of 333 steps led up. It was the late pope who had the documents removed to their present rooms, where they occupy three floors. The first floor, containing eight rooms adorned with excellent paintings by Brilli, is called "the department of Avignon," because here are collected all that is left of the archives of the papacy during the residence in Avignon—the rescripts, bulls, briefs, apostolic letters, &c. The rescripts, which date in almost continuous succession from Innocent III. (1198-1216), come down to the present day. A few rescripts of popes anterior to Innocent are to be found here. One of the most curious is that of Boniface VIII., some parts of the document having been effaced. The second floor, consisting of four large halls, contains the archives "del Castello"—that is to say, all documents relating to the temporal power of the popes, which were formerly deposited in the Castel Sant' Angelo, whence they were ordered to be removed in three days by the French

General Berthier in his invasion of Rome in 1796. Great disorder and considerable loss of documents followed this removal. The Castello archives contain the famous imperial diplomas of donations to the popes, with the ancient golden bull or seals attached. The third floor contains the documents of the nunciatures—the correspondence of the papal representatives or nuncios accredited to the various foreign Governments. Here there is considerable difficulty in finding particular documents; the only classification is by states, and the task of finding a needle in a bundle of hay is akin to that of finding the document you want in such a mass. There is no catalogue or index for this collection. The huge volumes are bound in chamois leather, and placed in hazelwood cases. One hall has been devoted to "miscellanea"—manuscripts not yet classified, the very contents of which are unknown. Some persons hold that in this uncatalogued miscellanea the manuscript of the "Divine Comedy" is to be found. If this be the case, the discovery will be most valuable, for not a scrap of Dante's manuscript is known to exist.

The books and documents of the Vatican are splendidly housed. It would occupy much space to describe, even briefly, the rich specimens of ancient and modern art contained in the Vatican Library, from the great vase of Aberdeen granite in the large hall (the Duke of Northumberland's gift to Cardinal Antonelli) to the surpassingly interesting collection of early Christian glass—cups and chalices of rich hues—found in the catacombs around Rome. The very walls and ceilings are bright with symbolical or historical paintings. It was the late Lord Lytton who said where there is place for a man there is room for a benefit; and it may be said here that the spirit animating the masters of this library was, wherever there is a square foot of wall there is place for a picture in fresco. In the words of De Rossi, writing on this theme, "to this palace Italy owes the most splendid of her glories, and the preservation and recovery of the Classic arts and culture, and frequently her priority in all kinds of literature and science."

#### THE ITALIAN NATIONAL MEMORIAL.

IT is announced in the *Stampa* that Signor Baccelli, Minister of Public Instruction, has commissioned the well-known sculptor, Signor Monteverdi, to prepare, as quickly as possible, a design for the monument to Victor Emmanuel, to be placed in the middle of the Pantheon. This resolution has been taken in consequence of a telegram which King Humbert has sent to the Minister, and which the *Stampa* has published, together with the Minister's reply. The King telegraphs:—

"I receive remonstrances from all sides on account of the protracted delay in constructing the tomb of King Victor Emmanuel. Knowing from experience how you are acquainted with my sentiments, and are desirous of definitely giving a final resting-place to my father, I beg you speedily to solve the difficulties which have delayed the fulfilment of our ardent wish. I shake your hand.—Your very affectionate, HUMBERT."

The Minister's reply is to the effect that, being acquainted with His Majesty's views, he had always firmly held the opinion that King Victor Emmanuel's tomb should be placed in the middle of the Pantheon, and not in one of the chapels of it; and, certain of His Majesty's consent, he would take prompt measures accordingly.

#### THE GLASGOW INSTITUTE OF ARCHITECTS.

THE annual meeting of the Glasgow Institute was held on Tuesday last. The president and vice-president being unavoidably absent, the chair was, on the motion of Mr. Sellars, taken by Mr. Honeyman, past president.

The annual report stated that the number of members on the register was one less than last year. Since the last meeting Mr. William Spence had died. He was one of the original members, and highly esteemed. The report referred to the action of the Institute in connection with the Glasgow Police Bill. When the Bill was withdrawn, on the intimation of the Lord Advocate that his Burgh Police and Health Bill was to be applied to all burghs in Scotland, it was suggested that all clauses relating to building should be eliminated from the Bill, and embodied in a separate measure based upon the Metropolitan Building Act, and applicable to the whole of Scotland. A deputation, consisting of Mr. Thomson, Mr. Honeyman, and Mr. Campbell Douglas, met the Lord Advocate in London, and his lordship expressed a desire to be furnished with the details of the suggested scheme. The preparation of the statement was delayed by the summer vacation. The report next referred to the examination of candidates for the Royal Institute of British Architects, which is to be held in February 1884, and the claims of the Architects' Benevolent Society on the support of the members was also advocated. It was said that the rules and regulations for the measurement of masons' work was again before the Institute, as well as the subject of measurers' fees. The council had been considering the conditions of the competition for the War Office and Admiralty buildings in London, and were

of opinion that it was exceedingly desirable that certain of them should be amended, more especially those relating to the constitution and duties of the tribunal which is to judge the designs. They had been in communication with the council of the Royal Institute of British Architects on this subject, and had laid before that body a statement of the alterations which they thought desirable, knowing that the Institute had already taken the matter up.

The Chairman moved the adoption of the report, which, he said, showed that there had been no diminution of activity or usefulness on the part of the Institute. For the first time for several years there was no reference in the report to the Municipal Buildings competition. He thought, however, that his feeling would be shared by all the members of the Institute that it was a good thing for the city to see this great undertaking inaugurated, and they especially felt disposed to congratulate the Lord Provost on his having had to do with the commencement of it. With the Police Bill, as a mere local measure, they were done. They had taken an important step in addressing the Lord Advocate on the subject of the general Bill, and if they had done nothing else they had at least got from his lordship a recognition of their *locus standi* in the matter. His own impression was that they ought to make good use of the step they had taken, and that they should not hesitate to go into this matter very cordially, and do their best to secure for the country a really good General Building Act. The Government Offices competition was certainly a very important event, and he trusted that many members of the Institute would think it worth while to go heartily into the competition. They would all remember that on the occasion of the last competition of this kind a Glasgow architect, the late Mr. Rothead, was neck-and-neck with Sir Gilbert Scott, who ultimately carried out the work. There were many reasons for dissatisfaction with the action of the Government in the conduct of that competition, but he believed there was a fair prospect that such muddling would not be repeated on this occasion. He trusted that the Glasgow architects would not only put in a good appearance, but carry off the palm on this occasion. There was nothing whatever on earth to prevent them from doing it. After advocating the claims of the Benevolent Society on members of the Institute, Mr. Honeyman alluded to the proposal to inaugurate an examination in architecture in the city. They were bound to recognise the fact that at present their profession was a sort of disorganised rabble of all sorts and conditions of men. In all parts of the country men took upon themselves to call themselves architects who had no claim whatever to the distinction, and who, unconnected with any association, were perfectly unscrupulous in their conduct. The result of that was that the character of the whole profession was blackened in public estimation. A remarkable instance of this was afforded in a leading article in a London paper. Commenting on professional peculations, the writer went on to say that whereas there were among lawyers and accountants certain black sheep—some men who did dishonourable deeds—among architects the practice to act dishonourably was invariable—there were no exceptions whatever. This was repeated two or three times in the most offensive as well as falsest possible manner. What he would like to say to the writer of that article was this, that if he would name a single member of the Glasgow Institute of Architects, or bring forward such evidence as would lead to the conviction of a single member of the Institute of such conduct as he said was practised by all architects in the country, he should undertake that that man would be expelled from their ranks. It was quite possible that the ignorant cockney who wrote these words didn't know that there were any architects in Scotland; he had no doubt he never heard of the Glasgow Institute of Architects. He would be very willing to speak for his brethren in England—he was proud to say that he could speak for them—but he would content himself with saying that in Scotland, at all events, such conduct as this man attributed to all architects was almost unknown in the profession. He said so without fear of contradiction. One object of such associations as theirs was simply to prevent anything of that kind, as everyone who was admitted into their ranks had to give certain guarantees for his conduct in this respect. He thought also that this was an argument why many in Glasgow who had not yet joined their association should do so. They should identify themselves with some recognised body. It was also a strong reason why they and everyone interested in the profession should encourage every step that was taken in the direction of making admission to their ranks a matter of examination. There must be some test applied to everyone who was to be recognised by the public as an architect, and in that way men who were utterly unworthy to adopt the title would ultimately be excluded from practice.

Mr. Campbell Douglas seconded, and the motion was agreed to unanimously.

Mr. John James Burnet moved that the following gentlemen be elected the council of the Institute, namely: Messrs. James Sellars, jun.; William Landless, Hugh Barclay, John Gordon, John Murdoch, Robert Turnbull, T. L. Watson, David Thomson, James Thomson, Wm. Leiper, and Alex. Skirving.

The motion was adopted.

The council afterwards met in private, when the following gentlemen were elected office-bearers, namely: Mr. James Thomson, president; Mr. David Thomson, vice-president; Mr. William

Landless, hon. treasurer; Mr. John Burnet, auditor; and Mr. William McLean, secretary.

This was all the business.

## ARCHITECTURAL COMPETITIONS.\*

ALTHOUGH once deemed a professional necessity, the practice of "architectural competition" is destined eventually to become the refuge of the incompetent, the inexperienced, the indolent, and the unscrupulous. Like the weeds that are shipped with good seed from abroad, the bad custom came over so mixed with the good that during our more dependent and colonial years it was supposed to be a necessary element of ordinary practice. Although boldly denounced in the home of its origin by some of the foremost architects of the day, including two presidents of the British Architectural Association, and although the great majority everywhere look upon it as more or less injurious to the best interests of all concerned, it is still justified and supported by many as a venerable public and professional necessity; an equally venerable method for the discovery and development of youthful genius; and also on the ground that its acknowledged defects can be remedied in due time by the united efforts of the people and the profession.

Mere antiquity claims little consideration unless coupled with real merit. Although the remote past furnishes the richest materials for the study of art, it is no guide for the architectural practice of the present. The ancient foreign aspect of art competition has as little to say to the modern practitioner as the Greek games or the brutal sports of the Roman amphitheatre. Just as good work was done in the elder days without the stimulus of strife and speculation. The recluse in his cloister, the household servant of pope or cardinal, worked with more than the skill of the public competitor.

In much the greater part of his relations to the world, the architect of to-day is as free from limiting antecedents as the promoter of railroads and telegraphs. The half-equipped and one-sided men are the most nearly allied to the past. The dreamer of wild and impracticable fancies traces his origin to his mythical monkish brother of mediæval days, while the builder architect travels back to the same source to find inspiration for his latter-day enormities in his descent from the brotherhood of "free masons." The well-balanced man, on the contrary, leaves the dead past to bury its dead architects, and studies not their methods of practice, but their monuments.

Modern competitions abroad, especially in England, have little of good to teach us. A volume might be filled with their absurd and often disgraceful record. Our brethren of the "old home" must be a very testy body of men to judge by the criminations and recriminations of the correspondents of their professional journals. The *melée* which follows the announcement of the award of the "assessor" in a "competition" reminds one more of the prize-ring than of any more dignified calling. To a non-believer in such contests some of the late ones seem absurdly funny. Passing by the extended and bitter controversies of the larger tournaments, which would have afforded admirable occasion for the work of "congressional investigating committees," we find a late instance in which some church building promoters were eagerly offered designs by eighty-five architects, represented by more than five hundred drawings prepared at an estimated cost of 8,000 dols. Before the award was made it was ascertained that the projectors of this religious undertaking, in which it was intended to invest only about 30,000 dols., were not in possession of funds sufficient to commence the work of building, so that the remote chance of a beggarly premium was the high goal for which all this loss was suffered. This was a competition with all modern improvements, including a professional "assessor." Whether the "assessor" knowingly lent his name to the sharp game of the promoters does not appear. In another instance, in order to obtain the commission for the restoration of a cathedral, an architect in good standing offered as a bribe a gratuitous design for a reredos. This offer was speedily "seen" by a provincial competitor, but another provincial "went one better" by inducing a friend to undertake to construct the reredos, providing "his man" was employed on the restoration; this offer, of course, carried the day, and the man with the heaviest backer won.

These are not extreme examples, and they abound even after half a century or more of attempted regulation and reform. In England, certainly, the competition system is rotten to the core. Like some other phases of English practice it should teach us what to avoid.

The general history of architectural competitions in America has been to the profession and to the public a record of humiliation, mortification, and pecuniary loss. Little else could be expected of a custom founded on the absurd supposition that a building committee, board of trustees, or an individual client, can secure the best design, construction, and administration of a building

\* A paper read by Mr. John A. Fox at the late Convention of the American Institute of Architects.

by the employment of the architect whose name is appended to certain sketches which are most admired by variously constituted and more or less qualified judges. Practices to which the members of no other profession would stoop come to be encouraged and justified as necessities, and serious work gives way to feverish speculation. All the evils which hamper the efforts of the regular architect cluster about, or originate in, competitions: the want of honourable consideration and respect in some communities, the often futile efforts to obtain fair and equitable compensation for painstaking labour, the low standard of acquirement arising from the prominence given to the chance element in practice, and the growing impression that hard work is not so essential to success as influence combined with tricky design and superficial draughtsmanship. That occasionally a good building is the result of a competition is nothing to the question. It remains none the less true that to the public and the profession at large the practice has proved injurious. It is not a bad saying of the French army that "every private soldier carries a field-marshal's bâton in his knapsack"; but we press the principle too far when we encourage our office boys to think that "capitol" and "state house" commissions are within their early reach, as the awards of happy accidents rather than of patient and self-denying toil. The lack of earnest and faithful workers in the lower ranks may well be traced to this pernicious teaching. The standing of the profession with the public has been seriously lowered by the blunders of incompetent practitioners brought prematurely to the front by the competition system.

Let us not delude ourselves by shifting the responsibility of these and kindred evils on the broad shoulders of the public. The people of America derive much of their information on such matters from their architects, and their representative journals. There is ample evidence that the best of our clientage are willing to pay liberally for what they are led to believe is the best expert service.

If in the train of mismanaged public competitions follow worse managed private ones, and if from the lessons of these follow undignified solicitations of employment; if men not lacking in self-respect under ordinary conditions are constrained to fawn and court indignities; if the feeble and inexperienced resort to competition in rates of compensation as well as in merit of design; and if these irregularities sometimes lead to the scamping of both plan and construction, and finally even to bribery and corruption, let it be remembered that we hold to a great extent the position of teachers, and that a people who take readily to speculation of all kinds are apt pupils in these matters. Already the inventive genius of the West has evolved new phases of competition. Architects have been invited, and some of the so-called have accepted invitations to take part in ventures from which even our hungry foreign brethren would recoil in dismay. There is as yet no case on record where the craft has been induced actually to build state houses "on approval," but the practice is fast tending towards such a consummation.

It has been wrongly claimed that the interests of the junior members of the profession are served by competitions. This, like many other things that hamper us, is an imported mistake. In a community where only the aid of the sign-painter is requisite to constitute an "architect," where every village newspaper gladly chronicles the most crude and imperfect development of local talent, and where technical education is within easy reach of all, there is little danger that future Wrens and Le-Ducs will "be born to blush unseen, and waste their sweetness" at the carpenter's bench. There is room in America to-day for all the skilled architects that our schools and offices can furnish, and the demand is steadily increasing. If we do not occupy the field with trained men the engineers and builders will do so as best they may, and we can have but ourselves to blame for it.

There is too much of the gambling fever in our national air. Its infection to-day threatens legitimate business, and we are not exempt from the losses indirectly entailed by it. Enterprises less reputable than gambling are dignified by the name of speculation, and short roads are eagerly sought which sometimes end in fortune, but often in the felon's dock. The followers of law, of medicine, of religion and art cannot be too careful to keep clear of popular vices of the day, even avoiding the appearance of evil. Temporary success can never justify false methods.

The teachings of public competitions have encouraged the common fallacy, which has even found believers in our courts of justice, that architects are solely draughtsmen, and that drawings are their only products on which a value can be placed. Following this has naturally come the client's claim to the drawings as the only tangible results of service. The charm of design, the cleverness and method of plan, the skill and science of construction, the thousand items of excellence, the result of thought, study, and experience, and, more than all, the slow mastery of the combination of all these, the expensive accumulation of years of arduous toil, become as nothing opposed to the clever picture that has caught the unreasoning popular fancy. If the result is conspicuous failure, the obvious lesson that an architect should be judged by what he builds seems to make but little impression on the sufferers. In the present state of things even the representative picture may have been bought or stolen. It is a notorious fact that some of our

most successful competitors are not even ordinarily competent draughtsmen and designers. It takes but little wisdom to forecast a professional future in which the clever designer and the unscrupulous manipulator shall be encouraged to push themselves to the front.

It is disheartening to reflect on the time and money that have been squandered in these unsuccessful and discreditable ventures, and of the great benefits that might have accrued from the proper use of such an amount of labour.

The profession of the architect, with its heavy responsibilities of life and property, is a wearing one at the best, and it is foolish to add to its embarrassments the anxieties and disappointments of needless strife. We are brethren labouring for common ends, and those worthy ones. The best work is of slow growth. A great project should be wrought out calmly. Bustle, hurry, and rivalry of the meaner sort can only retard its proper development. The intimate and friendly relations of employer and employed, the thorough knowledge of uses, means, and materials—these and many other things essential to real success are daily sacrificed to a professional craze. The fact that such methods have failed conspicuously in the arts of painting and sculpture, where their chances of success should have been tenfold greater, should carry some weight.

In the extreme West it is said that lawyers advertise, compete in rates, and resort to other disreputable devices to obtain employment. In the advance, and on the outskirts of a profession, the guerilla and free lance figure conspicuously, but they have a very demoralising element when mingled with the main body. It is less difficult for an employer to make choice of an architect than of a doctor or lawyer. The acquirements and abilities of the former are more easily gauged and measured than those of the latter, whether it be at the beginning of a career, or in the midst of one. A profession that adopts methods foreign to all the professional practice will find it hard to maintain a high standing with the public.

The practice of competitions, borrowed from abroad, has not as yet taken a very firm hold among us. A moderate effort made at little sacrifice on the part of our leading men; an expression of disapproval by the Institute and other societies; an abstinence from such ventures by the well-established members of the profession, would go very far towards ridding the public and ourselves of such methods altogether, and the final result would be to place our work on the same basis as that of other professions, and to give sterling merit a fair opportunity to find its full reward in due time under conditions alike honourable to both architect and client. Then we could hope that the architect of the future might claim a better title to the name, and become what another has fitly said he should be, "a true artist, a skilful draughtsman, a mathematician, a person endowed with considerable scientific knowledge, a mechanician, an arithmetician, a man of probity, and a gentleman."

## THE REBUILDING OF CASAMICCIOLA.

A COMMISSION of Neapolitan engineers and architects, which has for some time been occupied in considering the best mode of providing for the future of the island of Ischia, has now closed its deliberations, which were approved by the general assembly of the profession. Their investigations were confined to the causes of the great disaster of Casamicciola from an architectural point of view, and to the best method of reconstructing the houses. During the investigation they were much struck by finding in the midst of the ruins a zone of about 300 mètres square which had escaped untouched. There is not the slightest trace of the severe earthquake in this oasis—no house was damaged, and the walls of the gardens are intact. Wood and iron are recommended as the best materials to be employed for rebuilding the houses, and two types of this mode of construction were minutely examined, the one called the "Calabrese," consisting of wood and mason work on walls; the other, much used in America, consisting of iron. Preference was, however, given to the Calabrian type. One thing was decided—that vaulted roofs should be avoided in a country subject to continual shocks. The sum total of what has been collected for the sufferers in Ischia now amounts to 2,735,268 lire, or about 110,000*l*.

**Parkes Museum.**—The following gentlemen have recently been elected by the Council as members of the Museum: The Duke of Bedford, the Earl of Bathurst, Lord Sudeley, Lord Chelmsford, Sir Robert Rawlinson, C.B., Sir Curtis M. Lampson, Sir Trevor Lawrence, Mr. T. W. Evans, M.P., Mr. John Fowler, Mr. H. Tritton, and Mr. Hugh Leonard, M.Inst. C.E. Mr. E. White Wallis, F.S.S., has been appointed secretary in the place of Mr. Mark H. Judge, who has resigned.

**A Roof of Glass and Iron** for the Royal Exchange is being manufactured by Messrs. Whitford, of the Regent's Canal Iron-works, from the designs of Mr. Charles Barry. The cost will be 10,000*l*.

## NOTES AND COMMENTS.

THE session of the Architectural Association will commence under the presidency of Mr. COLE ADAMS, by a conversazione on next Friday, the 26th inst., which will be held at the new galleries of the Institute of Water-Colours, in Piccadilly. The introductory lectures to their courses, by Mr. BLASHILL and Mr. TARVER, will be delivered in the course of the following week.

THE Exhibition of the Scottish Water-Colour Society, which is about to be held in Glasgow, will, in addition to the finished drawings of the members and associates, contain a collection of sketches by them. Many of the sketches being in monochrome, it is intended to have them on white mounts with inexpensive frames. In addition to the novelty and interest of the sketches, the committee expect that they will attract purchasers who may not be able to invest in the more elaborate works of the Society.

ON Monday last the Brussels Palais de Justice was opened, with befitting pomp and circumstance, by the King of the Belgians, in the presence of all the notabilities of the kingdom, while the approaches were blocked by a living mass of enthusiastic spectators. The design, somewhat modified in execution, is due to the architect, M. POELAERT, who died about eighteen months ago. His statue will be placed in the palace, and one of the new streets to be formed in the vicinity of his great work is to bear his name. After the ceremony of inauguration, wreaths of flowers were placed on his grave at Laeken Cemetery by a *cortège* of members of the Société Centrale d'Architecture. The colossal edifice is in the Græco-Roman style, the blue stone of Soignies (Belgium), and the white stone of Comblanchien (France), being mainly employed in the exterior. There are twenty-seven courts and two hundred and forty-seven smaller chambers in the interior, which, owing to the difference of level in the two sides, has two ground floors, with a principal upper floor. The site occupied is over two hectares, or about five acres; and the height from the foot of the steps leading to the main entrance to the top of the dome is 102.62 mètres, or 336½ feet. The total quantity of masonry is 370,000 cubic mètres, or 13,067,100 cubic feet; and the cost is expected to fall very little short of 50,000,000 frs., or two million pounds sterling.

THE damage that is likely to arise to landed property from the construction of outfall sewers, gives opportunity for the exercise of the imaginative powers of valuers. When an injunction is applied for it is astonishing what new qualities are discovered in ordinary fields, and what unlimited capacities they afford for profitable investment. When the sewer is constructed new dangers are created, and it would seem to be the terror of farmers—for, according to the landowners' valuers, property in the neighbourhood immediately deteriorates. A case has lately been decided which suggests the extent to which the damage to land by a sewer can be magnified. The trustees of the Duke of NEWCASTLE'S property claimed 9,960*l.* from the Corporation of Nottingham for injury to the estate through the outfall sewer in connection with the Leen Valley scheme. The case was heard in London before Sir HENRY A. HUNT, C.B. The award has been published, and the damages are put down at 1,616*l.*, or about one-sixth of the original claim. The case is a sample of the opposition which is raised by owners of estates near a town whenever drainage works are projected; but it does not always happen that justice is so sternly meted out to the claimants.

A TESTIMONIAL is to be presented to the Duke of BUCCLEUGH in recognition of the services which he has rendered to Scotland for over half a century. What form it is to take has yet to be decided. A great many suggestions have been offered, as will be seen from the following list: 1. A service of plate, which might become an heirloom in the family; 2. An equestrian statue, to be placed either in Edinburgh or in Dalkeith; 3. A portrait of the Duke; 4. An ornamental monument erected in the open space in Parliament Square, Edinburgh; 5. A tower for the new university buildings; 6. A hall in the new university buildings; 7. Some chair to be

founded in connection with agriculture in the university; 8. An agricultural college, in which practical farming should be combined with scientific research; 9. A great agricultural hall, with some memorial of His Grace to be placed in it; 10. A national portrait gallery; 11. A fund from which grants in aid of such sciences as meteorology, &c., might be made; 12. Wings to the hospitals in Edinburgh and Glasgow; 13. A monument in Princes' Street to correspond with the SCOTT monument. Among all these suggestions the last is the least fitting. Edinburgh owes much of its prosperity to the influence of the writings of WALTER SCOTT, by which a new interest was given to Scotland. His monument deserves to have an unique position. The Duke of BUCCLEUGH is a good landlord, and was the chief promoter of the harbour at Granton, but his flatterers are going too far when they put His Grace on a level with the author of the Waverley novels.

\* MR. JAMES MATTHEWS, architect, Aberdeen (of the firm of Messrs. MATTHEWS & MACKENZIE), was lately invited to become a town councillor, with a view to his subsequent election to the lord provostship of the city. But inasmuch as Mr. MATTHEWS is joint architect for the new harbour offices, it was feared that his candidature would be illegal. The Solicitor-General for Scotland was consulted, and he is of opinion that, while Mr. MATTHEWS might legally accept the appointment of lord provost, he could not occupy the position of chairman of the Harbour Board. The difficulty, however, it was suggested, might be got over either (1) by Mr. MATTHEWS denuding his firm of the contract, or (2) by his declining to become chairman of the Harbour Board, an office held *ex officio* by the provost—that appointment being left to another person. After a consultation with his supporters, Mr. MATTHEWS has announced that he is prepared to stand provided it can be at once and satisfactorily arranged that the Harbour Commissioners accept another as architect in place of his firm, to the effect of completely relieving him of his contract with them, and all responsibility in connection with it.

MR. HENRY SUMMERS has prepared a drawing to show the advantages of the St. James's Mount and Cemetery in Liverpool as a site for the proposed cathedral. Although other sites seem to find much favour with the committee, Mr. SUMMERS maintains that the St. James's Mount excels them. The foundations of the building would be on rock, the position is elevated and accessible. If the cathedral were erected there the western front and central spire would tower above the city, and the whole structure be seen from the river and in Cheshire; and, if it could be accomplished that the blocks of property at the west end from St. James's Road to Great George Street, between Washington Street and Alfred Street, could be removed, a splendid approach might be made, with steps and ornamental terraces, with grass plots and fountains, that could not be surpassed for effect. The Cemetery would be only slightly disturbed, and Mr. SUMMERS proposes to convert it into a Campo Santo, in which memorials of eminent citizens might be placed. The sites which are now under consideration are St. John's Church, Kensington Fields, St. James's Mount and Cemetery, Abercromby Square, St. Mary's Cemetery, Cambridge Street, the union of St. Mary's Cemetery with Abercromby Square, Monument Place, and St. Peter's Churchyard.

THE Ben Nevis Observatory, carried out from the designs of Mr. SIDNEY MITCHELL, architect, of Edinburgh, was formally opened on Wednesday. A description of the building was given in a recent number of *The Architect*. A small handbook has just been published with an account of the observatory. Mr. GEORGE REID, R.S.A., has contributed drawings of Ben Nevis from the sea and of the observatory building. Dr. ARCHIBALD GEIKIE has sketched bird's-eye views of the scenery visible from the mountain top, and there is also a map on which the ordnance contour lines have been laid down. Ben Nevis is not the only meteorological station at a high level. America maintains two, namely, Pikes Peak, 14,151 feet, and Mount Washington, 6,286 feet; while France has four, ranging from 3,989 to 12,199 feet, and Italy three, of which the highest is 8,386 and the lowest 7,087 feet. Russia has one 3,787 feet high, and Switzerland two, of 7,505 and 2,875 feet respectively. Hawes Junction is 1,135 feet, and Dalnaspidal, 1,450 feet, while Ben Nevis has an elevation of 4,406 feet.

## ILLUSTRATIONS.

NATIONAL MUSEUM, DUBLIN.

THIS design, by Mr. R. KNILL FREEMAN, F.R.I.B.A., of Bolton-le-Moors, was one of the five selected for the final competition, and premiated. It was recommended for adoption by the committee of selection, and when, in deference to popular clamour in Dublin, the whole scheme was re-opened, a further sum in compensation was specially awarded by the Government to the author.

NEW-HOUSE PARK, ST. ALBANS.

THIS house is situate on the south side of the London road, near St. Albans. The walls are of red brick from NORRIS's brickfields at Hemel Hempstead, and the string courses, panel tiles, &c., from those of Mr. JAMES BROWN at Braintree. The roofs are covered with Broseley tiles, and a bold plaster cove is carried round the eaves of main building. The ground, sloping towards the south, allows of a broad terrace being formed on the principal or garden front of house, having a red brick retaining wall and piers, with Doulton red terra-cotta balusters, and Dumfries stone cappings, plinths, and strings. The whole of the works have been carried out by Messrs. RAYMENT, builders, of Hertford, for Mr. H. GOTTO, from designs and under the superintendence of Mr. S. C. CAPES, architect, of Doughty Street, London, W.C.

WOODLANDS, STOKE POGIS, BUCKS.

THE illustration represents a house recently reconstructed. The dining-room wing was alone left in the demolition of the old premises, and this part has been decorated with tile facings, and otherwise altered to be in accordance with the new portion. The house is pleasantly situated about a mile from Stoke Church of historic fame, in about 15 acres of garden, shrubbery, and meadow land. The bricks and tiles used were obtained from Messrs. GURNEY & HEALEY's kilns, Penn Lands, Slough, and are of good colour and quality. The hall and staircase have been treated in wainscot oak, and the whole of the work has been satisfactorily carried out by Mr. G. ALMOND, builder, of Burnham, under the superintendence of Messrs. THURLOW & CROSS, architects.

PROPOSED NEW CHURCH, EDALE, DERBYSHIRE.

OUR illustration shows the existing building, and also the proposed new church, the former, a barn-like structure, possessing neither beauty nor interest, and ostentatiously out of place among the beautiful scenery surrounding it. The new building will be constructed of stone, and roofed with red tiles. It will accommodate 187 persons. The general arrangement is indicated on plan. Mr. WILLIAM DAWES, of Manchester, is the architect.

WESLEYAN CHAPEL, NEWPORT, MON.

THE Wesleyan chapel in course of erection at Newport, Mon., is being built of local stone, with grey Pennant stone facings and Bath stone dressings and tracery. It measures internally 68 feet long by 53 feet wide, exclusive of transepts. The roof is constructed of pitch pine framing and arcading, supported by iron columns, which also carry framing of gallery. The ceiling will be match-boarded and formed into panels by moulded ribs, with carved bosses at intersections. The gallery front will be of pitch pine framing and iron panelling, rather novel in character. There will be accommodation for 580 persons in the body of the chapel, and 393 in the galleries, making a total of 973 persons. The pewing will be of pitch pine, and the whole of the internal woodwork is to be stained and varnished.

Beneath the chapel will be situated a large school-room, six class-rooms, warming-chamber, and other offices. The contract is let to Mr. C. MILES, builder, of Newport, for 5,484*l.*, and is being carried out from the drawings and under the superintendence of Messrs. W. G. HABERSON & FAWCKNER, architects, of London, Newport, and Cardiff.

**Brechin Town Hall**, which has been erected from the designs of Mr. Alexander Ross, architect, of Inverness, was opened on Tuesday.

## UNIVERSITY COLLEGE, DUNDEE.

(Continued from page 230.)

THE following is the second part of the description of the new University College, Dundee, which has been prepared by Mr. David MacLaren, the architect of the buildings.

**The Chemical Department.**

The chemical laboratory is one of the finest in the kingdom, and has been newly erected at a cost of about 10,000*l.*

*Store and Reagent-Room.*—In the store and reagent-room the students obtain their chemicals and glass vessels. The fittings in this room consist of a set of shelves for the liquid reagents, such as acids, &c., most frequently in use. Across the centre of the room runs an ordinary shop counter over which an assistant serves out glass apparatus to the students as required. This counter is fitted up with a number of drawers and cupboards, storing corks, files, and all the smaller pieces of apparatus used in the large laboratory. There is also a large case for glass vessels. In this room also the assistant prepares the various solutions, and chemicals required for the lectures and laboratory practice; for this purpose a draught-place, sink, and work-table is provided.

*Professor's Laboratory.*—In this room the professor carries out his own experiments and researches; and here also, in certain cases, students engaged in original research will be accommodated. On each side of the fireplace there is a large draught-place, suitable for long trains of apparatus. The ordinary work-tables are arranged round the windows of the south and east walls, and are provided with gas, water, and other conveniences. There are also large cupboards for glass and reagents. There are further arranged on the east wall a blow-pipe, driven by the Root's blower in the engine-room; also, two Bunsen pumps for rapid filtering; and, lastly, in the south-east corner, there are terminals for obtaining a powerful current from the dynamo in the engineering workshop.

*Blow-Pipe and Combustion-Room.*—On the north wall is arranged a series of six blow-pipes, supplied with gas, for the combustion of which a blast of air is supplied to each blow-pipe by the Root's blower, referred to above. By this means the students will be enabled to carry out fusions and other operations where a high temperature is required without the necessity of employing an ordinary bellows blow-pipe, as is usual in most laboratories. These blow-pipes also effect a great saving of time, since it is only in some cases the constant attention of the operator is required. A long draught-place runs the whole length of the south wall of this room, and is fitted up with gas, water, and three air-blasts. Here the student performs those experiments which require the use of a gas furnace, such as organic analysis, determination of carbon in iron and steel by combustion, and other operations of a similar nature.

*Draught Hoods.*—All the draught hoods throughout the building are formed of mahogany, French polished and ebonised, glazed with plate-glass, the front being a sash hung with cords and pulleys. The soles are of slate, grooved, and have waste pipes and gratings, and each hood has a supply of gas and water.

*Balance-Room.*—Here, as the name indicates, are kept the delicate chemical balances which are used in quantitative analysis. In passing it may be said that the chemical balances ordinarily used by the student weigh to the one sixty-thousandth part of an ounce ( $\frac{1}{60000}$  oz.), whilst those used in special experiments weigh even less than that. The balance-room is also fitted up with a small dark closet, in which the students will use a Browning's one-prism spectroscope in ordinary analysis.

*Professor's Room.*—The professor's room is provided with two bookcases of American walnut, a table, and chairs.

*Small Lecture-Room.*—This room is used for small classes, and is more especially convenient when two lectures are given consecutively, in which case the same room cannot be used for both, owing to the necessary pre-arrangement of experiments. This room is fitted up with a small lecture-table, supplied with water, gas, and electric current when required. Behind the lecture-table there is also a blackboard, a cupboard for re-agents, as also screens for diagrams.

*Museum.*—Here are kept the chemical specimens and such permanent apparatus and instruments as are required for illustrating lectures. The fittings consist of three large apparatus-cases, a large space for chemical specimens, also cabinet for minerals and metallic ores, and lastly a specially-constructed airtight cabinet for iron and steel specimens, so arranged as to be perfectly dry, and thus avoid any damage to the specimens by rust.

*Preparation-Room.*—The apparatus required for the lecture experiments is prepared and fitted up in this room. Among the other fittings in the room there are two draught-places for making such gases, &c., as it is necessary to have ready before the lecture commences. There is also a blow-pipe, driven by the Root's blower, for making glass apparatus, and a large copper gasholder for keeping a store of oxygen always on hand. From this gasholder pipes conduct the oxygen gas on to the table in the lecture-theatre, so that it may be conveniently obtained for any experiment at a moment's notice.

**Large Lecture Theatre.**—This room is capable of seating 170 students, the seats being arranged in tiers. The lecture-table, which stands on a platform at the east end of the theatre, is 20 feet long, and when necessary may be lengthened 6 feet. It is fitted up in the most complete manner with gas, water, air blast, powerful electric current from the dynamo in the engineering workshop, also with the supply of oxygen gas, and is further fitted with a pneumatic trough and mercury trough, each of the latter being faced by plate-glass, so that any experiments performed therein are readily visible to the audience. The table has also two down draughts for conducting away any noxious vapours which may be evolved from any experiments performed on the table. The table has also numerous drawers and cupboards for such apparatus as is frequently required during lectures. There is, further, an important series of fittings behind the lecture-table. These consist of two draught-places for the preparation of gases, &c., during the lecture, and of three blackboards, hung with cords and pulleys. Behind the two side ones there are four small cupboards, with glass doors, for keeping the chemicals and reagents used in lectures; the centre blackboard, on being raised, exposes to view a stone arch passing into the preparation-room behind. The object of this is to allow a table (6 feet by 2½ feet), provided with slate top, and running on rails, to be brought forward on to the lecture platform from the preparation-room behind. By this arrangement a furnace or other piece of apparatus, which it is not desirable to have in the theatre during the whole lecture, may be prepared in the room behind whilst the lecture is going on, and only be brought forward when required; or, if necessary, it may be pushed back into the archway, in the roof of which there is a flue conveying away noxious gases, or the smoke of the furnace, &c. When in this position a window-sash can be drawn down from behind the blackboard, and so prevent the entry of any objectionable fumes into the lecture-room, and still not shut out the view from the audience from what may be going on within the archway. The side of the archway next the preparation-room is also provided with a similar window, so that an assistant at that side may watch the course of the experiment and yet not be exposed to any of the noxious vapours which may arise from it. The interior of the archway is fitted up with gas, water, and other conveniences. At the back of the lecture-table, above the fittings previously described, there are four screens for diagrams, each 9 feet by 6 feet, and which are worked by a series of pulleys. Behind the diagram screens there is a large screen, 10 feet square, for use with the oxyhydrogen lantern and the electric light. When not in use this screen is almost hidden from view, but when required may be let down in front of the blackboards in a position convenient for receiving the image of any object thrown on to it by the lantern. The room is lighted by large windows on the south and west walls, and at night the gas-jets of the students' tables are sufficient to light up the laboratory.

**Diagram-Room.**—The space under the higher part of the gallery in the lecture theatre is utilised as a room for making and storing the diagrams used in illustrating the lectures. The fittings of this room consist of a large table, 12 feet by 6 feet, on which the diagrams are drawn; the very large-sized paper used being run off from a roller placed under one edge of the table. The body of the table is fitted with a number of drawers for keeping the diagrams.

**Large General Laboratory.**—Ultimately it is intended that there should be two large laboratories, the one for qualitative analysis, and the other for quantitative analysis; but at present only the latter has been built, and, to begin with, will be used for both purposes. This laboratory is 50 feet long by 30 feet wide, and 29 feet in height to the ceiling, which is semi-octagonal in form, and is lighted from each side and from the roof. The main or principal couples of the roof stand partly out against the roof-lining, and a strong semicircular tie, starting off stone corbels projecting from the side walls, runs round the under side of main rafters. All the exposed timbers of roof are of a selected and beautifully-marked pitch pine. There are eight students' work-tables, each of which accommodates four, so that thirty-two students may work at the same time, besides a demonstrator's table, placed at the north end of the laboratory. The following is a description of the students' tables: Each table, as already mentioned, accommodates four—two on each side. The table space allotted for each student is 4½ feet by 2 feet 8 inches; below his table he has a lock-up cupboard and four drawers for apparatus, besides a long drawer for glass tubing; above his table he has a lock-up cupboard for chemicals, provided with sliding glass doors, and a small closet with draught for his sulphuretted hydrogen apparatus, &c. He has a gas bracket for lighting, and two gas nozzles for attaching Bunsen burners. At each end of each of the students' work-tables there is a small sink supplied with one large and two small water-taps, the latter being used for distilling operations. The demonstrator's table at the north end of laboratory is fitted up in a somewhat similar manner, but is in addition provided with cupboards and drawers for keeping the solutions, minerals, ores, &c., which are given to the students for analysis. Down each side of the laboratory at intervals there are four small draught-places, whilst at the south end there are two, and at the north end the large draught-place for operations which require

greater space than the small ones can accommodate. At the north end there is a niche containing a set of seven small copper drying-ovens heated by steam, and a copper still for making distilled water. At each end of the laboratory there is an ordinary sink provided with hot and cold water. Down the west wall there is a series of shelves for the special reagents; on the east wall there are arranged at intervals six of Bunsen's pumps for rapid filtrations.

**Cloak-Room and Lavatory.**—A cloak-room and lavatory are provided for the use of the students at the south-west corner of the building.

**Corridor.**—The corridor (7 feet wide) extends round three sides, and from it access is gained to all the various rooms. It is lighted by five circular lights, glazed with domed glass. Running along each side of the corridor is a rich border of mosaic tilework, and the centre portion is filled in with a floor of strong cement concrete. There is a stair leading to the flat roof over the corridor, where operations may be performed in the open air.

**Vestibule.**—The vestibule is a feature in the building. The floor is laid all over with marble mosaic, the walls are finished with a pitch-pine dado, and two columns and pilasters with die blocks, bases, and caps are placed at the top of a short flight of steps inside the vestibule. The walls are enriched with an effective cornice, and the ceiling is divided into ornamental panels.

**Basement.**—Entrance to the basement floor is attained by a staircase at the south-east corner of the corridor. The general arrangement of the basement is similar to that of the ground floor. Passing along the corridor northwards there are, first, two store-rooms for glass, then a store-room with pavement floor for acids and other chemicals, beyond which is a fourth room which it is intended in the future to fit up as a metallurgical laboratory. Opening off the north corridor there are the furnace-room, for heating, and coalhouse; there is also the engine-room, containing the Root's blower and a 2 horse-power Otto gas engine. This engine drives the blower and the five ventilating fans which are situated in the large room under the lecture theatre. A small room at the extreme end of the north corridor, fitted with a lathe and a joiner's bench, is used as a workroom for making wood and metal apparatus. Opening off the south corridor we have first a large room, which it is hoped may be fitted up before long as a technical laboratory for dyeing and bleaching. Beyond this there is a room for rough operations provided with two draught-places and a long work-table and gas and water; and still further to the west we have a dark room for photography, photometry, and for more advanced experiments in spectrum analysis. This room is fitted up with work-table, sink, and convenience for obtaining a powerful electric current. The last room in this corridor is used as a lavatory. Under the students' general laboratory there is a large dark cellar to be used as a lumber room. In the centre of this cellar has been sunk a well 17 feet deep, for the purpose of obtaining a 35 feet fall of water—the object of this being to work the filter-pumps in the laboratories above. Among the permanent apparatus with which the chemical department has been provided may be mentioned a set of specimens of the elements and their more important compounds, a good collection of mineral and metallic ores, numerous diagrams, spectroscope, microscope, goniometers, a Bunsen photometer, and a number of furnaces.

**Heating and Ventilating.**—The heating and ventilating are effected on Mr. Cunningham's system. Two inlet air shafts, each 22 feet high, are placed on the north wall of lecture theatre, and conduct the fresh air down to the five air pumps in basement floor. These pumps are driven by a 2 horse-power Otto gas engine, and force the air into the rooms through flues under the ground floor, in which are placed the heating pipes. The fresh-heated air is brought into the room by upright shafts at a height of 5 feet from the floor. The vitiated air is taken off by shafts which extend from within 2 feet of the floor up to the exhaust-flue in the roof. The noxious gases from the draught-places and students' working tables are also conveyed through flues into the exhaust-flue in the roof. The air in the exhaust-flue is discharged through louvre-boarded ventilators on the roof, fitted inside with valves, which prevent any possibility of back draughts.

In the general arrangement of the building the main objects have been (1) to obtain all the principal rooms on one floor—an advantage which is wanting in many of the large English laboratories, and (2) to have all the rooms as well lighted as possible.

#### College Hall.

Free St. John's Church has undergone some slight alterations so as to adapt it for lecture purposes. Where the pulpit and platform stood there is now a lecturer's platform, and a table fitted up with gas, water, sinks, and frames for diagrams, &c.

#### Meter House.

A meter house has been erected against the west boundary wall. There is one gas-meter for the chemical laboratory, and one for the gas engine, and one for water for the whole departments.

#### Workshop.

A large new workshop of two storeys has been erected to the west, and in line of the chemical laboratory. On the ground floor is a forge, a 6 horse-power Otto gas engine, a line of shafting and

working benches for vices, &c. The upper floor is fitted as a joiner's workshop, with the necessary benches, &c.

The whole of the works have been carried out from plans prepared by Messrs. Ireland & MacLaren.

## THE ROYAL COMMISSION ON TECHNICAL EDUCATION.

AN address has been delivered by Professor Roscoe, in the town-hall, Southport. They were aware, he said, that in August 1881, a Royal Commission was appointed for the purpose of investigating the whole subject of this so-called technical education or instruction, not only in our own country, but on the Continent and in other countries—in America, for example. The appointment of this Commission, on which he had the honour to serve, was occasioned by a very natural inquiry as to how far England was in the forefront in the race for knowledge and for its application to industry. It was stated over and over again that our industries were languishing, that we were no longer occupying the position which we had hitherto held, and that this was in consequence of our not attending sufficiently to the proper advancement and spread of technical education from the top to the bottom of the ladder; and the Commission was appointed for the purpose of inquiring how far such statements were true, to point out what was being done in this respect in other countries, and what influence the educational establishments, such as they had them abroad, appeared to exert upon the industries of those countries. The Commission was appointed on August 25, 1881, and in about six months they issued their first report containing an account of their visit to the schools of France, more especially to those schools which were and are still in a great condition of change, namely, the primary, elementary, or national schools of France. It was important for them to do this because they must begin at the bottom, and, before they could understand the institutions in which the special technicalities were taught they must know something of the foundation, and the way in which primary instruction was given. Since then they had visited a great number of places in France, Germany, Austria, Italy, Belgium, and Holland, besides visits which they had paid to the more important centres of industrial and intellectual activity in this country. Without anticipating the report, he might say that it would contain an account of the various schools they had visited; not all the schools, but at any rate a selection of the typical schools, those which they thought it was important the people of England should know something about; and beginning with the schools for the children of the ordinary workman, and going on to the universities and the higher technical schools which each country possessed. The report then would contain a full, and he hoped luminous, and he believed interesting account of what was being done on the Continent. This would be the first part of their report; and the second part would contain a statement of what was being done in England, and of the progress which was being made in this very important direction of scientific and technical education. Then they would have to draw their conclusions and such recommendations as they might be able to make. He thought, therefore, that the report when it came out would really be one which all educationists would look to with interest. He hoped it would not be used entirely for wrapping up pounds of butter, as it was stated that most of the blue-books were used for this no doubt useful but not absolutely the best purpose for which they could be employed. If he was asked what was the general impression on his mind after being abroad and seeing the condition of things, he should say in the first place it was very difficult to estimate the amount of interest and attention that was now being paid to the question of education both of a low and of a high character, both of an elementary and of a technical kind, in all the countries which they had visited. No one who knew France and knew what France was under the Empire and saw what France was at the present moment could doubt that she was making and had made enormous educational progress. But then this did not apply to France alone. It applied equally to Germany, although in the case of Germany the difference was not so perceptible because for a long series of years the Germans had been far in advance of any other nation, perhaps Switzerland excepted, in the amount and systematic character of their regular national education. The next point which struck one was not only the great activity but the personal interest which was taken in the subject by both masters and men, more so, he was afraid, than was at present the case in England. Then another point which struck every one who knew anything about Continental education in opposition to what was the case in our own country was the fact that the State and the municipality bore a very much larger share in the working and, what was an equally important matter, the payment of those establishments than was the case in England. On the Continent, from the top to the bottom, education was assisted by grants from the central government, from the municipality, and from often the departmental government. This was not the case in England; perhaps in time it might be so, and he trusted it would be. He

hoped the time would come when more would be done for education by the State and the municipality, and when voluntary effort would be as great or greater than it was now. With regard to France, it was pleasing to note the great interest that was taken in education by the upper classes. Time was when no one took any interest in the schools, but now an interest in education had permeated the whole French nation, and they saw more than ever the necessity of education. What effect, it might be asked, had all the teaching that was going on upon the Continent upon the industries of this country? There again they met with a great many difficulties, and it would be extremely difficult and perhaps impossible for him to give them any satisfactory answer. We in England had stood, and he most firmly believed still did stand, in the forefront of the industrial countries of the world. Why had we obtained this position, and how could we preserve it? We had attained it first of all because, he believed—he supposed they might flatter themselves—there was something after all in an Englishman. That he most certainly for one was happy to believe. Our insular position and our mineral wealth had contributed also very greatly to the attainment of our present position. In consequence of these things and having that dogged perseverance and that power which after all, as he said, belonged to an Englishman—for we had accomplished both in science and industry that which other nations never had and never would—we had attained to our present position. Progress in educational matters had been made on the Continent, and he was glad to know that in England we had not been standing still. We were making rapid progress all along the line, beginning with our elementary schools up to our universities and the highest technical schools. It ought not by any means to be supposed that the technical schools were intended to take the place of workshops. What was wanted was to teach people the principles underlying their industries, and to instruct the master to thoroughly understand the details of his business whether scientific or artistic, and the principles on which it was based, in order that he might be able to take immediate advantage of those discoveries in science which had a practical bearing, and upon the successful adoption of which the future prosperity of our country so greatly depended. Whilst much remained to be done, and whilst we were as a nation much behind Continental nations in the means which we at present possessed, and in the general attention which was directed to this subject, it was satisfactory to feel that England was awakening to the necessity of placing the education of her leaders of industry on as scientific a footing as had been accorded for generations to the instruction of the so-called learned professions of law, physic, and theology.

## HOW TIME-SHEETS ARE MADE OUT ON ORDNANCE WORKS.

A COURT-MARTIAL was concluded last week at Sheerness which had occupied several days. The prisoner, Samuel Ichabod Rayner, a Quartermaster-Sergeant of Royal Engineers, was arraigned on seven distinct charges of having, while foreman of the Royal Engineer Works at the Isle of Grain, fraudulently certified that certain artificers, excavators, and labourers, for whom wages were claimed in the contractors' bills, were employed on such works for certain specified times, well knowing such statements to be false, thereby, in some of the cases, defrauding, and, in the remainder, intending to defraud the public of various sums amounting in the aggregate to upwards of 130*l*. An eighth count charged him with having knowingly made a fraudulent statement that a bricklayer named Catling, and a labourer named Green, worked on an improvement to the ventilation of the magazine at Grain Fort for fifteen hours, which was false, with intent thereby to defraud the public of the sum of 7*l*. 18*s*. 6*d*. The prisoner, who has been under arrest since August last, was foreman of the Royal Engineer works at the Isle of Grain, and it was his duty to record the time worked by the contractors' men. According to the case for the prosecution, the fraudulent statements consisted, in some instances, of returning certain artificers and labourers as having been employed for a considerable number of hours in excess of the time they actually worked; in other instances, of claiming wages for the execution of certain works by men who were returned as having been employed at the same time on other works—the men's time, in fact, being charged twice over—and, in further instances, of charging time and claiming wages for men who, as a matter of fact, were not employed at all during the period in question. One of the principal works was the sea wall at Grain, and it appeared that in connection with these three or four men were returned week after week as having been there employed upon that work, whereas they were not there at all; two of the men in particular had gone away from the neighbourhood and enlisted in the army. The greatest aggregate number of hours falsely returned in this way for one man was about 1,000 hours. Another branch of the alleged fraudulent returns by prisoner was that of returning labourers at work in assisting artificers, whereas the assistance was rendered by Gunner Phillips, and no labourers were employed—full wages being claimed for the labourers, while a nominal sum

was privately paid to Phillips—or the assistance was rendered by labourers who were returned as having been employed on the sea wall, their time being thus charged twice. It appeared that the prisoner had seen over twenty years' service; that he had risen to the highest rank to which a non-commissioned officer could attain, and he would in the course of a few months have been entitled to a pension of 2s. 9d. per day. Colonel Le Mesurier said that, apart from these charges, he could give the prisoner as high a character as he could give any non-commissioned officer. The finding of the court and sentence will be reported to the Horse Guards and promulgated in due course.

### THE OXFORD COLLEGES.

THE *Oxford Chronicle* gives the customary description of the work which has been undertaken at the colleges since last year. In other parts of Oxford it appears that "although some important works are in progress, the erection of new buildings has not been upon so large a scale as in several preceding years. House property, especially in the outskirts of the city, appears to be a drug in the market, and the number of dwelling-houses without tenants is larger probably than at any former period."

Good progress has been made with the Indian Institute which is being erected at the corner of Broad Street, and the memorial stone of which was laid by the Prince of Wales in May last. The style of the building will be that commonly known as Jacobean. The angle formed by the junction of Holywell with Broad Street will be occupied by a turret surmounted by a lantern, which will contain the principal staircase leading to the basement below and to the library and museum above. On one side of this turret, facing Broad Street, will be the main entrance. The whole of the first and second floors towards Broad Street will be occupied by the library, which will, when completed, have a series of five oriel windows, while the upper floor will have the same number of smaller windows lighting the galleries. The front towards Holywell Street will be broken up into parts by two projecting features, which are intended to obviate the awkwardness of the site. The material throughout will be of Milton stone. The roof timbers are already being put on, and the building is expected to be opened in March. Mr. Basil Champneys is the architect, and the builders are Messrs. Symm & Co.

The repairs in the interior of the quadrangle of the Bodleian Library and the Old Schools were begun in June 1882, under the direction of Mr. T. G. Jackson, architect for the Curators of the University Chest, and are as follows: The old stonework was very much decayed, and where it is replaced Clipsham stone has been used. There are twenty new pinnacles, and a lightning-conductor is fixed to each. The parapet walls, of which there are twenty-one between the pinnacles, are all renewed, and the copper and lead gutters with flashings are made good at the back of them. The cornice on the north, south, and east sides is renewed, with the carved bosses, which have been carefully copied from the old ones, that were too far decayed to be refixed. There are thirty large four-light windows on the north, south, and east sides, and twenty-four smaller windows in the four corner wings, which are more or less restored with new sills, jambs, and mullions, and the lead glazing made good. Ten of the doorways have been restored, as also has the greater part of the basement with much of the ashlar in the walls. The west side with the two wings of the Bodleian Library wall, are panelled, and much of it is being restored in the two upper stages. The large centre window has the jambs and mullions renewed on the outside. The old lead stack pipes have been made good and refixed, and the library floors ventilated. Proper soil and water drains have been laid to convey the water from the roofs and surface and building in the quadrangle, and connected to the main drain near the corner of Brasenose Lane. Messrs. Symm & Co. are the builders; Mr. McCulloch, of London, did the carving in an excellent manner; and the work has been carried out under the able supervision of Mr. Wm. Burgess, as clerk of the works.

The important extensions at Magdalen College, which have been in hand for about two years, are now almost completed. The façade in the High Street is nearly 200 feet in length, and the west wing extends 114 feet northwards at right angles to it. The entrance to the new buildings is under the tower at the east end, which rises some 80 feet from the ground, and harmonises in effect with the "Founder's tower." St. John's Quad will now embrace the whole of its former site and the ground up to the new buildings. At either end of the High Street front are two boldly-designed oriel windows on each storey, and the other windows along the front are similar in character to those in the old building. The sitting and bedrooms are mostly 15 feet by 12 feet 6 inches, with a height from floor to ceiling of nearly 11 feet, while the fellows' rooms are larger. The lecture rooms, of which there are two, are on the ground floor, and are panelled to the height of about 10 feet. Messrs. Franklin & Son, of Deddington, had the contract for the work at 36,000*l.*, and have carried out the designs of the architects, Messrs. Bodley & Garner, of London, in a thoroughly satisfactory manner. The stone used

is from the Deddington and Taynton quarries, except that for the carved work, which is Ancaster stone. New hydrants have been fixed in different parts of the buildings, and new iron doors and casements, which are fireproof, placed to the muniment rooms. Improved sanitary arrangements have been made, besides general repairs in the college, the work being carried out by Mr. George Castle.

The important additions to Brasenose College have been completed and handed over to the authorities. The new buildings take the place of two slightly-built and not well-planned constructions, formerly standing in the kitchen or cloister quadrangle. By their removal, and that of some cottages and outbuildings, a spacious quadrangle, bounded on the east by the ante-chapel and cloisters, and on the west by the new wing, which is set a good way back, has been formed in the place of the old confined and irregular space. To the south the new quadrangle is only separated from High Street by the houses and shops facing that street, and the buildings now erected form part of a scheme for the quadrangle which will extend the whole distance from the old Brasenose buildings to High Street, and add one more to the series of collegiate and academical buildings with which the street is lined. The building contains twenty-two sets of rooms for undergraduates, two large lecture rooms, and a spacious set of rooms for a fellow. The old plan of disposing the rooms on separate staircases has been followed, but various conveniences in the way of sculleries and servants' offices are provided, which were unknown or disregarded when the older college buildings were designed. The foundations are laid at a depth varying from 14 feet to 20 feet, being the depth of the "made" or artificial earth for the most part within the ancient limits of the city. It is remarkable that even as early as the middle of the fifteenth century, when the kitchen of the adjoining college of Lincoln was built, the depth of made ground was not much less than it is now, as has been discovered by the exposure of the foundations of that building during the works in progress at that college. In the soil that has been removed at Brasenose, a great variety of relics of the past were found, consisting chiefly of pottery, coins of no great value, old knives, wig curlers, and tobacco pipes, some of which date from the introduction of tobacco. In order to gain space enough for the new building it was necessary to demolish the greater part of Amsterdam Court, which occupied the site, and preserved the name of Amsterdam or Broadgates Hall, one of the numerous academical halls with which Oxford abounded during the middle ages, and especially before the existence of colleges. Broadgates Hall is said by Ingram to have been a place of some importance, which preserved till the Reformation the privilege of sanctuary for petty offences, and even manslaughter, and was finally pulled down in 1661. The cottages which occupied its site contained a few traces of work at least as old as that time. One of the fireplaces has been refixed in the basement of the new building, where also are several fragments of twelfth and thirteenth-century work, which were found built into the cottages as ordinary walling stone. The walling of the new buildings is of Headington rubble, faced with Gibraltar rag stone, with dressings of Clipsham stone for strings, sills, weatherings, and mullions, and hard Douling for the rest. The durable flagstone of Castlehill, near Thurso, will be used for the landings, and the stairs will be of hard Portland. Mr. Meekford was the clerk of the works. The contract for the building has been carried out by Messrs. Symm & Co., of Oxford.

A very considerable amount of work has been done at Merton College during the Long Vacation. St. Alban Hall has been added, and the two quadrangles connected by massive and effective archways, the difference in the level of the two quads being well arranged by a slight incline in the floor which passes under the Warden's Gallery. The kitchen and other offices used by the Warden in Merton Quad have been made into undergraduates' rooms, and the Warden's new kitchen and other offices have been formed in the rooms formerly used by undergraduates on the south side of St. Alban Hall. The tradesmen's door to the Warden's House is now from Merton Street, through a passage taken out of the Fellows' Garden, which can be approached without going through the college quads. The best Taynton ground stone has been used for this alteration. The work has been entrusted to Messrs. Symm & Co., of Oxford.

The stone-work of the south bay window of the Christ Church dining-hall has been restored in Taynton stone, and a new stained-glass window inserted. A considerable amount of sanitary work has been executed under the supervision of Mr. Griffiths, sanitary engineer, of London. Three spacious lecture rooms have been formed on the first floor of the old library. The builders entrusted with the work were Messrs. Symm & Co.

A considerable part of the stone-work of the north side of the large quadrangle of University College has been refaced by Messrs. Symm & Co.

Messrs. Knowles & Son, of Holywell, have restored and re-cased the front of the main tower of Lincoln over the entrance-lodge with Bath stone from the Combe and Down quarries. About a dozen chimney-stacks have been taken down and rebuilt, and in each case lined with fireclay pipes. The buttery and cellars have been thoroughly rearranged.

The library and rooms north of the All Souls' tower have been

recased and restored in Box ground stone, to match the existing work under the superintendence of Mr. George Young, the college surveyor, at a cost of 1,200*l*. The main drainage system of the college has also been thoroughly overhauled under the supervision of Mr. Griffiths. Messrs. Knowles & Son carried out the work.

Messrs. Knowles & Son have removed a lot of old oak panelling in several sets of rooms in the back quad of New College, which has been replaced with ordinary plaster.

Mr. Curtis has continued the work of restoring the gables on the south side of the quad at Oriel College.

General restorations have been carried out by Mr. George Castle at Corpus. A new lecture room has been formed in the fellows' block. This work has been done by Messrs. Symm & Co.

The whole of the interior of the two staircases on the south side of the outer quad at Jesus have been entirely removed. The old rooms were inconvenient in many respects, were almost worn out and in a dilapidated condition. Several of the old partitions have been removed, and nine sets of rooms have been rearranged in a very excellent manner. New windows have been put in, and water pipes laid throughout. The new staircases are of solid teak, with oak rails and posts of a very substantial character. At the back of the inner quad some requisite sanitary additions have been carried out in an efficient manner. The whole of the work has been executed by Messrs. Franklin & Son, of Deddington, from the plans of Messrs. Bodley & Garner.

### THE ROMAN OCCUPATION OF BRITAIN.

THE first of a series of lectures on "The Roman Occupation of Britain" was delivered on Monday in Edinburgh by the Rev. Dr. J. Collingwood Bruce, who holds the office of Rhind Lecturer for the present year.

Dr. Bruce said that when they thought of the important position which the British Empire held among the nations of the earth, the mighty influence which it exercised over the whole family of mankind, the inquiry into the mode in which it first rose from obscurity became an interesting one. The voyager who first revealed to the inhabitants of Europe the existence of our little island was Pytheas, of Marseilles, who flourished about the year 330 B.C., and was contemporary with Alexander the Great and Aristotle. As the Carthaginians jealously concealed from other people the places where they obtained their supplies of tin, the merchants of Marseilles, who were desirous of sharing in the trades, sent Pytheas, a mathematician of eminence, upon a voyage of discovery. His main object was to find out the Capsiterides, or the tin islands, on the north-west coast of Spain. He was, however, directed to proceed as far as his judgment prompted and circumstances allowed. Sailing out of the Mediterranean, and skirting the coasts of Spain and France, he reached Britain. He appeared to have arrived in Kent in the early summer, and to have remained in the country until after the harvest. He saw in the southern district abundance of wheat in the fields, and he told them also that the natives made a drink by mixing wheat and honey—a drink against which the Greek physicians warned their patients, as "producing pain in the head and injury to the nerves." Leaving the Thames, he sailed by the east coast of Britain to the Shetland Isles, and thence, by the coast of Norway, as far as the Arctic Circle. On his way back he visited Britain a second time. This voyage was an adventurous one to have been made at so early a period. Two results of the visit of Pytheas to England, as Mr. Elton remarked, might be traced—doubtless he learned something about the tin trade, and he was probably the originator of that commerce in the metal which was established soon after his time on the route between Marseilles and the Straits of Dover. Again, almost all the earlier British coins were modelled on Greek money of the age of Philip of Macedon and Alexander the Great, though, as time went on, they departed more and more from the excellence and correctness of the original. The existence of these coins gave confirmation to the probability that Britain at this period was brought into connection with some Greek colony. Cæsar had been understood to say that when he visited Britain the use of coined money was unknown. The passage in which that statement was made was believed to be corrupt. Mr. Evans, in his work on coins, remarked that if the art of coining was unknown in Britain until the time of Cæsar, the coins must either have been struck on the Roman model or that of the later Gaulish coinage, in which nearly all reminiscence of the original Macedonian types had been lost, and which showed unmistakable signs of Roman influence. Although Britain was thus revealed to one portion of the Continent when the Macedonian empire was still in its prime, the people of Rome seemed to have regarded its position as inaccessible, and its very existence as a matter of mystery and dread. The history of its original discovery had been lost and obscured by fable, and of that circumstance the great Julius skillfully availed himself. After a sketch of the position of the Roman empire, B.C. 56, when Julius Cæsar resolved to bring the Roman eagles face to face with the Britons, the lecturer said that, owing to the altera-

tion in the coasts, it was difficult to say precisely from what point of the French coast Cæsar took his departure, and where on the British shore he landed. It was probable that Wissant, near Cape Grisnez, was the point of his departure, and that the coast near Deal was the place of his landing. The leading incidents of the familiar narrative of Cæsar's landing were next recapitulated, a short extract being read from the Commentaries of the difficulties which he had to face, and the manner in which these difficulties were overcome. These extracts, said the lecturer, showed that the occupants of the British soil in that day were not the wild untutored savage people that were generally pictured. Their cornfields showed that they knew and practised the arts of peace, and the construction and management of their chariots proved that they were skilled in the arts of metallurgy, and no mean mechanics and tacticians. It was noted that among the trophies of Cæsar's second campaign were some British pearls, which in the form of a breastplate were presented as an offering to the goddess Venus. Cæsar after his death was no longer regarded as a tyrant, but as a god. On a bronze coin struck in the time of Augustus—a drawing of which was exhibited—they had the radiated head of Julius on the obverse, the legend "Dives Julius," and the portrait of Julius himself. On the reverse was the unlaureate head of Augustus, with the simple legend "Cæsar Divi Filius"—Cæsar, son of the god. That coin, as it circulated no doubt largely among the populace, would plead his cause most powerfully. Coins might be made the means of instruction. In these modern times their usefulness was overlooked. Tiberius—by whose authority, though he knew not of it, our Lord was put to death—was too much occupied in the indulgence of his base passions to concern himself about Britain. Dr. Bruce exhibited—and great interest was taken therein—a denarius of Tiberius, the penny that was shown to our Saviour. On the obverse was a portrait of the Emperor and the legend, "Tiberius Cæsar, Divi Augusti Filius Augustus" (son of the god Augustus), and on the reverse was the figure of his mother Julia in the character of the goddess Ceres, and the legend "Pontifex Maximus" (Great High Priest.) That, said Dr. Bruce, holding up the penny, might have been the coin that was put into the hands of the Saviour. They could not prove that it was not. It was strange that the man by whose authority "Our Great High Priest" was put to death should by his coinage throughout the whole civilised world proclaim himself to be the Great High Priest. The expedition against Britain in the time of Claudius, A.D. 43, was next referred to, and a graphic sketch given of the character of the army which was commanded by Aulus Plautius. This army consisted of about 24,000 legionary troops, and of 45,000 auxiliary troops, including cavalry—making together 70,000 men. That high figure, with the character of the generals sent, said much for the bravery and the military skill of the inhabitants of Britain at this early period. The Roman historians did not tell where this large army disembarked. That was of little consequence; but it was natural that their operations would commence in the middle of the south coast, which it was their business to take possession of. At Chichester there was a suitable landing-place, and there also was still existing a Roman inscription belonging to the period of which they were now treating. It recorded the erection of a temple to Neptune and Minerva, in honour of the Imperial Family, by Cogidunus, a native prince, who had received from Claudius the right of Roman citizenship, and the rank of Imperial legate. Tacitus, in his "Life of Agricola," and the lettered stone illustrated and confirmed one another in regard to Cogidunus. The stone was now at Goodwood, and it had been asked how many of the thousands who went there at a certain season of the year ever paused to read and ponder upon this inscribed stone, which contained so early a record of the events of their beloved country. At Winchester an altar had been found, which was now in the British Museum, dedicated to the "Mothers" of Italy, Gaul, Germany, and Britain—*i.e.*, the mother goddesses of the men of which the main body of the army was composed. In the triumph which followed upon the success of the Roman armies, the title of Britannicus was conferred upon the young son of the Emperor, and for the first time Britain was named in the coinage of the Empire. Some gold and silver pieces had come down to their time bearing on the reverse side a triumphal arch, on which was inscribed the words *De Britannis*. A splendid triumphal arch was erected to the Emperor, the remains of which in the sixteenth century still spanned the Corso in Rome. A fragment of the inscription—about one-half which was attached to this arch—was now preserved in the wall of a terrace near the Barberini Palace. It consisted of a huge marble tablet, the inscription being formed of inlaid letters of brass of a large size. The inscription was as follows, the missing portion having been conjecturally supplied:—"To Tiberius Claudius Cæsar Augustus, High Priest, possessed of the Tribunitian power for the 11th time, Consul for the 5th time, Emperor for the 22nd time, Father of his country, the Senate and Roman people dedicate this arch, because without any loss he subdued the Kings of Britain, and for the first time brought the outermost nations of the globe into subjection." The resistance of Caractacus and of Boadicea to the Romans was next successively referred to; and a notice of the extension of the limits of Roman occupation northwards under Vespasian brought the lecture to a close.

## BURNT AND RAW SIENA.

THE report of Consul-General Colnaghi refers to the preparation of the Siena earths, which are largely used for pigments. "Terra di Siena," or "Terra Bolare e Gialla," known also under the names of ochre, bole, umber, &c., are considered by some mineralogists to be ferruginous clays, by others minerals of iron. They are chiefly found in large quantities in the communes of Castel del Piano and Arcidosso (Monte Amiata). The yellow earths and bole found on this mountain are true lacustrine deposits, found amid the trachytic rocks, of which it is principally composed. They lie under, and are entirely covered by, the vegetable soil. Varying in compactness and colour, they are termed yellow earths when of a clear ochreous tint, and "terra bolare," or bole, when of a dark chestnut colour. Each deposit consists, for the greater part, of yellow earth, beneath which bole is found in strata or small veins. The mineral being very friable, its excavation is easy, and is generally conducted in open pits. The different qualities are separated during the process; the bole, which has the higher commercial value, being the more carefully treated.

After the first separation the bole is further classed into first, second, third, and intermediate qualities—"boletta," "fascia," "cerchione," &c. Its most important characteristic is termed, in commercial language, "punto di colore," or tint. The value of the bole rises as its tint deepens. Thus bole of the third quality is lighter than that of the second, and the second than that of the first. After No. 3 comes the "terra gialla."

The yellow earths, after excavation, are exposed to the open air for about a year, by the pit side, without classification. The bole, on the contrary, is placed in well-ventilated storehouses to dry for about six months. This diversity of treatment is owing to the fact that exposure to the elements brightens the colour of the yellow earths and raises their value, while it would damage the bole, by turning its darker tint first into an orange yellow, and, if continued, into an ordinary yellow earth. It also loses in compactness and crumbles up under exposure.

In addition to the "punto di colore," the size of the pieces influences the commercial value of the bole, which increases with their volume. Thus the classification is "Bolo pezzo," "Bolo grapolino," and "Bolo polvere." The yellow earths are classed as "Giallo in pezzi," "Giallo comune," and "Giallo impalpabile," but in these cases the impalpable is worth more than the common yellow.

The production of the Siena earths may be calculated at about 600 tons per annum, of which sum 50 tons are calcined, and the rest sold in their natural condition. The value of the trade may be estimated from 100,000 to 150,000 lire. A company (limited), for the working and sale of the yellow earths and bole of Monte Amiata, was formed at Siena in 1872, with a capital of 100,000 lire.

## THE NEW PATENTS ACT.

ONE of the subjects considered in his address by Mr. J. E. Bristow, president at the annual meeting of the Incorporated Law Society at Bath on Tuesday, was the Patent Act which was passed in the last session. Mr. Bristow said that the law relating to patents has for the last thirty years been regulated by the Patent Law Amendment Act, 1852; and, although subject to many imperfections, it has on the whole worked fairly well. There were certain defects which experience detected, and which, in common with suggestions for improvement and demands for total abolition, have been discussed in the reports of no less than three Parliamentary Committees and a Royal Commission, which have during that period had the subject of patents under consideration. Besides these reports, many abortive Bills of varying degrees of merit have during that time been brought before Parliament for amending the Patent Law, and among them one of great merit introduced by the late Sir John Holker when Attorney-General in 1879. It is very curious to note how the feeling of the public and our legislators towards patents and patentees has varied during the last thirty years. At one time, some fifteen years ago, so great was the outcry against patents, that it was predicted that the day was not far off when this branch of our legislation would be wiped out of the statute-book. Except among inventors themselves, and those who like myself have been brought into intimate relations with them, there seemed a general consensus of opinion that inventors were a nuisance and patents injurious to the public interest. But to see how completely public opinion has come round upon this subject we have only to turn to the speech of the President of the Board of Trade in the last session, in introducing his Bill into the House of Commons, when, in referring to that class whose interest it was part of the object of his Bill to protect, he said—"An inventor was a person to be encouraged and not repressed. He was a creator of trade, and accordingly they (the Government) desired in every way in their power to stimulate his inventive capacity." Approaching the subject in this spirit, the Government have passed an Act which is in many important respects a great improvement upon the Act of 1852, and which, while it confers very substantial benefits on the patentee, does not

fail to take care of the public also, in the reasonable restrictions which it imposes upon inventors, and the provisions it makes against patents being used for obstructive purposes only. An entirely new departure, and one as to the working of which many doubts have been entertained, is the substitution in place of the Commissioners who were appointed by the Act of 1852, of a controller to be appointed by the Board of Trade, and who, subject to a right of appeal to the law officers, will have the entire management of the working of the Patent Office. It was thought by many persons, and especially by the council of the Society of Arts, who themselves brought in a Bill last session, some of the provisions of which have been embodied in the Act, that the office of controller and the staff provided by the Act would not adequately meet the requirements of the case, and that there ought to be a highly-skilled body of commissioners to whom should be delegated all matters relating to the granting, amending, and prolongation of patents. It was even suggested that this body should be entrusted with the control of patent actions. This suggestion, however, found no favour with the public or the Board of Trade, and was severely commented on by one of Her Majesty's judges, and was abandoned almost as soon as made; but the Act provides that the court on the trial of a patent case may call in the aid of a specially qualified assessor. Probably this will afford as good a tribunal as can be desired for dealing with matters requiring a combination of legal and scientific knowledge. The President of the Board of Trade stated distinctly that the Government could not recommend the expense necessary to pay highly-skilled commissioners, and it was admitted on all hands that unless the commissioners were of the highest attainments, their appointment would be useless. The Act contains new provisions relating to certain preliminary examinations of a formal character before a patent is granted; but the Board of Trade declined to adopt the suggestions that examination should be made in the question of novelty, and whether the invention was the proper subject for a patent. The reasons of the Government for refusing to adopt the suggestions seem to be conclusive. They pointed out that an examination into novelty to be effectual must be costly; that it could only be of practical use in cases where the validity of the patent was disputed; and that the proportion of patents where such a dispute arose was very small, so that practically it would be saddling every inventor with a great expense, which, in the majority of cases, would be unnecessary. The same objections apply, though certainly in a less degree, to an inquiry into the question of subject matter, which it was submitted ought, in justice to the patentee, to be made before he paid his money for a patent, which it might hereafter turn out the Crown had no power to grant. You are probably aware that the American practice is to examine not only into subject matter but into novelty also. This examination causes an enormous amount of expense, delay, and vexation to inventors, which, as far as I can judge from the information I have been able to gather on the subject, more than counterbalances any advantage which the patentee may obtain from the ordeal he has to undergo. For, be it borne in mind, this examination confers no indefeasible right, and the novelty of the invention and the validity of the patent are still open to be questioned in a court of law. Considerable discussion arose in the grand committee as to the term for which a patent should be granted, whether it should continue at fourteen years, or whether the term should be increased to the seventeen years for which patents are granted in America. No alteration, however, has been made in this respect. A more important consideration for patentees was the amount charged by Government in the matter of fees. In America the charges for the whole term of a patent are 7%. In our country the Government fees have hitherto amounted to 175%, of which 25% had to be paid in the first three years, 50% at the end of the third year, and 100% at the end of the seventh year. The new Act reduces the total amount of the fees to 154%, and the payment for the first four years to 4%. The subsequent fees are the same in amount as before, but may be spread over a series of years, instead of being payable at the expiration of the fourth and seventh years, so that for a payment of 4% the patentee has four years within which to ascertain whether it is worth his while to go further, while by moderate annual payments afterwards this option is continued to him, with the power of stopping the payments at any year up to the thirteenth. The power of amending the specification, which, by the old law, was limited to disclaimer, is now extended to correction or explanation, so long as the patentee does not extend his invention beyond what it originally claimed. And the power to amend by disclaimer may, by leave of the court, be exercised at any stage during the pendency of an action for infringement or revocation. The Act also contains powers for the Board of Trade to direct the compulsory granting of licenses, where necessary, either in public or private interests. These provisions seem to remove an objection, which has often been made, that patents may be taken for the purpose of obstruction only. The powers which have hitherto been reserved to the Crown to make use of patented inventions, without necessarily making any compensation to the inventors, have long been deemed to be a great hardship. It has been felt that if patents stimulate invention, it is not wise that in the case of inventions required by the Crown, perhaps for the defence of the realm, and on which the safety of the kingdom may depend, the

meritorious inventor should be treated differently to the inventor of matters of less importance, and that if invention be required, the readiest way to secure it is to give proper remuneration to the inventor. It has also been found by experience that the Treasury, though professing to make some acknowledgment by way of grace for inventions adopted by the Crown, has hitherto dealt with the matter in too narrow a spirit, and it is hoped that a broader and fairer, because more liberal, view may be expected from the Board of Trade. It is, therefore, matter of satisfaction that the Act provides that a patent shall hereafter have the like effect against the Queen as against a subject, with a further provision that, in the event of an invention being required for the public service it may be used or taken by any department of the service of the Crown, on terms to be agreed with the patentee, or, failing agreement, to be settled by the Board of Trade. There are many other improvements introduced by the Act which I can only name without comment; such as the power to grant a patent to several persons (say, for instance, to a firm) where one only of the grantees is the actual inventor, and the provision that a patent may be taken by the legal representatives of a deceased inventor. The duration of an English patent is not now to be dependent on the continued existence of a prior foreign patent for the same invention; and where certain international arrangements may be made with other States, a foreign patentee is to have priority over all other applicants if he apply for a patent in this country. The Act is not confined to patents, but deals also in a comprehensive manner with the subject of trade-marks and designs, and repeals the several separate Acts which have hitherto contained the legislation relating to such matters. Numerous facilities are provided for the registration of designs, and the various terms for which copyright in registered designs have been granted are now altered into a uniform term of fourteen years. The Act is altogether a great improvement upon the existing law, while the convenience of having the hitherto widely-scattered enactments relating to patents, trade-marks, and designs collected within the provisions of a single Act of Parliament will be appreciated both by the public and ourselves. I feel that in dealing at such length with the new patent law I have, perhaps, been speaking of matters with which all my hearers may not be equally conversant, or in which they may not all feel an equal interest. But when I look to the returns of the Patent Office, and regard the steady rise during the last few years in the number of patents applied for (the number having increased from 3,405 in 1870 to 6,241 in 1882), I feel that business connected with patents must be on the increase also, and that any legislation which beneficially affects the inventor, either in procuring his patent or defending his rights, must necessarily be of interest to our profession.

### A FIRE-RESISTING CEILING.

A SUMMONS, which had been taken out by the Metropolitan Board of Works against Messrs. Gatti, the owners of the Adelphi, was again heard by Mr. Flowers at Bow Street on the 12th inst. The defendants were charged with unlawfully making default in certain alterations necessary to remedy some structural defects as required by a lawful and valid notice signed by the clerk of the said Board. The notice required—1. That a proscenium wall of brickwork should be built to divide the stage from the auditorium—the wall to be carried down to the level of the foundations of the building and carried up to a height of 3 feet above the roof of the auditorium, measured at right angles at all points to the slope of the roof, and that all openings in this wall, except the larger or proscenium opening in front of the stage, be closed with wrought-iron doors fitted without woodwork. 2. That the portion of the house, 18 Maiden Lane, used as a scene dock, be separated from the rest of the house by fire-resisting materials. 3. That the house, 19 Maiden Lane, be separated from the stage by a brick wall, and that all openings in such wall be closed by wrought-iron doors fitted without woodwork. 4. That the whole of the ceiling over the auditorium be made fire-resisting. 5. That the partitions and floors dividing the property shop, dressing-rooms, store-rooms, armoury, and painting-rooms from the stage, be constructed of fire-resisting materials. 6. That the ceiling over the entrance from the Strand be formed of fire-resisting materials. 7. That strong hand-rails be fitted on both sides of the staircase from the principal entrance of the dress-circle level and on the side of the staircase to the upper circle and the gallery staircase respectively, and that the hand-rail to the gallery staircase be strengthened. 8. That the doors to the gallery staircase next to Bull Inn Court be made to open outwards. Mr. Burton, who appeared for the Metropolitan Board of Works, admitted that the necessary alterations had been effected to the satisfaction of the Board, with the exception of requisition No. 4, which was that the whole of the ceiling over the auditorium should be made fire-resisting. The roof had been covered with thin sheet iron, which was not quite approved of by the Board; but it would be for the learned magistrate to decide whether the requisition in question had been properly complied with.—Mr. Fladgate, for the defendants, said that, in addition to carrying out the Board's

requisitions, a sum of 6,000*l.* had been expended. With regard to the ceiling, evidence would be given.—Mr. Spencer Chadwick, architect, said that he had been instructed to carry out the requirements of the Board. He had interviewed the architect appointed by the Board, who had intimated that it would be requisite for the roof of the auditorium to be of tiles or 5-lb. lead; but witness had pointed out the danger that might arise, in the event of fire, by the falling of molten lead on to the audience. He had therefore suggested the substitution of the galvanised sheet iron, which, in his opinion, would be more effectual for fire-resisting purposes than the means proposed by the Board.—Mr. Flowers: The only question is whether the iron is thick enough.—Witness: It is more fire-resisting than 5-lb. lead.—Mr. Flowers said that, as far as his judgment went, he thought that everything had been done by the defendants, and he considered that the roof was fire-resisting. It was therefore only a question of costs, and he ordered Messrs. Gatti to pay 3*l.* costs of the several adjournments that had taken place in connection with this matter.

### CHURCH BUILDING AND RESTORATION.

**Girvan.**—The memorial-stone of the new parish church, Girvan, has been laid. The church is seated to accommodate 940 persons. The architects are Messrs. J. M'Kissack & W. G. Rowan, Glasgow. The cost of the building is 4,500*l.* A hall and class-room is to be added at a cost of 650*l.*, so that the entire sum will amount to 5,150*l.*

**Govan.**—The memorial-stone of a new Wesleyan church, situated at the corner of Fleming and Brunel Streets, Govan, has been laid. It will accommodate about 500 persons. A hall adjoining, to be used for Sunday school purposes, is capable of holding 300. The church is estimated to cost about 5,000*l.* The architect is Mr. William F. M'Gibbon, I.A., Glasgow.

**Hanford.**—The memorial-stones of a Primitive Methodist chapel have been laid. The building will be plain, but substantially erected of red and blue bricks, with red-pressed tiles, and crest ridging for roof. Accommodation will be provided for 160 persons. Mr. E. Jones, of Hanley, is the architect, and Mr. J. Bennett, Newcastle-under-Lyme, the contractor.

**Irby-on-Humber.**—The church of St. Andrew's, Irby-on-Humber, has been reopened after thorough restoration. The church is of early Norman foundation, dating from soon after the Conquest. It was then a small building, as the nave arcade on the north side is of two arches only. It had probably only one aisle, as the arches on the south side are nearly a century later in date, the aisle wall being much later still, probably late thirteenth-century work. At present the church consists of a nave, with north and south aisles, chancel, western tower, and a modern small porch. Before the recent restoration the nave and aisles were all under one roof. Now the nave has been raised to its original pitch as shown by the old weather mark on the east face of the tower. The chancel was so dilapidated that it was necessary to rebuild it, and this has been done on the plan following the architecture of the interior of the church, rather than the exterior. It is a simple Norman building, with three windows at the east end and two on the south side. They are small and narrow, and similar in character to those south of the nave at Lacey, and are widely played within. Mr. Fowler, of Louth, is the architect under whose direction the work has been carried out.

**Ketton.**—The beautiful spire of the parish church has been considered unsafe for some time, so much so that it was thought advisable to take part of it down and rebuild it. Scaffolding for that purpose has been erected, and the work of demolition commenced. The work has been entrusted to Mr. Halliday, builder, of Stamford.

**Lewisham.**—A mission church in Brookdale Road, Springfield, Catford, S.E., in connection with St. Mary's parish church, was opened on September 29. The building comprises an open nave, 52 feet by 28 feet, with small chancel, with moulded arch and stone corbels; a class-room for tea and other meetings, 22 feet by 14 feet; vestry, 14 feet by 12 feet; closets, lavatory, and other conveniences. The church is of stock brick, with red brick arches and dressings externally, with plain lancet and circular windows throughout. The church will accommodate 300 persons in chairs, and the contract price, including special-made gas fittings, stoves, drains, fencing and gates, was under 950*l.* The work has been well carried out by Mr. S. J. Jerrard, under the superintendence of the architect, Mr. Horace T. Bonner, A.R.I.B.A., of High Street, Lewisham, S.E.

**Liverpool.**—The memorial-stone of St. Gabriel's Church, Beaufort Street, Toxteth Park, has been laid. The church is arranged to seat 615 worshippers, and will consist of nave, transept, chancel, vestry, and tower. The nave is spacious and lofty, 92 feet long, 39 feet 8 inches wide, and 33 feet in height from floor to ceiling, the roof being in one span. The transept is placed on the south side of the nave, and is 29 feet 10 inches wide and 12 feet 6 inches

deep, also 17 feet in height, opening into the nave with an arcade of two bays. The chancel is fully developed, being 25 feet long, 21 feet wide, and 27 feet high, opening into the nave with a lofty arch, 18 feet wide; and on the north side of the chancel provision has been made for adding an organ-chamber 14 feet by 11 feet. The floor of the chancel will be laid with tiles, on iron and concrete sub-floor, and will contain seats for the clergy and choir. The tower, which is placed at the north-west angle of the nave, and the base of which forms the principal entrance to the church, is 10 feet square inside, and 15 feet square outside. Its height from the pavement to the parapet measures 83 feet, and the total height to the top of the vane 117 feet. The contractor is Mr. S. Webster, Bootle; subcontractors, Mr. J. Dilworth, bricklayer, Wavertree; Mr. J. Leslie, mason, Bootle; Messrs. Callaghan & Son, plasterers; and Mr. T. Lea, plumber—both of Liverpool. The architects are Messrs. H. & A. P. Fry, of Liverpool.

**Moseley.**—The corner-stone of a new church has been laid. The building, a portion of which only will be now erected, is designed by Mr. W. Davis, architect, Colmore Row, Birmingham. It comprises chancel, clergy and choir vestries, organ chamber, north and south transepts, and part of the nave, accommodating nearly 400 persons. The second portion will comprise an extension of nave and aisles, and the erection of a north porch with tower and spire, providing additional accommodation for 326 persons. The tower and spire will be in the centre of the west end, having a total height of 137 feet. The builder is Mr. William Bloore, of Alma Street, Aston, and the masonry work will be done by Messrs. Miller, Carr & Co. The total cost of the completed building will be about 8,000*l.*, the cost of the portion now being erected being about 4,000*l.*

**Rosehearty.**—A church, which has been built by the United Presbyterian congregation of Rosehearty, has been opened. The style of the building is early Pointed Gothic. The walls are built of the dark blue stone of the district, squared; while the dressings and ornamental parts are of picked Pitsligo granite, the two colours of stones forming a pleasing contrast. The principal elevation is to the east or street frontage. The architects of the new church were Messrs. Ellis & Wilson, Aberdeen. The contractors for the work were: Mason work, Mr. Davidson, New Pitsligo; carpenter work, Mr. Scott, Rosehearty; slater work, Messrs. G. & R. Morrison, Fraserburgh; plaster work, Messrs. Kirk & Piggot, Aberdeen; plumber work, Messrs. A. Robertson & Son, Aberdeen; painter work, Mr. A. Chalmers, Banff.

**Sevenoaks.**—On Monday last, the 15th inst., the memorial-stones of the new Bible Christian chapel at Sevenoaks were laid. The style of the building is Gothic, of the Early English period; the materials are brick, with stone dressings, the principal front being of a rich red from Lord Stanhope's fields, and by the introduction of moulded and ornamental bricks, a cheap but effective elevation is produced. The architect is Mr. J. Kingwell Cole, of London; and the builder is Mr. John Boase, of Sevenoaks.

**Stranraer.**—The foundation-stone of a United Presbyterian church has been laid. The new church occupies a fine site adjoining the county buildings, and is expected to cost about 3,000*l.* The architect is Mr. Pettigrew, Glasgow.

**Whiston.**—The restored church at Whiston, near Rotherham, has been reopened. The work has been carried out from the designs of Mr. John Oldrid Scott, by Mr. J. J. Fast, of Melton Mowbray, Mr. J. Hannaford acting as clerk of works.

**Woodham Ferris.**—The parish church of Woodham Ferris having for a long time been in a dilapidated condition, an effort is being made to repair and refit it throughout. This church is mainly of the date of 1154. The tower fell in 1704, and again in 1774, and was then replaced by the present wooden turret. The work of restoring the church has been entrusted to Mr. C. Pertwee, architect, of Chelmsford, and is being carried out with special care that every feature and detail of interest shall be preserved.

**Woolston.**—A new chancel has just been added to Jesus Chapel, Pear Tree Green, Woolston. The chancel, which is of the Decorated period, extends 33 feet clear eastward of the old building, with a width of 22 feet. On the south of the chancel is an aisle 22 feet in length, with a width of 16 feet, and separated from the chancel by an arcade of two arches. The architect was Mr. J. Piers St. Aubyn, of the Temple, London; and Mr. W. H. Chapman, builder, of Woolston, carried out the work.

## NEW BUILDINGS.

**Ingestre Hall.**—This mansion, which belonged to the Earl of Shrewsbury, was destroyed by fire about a year ago. It is now being rebuilt, and the walls are up to the level of the first bedroom floors. The building is being made fireproof, as far as practicable, by the use of iron and concrete. At the present time about thirty masons and twelve bricklayers are employed on the work, and

this number will shortly be increased. The exterior of the building will be a facsimile of the original, while the interior will be partly remodelled, the designs providing for a hall of splendid proportions, approached through the fine old south porch, and a magnificent staircase. Lord Shrewsbury is taking the greatest interest in the work of reconstruction, and its progress is under the constant supervision either of himself or of Mr. Mynors, his agent. The architect is Mr. J. Birch, 8 John Street, Adelphi, London.

**Municipal Buildings, Paisley.**—Plans for new municipal buildings have been prepared by Messrs. Barclay, of Glasgow. The estimated cost is 30,000*l.* The ground-floor facing High Street will be arranged for shops.

## ARCHÆOLOGY.

**The Dane John, Canterbury.**—Some interesting archæological discoveries have just been made at Canterbury. In the course of the repair of the old city wall and buttresses still in existence beside the Dane John, a piece of Roman tessellated pavement was found imbedded in the structure. It is formed of small stone cubes, the tesserae, all white, being inlaid in a layer of fine salmon-coloured mortar, similar to the remains of a Roman villa recently found at Wingham and at the ancient church of St. Martin. Excavations within a short distance of the old city moat have resulted in from twenty to twenty-five skeletons being unearthed, together with Roman urns of fine red ware, a fragment of a highly-decorated bowl, bearing a raised image of a Roman soldier, with a shield on his left arm, coins, rings, bracelets, some curious flint implements, and rounded sling stones.

## GENERAL.

**A Fine Art Exhibition** was opened in Perth on Monday.

**The Munich International Exhibition** was closed on Monday. Many of the pictures exhibited are said to have been bought by English and American dealers.

**The Berlin Museum** has purchased for 180,000 frs. Rembrandt's painting of *Potiphar accusing Joseph before Pharaoh*. The work was formerly in possession of Sir Thomas Lawrence.

**Mr. William Morris** will deliver a lecture on "Art under Competitive Commerce," at the West Bromwich Institute.

**A Statue** of Tannahill, the poet, by Mr. D. W. Stevenson, A.R.S.A., has been cast, and will be unveiled in the Abbey churchyard, Paisley, to-day. On the pedestal will be a relief representing peasant girls singing one of the poet's songs.

**A Statue of Sir Thomas White**, who was a liberal benefactor to Coventry in the sixteenth century, was unveiled on the 11th inst. It is the work of Messrs. Wells, and the pedestal was designed by Mr. T. W. Whitley, architect.

**The New Facade** of the cathedral at Florence will be uncovered on the 1st of November next.

**Messrs. Ward & Hughes**, the glass painters to the Queen, have completed a large three-light window for Christ Church, Walmersley, Bury, which is a memorial of the late Mrs. Jardine. Lady Affleck has presented Dalham church, Suffolk, with a memorial window by the same artists.

**Two Western Piers of Peterborough Cathedral** have been condemned, in addition to those already demolished, and this will entail on the Dean and Chapter an additional expense of 6,000*l.* The sum required for the complete restoration is over 60,000*l.*, of which only 17,000*l.* has so far been collected.

**Mr. John Gray**, engineer, of Waverley Place, Aberdeen, has offered to present the town with a school of art. The community have already subscribed 12,000*l.* for an art gallery and museum, and the cost of the school of art, which would be erected in juxtaposition with the museum, is estimated at not less than 4,000*l.*

**The Novelty Theatre**, Great Queen Street, was put up to auction on Tuesday, at the Mart, Tokenhouse Yard, and withdrawn, the only offer received being one of 7,000*l.* The property is estimated by Mr. Tewson, the auctioneer, to be worth 25,000*l.*

**The Rebuilding of Szegedin**, which was nearly destroyed by an overflow of the River Theiss, is nearly complete. The new buildings number 3,000, and comprise a theatre, a law court, telegraph offices, a town hall, barracks, schools, various charitable institutions, and four churches of different confessions. New quays and an iron bridge over the river have also been constructed, and above all three large dams have been made to protect the town from future inundations. In all some 30,000,000 fls. have been laid out in the new town.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, OCTOBER 20, 1883.

### EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

### TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*\*\* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—“Contract Supplement to THE ARCHITECT.”*

### TO AMERICAN SUBSCRIBERS.

*All subscriptions are payable one year in advance, and may commence at any date.*

*The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.*

*Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED TO GILBERT WOOD, 175 Strand, W.C., London, England.*

*In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—*

*To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order.*

### COMPETITIONS OPEN.

# The Architect.

## ARCHITECTS AND "AGENCY."

ANY of our readers who know a little less of the world than others may scarcely believe it possible that the following communication could have been received—as it certainly was, and not long ago—by an architect in good practice, in the form of a loose slip inside a letter from, we believe, a London solicitor with whom he happened to be in correspondence on some incidental matter of little moment:—

"N.B. Doing a good share of Beer and Spirit Licensing, I take this opportunity to say that if at any time you feel disposed to refer anyone to me on such business I could bear in mind the terms of 'agency,' as I do with many solicitors and surveyors."

The recipient of this courageous notification informs us that it surprised him very much; and we have no doubt it did. But what is still more surprising is that the proposal it contained is not in any way intended as a temptation to evil; although how far it is suggestive of equivalent indignity we do not for the moment say. In a word, in these pushing times when "agency business" is becoming extended more and more every day, both in practice and in principle, architects need not be astonished to find themselves brought into contact and indeed into collision with it like other people, and compelled indeed to understand what it is, as an institution directly recognised by the law—and by the lawyers even further than by the law—in more departments of business than could well be specified. We may say, however, of the particular form of proposal above quoted that it is one which we take leave to think no class of what we call "surveyors" can really be accustomed to receive.

The practice of professional "agency" in general may be taken to have arisen, probably, out of the arrangements whereby a solicitor in the country employs a solicitor in London to conduct on the spot those proceedings which the rules of the Courts require to be done at headquarters. Solicitors are not a sentimental or squeamish profession; they work for pay without disguise or compromise; and accordingly they have certain established rules of their own by which—at least so the outer world understands—the costs in such cases are apportioned between the country practitioner and his agent, in such shares as fairly to recognise their relation to each other. Originally we may suppose there had been no idea entertained of the principle being carried further than the simple appropriation of each item in the bill of costs to the person who performed the item of service; but out of it there has eventually come a very different custom, which in some quarters allows a solicitor to take a share of the earnings, not only of another solicitor, but of an auctioneer, for instance, or a stockbroker, to whom he has (in the phraseology of the transaction) "introduced business." Now, inasmuch as solicitors know the law if anybody does, we may take it that there are a good many classes of adventurous "men of affairs" who are encouraged hereby to cultivate "agency" as an art—an artifice, if the reader prefers to call it so—and to call upon the Courts of Law to recognise such transactions as legitimate. And everyone who takes the trouble to read reports of litigation knows perfectly well that "the introduction of business" is so recognised, as a benefit which may be made the specific subject of a bargain for recompense. The practice has not got so far as to give a man a title to payment for the mere act of recommending another to profit, but certainly when recommender and recommendee have previously made a contract between themselves on that principle the Courts will so far enforce the contract.

Thus it happens that for a long time back it has not been unusual for manufacturers and dealers to give architects to understand that what is known as "the trade discount" would be payable to them, as to a builder, upon articles ordered by them directly instead of through a builder; indeed the offer has been expressly justified on two specific grounds. In the

first place, it has been said, there is the discount at somebody's service as a mere element of price; there is no builder to take it; the rules of trade refuse it to the employer; therefore let the actual intermediary have it; in the second place, if regarded in the light of remuneration for the trouble of the intermediary service (often considerable), let him have it who has had the trouble. So far it is enough for us to say that the Institute of Architects has from its foundation opposed the practice *in toto* as a point of honour, holding it to be manifestly inconvenient that the supervisor of building works should upon any pretence be allowed to involve himself in the supply of articles, the quality and price of which he is employed to check in the interest of the purchaser, his client. At the same time it is only fair to add that there are thoroughgoing men of business, as business goes, who still maintain the arguments above-mentioned to be sound, and who fail to see why an invariable trade discount should be lost, or why an architect should spend his time attending upon the selection of cheap articles of taste without remuneration. To this, however, the principle adopted by the Institute would still seem to have an answer to give, namely, that whenever any special remuneration is due, it ought to be paid directly by the employer, who, it may fairly be supposed, if he be one of those who prefer to take a tradesmanlike view of such matters, will be found ready to endorse his own opinions.

The division of labour, and of profit to correspond, of that kind which belongs, as we have said, to the agency business of lawyers, does not seem to be practised in architectural business; but there is another and not altogether dissimilar mode of co-operation which may be mentioned. We allude to those arrangements whereby, when two rivals find themselves equally supported amongst the patrons of some "job," they combine together and enable their supporters to coalesce. This is not a transaction which commends itself to the approval of abstract reasoners outside. It does a kind of credit to the good nature of the men engaged in it, and perhaps to their appreciation of the convenient English principle of compromise; but when, as sometimes has happened, one of the partners does all the work for love of the work, and the other takes half the money for the love of the money, this result is at least somewhat shabby.

It is not a long step from this kind of transaction to that wherein an outside practitioner, one of another profession altogether, although professing kinship for the occasion, "introduces" an architect to a client and claims "agency." Upon a proposal of this description, what we have to say may simply take the form of a moment's calculation. The architect is to earn 5 per cent.; and suppose his friend asks boldly for half; and indeed he may quote amongst other things in support of his demand the undeniable fact that architects of distinction have been known to work eagerly at half price for so-called "charities." Now it is a very fair rule that the outgoings of the architect in an ordinary work may be estimated at about 2½ per cent. Consequently, if half the commission of 5 per cent. is to go to the introducer, the worker will get nothing; and if the "agency" is to become less than half, it is plain that the balance of actual profit may still be difficult to discover. We need only add that the discredit of sharing with an outsider still remains to be considered; although, after all, the coalition partnerships we have alluded to are sometimes little if any better; and the practice of taking half price from "charities" is almost worse. Another specious form of self-denial seems to be unquestionably worse—namely, that of acting as "honorary architect," a thing which is never done, except in the way of baiting a hook for business, which robs it of all its merit if it has ever had any.

A slight flutter was occasioned in certain walks of architectural practice a year or two ago by a manifesto being issued by the Council of the Institute declaring their intention of expelling such members as might be found to share commission with quantity surveyors. If there is any kind of agency business in architecture which the law would on principle justify more than others, it is probably this. By the rules of the Institute itself an architect is authorised to be his own quantity surveyor if so employed by his client. In country practice it is said to be frequently impossible to work otherwise. Supposing, again, the existence of honesty—and why should this not be?—there are many who maintain that no better plan can be devised for enabling a young architect to perfect his practical knowledge than to encourage him to take out his own quantities, and, if he so pleases, to do the same with or for

a friend. But, as we take it, it is not this that the Council of the Institute have assumed the power of condemning; it is that kind of mere commercial "agency" in which an architect who is himself not a surveyor claims the right of bestowing employment upon a surveyor who is not an architect in consideration of a share of the payment. This is no doubt done by some persons, and without much concealment; but we cannot regard it otherwise than as a discredit to the profession, although perhaps perfectly lawful; and we rest this opinion upon the simple argument that no work is done for the money.

As a general rule, it may perhaps be admitted that the practice of "agency" is one which we must expect to see developing itself more and more as the times change and the ways of business change with the times; but there are certain principles which ought never to be lost sight of in a profession like that of architecture, such as these—that whatever is done must be done openly and above-board, and that no payment can honourably be received except for work done by the recipient. The necessity for acting, under any circumstances, in any sort of underhand way we wholly deny.

### PALAIS DE JUSTICE, BRUSSELS.

"THERE is but one monument in Europe," observed the architect of the Paris Opéra, M. GARNIER, speaking of the Palais de Justice, Brussels, on visiting that edifice under construction. And when the King of the Belgians remarked lately to the Procureur-Général that the country would soon possess a temple erected to Justice, that functionary replied by the following question: "Sire, are you quite sure that it is not rather a temple erected to Architecture?" Again, after the inauguration ceremony, the King, in replying to the address of the workmen who had been employed on the building, said: "The Minister of Justice remarked to me just now that the grand palace which you have constructed is a permanent exhibition of what our industries are capable of producing, an exhibition which does them infinite credit, and which I hope will be of great use to them." Certain it is that so magnificent a shrine has never before been dedicated to THEMIS, whether in ancient or modern times, and that the building, whose fit epithets are grand and colossal, is worthy to rank with the Acropolis of Athens and the Capitol of Rome. Erected on the highest ground of the city, it forms a prominent object from all directions. Its pyramidal form is indicative alike of that firmness which is the special attribute of Justice, and of the invocation, by pointing upwards, of a higher power to be present at the deliberations, while the immense portico would seem to bid all enter without exception. Indeed, DIDEROT's dictum that the use of a building should be manifested by its appearance from a distance is amply satisfied by the classical edifice which was inaugurated on Monday, October 15.

The architect of this creation was JOSEPH POELAERT, who was born at Brussels on March 21, 1817. Having studied at Paris under VISCONTI, the architect of the Louvre, he was, in 1856, named architect to the City of Brussels, and was subsequently instructed to prepare the plans of the church of Sainte-Catharine, and those for the rebuilding of the Monnaie Theatre or Opera-house, after it was burnt down in 1855. He also designed the column erected to commemorate the National Congress of 1831, and the church at Laeken containing the royal mausoleum. So far back as 1847 it was decided, on the report of the architects CLUYSENAAR, PARTOES, SPAAK, and SUYS, that the Jesuits' Convent in the Rue de Ruysbroeck, which has served for the Law Courts up to the present time, was too old, and that a new Palais de Justice must be erected. In 1861 a public competition, in which foreign architects were placed on the same level as Belgian, produced, indeed, several fine designs, but none which fulfilled the requirements of the case. Accordingly, the Government, on the proposal of the Minister of Justice, entrusted POELAERT with the design of the new edifice; and it is said that he immediately produced it, having worked at it secretly for ten years. His plans were elaborated and approved the following year, when he was commissioned to carry them out. Towards the closing years of his life, however, he became so excitable that he could only work at his drawings in the dead of the night, when absolute silence prevailed, the slightest noise unnerving him. He, at last, went out of his mind, and after lingering for upwards of twelve months, died on November 3, 1879, at the age of sixty-three years, leaving some

of the details unfinished. He was officer of the Order of Leopold, and Chevalier of the Legion of Honour, while the international jury of the Paris Exhibition of 1878 awarded him a gold medal for his design of the palace.

The works were begun in 1866, and the foundations, consisting of masonry pillars and arches, were finished in 1868. The site chosen is the summit of a hill near the Boulevard Waterloo, sloping down to the valley of the Senne. On account of having to provide for all the courts, civil, criminal, and military, that hold their sittings in the capital, as well as for the tribunal of commerce, with their several dependencies, the area of the building is necessarily considerable, and has been increased successively from 16,000 to 20,000, and ultimately to 26,700 square mètres, or 287,407 square feet; that is to say, nearly double the area of the New Law Courts, London. From this figure must be deducted 5,100 square mètres for internal courtyards, leaving 21,600 mètres, or 232,508 square feet for ground actually built upon. The Salle des Pas Perdus, occupying the middle of the building, with its galleries, the staircases, vestibules, and other vomitories, cover an area of 14,800 square mètres (159,311 square feet), which is therefore rather over two-thirds of the whole area built upon. There are no less than 272 separate chambers, of which twenty-seven are large courts of justice. The difference of level caused by the slope of the site has necessitated the formation of an immense *terre-plein*, or platform, ascended by inclined planes of easy gradient, 300 mètres (984 feet) long, and 17 mètres (nearly 56 feet) high, which greatly enhance the effect of the building when viewed from the lower side. The total area of the site, including this platform, the terraces and steps, is 52,464 square mètres, or 564,738 square feet. The style adopted is the Grecian, mingled in parts with Roman, and to a slighter extent with Hindoo and Egyptian; but the whole is treated with such marked individuality that the structure is likely to remain perfectly unique, as it is probably the largest of the kind in existence.

The principal façade, facing the north, is on the same centre line as the Rue de la Régence, which it terminates at the end farthest from the Place Royale. Its chief feature is an immense portico of striking appearance, 39 mètres high and 18 mètres wide (128 feet by 59 feet), executed entirely in white Comblanchien stone, and thus contrasting with the slate-blue Soignies stone of the rest of the façade. The Classical style adopted did not permit of turning an arch over this wide opening, which is, therefore, spanned by girders covered with plaster, so as to present the appearance of a monolith; but this expedient has been severely criticised, on account of the method of construction being concealed from view. Two enormous *antæ*, supplemented on the inside by Corinthian columns, form a support to griffins carrying a severe entablature crowned by a pediment. Over the *antæ* are *acroteria*, and an attic storey surmounted by a bust of MINERVA, 3½ mètres (or 12 feet) high. To the right and left of the portico, a peristyle or double colonnade, composed of shafts in Soignies stone, 1'8 mètre (or 6 feet) in diameter, and of a fine Doric profile, extending the whole length of the façade, leads to pavilions at the angles of the building. The side frontages form continuations of these two pavilions; and in the middle there are two *avant-corps*, or fore-parts, leaving the central motive recessed. The lateral portions of these frontages are very fine, being ornamented with a Doric colonnade. The rear façade, of noble simplicity, is by many considered the finest portion of the whole structure. An immense *avant-corps* projects considerably beyond the sides, being terminated by two large pilasters of magnificent sweep, and ornamented by a pediment surmounting a loggia. The cornice running round the building is 5 mètres (or 16 feet) high, and projects 1¼ mètres (or 6 feet), being surmounted by an attic storey of 3¼ mètres (or 12 feet). The base is 8 mètres (or 26 feet) high, and projects 1½ mètre (or 5 feet). Constructed of Soignies stone, it is boldly treated and produces a grand effect.

The plan of the building presents the form of a parallelogram, nearly approaching a square, but with the addition of the two wings above mentioned, projecting 25 mètres (or 82 feet) from the principal façade. There are four main entrances, one in the centre of each of the sides. On account of the difference of level there are two ground floors—the *rez-de-chaussée supérieur* and the *rez-de-chaussée inférieur*—below which is the basement, containing the cells for prisoners and various offices, and still lower the cellars. The Salle des Pas Perdus, 74 mètres (or

243 feet) long by 40 mètres (or 131 feet) wide in the clear, is situated in the middle of the upper ground-floor, and it is surrounded by galleries 6 mètres (or nearly 20 feet) wide, on the level of the *étage supérieur*, or upper storey. The area of this hall, with its galleries, is therefore 4,400 square mètres, or 47,363 square feet.

From the middle of the Salle des Pas Perdus rise the four immense piers which support the cupola, surmounting the square dome, the total height being  $97\frac{1}{2}$  mètres (320 feet) above the floor, and  $102\frac{1}{2}$  mètres (336 feet) above the bottom of the steps leading to the main entrance. In this cupola alone has the architect permitted himself to depart from the straight lines of the severe Classical style he has adopted throughout the building. The dome generally is, perhaps, the most original portion of the structure, and has given rise to the greatest amount of controversy, both as to its design and practicability and the means adopted for carrying it out. The dome, viewed from the outside, consists of a stylobate, a series of steps carrying the base, the cupola, and two rows of pillars and superposed columns. Four piers, 48 mètres high and  $2\frac{1}{2}$  mètres square ( $157\frac{1}{2}$  feet by 8 feet), at the corners of the dome support the cupola. Between these four piers are rows of Ionic columns, separated by pillars nearly  $1\frac{1}{2}$  mètre (5 feet) wide. Columns of the same order, and more than a mètre in diameter at the base, project from the outer faces of the corner pillars, thus giving the dome a width of 27 mètres (88 feet). The columns in the second row are 10 mètres (33 feet) high, including the entablature and the attic which surmount them. Four seated bronze statues, representing *Power, Justice, The Law, and Royal Clemency*, executed by M. VINÇOTTE, M. DUTRIEUX, M. DESENFANTS, and M. DE TOMBAYS, occupy the angles of the dome. At the height of the bases of the columns which project from the outside faces of the corner pillars there is an external gallery communicating with a second inside the base, while a third gallery is formed at the same height inside the dome. These three galleries are placed in communication with the stairs, which lead from the ground-floor to the top of the cupola.

Contrary to the usual practice of allowing the entire dome to rest only on four supports, which must consequently be very large, POELAERT has arranged the cupola, its stylobate, and its base in distinct vertical planes, and has therefore increased the number of the points of support, while giving them all dimensions proportioned to the load they have to carry, and also in harmony with the general design. Instead of the usual arches, a system of girders has been adopted, in which vertical pressure is substituted for horizontal thrust. There are twenty-four points of support, divided into four distinct groups, and all placed symmetrically round the large central piers which carry the cupola. As the height of these piers is nearly 48 mètres (157 feet), it was necessary, in order to keep them perfectly vertical, to tie them together by girders placed at three different heights, and arranged so as to form large soffits for carrying the wall. The construction of the dome has required 172 girders, weighing together about 4,000 tons. The supports for the dome, constructed of brick, are loaded with less than a tenth part of the crushing strain; while the four central piers, which carry the cupola, are loaded to nearly one-eighth of that strain. These are, however, constructed of large and carefully-selected blocks of Soignies stone, with the beds and joints carefully dressed; and every effort has been made to reduce the load upon them in carrying out the details of the superstructure.

The staircases have been pronounced the grandest part of POELAERT's magnificent conception. The Salle des Pas Perdus, which, it must be borne in mind, is on the upper ground-floor, and is reached directly, from the portico in the principal façade, through a large door, is also reached from the east frontage, that in the Rue aux Laines, by a staircase remarkable for its boldness and for its variety of perspective. It is also reached from the opposite side, that of the Rue des Minimes, which is on the lower level, by a straight flight of a hundred and seventy-one steps, 80 mètres, or 262 feet long, and rising  $20\frac{1}{2}$  mètres, or about 67 feet. The galleries, 6 mètres or nearly 20 feet wide, surrounding the Salle des Pas Perdus, are reached from the upper ground floor by four magnificent staircases. They are also approached from the peristyle at the principal entrance by two colossal staircases rising on the right and left of the immense portico. At the base of these staircases are placed white marble statues, larger than life, of *Demosthenes* and *Lycurgus*, by

M. CATTIER, and of *Cicero* and *Ulpian* (DOMITIUS ULPIANUS, the Roman juriconsult, who died A.D. 228) by the late M. BOURÉ.

In the upper storey, reached from the peristyle by a pair of colossal staircases, the gallery overlooking the Salle des Pas Perdus communicates with the ordinary civil court of appeal on the right, the tribunal of commerce directly in front, and the ordinary chamber of the high court of cassation on the left; while the chambers for the special sittings of the courts of appeal and cassation are placed on the same level in the corner pavilions. On the centre line of the upper ground-floor, and opposite the main entrance—that is to say, just underneath the tribunal of commerce—is the assize court; while to the right, when facing it, is the criminal court of appeal, and to the left the civil tribunal of first instance. In the lower ground floor (*rez-de-chaussée inférieur*), the military court lies immediately below the assize court; while the council of war, the chamber of the justice of the peace, and the civil tribunal also find a place on this floor.

The three courts of assize, appeal, and cassation, measuring 28 mètres long by 12 mètres wide (92 feet by 39 feet), are the largest and finest, and differ from one another only in the decoration. The assize court is surrounded by a wainscot of black marble, with panels of white-veined green marble, except the reserved portion, where it is of oak. The wainscot is pierced by six low doors of carved oak, while the wall above is of a slatey-grey tone. Square columns of grey marble carry a gallery on either side; and the floor is laid with oak in the reserved portion, and with grey and blue stone elsewhere. The decoration of the court of appeal is richer than that of the assize court, the oak doors being surrounded by *portiques* of black, green, and red marble. Over the principal entrance there is the frame for a future painting of *Leopold II. proceeding to the Inauguration of the Palais de Justice*. The most sumptuous of the three courts, however, is the high court of cassation, having a single row of red marble columns with gilded capitals, brass bases, and black marble pedestals; while the doors are of carved ebony, enriched with gilt *appliques*. The ceiling is richly decorated; and the walls above the marble wainscot are green and gold. Over the principal entrance, which is surrounded by a *portique* of rare marbles, there is a frame destined to receive a picture representing *Leopold I. decreeing the construction of the Palace*. Above the dais for the court, which is opposite the main entrance, there is a loggia, the front of which rests on two lofty columns.

The total quantity of masonry is 570,000 cubic mètres or 20,130,500 cubic feet, and the façades have a superficial area of nearly 50,000 square mètres or 538,215 square feet. There are about 1,500 windows, measuring together 10,243 square mètres (110,258 square feet), and 1,400 doors measuring 10,970 square mètres (118,084 square feet). The site was purchased from the Comte DE MÉRODE, for 3,000,000 frs. (120,000*l.*); and the original estimate of the building was 8,600,000 frs. (344,000*l.*). The cost at present incurred is, however, 45,000,000 frs. (1,800,000*l.*), the foundations alone having amounted to 1,600,000 frs. (64,000*l.*), while the various fittings and adornments yet to come will probably bring up the total to 50,000,000 frs., or 2,000,000*l.* sterling. Four-sixths of the cost will be defrayed by the Belgian Government, one-sixth by the Province of Brabant, and the remaining sixth by the City of Brussels. The work has been carried out under the direction of M. WELLENS, Ingénieur-en-Chef des Ponts et Chaussées, assisted by MM. CARPENTIER, ENGELS, and BÉNOIT, architects, and M. MARCQ, engineer; while it has been executed by M. DE VESTEL as principal contractor. We are indebted to the executive of the palace works for the plans and for facilities of obtaining information, and also to M. P. SAINTENOY, architect, of Brussels, for great assistance in compiling our notice.

## PROJECTED STREET COMMUNICATIONS IN LONDON.

NO doubt the announcement just made,\* unofficially at present, that the Metropolitan Board of Works intend to postpone all their schemes of improvement "for the facilitation of traffic in London," in consequence, it is said, of the grave doubt which exists as to the possibility of procuring an extension of the term for the coal and wine dues, will cause considerable disappointment to those who looked forward to

\* See the *Times*, October 24.

the coming session as one likely to afford relief to the long-suffering public of London in various directions from the congestion of traffic, and the want of direct communication from one quarter of the metropolis to another in its most crowded and most important parts.

A new project, however—a new Thames tunnel—is to be the exception. But while we gladly think something may at last be done to try and remedy the evils of the natural severance of one great district from another by the river, we cannot think that the easier and in some respects more important matters connected with the centre of London should be neglected, and be summarily set aside, because of the lecture which the Treasury read to the Board on the importance of economy in public works. Why, for instance, now that the Law Courts are in full working order, and more and more resorted to day by day, should the small but very important and long-awaited-for improvement of the approaches be postponed, and the streets so much wanted from south to north to afford direct access from the Strand across Holborn to the Northern Railway Stations be abandoned, when it is evident that a little attention to details, and a little cutting down of the magnificence of the scheme proposed by the Board, would bring it within reasonable bounds, and within measurable distance of possibility?

Without disturbing at vast cost the whole of the block of buildings between the Strand and Wych Street, a full and sufficient improvement could be made, and by reducing the churchyard of St. Clement Danes (as proposed, we are informed, by the Metropolitan Board) ample width for present traffic would be obtained.

A new street carried over vacant ground, or over such vile property as it would be a charity to remove—at the side of Clement's Inn—brought to join the prolongation of New-castle Street at a point south-west of Lincoln's Inn Fields, might readily be laid out. The frontage of a circus formed at this point is already partly made by recent additions to the backs of houses which form a portion of the south side of the Fields, and the proper completion of it would give a fine vista into and through the Fields northwards. Without necessarily entering it or disturbing the valuable quiet and unique beauty of this square (the largest in the metropolis) by through traffic, a street can be carried from this circus at the back of the west side of the Fields, passing through stables, gardens, and other comparatively unimportant property to enter Holborn through Little Queen Street in a *direct* line, and thence straight onward to the north, in an unbroken line. Of course Little Queen Street would have to be widened, but it was to have been widened some time ago, and would have been had not the local authorities refused the handsome contribution of the Metropolitan Board at a time when it might most easily have been carried out. But Little Queen Street wants widening now, independent of any new project whatever. Every day shows the inconvenience of such a narrow thoroughfare, which after all leads nowhere *directly* south, though always full of traffic, endeavouring to find its way southward.

The plan we have been describing is that of Mr. CHAS. FORSTER HAYWARD, F.S.A., architect, which has been before the public now some considerable time, and has been supported by deputations to the Board, and as to which even now a memorial is being extensively signed. It seems to us the proper solution of the problem, and a solution we want in good earnest, if only to clear away the abominable and filthy courts and alleys on the route.

It is rumoured that the Board of Works preferred a plan coming through Lincoln's Inn Fields, cutting off some forecourts of houses and taking down others merely to get into Holborn, and stop there. But against this all the lawyers are in array, and all the more reasonable inhabitants of the district, for it is evident to anyone who has the proper map before him, that to carry a street as Mr. HAYWARD proposes through very unimportant property, opening frontages right and left, communicating with adjoining streets, and so affording good chances of recoupment of cost, would be more economical than to destroy frontages in Holborn, and houses in Lincoln's Inn Fields merely to gain access to Holborn itself, and go no further.

If Mr. HAYWARD's plan were a costly one, it would be worth carrying out from its intrinsic merits, and the advantages it offers for north and south direct traffic in a part of London where there is none, although most urgently needed. But we are assured that it is as economical as it is valuable, and

deserves to be well considered before it is set aside for anything less advantageous or more costly.

We are informed, too, that the oft projected railway from King's Cross to Charing Cross would pass at the point of junction of Little Queen Street and Holborn, and to accommodate this especially (and for other considerations), an octagon form of "Place" is proposed, so as to widen out the approaches either way, the station being on one face of the octagon; and that this can now be done without much additional cost, throwing the east side of the new and magnificent Holborn Restaurant into view. Also a diagonal street, if desired, from the Great Queen Street junction to Holborn by Little Turnstile—if required to relieve traffic cityward, if it should be found to set in that direction, which we rather question—is laid down in Mr. HAYWARD's plans.

The following would be some of the buildings and localities immediately interested in the through communication or in the quiet and salubrity to be obtained by the project: Northwards, Euston, St. Pancras, and King's Cross termini, with the stations of the underground line; the British Museum, and the West Central Post Office, Bloomsbury. In Lincoln's Inn Fields, the Soane Museum, the Inns of Court Hotel, and the College of Surgeons, King's College Hospital, the Law Courts—both the Carey Street and the Strand fronts—and the west side when extended; the Temple, and that part of the Strand and Embankment eastward, with Somerset House, Waterloo Bridge, and the Strand westward, and indeed the whole of that quarter of the metropolis.

We cannot, therefore, look upon this as a local improvement merely, but one of great importance to all; and we heartily commend it to the consideration of the Board should they be able to make an exception in their sweeping determination to give up "the projected metropolitan improvements."

## PARIS NOTES.

THE success of the day (the *actualité* as the French would call it) in the Paris municipal world is wood-paving. Notwithstanding the extent to which it had been adopted in England, this method of road-making was until very recently held in extremely low esteem on this side of the channel. Last year, however, the Wood-Paving Company, Limited, of London, obtained permission to lay down their blocks in the lower part of the Champs Elysées, from the Place de la Concorde to the Rond Point. The success of this experiment was so great that the authorities have since then adopted it at their own expense in the Boulevard Poissonnière and the Rue Montmartre—two of the very busiest thoroughfares in Paris. The crowning triumph of the system appears, however, to have been brought about by the visit lately paid to London and other English cities by some delegates of the Municipal Council. The report of these gentlemen as to the advantages of the system was so conclusive that the Council has decided to have it laid down in (1) the Faubourg Saint-Honoré between the Rue de l'Elysée and the Place Beauveau; (2) on the interior boulevards from the Madeleine as far as the Boulevard Poissonnière; (3) in the Avenue and Place de l'Opéra; (4) in the Rue Royale and south side of the Place de la Madeleine; (5) in the Rue de Rivoli from the Louvre to the Place de la Concorde; and (6) in the Rue des Saints-Pères from the Rue Jacob to the Boulevard Saint-Germain. It will be seen that these are all points where the traffic is extremely heavy. In the report above referred to, which was prepared by M. Vauthier, one of the delegates, it is remarked that this kind of paving has only entered upon its practical phase since the layer of wood blocks has come to be regarded as a simple coating to the road beneath, and not as intended to bear by itself the weight of the traffic. In the Rue de Rivoli, where the new roadway is now finished and opened for traffic, the method adopted has been that of making a regular bed of very hard concrete upon which the blocks are laid, and form a sort of slightly elastic medium between the vehicles and the stone surface beneath, which would by itself be very speedily worn out. The same method will be followed in the other thoroughfares mentioned above, and when completed Paris will possess 90,000 square mètres of this paving against about 600,000 in London. The work is being done by a French Société Anonyme. The inhabitants and frequenters of the Champs Elysées and its

neighbourhood, on returning this autumn to their favourite haunts, must have been agreeably surprised to find that the Quartier Marbœuf—the one blot amid the surrounding magnificence of spacious thoroughfares and sumptuous mansions—is being improved away. This district, bounded by the Avenue Montaigne, the Avenue des Champs Élysées, the Rue de Chaillot, and the Avenue de l'Alma, with its narrow, winding streets, tumble-down cottages, and miserable huts, could only be compared for wretchedness and squalor to the very worst slums of the capital, such as the Quartier Mouffetard or the heights of Belleville. To effect the desired transformation, it has first of all been necessary to raise the level of the streets, which were nearly 20 feet below the surface of the surrounding avenues, and this gigantic work of levelling-up has necessitated the bringing to the spot of no less than 15,000 waggon loads of rubbish, &c. At the same time, new thoroughfares are being made, improvements carried out in the gas and water supplies, at a cost of several million francs, and the land, the whole of which has been expropriated by the city, let for building purposes; everything, in fact, is being done to assimilate this bit of desert, which a few months ago was almost unknown by the mass of Parisians, to the luxurious district near the centre of which it lies.

Large temporary sheds have lately been erected in the south court of the Louvre for the reception of the statuary at present exhibited in the Vénus de Milo Gallery, which has to be cleared in connection with the construction of the cellars that are to be made under all the ground-floor rooms; as has been already done under the Caryatides Gallery. It is expected that some important archaeological discoveries in connection with the old Louvre may result from these excavations. The object of the administration in thus cellaring under the Louvre is to make the ground-floor rooms and galleries drier, great damage to many works of art of priceless value having already been occasioned by the damp.

The attendance at the Triennial Exhibition in the Palais de l'Industrie amounted to upwards of 20,000 on Sunday last—a free day. The Government must, however, be convinced by this time that the season was badly chosen for the inauguration of this new Salon. On some days there are not more than 1,500 visitors; rooms may be seen at times entirely empty, and the sculpture garden below is generally deserted.

In the course of the excavations undertaken in connection with the construction of the Suresnes weir and locks, traces have been found of a lacustrine station, which, judging from the large number of bones and utensils collected in a few hours, must have been an extensive settlement of the race that was driven out by the Gauls.

The four allegorical statues of *Justice*, *Wisdom*, *Force*, and *Prudence*, which were taken down a year ago from the Grand Entrance of the Palais de Justice, have now been replaced by *fac similes* executed by M. Hayon. The originals, by Berruyer and Lacombe, were erected in 1782, and remained in position exactly a century. During that time they had become so damaged by the influence of the weather that they were visibly crumbling away, and threatened to fall into utter ruin. Last year plaster casts were taken of them, and from these the copies above referred to have been produced. The acroterion of the Grand Entrance where they stand has also lately been restored, and the whole may now be considered in a satisfactory condition.

#### MR. G. SIMONDS ON MODERN ART.

THE prizes in the Reading Art School were lately handed to the students by Mr. George Simonds, the sculptor of the *Dionysos* and the *Theseus*, lately exhibited at the Royal Academy, and who is a native of the town. Mr. Simonds said it was seldom that sculptors were called upon to perform those pleasant offices, and he must attribute their kindness to a desire to express to their fellow-townsmen sympathy with his endeavours, however feeble they might have been, towards the promotion of a pure and noble school of sculpture in this country. He had visited the exhibition of the works of art students in those buildings, and could not refrain from saying how excellent and painstaking must be the teaching that had produced such satisfactory results. Everyone who was at all in earnest in his professional work was pleased to advise and assist his younger brethren, and especially was that the case in the Middle Ages, during the great revival of the arts. In those days art seemed to have been a natural spontaneous growth, and an academy of arts, with an annual exhibition, "admission one shilling," would have surprised and perhaps shocked those simple folk who loved art because they recognised it as being something noble, true, and beautiful—to whom it was so far from

being a fashion, that it was almost a second religion. The strongest man soon came to the fore, and around him were grouped a numerous body of minor lights, who worked with him, assisting him faithfully, earnestly, and admiringly, in the execution of his great works. In that way schools were formed, and a lad who entered one or other of those studios was kept under the influence of some master mind, and instructed with a thoroughness which it is impossible to attain on any other plan. In the present day, science had far outgrown her twin-sister art, and men were now forced to apply themselves to separate branches of science and art. While science had flourished altogether without precedent, and with the natural hardy growth of a native plant, art, on the other hand, seemed to be rather as a costly exotic, cultivated in accordance with the dictates of fashion. Probably, never had art been more propagated, more lavishly patronised, and less generally understood than at the present day. But our rage for art was not a national taste so much as a prevailing fashion. Another point in modern art-patronage seemed to him to be worthy of notice, as being peculiar to modern times—he meant the speculations in pictures both by dealers and by private persons. The artist, of course, reaped a pecuniary benefit from that quiet gambling, but whether it benefited his art or the reverse was an open question. With regard to the modern system, being under many professors, each with his own idea of style, often in direct opposition one to the other, could not fail to be very bewildering to the student and prejudicial to progress. The fact was clearly recognised by the best academies on the Continent, some of which had a number of studios attached, each presided over by one of the professors, who was obliged to receive a certain number of students as pupils. That was the case at Dresden, where he himself received the greater part of his professional education, the studio to which he was attached being that of Professor Schilling, the author of the great national monument which had just been unveiled in Germany. Having described the system of instruction there, he said a sculptor in England was assisted, not by men whom he had himself trained up, but by hired workmen. Although there was no doubt that this country had made very rapid progress in matters artistic, every true lover of art must feel that the present condition of things was not altogether satisfactory. We gave too much attention to the "cabinet" art; and decorative art—by which he meant a harmonious co-operation of painting, sculpture, and architecture—which he took to be the highest and noblest form of art, was left to take care of itself. In every work of art three chief points were to be considered—first its suitability to the purpose it had to fulfil, and to the place it was destined to occupy; secondly, its truth to nature; and thirdly, its beauty. But unfortunately most of the art that was produced was made for exhibition, not for decoration, so that they were forced to trust to chance for the first condition of excellence—suitability. They did know, however, that their work would probably be in conflict with all the other pictures and statues near it; and consequently the temptation was often irresistible to paint or to model in too high a key either for truth or beauty—to work for the public praise or to catch the eye of the newspaper critic rather than to carry out conscientiously one's own convictions of what was true and beautiful. Again, the architect was too apt to consider that such matters as sculpture and painting were trifles not worth troubling about, whilst the painter and sculptor on their part regarded his work as being merely a site for a statue or frame for a picture. It was hard to persuade a man that he was merely taking part in a trio when he fancied he was performing an important solo. Having strongly condemned the present system of competitions, especially in architecture, he said it was to the Academy exhibition that he would direct the attention of committees. If they would select an artist from the numbers of those there represented, and tell him what they wanted and how much they could spend, they would find it more satisfactory. His advice to young students was to avoid competitions. If they had time on their hands let them employ it in the production of the best and noblest work of art they were capable of, and, when they had done their utmost, exhibit it. They should all do their work for the work's sake—it was the art; and not the artist, that should be paramount. Mr. Simonds then referred to the art-criticisms of the public press, and concluded with a word of warning to those who had succeeded in gaining prizes, and of encouragement to those who had failed. There was no quality so dangerous to a young artist as very great facility, which often led to hasty and ill-considered work; there was no quality so valuable as a power of intense concentrated application. While he heartily congratulated those who had succeeded, he would urge them not to think their task easy or their burden light because heaven had given them the gift of speed and strength. To those who had failed he would say, "Be not discouraged; the race is not one against time, and patient industry and loving labour may enable the weaker man in the end to accomplish as hard a task as his stronger, but perhaps less earnest, competitor." Of them all he asked was that they would do all in their power for the advancement of whatever was good in art and in science. "Whatsoever things are lovely, whatsoever things are true, whatsoever things are of good report, if there be any virtue, and if there be any praise, think on these things."

## THE INCOHERENT ARTS.

PARIS is laughing just now over a curious picture show—the Exhibition of the Incoherent Arts, in the Galerie Vivienne. It is, says a correspondent of the *Manchester Guardian*, in some sort the revenge of the men who cannot find a place in the coherent arts. Once a year—at least this is the second year of it—a sympathetic member of that order invites all his fellows to send in their wildest inventions in satire of the great existing schools. It is peculiarly appropriate just now, while the solemn triennial show in the Champs Elysées is still open. In the one you see the schools on their serious side; in the other, you see them in caricature, and the caricature is by a long way the more amusing. The brush seems, after all, the best implement for satire on the brush. No doubt in time to come many of the contributors to this modest show, when seeking for admission to the Institute, will feel glad to buy up all the copies of a certain small yellow catalogue which recalls their participation in this practical joke. For the moment, however, they laugh without a thought of the morrow, and it is impossible not to laugh with them. Their fun is pretty equally distributed among all the schools. A distinguished impressionist on our side of the water comes in for a share of it in the painting of a *Nocturne in Two Voices*—a few dabs of red and a few dabs of white in a cloud of gloom. It is not only impressionist, but, say what you will, it is impressive in its suggestion of an infinite mystery of darkness, though it was certainly never meant to be that. This mark of the school—its taste for vast, misty effects—is shown again in the study of *Hyacinthe in London*. Hyacinthe, the actor, as every Parisian is aware, is famed for his abnormal development of nose; in the picture we see this organ, and this organ only, in the foreground of one of our densest fogs. The impressionists receive another hit in an absolutely empty frame labelled *A Painting of the Future*. The realists are even more severely treated. In the *Macaroni Harvest at Naples* we have a woman, with a bundle of sticks of real macaroni on her back, in a field covered with a growth of the same kind. The catalogue informs you that you are quite at liberty to taste and try. *An Egyptian Frigate Chasing Three Cholera Patients* belongs to the same school of art. The three cholera patients are three red herrings fastened to the canvas, and realistic in treatment beyond all doubt. The *Paris by Night* and *Paris by Day* cuts with a double edge at the Realists on one side, and at the Prefect of the Seine on the other, who has lately caused an all but absolute block of traffic by simultaneously repaving half the city with wood. This is not a picture, indeed, but rather a statuary group, made up of a wheelbarrow, a pickaxe, a shovel, and a lantern, in exact resemblance of the curious trophies of labour that are now to be seen everywhere in the streets. *The Genius of Naturalism*, dedicated to M. Emile Zola, is a figure of a winged boy with the head of a pig; and the *Portrait of M. de la Pommeroye*, the critic and lecturer, is realism carried to its furthest limit. Only the face is painted; the hair is real hair, the books in the foreground and the glass for water are real glass and real books, the eyeglass and the long drooping moustache are as real as all the rest. *The One-year Volunteer* is another portrait study, treated with all that originality of invention in this style which the younger painters have brought so much in vogue. It is merely a hand and arm, the hand gloved with that huge coarse mitten which the French linesman wears on public occasions, and which is his most distinctive mark. The theory, presumably, is that you are to represent your sitter by what is most characteristic of him, and the characteristic of the little French soldier is his big-gloved hand; all the rest of his body is mere detail. Another portrait is more fantastic still. This is the *Venus de Mille Os*, and it bears a marked resemblance to Madame Sarah Bernhardt. The face is the face of Sarah, but the body is made up of innumerable bones, a rather retrospective satire on her thinness, for she has long since grown as shapely as most of her rivals. In the military series we have several square yards of canvas, which are at the same time only so many square yards of battle smoke, with here and there a képi, and here and there a sword. They represent *Jena*, *Solférino*, *Magenta*, *Wagram*, *Austerlitz*; and you are to take your choice among them for any particular battle you want. There has been nothing more telling since that painting shown in a piece at the Variétés, which, if you held it up one way, was the desert under a blue sky, and if you turned it upside down was the Mediterranean under glowing heavens. The *Clarion sounds the Charge* is at once military and realistic. The warrior rushing at us right out of the picture is half painted and half real properties; his plume and his sword stand out in relief half a foot high. In the *Incoherent National Flag*, hung as a decoration on the staircase, the artist has finely typified the confusion of parties and factions as it must exist in the mind of a plain dealer. The ground of the flag is the red of the barricades, but this is dotted with the lilies of France; and the flagstaff is surmounted by the imperial eagle. Make what you can out of it; but then make what you can out of the politics of the day! *Genre* does not escape. The French have always had a certain contempt for those pictures representing domestic or everyday incident that find so much favour on our side. Here we have a study of a street bootblack and his customer. The customer is a mendicant friar without

shoes, and the astonished artist of the brush is asking him if he wishes to have the great toe blacked as well as the rest. The catalogue is a continuation of the jest; every artist, as in the dignified official volume of the Salon, is required to give his name and birthplace, and the name of his master. All sorts of names are given, partly no doubt from motives of prudence; and, still further to baffle inquiry, the birthplace is equally vague or misleading. One artist declares that he was “born at Bougival or elsewhere;” another, that he was born at Cape Horn; a third, that he [has really forgotten his baptismal name; a fourth writes himself down a “pupil of Rembrandt;” another is “self-taught but vaccinated;” and one dates from the madhouse at Bicêtre. This gentleman contributes a row of figures in gingerbread, which may be said to be the masterpiece of the department of sculpture. Grotesque as it is, the show may not be without a wholesome effect upon certain eccentricities of the art of to-day.

## THE LATE MR. J. H. CHAMBERLAIN.

WE regret to announce the death of Mr. John Henry Chamberlain, of Birmingham, who expired on Monday evening, shortly after the close of the lecture delivered by him at the Birmingham and Midland Institute. Mr. Chamberlain had, with much reluctance, but at the earnest solicitation of his colleagues upon the Council of the Institute, consented to allow his name to appear upon the lecture-list of this session; and, in accordance with his appointment, lectured that evening to a crowded audience upon “Exotic Art.” His remarks lasted a little over an hour, and were characterised by that happy commingling of earnestness and humour which rendered him among the most charming of lecturers. Within half an hour the lecturer had passed away from earth. In company with his wife, his sister-in-law, and his youngest son, and one of his daughters, he walked to the house in the Crescent of his friend, Mr. Lawson Tait, who with Mrs. Tait and Mr. Orford Smith, the town clerk, who was also of the company, had been among his hearers, to partake of supper before going home to his residence in Somerset Road. He appeared slightly but not over-fatigued with his lecture, and requested his companions on leaving the Institute not to walk too fast. He continued to chat pleasantly with Mr. Tait and Mr. Smith upon the way, and also upon entering Mr. Tait’s house. On ascending the stairs to the first floor, Mr. Chamberlain sat down upon a chair opposite a China cabinet, and appeared to bend his head forward. It was not noticed for a few seconds that anything was amiss, either by Mr. Tait, the town clerk, or Mr. Oliver Chamberlain, who were present upon the landing; but on Mr. Tait putting his hand upon his head to tell him that supper was ready, he fell heavily upon the floor dead. Mr. Tait endeavoured to apply restoratives, but it was evident that disease of the heart had caused instantaneous death.

Mr. Chamberlain, says the *Birmingham Post*, was born on June 26, 1831, at Leicester, where his father was a minister of a congregation of Calvinistic Baptists, in which denomination he held a position of eminence both as a pastor and a divine. The son was educated partly in Leicester and partly in a school in London. He had an early bias towards art, and, on leaving school, he was articled to Mr. Goddard, an architect of note at Leicester, with whom he remained for several years, and of whom, as regards kindness and ability, he often spoke in later life with much regard. On the completion of his term with Mr. Goddard, there was a brief interval of further study spent in a London office, and then Mr. Chamberlain received the impulse which for the rest of his life governed his own course in his art. He became an ardent student of the works of Mr. Ruskin—the earlier volumes of “*The Modern Painters*,” and especially of “*The Seven Lamps*” and “*The Stones of Venice*.” The last-named work, in particular, decided him to visit Italy, and to master for himself the great monuments of early Gothic architecture. To this task he devoted himself with characteristic ardour; making careful drawings of St. Mark’s, at Venice, and sketches and studies of details there and in other Italian cities. Fresh from this journey, fired with enthusiasm for early Italian art, and full of the teachings of Mr. Ruskin—of whom he remained always a devoted student and admirer, adding to this of late years the privilege of personal friendship—he came to Birmingham in 1856, and settled in the town to practise as an architect. The choice was determined by the residence here of a relative, Mr. Chamberlain, formerly the head of the firm of Chamberlain, King & Jones, then recently established as Eld & Chamberlain. The first work he executed was a house for Mr. Eld, situated at the corner of Ampton and Carpenter Roads, Edgbaston. It was a bold and striking effort for a young man; the style, a modification of Lombardic Gothic, differed widely from anything that had been seen in the town, and the design evoked much criticism, and not a little hostility; for, in domestic architecture at least, Birmingham was then given over to what, for want of a better name, must be called the Rectangular style, the houses being mainly straight-sided boxes of brick or stone, with regular apertures for doors and windows. In the following year 1857, Messrs. Eld & Chamberlain commissioned him to build their busi-

ness house in Union Street; and here again he repeated and amplified the experiment begun at Edgbaston. Immediately after this period Mr. Chamberlain entered into a brief partnership with his lifelong friend, Mr. William Harris, but this being dissolved, he resumed practice on his own account. For a considerable time his prospects were not favourable—the town did not take kindly to architectural art, and but for commissions received from other places Mr. Chamberlain would have found it difficult to maintain his ground. Amongst other works executed at this period were a school-house at Uppingham, for Mr. Earle; another school at Leicester, for Mr. Franklin (his own old schoolmaster); the Hollings Memorial Column at Leicester—a singularly effective work; a picturesque engine-house and other buildings at the Monument Road station of the Birmingham Waterworks Company; and the Wesleyan Chapel in Essington Street. In 1859 Mr. Chamberlain made a most happy marriage; his wife being the daughter of the Rev. Mr. Abrahams, a minister in London of the denomination to which his father had belonged. About the same time he attracted the notice and the friendship of the late Lord Lyttelton, for whom he executed various works. But the practice of his profession seemed to afford such a remote prospect of success that he was slowly forced to the conclusion of abandoning it, so far as Birmingham was concerned. In 1864 this design was almost matured. Through Lord Lyttelton's intervention an opening offered itself in the colony of New Zealand, where a cathedral, actively promoted by Lord Lyttelton, was to be erected at Christ Church. To the deep regret of those who recognised his genius as an artist, and who had learned to value his friendship, Mr. Chamberlain was on the eve of accepting the proposal above-mentioned, and of emigrating to New Zealand, when a change took place in his plans, which happily kept him in Birmingham. Through the intervention of friends a partnership was arranged between him and Mr. William Martin, then an architect in established practice, and who had much work in hand for the Corporation, and for other public bodies. This partnership, to last for twenty years, began on April 13, 1864, and has, consequently, nearly run its full course. It was a happy arrangement, for no two men so intimately associated could have worked together with greater harmony, or with fuller advantage to their clients, for while Mr. Martin was singularly gifted with skill in planning and construction, Mr. Chamberlain brought to the new firm the highest faculty of design and a marvellous fertility in beauty and variety of decoration.

It is almost impossible, within reasonable space, to record the buildings with which, in conjunction with his partner, Mr. Chamberlain has adorned Birmingham within this period of twenty years; and if these were examined in detail, and their characteristic merits adequately described, a volume would scarcely suffice. Amongst the most important must be placed the extension of the Institute Buildings, in Paradise Street, and the reconstruction and extension of the Free Libraries in Edmund Street—both of them singularly noble in their mass, and exquisitely beautiful in their details, alike of form and colour. Of the interior decorations of both edifices there is no need for us to speak; they are acknowledged by all who see them to be masterpieces of art. Another group of buildings of remarkable beauty and nobility consists of the out-patient halls of the Queen's Hospital, the Children's Hospital, and the Women's Hospital; and nearly opposite the last-named of these, in the Priory, is another singularly charming structure, the Fire Brigade Station. In a third group may be placed the numerous buildings erected for the Waterworks Department, both in Birmingham and at the great reservoirs at Whitacre. Here, in a remarkable degree, Mr. Chamberlain showed how beauty and utility may be combined; and, given the taste of the artist united with the skill of the constructor, how easy and how admirable it is to render attractive edifices which are usually characterised by heaviness and ugliness! Yet a fourth group is to be found in the examples of domestic and business architecture which bear the impress of Mr. Chamberlain's genius—such, for instance, among the former, as Mr. Joseph Chamberlain's house at Highbury, Mr. Deykin's in Somerset Road, Mr. J. A. Kenrick's at Berrow Court, the additions to Mr. Jaffray's house at Park Grove, the decorations of Mr. William Kenrick's house at Harborne, and last, but not least, the graceful building erected by the architect for his own residence in Somerset Road; and among the latter the stately line of business edifices which distinguish Corporation Street—for illustration, Messrs. Marris & Norton's, that exquisite gem (Mr. Avery's) at the corner of Bull Street, Mr. Daniell's premises, the Household Stores, and others. To the same class—a very noble specimen of it—belongs Messrs. Kenrick's showrooms and offices at West Bromwich. This, however, is but a skeleton list of the works in which Mr. Chamberlain had so large a share, and in which most of the decorative details were drawn by his own hand. Amongst the others may be mentioned several of the police stations in Birmingham, the admirable new baths in Monument Road, the Rubery Hill Lunatic Asylum, the free library, Constitution Hill, the dispensary at Nechells, several churches, such as St. David's, the church at Selly Hill, that at Franche, near Kidderminster; and in works of decorative art, the Chamberlain memorial, and the canopy to the Dawson statue. Finally, for we must close the long and noble catalogue, come the thirty Board schools, begun in

1871, and even now incomplete. These, if they stood alone, would form an enduring and a worthy memorial of Mr. Chamberlain's genius; they constitute a distinction of which no other town in England can boast. There is yet one more work to be mentioned—the design for the new school of art; it bears the last touches of the master's hand; and at the time of his death he was looking forward eagerly to the time when the foundation-stone should be laid. We are reluctant to leave this part of our subject without some remarks upon the marvellous fertility of Mr. Chamberlain's genius in the style of architecture which he had marked out as his own—his mastery of picturesque form; his exquisite sense of colour, in its fulness as in its delicacy; his remarkable power of conceiving and executing detailed ornament; his bold and skilful use of new or revived materials, such, for example, as terra-cotta and decorative tiles. Something, too, should be said of his admirable skill in designing stained glass, metal-work in iron and brass, and domestic furniture. In all these respects he was a master; it is hard to say in which he most excelled. Indeed, in work so infinitely varied, yet in quality so equal in its variety, he recalled the great Mediæval artists, to whom all arts of construction, design, and ornament were familiar, and who stamped alike upon mass and detail the unity derivable only from individual character and original genius.

But space warns us that from the artist we must turn to the citizen; and here, as in his professional work, it is not one man we have to portray, but many. Had he done less, Mr. Chamberlain might still have been spared to us. He had learned, however, to apply the injunction, "what thy hand findeth to do, do it with thy might"; and his hand found so much to do, that none could do so well, as to leave him no leisure for repose; and the strenuousness with which he did it gave him no chance of conserving or recreating vital energy. There is hardly a department of our Birmingham life in which, for nearly thirty years, we fail to find traces of him, and of late years there is scarcely one in which he failed to hold a place so prominent that he seemed to be indispensable. Yet this was from no seeking of his own. While he undertook a vast amount of public work, in addition to his professional labours, he never sought it. No man ever was more careful not to force his way to the front. The work came to him because he was felt to be the best man for it; and when it came, he did it, at whatever cost to himself. This was especially so in the great labour of his public life—the Midland Institute. When, in October 1864, he was elected on the council he declined the honour, but being chosen by the governors in January of 1857, he accepted the position as an important trust, and in the following year he consented to become the honorary secretary to the council, and this office he held without interruption to the day of his lamented death; his last service, indeed, being rendered in connection with it. One fact expresses and emphasises his work. When he undertook the management of the institute there were only a few hundred students. Thanks mainly to his energy, his devoted thought, his incessant labour in developing the classes, there are now over 4,000 students. It is the same with the subscribers; there were 600 when he took office; there are now nearly 2,000. It is the same again with the lectures; he raised these from a condition of decay and of indifference to one of excellence, which has no parallel in the history of such institutions throughout the three kingdoms. In regard to the school of art, his labours were not less eminent there than those in connection with the institute. He was appointed chairman of the committee in February 1874, and from that date to this the school, under his fostering care, has steadily and rapidly advanced in magnitude and influence. The Society of Artists was another organisation which engaged his peculiar care. He was elected a member in March 1861, and was appointed professor of architecture: and on the resignation of Mr. Hollins in 1879 he was elected vice-president. In all these capacities he rendered services of the highest value not only to the society itself, but to the whole community, by his admirable lectures as professor. These were the leading institutions in which Mr. Chamberlain was the leader and the mainstay of those who worked with him. But there were others which must be added to the list. For some years, while the Arts Department of the Queen's College was in existence, he was professor of architecture here; he was one of the founders and (with his friend Mr. Samuel Timmins) was the hon. secretary of the Shakespeare Memorial Library; for some years he sat on the committee of the Old Library, in Union Street; he was an original member of the Shakespeare Club, founded by his most intimate and beloved friend, Mr. George Dawson; he was chosen by Mr. Ruskin one of the trustees of the St. George's Guild; and finally, in 1880, on the joint recommendation of the magistrates and the town council, he was nominated one of the justices of the borough.

---

**The Boys' Public High School Company of London** have selected the designs prepared by Messrs. Oliver & Leeson, of Newcastle-on-Tyne, and submitted by them in competition for the Company's first new school, which it is proposed should be built forthwith upon a site already secured at Westoe, near South Shields,

## NOTES AND COMMENTS.

THE Dublin Royal Institute of Architects has suddenly discovered that the sum mentioned in the instructions for the proposed museum is inadequate to produce a building worthy of the purpose. How much should be advanced is not stated. Considering that Kildare Street, where the museum is to be located, is not one of the principal streets in the city, and that the building will generally be visited at night by art students and craftsmen, the sum of 110,000*l.* is more suggestive of liberality than stinginess, especially when it is known that the decoration and furnishing of the museum and library will entail further expenditure under a new grant. The people of Edinburgh have somehow contrived to make profitable use of a museum that has cost the country a smaller sum. The objections that are raised against the arrangements will of course embarrass architects in England who are disposed to take part in the competition. They find the societies that are to use the building professing to be dissatisfied with the division of the space, their brethren in Dublin say the building is an impossibility unless there is an undefined amount of money forthcoming, and the Dublin newspapers, which create what is called public opinion in Ireland, are preparing the way for indignation meetings when the designs arrive in Dublin. Encouraged by their success in the first competition, when they monopolised the prizes, English architects might be indifferent to local agitation, but they cannot forget that the Government once succumbed to clamour, and may do so again. In fact, it may be said that the Irish genius for perplexing things has prevailed, and has added new risks to the competition system.

THE Dublin architects also consider "that the late competition was not satisfactory in the matter of an independent architectural assessor not having been engaged, as in other late important competitions; and that the result cannot be satisfactory to architects under the arrangements proposed as intimated in Mr. COURTNEY's letter of June 26, 1883." But for an architectural assessor there could be no better man than Mr. McCURDY, who was one of the five Irishmen who selected the designs in the last competition. His practice extends back for a great many years, and thus he should be more qualified than a stranger to understand what is and what is not suited for Dublin. Sir ROBERT KANE, who was another member of the Irish committee, has been teaching in museums and superintending them for nearly half a century. Would an architectural assessor from England have been more likely to select Irish designs? It is also forgotten by the Dublin Institute that architectural assessors do not always give general satisfaction. There has been much grumbling at the awards in Glasgow, Birkenhead, Birmingham, Newcastle-on-Tyne, Hawick, and other places, where there were no committees of selection.

MR. JOHN HENRY CHAMBERLAIN, who died on Monday night, was well fitted to hold authority in Birmingham. He was a Liberal of the Liberals, and was never more happy than when engaged in political meetings. His eloquence was remarkable, even in Birmingham, which abounds in good speakers. When the subject was related to art he was without a rival. Mr. CHAMBERLAIN had a good presence, a sympathetic manner, and a voice which was expressive of conviction. He had studied and travelled, and, more important still, he practised art. With so many qualifications, it is not surprising that his discourses always attracted crowds. He spoke without manuscripts, and he once told us that he avoided written speeches. Mr. CHAMBERLAIN was regarded as an almost infallible authority on art. His power was seen in such a case as the fiasco of the DAWSON statue. At the meeting he was able to control the aggrieved subscribers—a feat which no other man in Birmingham could have accomplished. Mr. CHAMBERLAIN was enthusiastic for the promotion of art in connection with the Midland Institute. He was the delight of students, and he retained himself much of the student's manner. This was the more remarkable as he had once been a college professor. The master whom he held in most esteem was Mr. RUSKIN, and his work often shows the influence of "The Seven Lamps." In private life Mr. CHAMBERLAIN's charming grace and good humour was almost enough to overcome any one who might

be envious of his success in monopolising the new buildings of Birmingham.

PROFESSOR JORDAN, the Director of the Russian Imperial Academy of Arts, died lately in St. Petersburg, at the age of eighty-three. He had a reputation as an engraver. A copperplate of *Mercury Imposing Sleep on Argus* received the smaller gold medal of the St. Petersburg Academy in 1824, and the engraving of *The Dying Abel* received the larger gold medal. JORDAN was then sent to Paris to prosecute his studies. On the outbreak of the revolution of July he was ordered to London, where he continued to work under RAIMBACH's direction on a copperplate of RAPHAEL's *Holy Family* (in the Louvre), which he had begun in Paris. In 1835 he went to Bologna, and thence to Rome, where he came under the influence of BRÜLLOW, at whose suggestion he undertook to engrave RAPHAEL's *Transfiguration* in the Vatican Gallery. This cost him eleven hours' work daily during eighteen months. JORDAN, like some other artists, thought he might settle down in Rome, and he became a domiciled citizen. But in 1850 he returned to St. Petersburg, where he was at once made Professor at the Academy. Three years later he went back to Italy, settling at Florence, but in 1855 he was recalled, and made Professor of Engraving at St. Petersburg, and Conservator of the Engravings Section of the Collection at the Hermitage. In 1870 he was appointed Rector of the Academy. Only a month before his death he was engaged on some portraits, which he has left unfinished.

MR. CHARLES ROWLEY, jun., has been reading a paper at the Manchester Literary Club entitled "A few more Noticeable Pictures in the Art Gallery Exhibition." Mr. ROWLEY, after commenting on works by GÉRÔME and other noted painters, fell foul of Mr. J. D. LINTON's *Admonition*. Although full of the finest work, according to Mr. ROWLEY, it is most provoking. In spite of technical excellence, it never touches the heart. You do not know what it is all about, and are so absorbed in the beauty of the work that you do not care. Some might regard that as a triumph, but there can be no vitality in art or literature except they have something to say, no matter how perfect the form may be. Even in such noble handiwork as this the absence of dramatic force, of motive, points to artistic decay, and not to life. Sir FREDERICK LEIGHTON when asked to design a picture to be called *The Arts of War*, has given us not a drama from the teeming life of Florence, but a group of Florentines doing nothing in particular, but everything in general that can be done with swords, banners, armour, and the rest. These things, he maintained, tend to substantiate the charge that we moderns in England have no idealism. Mr. ROWLEY evidently is an admirer of that class of art which corresponds with Transpontine dramas of the old school, where there is an unlimited amount of action and plenty of fighting.

SOME of the country members of the British Archæological Association have been visiting some of the buildings connected with lawyers in London. At the Record Office several of the national treasures were displayed to them, including "Domesday Book;" the Privy Seal Grant, temp. RICHARD II.; the Treaty of Castile, between ALFONSO and HENRY III. (having a massive gold seal appended to it); the final Treaty between HENRY VIII. and FRANCIS I., relating to the Field of the Cloth of Gold; and the Pope's famous Bull in gold, from CLEMENT VII., according to HENRY VIII. the title of "Defender of the Faith." The Rolls Chapel was visited in order to see the splendid monument of Dr. YOUNG, by TORREGIANO. It was described by the late Sir DIGBY WYATT in a paper read at the Institute of Architects, and is much less known than it deserves, being one of the best examples of Renaissance art in England. The Temple Church, Middle Temple Hall, the Chapel Royal, and the Roman Bath in Strand Lane were afterwards seen.

MR. EDWIN LONG, R.A., has completed his large work *The Flight into Egypt*, and on Sunday last it was on view at the artist's studio. It will shortly be transferred to Messrs. FAIRLESS & BEEFORTH's gallery, for which it was painted. There will then be opportunity to compare modern English and French treatment of religious subjects.

WE publish this week views of the new building in Brussels, which was designed by the late M. POELAERT. A description of it appears on page 250. The following table will explain the numbers on the plans:—

LOWER GROUND FLOOR.		PRINCIPAL FLOOR.	
COUR MILITAIRE.		TRIBUNAL DE COMMERCE.	
1 Chamber for consulting	14 Prisoners' staircases	1 Antechamber	16A Physicians
2 President	15 Water-closet	2 Consultations	
3 Antechamber		3 President	
4 Secretary		4 Vice-President	
5 Deputy		5 Witnesses, &c.	
6 Auditor-General		6 Registrar	
7 Auditor		7	
8 Registrar		8 Meeting-room	
9 Clerks		9 Bankruptcy	
10 Library		10 Messenger	
11 Evidence for prosecution		11 Robing-room	
12 " " prisoner		12 Water-closet	
13 Accused		COUR DE CASSATION.	17 Antechamber
14 Ushers		13 Antechamber	
15 Robing-room		14 Consultation-room	
16 Water-closet		15 First President	
		16 Antechamber	
		17 Procureur-Général	
		18 Antechamber	
		19 Advocate-General	
		20 Library	
		21 Secretary	
		22 Employés	
		23 Chief Registrar	
		24 Clerks	
		25	
		26 Ushers	
		27 Messenger	
		28 Robing-room	
		AVOCATS.	
		29 Meeting-room and library	
		30	
		31 Antechamber	
		32 Clerks	
		32A Water-closet	
		REGISTRAR.	
		33 Registrar	
		34 Clerks	
		35	
		36 Messenger	
		37 Consultation	
		COUR D'APPEL.	
		38 First President	
		39 Antechamber (public)	
		40 " (ushers)	
		CHAMBRE I.	
		41 Antechamber	
		42 Consultation	
		43 President	
		44 Antechamber	
		45 Prosecution	
		46 Robing-room	
		47 Water-closet	
		CHAMBRE II.	
		48 Antechamber	
		49 Consultation	
		50 President	
		51 Antechamber	
		52 Judges' chamber	
		53 Antechamber	
		54 Offices	
		55	
		56	
		57 Staircases	
		CHAMBRE III.	
		48 Antechamber	
		49 Counsel	
		50 President	
		51 Antechamber	
		52 Judges' chamber	
		53 Antechamber

		55	
		56	
		57 Staircases	
		CHAMBRE IV.	
		58 Antechamber	
		59 Counsel	
		60 President	
		61 Prosecutor	
		62 Registrar	
		63 Antechamber	
		64 Clerks	
		64A Summoning officers	
		65	
		66 Robing-room	
		67 Water-closet	
		CHAMBRE V.	
		68 Offices	
		69	
		70	
		71	
		72	
		CHAMBRE VI.	
		73 Antechamber	
		73A Consulting-room	
		74 President	
		75 Antechamber	
		76 Prosecutor	
		77 Robing-room	
		78 Witnesses	

Mr. Reynolds Rowe has purchased a central site in Cambridge, upon which he intends to build and endow a large free and open church, dedicated to St. John of Jerusalem. The scheme includes an infirmary for the use of members of the University, a training-school and home for nurses ready for engagement in private houses, and an ambulance centre for instruction.

The Rose Window of Lerwick Town Hall is to be filled with stained glass, and a design having been prepared showing the arms of all the ancient Norse provinces in the various circles, the chief magistrate of the county of Bergen, Norway, has intimated his desire that five of the circles in the window should be reserved for stained-glass shields to be presented by Bergen. No other window now remains to be filled.

## THE NATIONAL GALLERY.

THE passing of the National Gallery Loan Act in the last session of Parliament has been followed, says the *Times*, by considerable alterations in the arrangement of the Gallery. The Act, it will be remembered, gives power to the trustees, under certain limitations, to lend pictures to provincial museums, it being understood that the pictures so lent will be confined to the English school. During the last two months Mr. Burton has been busily engaged in carrying out the preliminary steps for taking full advantage of the Act. That is to say, he has been removing from the walls such English pictures as he proposes to lend, together with a number of others, which, if the truth must be told, are not worth wall-space, either in the National Gallery or anywhere else. The very ample Turner collection has not yet been touched, but it is felt that a considerable number of the works of this great master can be spared, and probably they will be transferred to new quarters within a short time.

It was found that the space thus gained would, by careful management, give just one room to be filled, and the question then arose, what rearrangement would be most effective. Mr. Burton has decided upon moving the Peel collection bodily from the lofty corridor, where it lately hung, to one of the rooms in the old part of the building, which it exactly fills, and where there can be no doubt that it is much better seen. The corridor in question is now filled with large and important Italian pictures, many of them recent acquisitions that have been till now hung on screens in and about the long gallery. The great *Assumption*, by Botticelli, purchased at the Hamilton sale, occupies the centre of the right-hand wall, being faced by the large picture of Ercole di Giulio Grande, while the two magnificent Signorellis, one of them the Hamilton picture and one lately bought in Italy, hang on either side of the doorway. Comparatively little alteration has been effected in the long gallery itself, except by the removal of these pictures. The screens still remain, though, as they are at present hung with smaller paintings, they do not seem, as they did a few months ago, to stand in the visitor's way and mar his enjoyment of the pictures on the walls. The chief actual addition to this room is Veronese's beautiful *St. Helena*, which has been transferred from its old quarters to its natural position among the principal Venetian pictures. The removal of this and one or two other paintings has enabled the director to devote the first room of Mr. Barry's new building exclusively to Spanish pictures, of which the gallery is now seen to possess examples which are not only fairly numerous, but are of great artistic interest. Among them is now to be seen for the first time the curious early Velasquez—if we are to accept the attribution—lately presented to the nation by Sir John Savile Lumley. This picture, which is sometimes called *The Institution of Prayer*, represents a child led by an angel to the scourged Christ; and, although the subject is no less painful than that of the majority of Spanish religious pictures, there is no denying its power. It must be added that the great Tintoretto, *Christ Washing the Disciples' Feet*, which Mr. Burton so cleverly managed to acquire at the Hamilton sale, has now been brilliantly restored, and hangs in the next vestibule above the *Bacchus and Ariadne* of Titian. It is much to be regretted that space could not be found for this most noble picture on the line. There seems, indeed, to be a fate which forbids the world to see Tintoretto well. His best pictures at Venice are in a building, the Scuola di San Rocco, where one has to judge by faith rather than by sight; and, now that we at last have a fine example in the National Gallery, it has been found necessary to hang it so high that no one can fairly examine or enjoy it. Let us hope that when the Government has made the contemplated additions to the building, which we have long ago described, a worthy place will be found for this masterpiece.

The construction of the building makes a really scientific classification of the pictures according to their schools an impossibility, and Mr. Burton has perforce to content himself with something short of an ideal arrangement. Little by little, however, he is succeeding in bringing order into the collection. Thus the early Italians have now two rooms to themselves; the Florentine and other mid-Italian masters are grouped on one wall of the long room; and the Venetians come fairly together on the opposite side. The most precious pictures in the gallery form a little *salon carré*, or tribune of their own, in which, by the way, the new Antonello da Messina is by no means the least important object. Most of the early Flemish pictures hang together in the small gallery above the staircase, the room having been lately enriched by Antonio Moro's superb *Portrait of a Girl*. Considerable readjustment has also taken place among the English pictures which have been left, the works of separate masters having been brought together and some kind of chronological order having been attempted.

A Science School is to be established in Kidderminster. The mayor has been informed that if 1,000*l.* in addition to 460*l.* voted from the surplus of the Worcester Exhibition be subscribed, the funds for the erection of the building will be provided by a gentleman who withholds his name.

## EXOTIC ART.

ON Monday evening Mr. John Henry Chamberlain delivered a lecture before the members of the Midland Institute, at Birmingham, and by a sad fatality it was destined to be his last public address.

Mr. Chamberlain's subject was that of "Exotic Art," and in commencing he referred to the article by Mr. W. J. Stillman, upon "Characteristics of London," in the current number of the *Century Magazine*. The writer, condemning in no sparing terms the architectural features of the metropolis, said: "It is impossible to say that artistic feeling is exotic in England, not knowing with absolute certainty whether they were Englishmen who built the magnificent old cathedrals or not; but it does seem that, since the race was what it is, anything æsthetic is a chance flower, and of so rare occurrence that its exceptionality—its want of visible cause and effect in precedent or succession—proves the rule more clearly than though no example had ever been found." Had he a favourable opportunity, Mr. Chamberlain thought he might convince the author of that article that without doubt they were Englishmen who built the old cathedrals. He would be able to show him that at the time those buildings were erected the whole of England was covered more or less with artistic work, and that the whole of it was produced by Englishmen. He was, however, prepared to agree that, although it was not always so, art in England had been to a very great degree exotic for 300 years. They might begin the period of English art at 1050, when it was just beginning to bud. 1550 might be regarded as the central period—a period of change; and 1850 or 1851 was the period of another great change. He was inclined to think that the essayist in the *Century Magazine* was a little too sweeping—he was a little stronger ally than he quite relished. It was as though he (the lecturer) were hesitating as to what kindly words he could use to hint that someone else was a little vague in matters of account—that he did not quite know the difference between that which was his own property and that of others, and that a third person interposed and said, "Oh, the man's been a thief and a swindler, and ever since he was born." What did they mean by exotic art? An analogy was afforded in gardening by the culture of exotic plants. In introducing exotic plants, or foreign ornament—exotic ornament—what they endeavoured to do what was to endeavour to reproduce under entirely new conditions, the particular products formed by some other and differing conditions. They must do either one of two things; either the imports must be acclimatised, or must acclimatise themselves, or they must make artificial conditions to suit them. In gardening these artificial conditions could be furnished by means of glass houses, but they could not make artificial conditions of that kind with regard to art. They knew perfectly well that if they planted a tropical palm-tree in cold English clay it would not flourish, and they soon saw that it was dead. But with regard to art, the majority of them did not know this. They went along the streets of their cities, and they did not know death from life, although there abounded matters of art which were as dead as any tropical plant would be if planted in an English garden and left out for the winter. If he were to define what exotic art was he would have to give two or three different definitions. They might call it, if they pleased, "foreign art out of place," or "foreign art reproduced under false conditions." Perhaps the best definition would be the negative one—that it was art that could not possibly be evolved from the natural conditions of the country or the race using it. People were apt to think of art as a fashion, and to overlook that it was a form of life, and therefore a perfectly natural development depending upon the conditions of the country, and the people amongst whom and by whom the art was evolved. In illustration of this Mr. Chamberlain pointed out that an Englishman, if left to himself and not copying some other nation, would not build a pyramid or an obelisk, or design a building upon the lines of the Parthenon. Englishmen of themselves would never have built buildings like the British Museum or St. Paul's, or in Birmingham a church like St. Peter's in Dale End—never; neither would they have developed any of that exotic or foreign ornament which was to be seen all over England. He did not say with respect to some of this art that it was not beautiful. He simply said it was not English. In emphasising that art should possess a meaning to the artist and that it should produce joy to the beholder, Mr. Chamberlain traced upon the blackboard lines similar to the channelling upon stone to mark the regular blocks, together with the picking out of the surface, called rustication or vermiculating. "Does that," he asked, "impress you with any sense of light?—because art is to make you happy. Is anyone the happier for seeing that? And yet I suppose some millions have been spent in England during the last three hundred years in repeating forms like that upon the stone of public buildings." In considering how far the charge that English art was exotic extended, the lecturer excepted painting and sculpture; but as regarded the two remaining branches of architecture and decoration, he powerfully urged the importance of their being free from any trace of foreign art. He dated the decline which had taken place from the endeavours which succeeded the revolution against mediævalism to imitate both in literature and art the pattern of the ancients.

They became acquainted in this way with the "five orders," with pediments, and balustrades and urns, and with all the "properties" of the pagan dressing-room. These were as much properties as the costumes of an actor were when hanging in his dressing-room, for the reason that they were divorced from the life of the people who used them, and were brought into a country which had very little in common with that life or the necessities that guided it and made it what it was. They were brought here because they were admired, and because it was easy to import them. At last by the time they arrived at the year 1851, it might be said that art in England was practically dead. Nobody talked about it, and it was an unpopular subject. At this time, however, a change began in the revival of the English Gothic—a style which was not brought from a foreign soil, but which was fitted to the wants of the people, which appealed to their sympathies and satisfied their passions. This prepared the ground for the recognition of art and the care for it. The same period was the commencement of a new outburst of English activity, the evidence of which they saw all around them. New countries had been discovered, photography had come to their help, and as the result they had gained a much wider idea of art than formerly obtained. At the same time this very development had in many ways increased their exoticism, because when the examples of the art of many countries had been brought here everyone tried to copy them. The art treasures brought from other countries were very charming to have as possessions and to admire; but let them not think that by their means they could ever make real or living art for themselves. The remedy for the evil of which he complained lay in the recognition of the truth that all art was the expression of idea. It was like speech, if they had nothing to say they should not try; but if they had something to say in art, let them first see whether the idea was theirs or belonged to someone else, and then see whether they had adequate expression for it. If a man was an artist, Heaven had given him a faculty of expression, and this was the main difference between artists and other men. The artist's main idea—the one thing necessary from the smallest scholar to the greatest artist—was simply admiration. Having this admiration, they must try to use it honestly, without affectation, and in the way that was natural to them. If they found in exotic art the revelation of the ideas that were dear to them, let them use it by all means if they could find no other vehicle—only let them be sure that the forms they made to tell other people what they saw were forms which they enjoyed. To the musician the beauty of this world was shown through music, to the artist it was shown on his canvas, to the architect it ought to be shown in the stone with which he had to deal, and in the bricks which he might mould into the forms in which he willed them to appear; and the sculptor, instead of his art being dead, ought to be able to take up our common and ordinary life, and show us not only its variety, but also its grandeur, nobility, and poetry. He would conclude with a little bit of Mr. Tennyson, from which they might take pattern:—

And I must work thro' months of toil,  
And years of cultivation,  
Upon my proper patch of soil  
To grow my own plantation.  
I'll take the showers as they fall,  
I will not vex my bosom;  
Enough if at the end of all  
A little garden blossom.

In the votes of thanks at the close, moved by Councillor R. F. Martineau, and seconded by Mr. G. S. Mathews, the former, referring to the manner in which Mr. Chamberlain had carried out the lessons he taught, remarked that it might be said to those in that theatre that if they sought his monument let them look around them.

## THE ROMAN OCCUPATION OF BRITAIN.

IN the second of the present course of Rhind lectures the Rev. Dr. Collingwood Bruce continued his narrative of the Roman occupation of Britain, from the time when Vespasian assumed the purple. Early in this reign, he said, the limits of the Roman province, which in the time of Claudius had been marked by a line extending from Gloucester to Colchester, were advanced northward so as to be represented by a line extending from Chester to Lincoln. In the year A.D. 78 Agricola was appointed governor of Britain, and in this post he was continued by the two subsequent emperors, holding it in all for seven years. An account was given of this general's campaigns, and it was stated that he usually spent his winters in promoting the arts of peace, and securing in this way his conquests. He saw, the lecturer remarked, that there were many abuses in Britain to reform, and he reformed them. The taxes pressed heavily, but the extortions of the tax-gatherers were more odious and intolerable than the taxes themselves. These abuses Agricola remedied. He encouraged the people to build temples, courts of justice, and commodious dwelling-houses; he established a plan of education, encouraging the sons of the chiefs to acquire a knowledge of the Roman tongue. Roman apparel was recommended, and the toga became fashionable. As

regarded the progress of his conquests, Agricola, in his second year, seemed to have overrun that portion of England lying between a line drawn from the Dee to the Wash on the south, and one running between the Solway and the Tyne on the north. In his third campaign he carried his forces among new nations, and advanced northward as far as the estuary of the Tay; and it was not improbable that, before making this advance, he had grasped the throat of England by planting forts on the more important points of the isthmus between Tyne and Solway, where Hadrian afterwards built his wall. The progress made in the Caledonian campaigns was traced so far as the scanty materials available to the historian permit; and the lecturer dwelt at some length on the question that has arisen in regard to the site of the great pitched battle with Galgacus, the native general. This engagement, according to Tacitus, was fought at Mons Grampius. The most recent editor of the works of Tacitus said the word should be "Graupius"; but where, asked Dr. Bruce, was Graupius? Mr. Hill Burton informed them that the Grampian Hills got their name from this misreading in Tacitus' Life of Agricola. The name Grampian, Mr. Burton said, was no later than the revival of classical literature, and was adopted from Tacitus when his works came to be read by the chroniclers. It was unknown in old documents, and, indeed, achieved a place in geographical books long before it was sanctioned by local use. As to the locality indicated by the historian, Dr. Bruce quoted a variety of opinions, including those of writers who had placed it at Comrie, at Fortingall, and on the moor of Ardoch. He himself inclined to the view of Mr. Skene, which pointed to the peninsula formed by the river Islay with the Tay. Leaving Agricola's administration with the remark that with the close of Tacitus' life of that general our continuous information as to the history of the British province ended also, Dr. Bruce passed rapidly to Hadrian's visit, rendered necessary by the unsatisfactory state into which the affairs of the island had fallen. The sixth legion brought over by this emperor probably came, he remarked, to the Tyne. There was recently dredged from that river an altar dedicated to Neptune; as if the soldiers, after experiencing the perils and discomforts of the German Ocean, had been profoundly thankful once more to set foot on solid land, and so expressed their gratitude to the deity to whom they owed their preservation. After observing that for our knowledge of Hadrian's proceedings in Britain we were chiefly indebted to the spade of the excavator, Dr. Bruce said that, first of all, the emperor looked to the state of the roads by which his troops might at any time be rapidly moved. Mile-stones bearing his name were still in existence, two having been found within the last month or two; and it was he who built the wall across the lower isthmus, between the Tyne and the Solway. The campaigns of Lollius Urbicus, including the construction of the rampart known as Graham's Dyke, between the Firths of Forth and Clyde, were next touched upon; and the subsequent incidents of the Roman occupation passed in rapid review, down till the year 406, when the requirements of Rome rendered it necessary that the legionary troops should be withdrawn, and Britain was left in a miserable condition. The lecture was illustrated throughout by reference to Roman coins, of which numerous drawings and enlarged photographs were exhibited, and *apropos* of which the lecturer took occasion to commend the ancient practice of preserving in the coinage a pictorial history of passing events.

Dr. Bruce commenced his third lecture by noticing first that at the beginning of the fifth century the legionary forces were withdrawn from Britain to defend the capital, and that the Roman occupation then came to an end. The lecturer proceeded to ask the question, "What could have induced that people to interfere with us?" There could be little doubt that Cæsar was mainly animated by ambition in his invasion of our island, but Cæsar's ambition would not account for the costly expeditions of Claudius and Vespasian, Hadrian, and other emperors. They must have anticipated substantial advantages. The government of Rome, in the time of the emperors, must have been carried on at enormous expense, and the revenues for this purpose were chiefly derived from the provinces. Tacitus told them that "Britain contains, to reward the conqueror, mines of gold, silver, and other metals," and it was certain that mines of tin, copper, lead, and iron were extensively wrought by the Romans from the time of Claudius downwards. Corn was also exported. Another object the Romans had in view in adding new territories to their empire was to provide settlements for those of their soldiery who had completed their period of service. This was done in Britain, and farms were doled out to the veterans, which were no doubt wrought by the native population. On all hands taxes were levied to pay the expenses of the State. Britain could not have been a poor country during the time of the Roman occupation. The number of towns and cities, the populousness of some of these, the luxurious character of the villas which were from time to time brought to light by the spade of the excavator, the rich and tasteful ornaments which were found associated with the dust of the departed in their burial-grounds, all testified to the fact that the occupation of this island of cloud and fog and rain, of long nights and dreary winters, was not an act of pure generosity on the part of her civilisers. Depend upon it, they made it pay. After an enumeration of the visits paid to Britain by many noble Romans, Dr. Bruce next spoke of the writers

who had described the works that the Romans had left behind them. Chief among these were William Camden, the father of British archaeology, and author of the "Britannia" (1586); Alexander Gordon, whose book, the "Itinerarium Septentrionale," was published in 1726; William Stukely, who, unfortunately for his own reputation, introduced to English antiquaries as a genuine work the clever forgery entitled "De Situ Britannicæ, by Richard of Cirencester;" John Horsley, the author of the great work "Britannia Romana" (1732); the Rev. John Hodgson (1845), who wrote a history of Northumberland; and Robert Stuart, the author of "Caledonia Romana" (1845). Going on to refer to the Roman roads, camps, and walls in Britain, the lecturer remarked that it might seem strange that he gave roads the first place. He did so because the Romans knew their importance. Troops went all the more boldly forward when they knew that they had the means of bringing up supplies, and, if need should occur, of effecting a safe retreat. Occupying the whole civilised world, and some of the uncivilised, as their domain, Rome was under the necessity of having the means of readily communicating with every part of it. On looking at a map of Roman England, they could not but be struck at the complete network of roads which overspread the land, and doubtless many existed of which no trace could now be found. By way of showing how well ready access to the great centres of population was provided for, it was mentioned that seven roads were known to have branched off from London—though it was not then the capital; Wroxeter was the centre of five roads, and six started from Manchester. Scotland was not so well provided with roads as England; just because it was not so tightly held in hand. The Watling Street of the North of England was, however, brought into Scotland, and, passing the Eildon Hills, was continued to Cramond, at the eastern extremity of the Antonine Wall. A branch of this road, starting from near Corbridge, in Northumberland, was continued as far north as Berwick; the Maiden Way, coming from Kirkby-Thore, in Westmoreland, crossed the Roman wall at Carvoran, and then proceeded by way of Bewcastle into Scotland. How far it went was not known. On the western side of the island a military way proceeded from Carlisle, through Dumfries and Lanarkshire, to Dumbarton, at the western extremity of the Graham's Dyke. All these roads were carefully paved. That the structure of the Roman roads was considered to be something extraordinary by the mediæval inhabitants of the country was evident from the fact that they considered them to have been the work of wizards; and one of them—that from Corbridge to Berwick—was called the Devil's Causeway. There were resting-places for travellers at reasonable distances, and the roads were also provided with mile-stones, which were cylindrical in form, 2 feet in diameter, and stood above the ground 6 or 7 feet. They were usually inscribed with the name of the emperor in whose reign they were erected, and the number of miles that the spot was from the next station. The emperor was lord of the road, and any offence committed on it was an offence against Majesty. The same idea had descended to modern times, for they commonly talked of the king's or queen's highway, and an highway robbery was yet an aggravated offence. A Roman mile might roughly be stated at 7 English furlongs. Most of the Roman mile-stones in Britain had perished. Two, however, stood in the places where they were put by the Romans—one in Northumberland, the other in Westmoreland. About seventy others were to be found in museums. Two were in the museum in Edinburgh. How numerous were the cities and camps between which these roads afforded communication was evident from the frequency with which the names of places, even at the present day, ended in "caster" or "chester"—the Gothic form of *castrum*, and in "caer," the Celtic form of the same word. Besides that, many of the cities, such as York and Chester, bore to this hour the form of a Roman camp. In Scotland the remains of Roman towns were not nearly so well marked, or so numerous as in England. The earthen camps which were met with in many places were conceived on a grand and colossal scale, but they seemed to have been places only of temporary military occupation. A few places, however, had all the marks of having been occupied by colonists engaged in civil pursuits. On the eastern coast they had the town of Inveresk, where a Roman altar had been found, as well as the foundations of an extensive Roman building, and coins and vessels of Samian ware. It was not likely that the bold position of Edinburgh would be overlooked by the Romans; and the remains found in the city went far to strengthen the opinion that the Romans had a station there. At Cramond, at the base of the Eildon Hills—where was a fortified camp of some importance—at Paisley, and at Camelon there were likewise evidences of Roman occupation for other than military purposes; but none of them had the decided characteristics which marked the English towns. It was quite evident that the hold which the Romans had, even of that part of the country south of Graham's Dyke was very slight. Dr. Bruce, in conclusion, gave an interesting description of the wall or barrier, which crossed the lower isthmus of the island, from Wallsend-on-the-Tyne to Bowness-on-the-Solway, and which was 74 miles in length. It consisted, he said, of two principal parts—the *muris*, or stone wall, and the *vallum*, or earth wall, together with a military way and camps. The opinion at present generally entertained was that these works

formed parts of one great design, and that all were originally constructed by Hadrian (A.D. 120). On the supposition that the works formed one great design, the *murus* was probably intended as a defence against the north, and the *vallum* as a defence against the south, for although the tribes to the south had been subdued their fidelity could not be relied on. It was supposed that the wall was 12 feet high, with a battlement of four feet, and that it was 9 feet in thickness. The highest piece of it now standing was 9½ feet high. It was likely that the wall had been constructed by forced labour, and, if that was so, the Britons had no easy task. Stationary camps, or barracks for the soldiery who garrisoned the wall were provided at an average distance along it of about 4 miles, and in addition there were attached to it mile castles and turrets—the former of which, in all probability, had been intended to receive detachments of soldiers, and the other for sentries. The lecture was illustrated by views and ground plans of many of the buildings referred to.

### THE PARISIAN MODEL.

WHOEVER has sufficiently studied the Parisian artist would do well, says a correspondent of the *Standard*, to cast an eye on the Parisian model before the type has lost its ancient characteristics. Respectability has not yet quite planed and whittled the model to its own dull level, but the doom is approaching. He is no longer the eccentric personage of Théophile Gautier's art-essay, "pouring, like the *Moses* of Michael Angelo, a river of beard down a doubtful frock-coat; a fellow whose eye said, 'Admire me—I am Jehovah, Jupiter, the Scamander river; I am a doge, a hermit, a hangman.'" In days not so long ago one might see at the private views of the galleries, dressed with a certain pretentious slovenliness, women with Hebrew faces, whose busts disdain the aid of corset-maker, stopping before the Astartes, the Nymphs and Undines, and smiling at their own faces, happy to have lent their bodies for the creations of an artist's ideal. They were the models who took part in the quarrels of the schools, according to their Greek or Mediæval type:—

Classiques bien rasés, à la face vermeille,  
Romantiques au visage blêmi—

But these models hardly exist now in greater numbers than the painters costumed like Murillo and Vandyck, wearing Rubens' hat and the chemisette of Raphael. The pure-blooded model is disappearing from circulation, and such as are yet extant have only melancholy legends to recite concerning the decadence of their art—for art they hold it to be. Préault, the sculptor, was a great authority on models; the brothers De Goncourt consulted him when composing their elaborate artistic novel "*Manette Salomon*;" only Préault libelled the profession, having an exaggerated estimation of the superiority of other days. This period of degeneracy, however, contains its notable models in sufficiency—Lambert, for instance, who is a veritable fellow-worker with his painter, and will stiffen his muscles during three hours to give his *collaborateur* a correct attitude, and who will end his sitting aching in every limb for the love of art. A man called Leclerc is held invaluable by Paul Baudry. He can pose as man or woman, and divines the very attitude desired by inspiration. And this is by no means the only example of the model's imagination coming to the assistance of the artist's. When Henner was competing for the Prix de Rome, which he won with his *Death of Abel*, the little model allowed him in his lodge helped him with suggestions and encouragement. "If I were you," he advised, "I would put a cudgel there on the ground—that which has just killed Abel"—and in truth that little piece of realism gives the picture nearly all its originality. The models of the last generation were nearly all the counsellors of their employers—Duborg, who left a legacy to the most meritorious *débutant* of the year; Sinel, who was a "super" of the Odéon and the Théâtre Français, and wore the *peplum* like a Greek hero; Cadamour, whom Bauville has celebrated in rhymes rich as the traders who published them; Caroline l'Allemande, who was not only a model herself, but a keen-scented discoverer of models; Vuagnat, a clock-maker now, and formerly one of the special models of the Fine Art School, were public functionaries, earning eight hundred francs a year. The latter not only gave artistic counsel to the pupils, but also lectured them morally. "Work, young men, that is the only royal road. Never be turned away from it by vain amusement," &c. Vuagnat was the Hannibal, the Witikind, the Hercules, and the Girondin of Delaroche. Other old models are curiosity-shop keepers—there is a notable one in the Rue Drouot. Cot *fils*, who is *fils* still, albeit eighty at least, is a still more ancient celebrity. His father, a model before him, introduced him as a youngster into the studios of Girodet and David. He is an artist himself, and is said to have achieved some very presentable water-colour sketches. He knew the dignity of his art, and has declared, "I don't frequent people who paint *genre* pieces." When Benjamin Ulmann produced his picture, *Prussians Pillaging a Farm*, Cot refused to know him. Such a derogation from a former Prix de Rome was too great.

In Cot's time the classic model earned three francs an hour;

but the amateurs stepped in with their plethoric purses, and straightway the market price rose to five francs for men and ten francs for women. The exactions, the affectations, have increased in like proportion. Many models decline to sit for less than a day, and some insist that a cab shall be sent for them. The model De Nittis, engaged for his *Frileuses*—the Bois de Boulogne skating scene—required chocolate and Turkish tobacco. The little Italian models come from the Abruzzi and the Basilicate; you may see them, melancholy as the Cervarolles of Hébert, playing their eternal *morra* in dark taverns at the foot of the Buttes-Montmartre or the Mont St.-Geneviève. They are not ranked high in the model scale. Every organ-grinder and hurdy-gurdy boy is a model at certain moments. The market is overstocked. There are families of them, like that of Giovannina, whose brother Bernardino was the original of Degeorge's admirable *Bernardino Cenci*, which is now at the Luxembourg. The military model is a curious variety of the species. He is nearly always an old Guardsman, whom you see in Prussian uniform before Detaille, in the red trousers of the Line facing De Neuville. He is clean and honest and punctual, as a rule; but art is not his strong point, and his tobacco is strong indeed. A number of models exercise several industries. Henri, the Communal colonel, was the original of ever so many colonels on canvas before he became one in reality; Saint-Denis, who poses for the Parisian, rough or exquisite, is a house-painter in summer. There is a *concierge* model; and there are several Jewesses, who sell lace and cheap trinkets when no painter needs their mute and motionless services. The Jewesses have occupied a conspicuous place among the models since the *grisette* went out with Vernet and Géricault. They came in after the taking of Algiers. They were everywhere—with Ingres, with Delacroix, with Horace Vernet; they were the Muses of the modish Orientalism of the moment—intelligent, graceful, and rapacious as harpies. They identified themselves with "their" master; said, "We have a first medal," or "The jury has behaved with infamous injustice towards us"; and, in fine, they became, in their own artistic circles, almost as famous as the pictures in which their effigies appeared. The girl who posed for Gérôme's *Phryne* was known as "Phryne" to the end of her life.

The social steps by which one descends to an artist's platform are not difficult to describe. The men, with a consciousness of a fine face and figure, with no trade, and no desire to learn one, are caught at a chance hostility over a glass of "blue" wine, and adopt the profession as the most democratic royal road to doing nothing. Give them their pipe, when the painter is receiving visits or washing his hands, their five francs at the end of a *séance*, often curtailed by caprice or lassitude, and they are happier than their class-mates—the mason with his trowel, the iron-worker with his hammer. For the women the profession is a safeguard—it saves them from worse professions; and the pride they take in it is at times ludicrous, if indicative at the same time of respectably honest principles. There are girls who boast that they only sit for their hands, and others who only condescend to represent ladies of title, and "only to M. Heilbuth *encore*!" The failures of the Conservatoire are a rich source for the artist *querens quem devoret*. The little theatres exhausted, hard lines at home, the softer lines they suggest to the painter of pleasant and piquant Paris visions are too easily sold to be kept long out of the market. And then one profession does not prevent the other. You may be a pretty actress and a pretty model at the same time. The Republic is not yet Draconian, and has not prohibited that cumulation of functions—art in the studio and art in the green-room. Marthe Miette, one of the liveliest soubrettes of the Palais Royal, has been one of the liveliest models in a dozen Paris studios; and Mlle. Meyer, who "created" the "Vénus de Gordes" at the Ambigu, was a famous representative of the highborn lady in many a studio where ladies have never ventured, and gentlemen rarely. A Vaudeville actress gave M. Gervex his wonderful head asleep in his scene from De Musset's "Rolla." These are nearly always models *con amore*; they respect the art that perpetuates their beauty. Let a stranger enter the studio where they are posing, it is a brief good-bye; and the painter sees them no more.

The life of the old model, the Jupiter maimed by rheumatism, the Juno with chilblains and a snuff-box—that is a story of realistic melancholy that only Balzac could fitly render. Such as have found it impossible to establish themselves, who have remained the utter Bohemians their calling almost compels them to be, these are the dread and horror of the studios where they may have been employed, the nuisance of the artistic taverns and *brasseries*, where they earn their absinthe by anecdotic garrulity. Most of them are literally supported by the alms of old patrons and the occasional gratuities of young neophytes, who gather from them many a trait of an old master whereof the outer world knew nothing—traits of character and trickeries of execution. The master is not by any means a hero to his model. They will tell you frankly that Ingres was hard, rude, violent, and treated his models like dogs. Delacroix was gentle and suave as a woman; Delaroche elaborately polite. He asked a man who sat for the *Passage des Alpes* to change his attitude, with the prefix of "Mille pardons, Monsieur." Gérôme has also the reputation of a bland master; but Tassaert is the favourite. Tassaert gives you wine, and jokes with you. Horace Vernet was even more amiable; he

had a collection of military witticisms at the tip of a ready tongue, and the laughter he is said to have inspired must have rendered his models excellent studies in epilepsy. Pradier, the sculptor, had the same happy temperament, and sang and chattered like a bird while he worked like a giant. Now, they will all tell you the model is simply an article of commerce. The relations between him and his hirer are simple—those which link the bought and the buyer. Gustave Doré had the old frank friendliness with his models; but then he had—he needed—so few. The Bonnats, the Bouguereaus, the Carolus Durans are rigid gentlemen, who have their models paid by their valets, and scarcely open their lips during a *séance*. True, they sell a picture for fifty thousand francs; while Heim sold one that contained sixty-six figures for three thousand. Putting the artistic value aside—and Heim was not disgracefully inferior to any one of the artists named—look at the cost of the models! No wonder the groups you may see expectant in the Place Clichy have a harder and more pragmatic look than their predecessors. The salt has almost gone from out their lives; they can only fraternise with the beginners and the failures, who are, like themselves, the supernumeraries of art.

### EDINBURGH UNIVERSITY BUILDINGS.

**D**URING the summer vacation important alterations have been effected in the south-east quarter of the Old University Buildings. A new senate hall, ante-room, retiring-room, and vestibule have been formed in the space formerly occupied as the librarian's house, while the old senate hall, with its ante-room, has been converted into a public office and secretary's office; the rooms hitherto used for those purposes, together with the basement and upper storeys of the librarian's house, being thus rendered available for the greatly increased requirements of the library. The entrance to the senate hall is by a doorway in the middle of the south-east quadrant of the courtyard, where a Doric doorpiece has been introduced, and the internal walls pierced with wide archways, admitting ample light to the inner vestibule, from which a wide and well-lighted passage leads to the hall. The senate hall proper is 36 feet long, 24 feet wide, and 18 feet high, the ante-room being divided from it by a screen with Ionic columns and wide sliding-doors, admitting of the two apartments being thrown into one, measuring 48 feet in length. An ornamental cornice in keeping with the columns runs round the room. Above it is a curved coving with moulded ribs, which are continued across the ceiling, dividing it into panels, two of which are furnished with ventilating gas pendants. The alterations, which have been carried out at the cost of 1,200*l.* to 1,300*l.*, and which included the removal of some very strong walls and the introduction of massive iron beams, have been carried out under the direction of Mr. Morham, city architect, by Messrs. Wm. Beattie & Son, the decorative painting being executed by Mr. Andrew Muirhead. It should be mentioned that an important feature in the senate hall is the chimneypiece, which is of white marble, the frieze being decorated with a mythological subject, the figures of which are admirably grouped and finely modelled in high relief. This frieze has been in the possession of the Senatus of the University for a long period, and we understand that an offer of a large sum of money for it was recently refused. The jambs consist of terminal figures, the whole being surmounted by a richly-moulded cornice. The walls of the hall are decorated with numerous portraits—several of them being by Raeburn—of former principals and professors of the University.

### THE NEW PATENT LAW.

**W**ITH the object of affording information to the public until the new rules under the Act are completed the following information is issued by direction of the Board of Trade:—

"1. Applications and all other documents will be required upon strong, wide-ruled foolscap paper (written or printed on one side only), having a margin of 2 inches on the left-hand part thereof. The use of parchment will be discontinued. Copies of specifications will no longer be required.

"2. The sizes of the drawings will remain unchanged, but they will be required upon drawing-paper instead of on parchment. A copy of the drawings will be required upon thin Bristol board.

"3. Forms of application (stamped) will be placed on sale at the chief post-offices in the United Kingdom.

"4. The forms required for an application will be—(a) for provisional protection—application form and form of provisional specification; (b) for complete protection—application form and form of complete specification. Where a complete specification is not left in the first instance, it may be left at any time within nine months after application for provisional protection.

"5. The fees will be 1*l.* for each stamped form of application and 3*l.* for each stamped form of complete specification. No fee will be charged for the form of provisional specification.

"6. Applications may be left at the Patent Office or sent by post. If sent by post, they must be addressed to the Contrôller, Patent Office.

"7. The 'declaration' in the application form must be made by the inventor or inventors. All other documents may be prepared and signed by agents.

"Note.—'Applications' for letters patent made during the present year must be proceeded with in accordance with the existing laws and rules."

### ARCHÆOLOGY.

**A Lost City of Mexico.**—Ancient ruins, which surpass anything of the kind yet discovered on the American continent, have been found in Sonora, about four leagues south-east of Magdalena, Mexico. There is one pyramid which has a base of 4,350 feet, and rises to a height of 750 feet. It has a winding roadway from the bottom leading by an easy grade to the top, wide enough for carriages to pass over, which is many miles in length. The outer walls of the roadway are laid in solid masonry from huge blocks of granite in rubble, and the circles are as uniform and the grade as regular as could be made at this date by the best engineers. To the east of the pyramid a short distance is a small mountain about the same size, and rising to about the same height. On the sides of this mountain a people of an unknown age have cut hundreds upon hundreds of rooms, from 5 by 10 to 16 or 18 feet square. These rooms are cut out of solid stone, and so even and true are the walls, floor, and ceiling, so plumb and level, as to defy variation. There are no windows to the rooms, and but one entrance, which is always from the top. The rooms are 8 feet high from floor to ceiling. On the walls are numerous hieroglyphics and representations of human forms, with feet and hands of human beings cut in the stone in different places. Stone implements of every description are to be found in great numbers in and about the rooms.

### CHURCH BUILDING AND RESTORATION.

**Bilston.**—The parish church of St. Leonard's has been reopened after restoration. Upon the exterior 1,777*l.* have been spent, which was voted by the town out of the 3,000 guineas received from the late Mr. Edwin Pugh for the sale of the advowson. This work, which has been carried out by Messrs. Higham, of Wolverhampton, has consisted in the complete recasing of the church in cement, the rebuilding of the tower in stone, restoration of the approaches, &c. The interior renovations have been defrayed out of a special fund raised for the purpose, and have been under the direction of Mr. Ewan Christian. The reseating of the floor and the new galleries are the work of Messrs. Lynex, of Walsall.

**Keighley.**—The corner-stones of a new church proposed to be built in Park Lane, Keighley, have been laid. The church will be dedicated to St. Paul. It will accommodate 500 worshippers, and also serve the purpose of a Sunday-school. The estimated cost is about 2,000*l.*, exclusive of site, which is the gift of the Duke of Devonshire. Mr. J. B. Bailey, Keighley, is the architect.

**Twyford.**—The church of St. Mary has been reopened on completion of structural extensions. The church was erected in 1847 from designs by the late Mr. Benjamin Ferrey, F.S.A., in a style based on the Early English, consisting of nave, chancel, south aisle with lean-to roof, small vestry, and an open oak porch. The church has been enlarged by the addition of a north aisle and a new vestry and organ chamber, under one roof, on the south side of the chancel. The roof to the new aisle is open and of English oak, plastered between the rafters, nearly corresponding with the existing work. The new benches are of English oak, of similar design to the old ones, on a boarded floor. The contractor was Mr. Weyman, of Henley-on-Thames, who has carried out the work from the designs and under the superintendence of Mr. B. Edmund Ferrey, F.S.A., of Spring Gardens, London. The clerk of the works was Mr. George Chinnock.

**South Littleton.**—The church of St. Michael, South Littleton, has been opened, after a complete restoration of the nave and chancel. The oldest existing part of the building dates from the twelfth century, but the marks of burial found underneath the foundations indicate that an earlier church was built upon the same site, which may have been Saxon, or even British. The present restoration has been carried out by Mr. Thomas Collins, of Tewkesbury, from designs by Mr. F. Preedy, architect, and adheres as closely as possible to the plan of the old edifice, the ancient parts of which have been carefully preserved. The renovation of the interior of the tower has still to be carried out.

**Seaham Harbour.**—A new Presbyterian church has been opened. It is built of common bricks, with freestone dressings, and relieved with pressed brick bands and arches. In the south-east corner is a tower and spire 70 feet high. The roof is covered with blue slates, with bands of green slates and ornamental tile ridging. The windows are glazed with cathedral tinted glass with coloured

border. The whole of the woodwork of the church is executed in pitch pine, and sized and varnished. The work has been done by Mr. R. Allison, Whitburn, under the superintendence of Mr. N. Macara, Darlington, architect.

**United Free Church, Clitheroe.**—Ten sets of plans were sent in for this competition, and the premiums have been awarded to the following architects: 1. Mr. William S. Varley, F.R.I.B.A., Blackburn; 2. Mr. E. S. Butterworth, Rochdale; 3. Mr. H. Isitt, Bradford.

**Sowerby, Leicestershire.**—The restoration of the chancel of the fine old church of All Saints, which has, through decay and dilapidation, fallen into disuse for some years, has at last been completed. The works comprise an entirely new roof of increased pitch, new gable and parapets, restoration of doorway and windows, new tile floor, oak benches, and altar-rail. Four of the windows are filled with stained glass by Messrs. Lavers, of London. The metal work is by Mr. Braun, of Birmingham; the tiles from Minton's well-known works; the builder was Mr. George Hayes, of Melton Mowbray; and the architect, Mr. R. W. Johnson, also of Melton, under whose superintendence the main body of the fabric was restored some years ago. As now completed, it forms one of the finest village churches in Leicestershire.

**Leadhills, N.B.**—The foundation-stone of a new Free Church at Leadhills, Lanarkshire, was laid on the 19th inst. by Mr. Jas. Alexander, of Glasgow. Some special interest is attached to the occasion from the fact that this will be, when completed, in point of altitude, the highest church in the United Kingdom, the village of Leadhills being, *vide* the gazetteers, the highest inhabited village, and the site of the church is at the highest part of the village. The church is situated on the main road to Wanlockhead, and is designed in a simple type of Early English Gothic. The principal front looks towards the village, and has a lofty centre gable rising over 50 feet above the road level. The lower portion has four small lancet windows lighting the vestibule, and set between massive buttresses, while the upper part is filled with a large triplet window under a moulded hood; and on the ridge over this end is set a quaintly-designed ventilator *flèche*, rising to a height of 70 feet. On the side next main road the front is flanked by a handsome stone belfry carried up on a very massive buttress, which also protects the main entrance door; and on other side is a semi-octagonal transept, containing the stair to gallery, and also another entrance. The side elevations have single-light lancet windows between heavy buttresses. Owing to the nature of the site, the floor-line is over 10 feet above the main road level, and the church is reached by broad flights of steps up from main road and down from road of opposite side. The interior is 62 feet long by 32 feet wide, with a ceiling height of 30 feet, and will seat 360 persons, each having full 20-inch sittings. The main couples of roof, which rest on carved stone corbels, will be exposed and stained and varnished, and it is intended that the whole interior will be suitably decorated. The windows will be glazed with antique cathedral glass in leaded quarries, and through the kindness of a subscriber all the windows will be partly enriched with stained glass. There are also provided session-house, vestry, retiring-rooms, &c. The materials used in the building are the local whinstone, with freestone dressings for walling. The roofs will be covered with Westmoreland sea-green slates, finished with red ridge tiles, and, as is required by the situation, all the work is proposed to be of the most substantial description. The building has been designed by Mr. J. B. Wilson, A.R.I.B.A., architect, Glasgow, and is being carried out under his charge, at an estimated cost of under 2,000*l*.

## GENERAL.

**A Portrait**, by Mr. Oulless, R.A., has been presented to the Bishop of Norwich by his clergy.

**The Works of the late P. F. Poole, R.A.**, will be exhibited at the Royal Academy in the forthcoming winter exhibition.

**The London Winter Exhibitions** will commence to-day (Saturday) with the private views of the Dudley Gallery and of the collection of the works of the late Hablot K. Browne ("Phiz"), at the gallery of the Fine Art Society.

**The Duke of Westminster** is about to present to the National Gallery of Canada a large oil painting of *The Death of General Wolfe*, being a well-executed copy of the original by Benjamin West, belonging to the Duke of Westminster, and which is in His Grace's collection.

**An Exhibition of the Works of Sir Joshua Reynolds** will be held during the winter at the Grosvenor Gallery.

**Mr. Thomas Heron**, of Manchester, has been awarded a silver medal at the Fisheries Exhibition.

**Messrs. Minton, Hollins & Co.**—By an oversight the word "Limited" was added to the advertisement of this firm in the last number of *The Architect*. We regret the error, which has been rectified. There is no change in the style or title of the firm of Minton, Hollins & Co.

**Mr. R. C. Woodville** has been commissioned by Her Majesty to execute a large picture of the battle of Tel-el-Kebir as seen from the position in the rear where Prince Arthur was with his regiment of the Guards.

**David Cox's** *Peat Gatherers in a Storm*, 15 inches by 10½ inches, dated 1850, was sold in Birmingham on Tuesday for 120 guineas. At the same sale *The Pass of Llanberis*, with figures and drove of oxen, 21 inches by 11½ inches, dated 1847, was sold for 84 guineas; and *The Big Meadow at Conway*, 28 inches by 17 inches, fetched 206 guineas.

**Mr. J. N. Mappin**, who died on Monday last, has left his collection of pictures, valued at 60,000*l*., to Sheffield, with a sum of 15,000*l*. towards the erection of an art gallery.

**The Entire Collection of Bewick Prints and Books** that belonged to Isabella Bewick, the last surviving daughter of the famous wood engraver, will shortly be sold by auction at New-castle.

**A Statue of Goldoni**, the Italian dramatist, is about to be inaugurated in Venice, where so many of his pieces were first brought out. The statue has been modelled by Antonio dal Zotto, and cast by Arquati. It will be placed in the Campo San Bartolomeo, opposite the Merceria.

**Mr. W. B. Barbour** has offered a sum of money to the Paisley Art Institute, for the endowment of ten yearly scholarships and other prizes for local students.

**The Mayor of Sheffield** (Mr. Michael Hunter, jun.) has guaranteed the raising of the 5,000*l*. required to erect museum buildings to contain Mr. Ruskin's collection.

**Mr. Henry Holtom**, architect, of Dewsbury, will, it is understood, be the mayor of Dewsbury for the coming year.

**A Pulpit**, designed by Mr. Aston Webb and executed by Mr. Forsyth, of Worcester, has been erected in St. Helen's Church, Worcester.

**Mr. Ruskin** intends to deliver a lecture on "The Stormclouds of the Nineteenth Century," at the London Institution, early in February next.

**Mr. R. F. Hayward** has been awarded the Gilchrist Entrance Scholarship in Engineering, at University College, London.

**Sir Edmund Beckett** has contributed 200*l*. towards the erection of a new church and school at Doncaster.

**Earl Granville** has decided to erect a structure on his Cliff's End estate as a memorial of the landing there of St. Augustine.

**St. George's Church, Edgbaston, Birmingham**, is to be enlarged, at an estimated cost of 6,000*l*., from the designs of Mr. J. A. Chatwin, of Birmingham.

**The Municipal Art Galleries** in connection with the free library buildings were opened at Cardiff on Tuesday evening by the mayor, Mr. G. A. Stone. The nucleus of the galleries is a collection of thirty-eight pictures, presented by the late Mr. W. Menelaus, of Dowlais, estimated to be worth 10,000*l*.

**The Chorlton Board of Guardians** have decided on plans for the extension of their hospital accommodation at a cost of about 19,000*l*.

**The New Metropolitan Opera-house at New York**, which was opened on Tuesday, is the largest opera-house in the world, the dimensions of the auditorium being 95 feet deep, 89 feet wide, and 82 feet high; and the stage 106 feet wide and 90 feet deep.

**The Church of St. Matthew**, Friday Street, Cheapside, is about to be taken down. The materials of the church have been sold by tender by Messrs. Fuller, Horsey & Co. A few months ago the internal fittings of the church were sold. Business premises are to be erected on the site.

**The Tender of Messrs. Wilkes & Co.**, of 17 Devonshire Square, Bishopsgate, has been accepted for the construction of the Hartlepool tramways.

**A Petition** has been presented from some of the ratepayers of Raglan, Monmouthshire, asking the Assessment Committee to increase the assessment of Raglan Castle. The Duke of Beaufort has signified his intention to close the castle to the public if the increase is allowed.

**Sir Charles Dilke** visited on Tuesday the new buildings in connection with the St. George's Workhouse and Infirmary, and expressed himself gratified with the completeness of all the arrangements. The infirmary is the largest in London, being erected for the accommodation of 800 patients. The workhouse will, when completed, contain nearly 1,500 inmates. Mr. H. Saxon Snell is the architect of the new buildings.

**New South Wales** now has 412 brick-fields, 9 drain-pipe manufactories, 98 limekilns, 13 potteries, and 12 tile works. There are over 200 saw-mills. In one establishment about 100,000 cubic feet of timber are sawn weekly.

**The Fitzwilliam Museum Syndicate** state in their annual report that the building of a new Museum of Classical and General Archaeology has been commenced, and is now almost completed. The Fitzwilliam Museum was visited by 48,482 persons during the year ending April 30, 1883. Permission was given during the same period to 42 persons to copy in the picture gallery, and to six in the sculpture gallery. Donations to the museum are acknowledged from Professor Legros, the Master of Trinity, Mr. F. J. H. Jenkinson, M.A., and Mr. Spence George Percival.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, OCTOBER 27, 1883.

### EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

### TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*\*\* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—“Contract Supplement to THE ARCHITECT.”*

### TO AMERICAN SUBSCRIBERS.

*All subscriptions are payable one year in advance, and may commence at any date.*

*The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.*

*Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED TO GILBERT WOOD, 175 Strand, W.C., London, England.*

*In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—*

*To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order.*

### NOTICE TO THE PUBLIC.

*By the Post Office arrangements THE ARCHITECT can now be sent to any part of the United Kingdom by an affixed Halfpenny stamp; hitherto the postage has very frequently been twopence per copy. The Publisher will be happy to forward, for 20s. per annum, post paid, THE ARCHITECT, to residents in towns and neighbourhoods to which there is no easy access by railway. Terms for the half-year, 10s.*

*Our readers are invited to address us on subjects of interest to themselves or the public. We shall be always ready to insert letters asking for a solution of any suitable questions of a professional or practical nature, and to receive replies to such inquiries.*

### COMPETITIONS OPEN.

**BIRKENHEAD.**—Dec. 1.—Plans are required for Laying-out Bidston Hill for Building Purposes. Premiums of 100 guineas and 50 guineas, and four of 15 guineas each. Messrs. Davies & Stephen, Estate Agents, Mollington, Chester.

**BRISBANE.**—Nov. 30.—Plans are invited for the Erection of a Town Hall. Messrs. Gordon & Gotch, 15 St. Bride Street, E.C.

**CAPE TOWN.**—Jan. 30.—The Town Council of the City of Cape Town invite Plans and Specifications, accompanied with approximate estimate of cost, of a System of Drainage. Selected Plans and Specifications to become the absolute property of the Corporation. All others will be returned free of expense. Premium of 250*l*. A plan of the City, with levels, may be seen, and further information may be obtained, on application to the South African Loan, Mortgage, and Mercantile Agency, 9 King William Street, London, E.C.

**LONDON.**—March 1, 1884.—The Commissioners of H.M. Works and Public Buildings are prepared to receive Designs for New Buildings proposed to be erected in Whitehall for the Admiralty and War Office. Mr. A. B. Mitford, Secretary, H. M. Office of Works, 12 Whitehall Place, London.

**NORTHAMPTON.**—Dec. 1.—Designs are invited for the Erection of a Board School, with Class-rooms and Out Offices, to Accommodate 1,150 Children. Mr. John B. Hensman, Clerk to the School Board, 4 St. Giles's Street, Northampton.

**SCUNTHORPE.**—Nov. 1.—Plans are required for a Cemetery Chapel, Mortuary, Lodge, Entrance Gates, &c. Messrs. Freer, Hett & Hett, Solicitors, Scunthorpe, Lincolnshire.

### CONTRACTS OPEN.

**ABERDEEN.**—Oct. 27.—For Additions to Commerce Street Public School. Mr. Duncan McMillan, Architect, 4 Dee Street, Aberdeen.

**AYLESBURY.**—Oct. 30.—For Rebuilding Walton Mill Stream Bridge. Mr. W. F. Taylor, County Surveyor, County Hall, Aylesbury.

**BRECKEN.**—Oct. 29.—For Building a Pair of Cottages. Messrs. C. & G. Butcher, Glasbury, R.S.O.

**BLACKPOOL.**—Oct. 29.—For Alterations and Additions to Two Houses. Messrs. Garlick, Park & Sykes, Architects, 6A Talbot Square, Blackpool, and 33 Winckley Square, Preston.

**CAMELFORD.**—Nov. 7.—For Building Police Station. The Police Inspector, Camelford.

**DARRINGTON.**—Oct. 31.—For Building Chapel at Darrington, near Pontefract. Mr. James Wilson, Architect, 12 East Parade, Leeds.

**DARTMOUTH.**—Oct. 31.—For Reseating New Church, St. Petrox. Mr. W. Smith, Solicitor, Dartmouth.

**DAWLISH.**—Nov. 3.—For Enlarging St. Mark's Chapel. Messrs. Hayward & Son, Architects, 50 High Street, Exeter.

**DENBIGH.**—Oct. 27.—For Alterations to Baptist Chapel. Mr. Richard Davies, Architect, Bangor.

**EASTBOURNE.**—Nov. 3.—For Building Town Hall and Municipal Buildings. Mr. C. Tones, Surveyor to the Local Board, Eastbourne. Mr. Tadman Foulkes, Architect, 100 Colmore Row, Birmingham.

**GAMRIE.**—Oct. 27.—For Building Farm House. Mr. George A. Bruce, Architect, Hotel Buildings, Banff.

**GULVAL.**—Oct. 29.—For Building Wesleyan Chapel and Schoolroom. Mr. James Hicks, Architect, Redruth.

**HAMPSTEAD.**—For Buildings in connection with the Workhouse Sick Wards. Mr. Charles Bell, Architect, Dashwood House, 9 New Broad Street, E.C.

**HEMSWORTH.**—Oct. 29.—For Building Hotel with Stable, Coachhouse, Shed, &c. Mr. William Richardson, Architect, 13 Park Square, Leeds.

**HETWOOD.**—Oct. 30.—For Alterations and Additions to Municipal Buildings. Mr. James Diggle, C.E.

**ILKLEY.**—Oct. 31.—For Building Hydropathic Establishment. Mr. William Bakewell, Architect, 38 Park Square, Leeds.

**IRVINE.**—Nov. 17.—For Building Shed and Offices at Irvine Academy. Mr. John Armour, jun., Architect, Irvine.

**KEIGHLEY.**—Nov. 1.—For Building Chapel at Cross Roads. Rev. W. Jackson, Keighley.

**KERACHIA, INDIA.**—Oct. 29.—For Cast-iron Pipes, Valves, Hydrants, &c. Messrs. F. P. Baker & Co., 6 Bond Court, Walbrook.

**LONDON.**—Nov. 30.—For Building Five Blocks of Artisans' Dwellings, Petticoat Square, Middlesex Street. Mr. Henry Blake, Sewers' Office, Guildhall.

Office: 175 Strand London, W.C.

# LINDSAY'S

## IMPROVED PATENT REVERSIBLE TREADS & LANDINGS

### FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

In Hospitals, or places where it is desirable to be free from dust, the blocks can be placed close together, not leaving any cracks, so that the treads or landings can be swept or washed quite clean; also, if it be necessary to get light under a Staircase or Landing, rough glass blocks can be fitted in the Iron frames, side by side with the wood, and a subdued light thus obtained.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be re-filled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works,

13, 14, & 15 SOUTH WHARF, PADDINGTON, LONDON, W.

# The Architect.

## TWO PALACES OF JUSTICE.

we were enabled to publish last week have astonished and delighted our readers to a very considerable degree. The new Palace of Justice in the capital town of Belgium is certainly a striking production; and those, indeed, who may be disposed to describe it as the most striking architectural production of our age, may probably not be easily persuaded to moderate their admiration.

A very short period has elapsed, as no one needs to be reminded, since the Palace of Justice in London was completed; and a comparison between the two buildings thus brought into contrast by such close correspondence of purpose and date can scarcely be avoided. Both are fine academical compositions. Both are monumental in the highest sense of the term. Both are intensely and demonstratively characteristic of the age we live in. And how different they are!

London, in respect of that which constitutes the business of courts of law, is the headquarters of a large empire; whilst Brussels is the focus of a very small one. London has a vast population of its own; it is the seat of enormous wealth, the centre of commercial enterprise dominating the whole world; whilst Brussels is comparatively of little importance either at home or abroad. All this, however, makes it only the more surprising that these two typical artistic manifestations should stand in such an odd relation to each other as they do.

What must first strike the critical fancy is the circumstance that England has gone about her work in a spirit so wholly ungenerous, and Belgium with such lavish magnanimity. It will be a long time before it is forgotten how Mr. AYRTON, occupying the sadly inappropriate office of Minister of Public Works, and Mr. STREET, in at least the equally unaccustomed position of the architect of a large and difficult municipal undertaking, were brought face to face in the direct battle of principle, which both may be said to have loved so well; the one possessed of probably the very meanest ideas of stately building that any man in authority ever could have had, even in Ashantee, and the other actuated by aspirations seldom equalled for force of resolution in the direction of an ideal of art, at once appealing to the most lofty patriotism and defying the most respectable public opinion. The result of this extraordinary conflict of sentiment is before us in the unique edifice in the Strand—unique in this very unusual way, that the longer we are accustomed to its contemplation the more mysterious it will seem to be, as a composition whose motive must be sought for, not in anything like a popular movement, even that of a party, but in the personality of an indomitable spirit at bay, confronting in the person of the First Commissioner a representative of popular movement whom it was a virtue of mere instinct in any artist diametrically to oppose. Thus, it may be said, everything like that afterthought which is so essential for monumental grandeur was prevented. Unlike Sir CHARLES BARRY at Westminster, who added grace to grace and polish to polish during twenty years, till the original design was unrecognisable in the finished work, Mr. STREET seemed to have tied himself down to his first crude proposals as if their improvement would have been an act of sin and shame in the face of such an enemy. BARRY, it is well understood, worked out his Palace of Parliament under a certain sense of reluctance; he would have preferred, in fact, to make it not unlike this very Palace of Justice at Brussels; but he was encouraged by a thousand manifestations of sympathy and approbation, and all Europe delights in the superb quality of his work. STREET, on the contrary, had his soul absorbed in the hard quaintness of his first design; he had no encouragement whatever but that of his own stern artistic con-

science; and perhaps he felt that if he had at all misconceived his task at the beginning the bravest course was to persist in his misconception to the end. There is no sort of disrespect for the memory of perhaps the most powerful artist of the Gothic revival—a Goth *sans peur et sans reproche*—when we thus suggest that the uncompromising and remorseless Gothicism of the London Law Courts will be their chief characteristic and chief merit in future times; but we may be permitted to express the opinion that if the architect had been coaxed and petted by authority, as Sir CHARLES BARRY was, and as M. POELAERT has been, instead of being regarded with continual distrust, we might at any rate have had a more lively building, whereby to diminish in some small measure, instead of increasing, the dreary dulness of the world of law.

But, at any rate, in the unambitious capital of the quiet and prudent *bourgeoisie* of little Belgium, it is well worth while for English people to observe what is done in similar circumstances. We hear nothing of a "Suitors' Fund," consisting of more hundreds of thousands of pounds than the outside community, in whose interest and out of whose pockets the money has somehow come to be accumulated, will ever know; the cash is straightforwardly provided, two-thirds from the national exchequer and the remainder from the resources of the province and the city. The original estimate of outlay was 344,000*l.*, and it has been allowed to run up, certainly somewhat freely we should say, to apparently four or five times as much. Perhaps there may be complaints of extravagance; very likely there are; but, at any rate, no one who has an eye in his head can deny that the commonwealth has got something more than mere houseroom for its money, and something, we doubt not, which is well worth all it costs. If we in England had doubled the cost of our Palace of Justice, the money would have been well spent, and never missed. If the Brussels building costs in the end some two millions sterling, let it be borne in mind that our Houses of Parliament cost three (because a PRINCE CONSORT had the matter in charge instead of an AYRTON), and no one who grudges the money now can get a hearing for his grumbling. We are inclined to think the article which is called extravagant building has never yet been fairly examined by political economists. A monument—some people in England think it is a fine thing to sneer at the phrase, but no matter—a monument like the Brussels Palace of Justice may possibly be pronounced a very paragon of extravagant building; but we are very much mistaken if it does not, in one way or another, pay the Belgian nation better within the next fifty years than the same amount of money spent in almost any other manner, two or three special objects of course excepted. The same sum, that is to say, could easily be frittered away in detail amongst the population at large, so that it might be difficult to trace what had become of it; but concentrate the expenditure upon a single magnificent and magnanimous act of public indulgence like this building, and every household in the land seems to have it for an heirloom of joy and pride.

We do not propose to enter upon any academical comparison of Mr. STREET's work and M. POELAERT's; but, having in view the animadversions which are from time to time delivered against our own great Gothic Palace, we must confess to a feeling of dissatisfaction with many of the details of the great Greek Palace before us. Monumentally considered—and especially when the unusually favourable character of the site is taken into account—the edifice is unquestionably superb. In other words, viewed as a single mass of highly-elaborated architectural composition, its magnificence of purpose is perfect, and the development of its features is calculated in every way to produce the most imposing effect. Its classical repose also is, in the mass, all that could be desired. Each façade is carefully worked out by and for itself; and all seem to harmonise together in the several angular perspectives. The central tower—needlessly, as we think, called a dome—is grandly devised, and singularly novel as well as appropriate. But, with all this, the detail, from beginning to end, is charged to the full with that inconsistency which is the invariable result of ambition too great for the artist, in whatever art. M. POELAERT's Classicism is grand, but clumsy and incoherent. Originality—so difficult in all Greek work—is with him a mere frantic struggle for force, superficial and forcible-feeble. Simplicity, a Classic principle above all others, is wilfully and needlessly outraged on all hands. The rules of scale are everywhere violated. Look, for example (in the principal view), at the great corner

piers, the two-storey Doric order, the one-storey Ionic order, the Corinthian order with half an entablature; at the great windows and small, the great consoles and small, the modillions and no modillions; at the futile pediments on the main cornice, the part blocking course, part attic light and graceful, part prodigiously top-heavy pile of no one knows what over the entrance; and lastly, at the central tower, with its podium, constituting an entirely different and separate structure from all the rest, as if a citadel stood on the summit of a rock within, the last refuge of the lawyers. Compared with authentic Cinquecento work, with French work, with the best German work, and with our own English Classic work when in good hands (even at the present somewhat fantastic moment), all this is unmistakably indicative of a defective sense of art in an accidental official; and the whole world is entitled to express regret that a monument so magnificent in conception and magnanimous in execution should so lamentably fail to answer to the simplest academical criticism. The effect of time will be, of course, to place so large and grand an edifice above rebuke; it becomes an object of pride to the nation and no longer a lesson to the student; but if Belgium cannot produce better architecture than this, we must confess surprise. Our last word, however, need not be one of censure; the *ensemble*, we repeat, is of the greatest splendour, and, in spite of those shortcomings which are natural to all human genius, the name of the architect will go down to posterity as that of a man who has nobly made his mark.

#### AUTUMN EXHIBITIONS.

THE first autumn exhibitions to open have the advantage of appealing to visitors refreshed by summer holidays. People whose eyes had become jaded by the mileage of pictures and objects which overcrowd the London season, return after a month or two among snow peaks or green fields, or from wanderings among foreign towns and townsfolk, with fresh zest and critical faculties rebraced, often, too, with new art experiences gathered in continental galleries.

The French Gallery in Pall Mall, and the exhibition of oils by the Dudley Gallery Art Society, as it styles itself, were opened with a private view last week. Messrs. DOWDESWELL showed a mixed collection, partly of works that have already run the gauntlet of exhibition review, partly of pictures or sketches this year's work. The Fine Art Society had a distinctive little exhibition of drawings and pictures by HABLÖT K. BROWNE—"Phiz," of happy memory—while the set of choice proofs of modern etchings remains on view in their small room. Mr. MACLEAN also opened an interesting collection of English and foreign water-colours.

The show at Messrs. WALLIS'S French Gallery cannot be said to be very brilliant in novelties; in fact, the leading attraction is the *S. Sebastien* by COROT—shown in the Paris International of 1867—a large and impressive picture, but by no means a most favourable example of the master. The foliage of the overshadowing trees lacks the especial grace and delicacy of his touch; the figures, arranged like the group of a Pietà, seem more of an afterthought than the motive of the picture, and are dwarfed by their position at the foot of a high canvas. We find the impression made now by the picture does not affect the notes to this effect taken in Paris sixteen years ago. Perhaps the most interesting piece in the room is the original study for MUNKACZY'S ambitious work, *Christ before Pilate*. The composition tells with greater concentration on the small scale, the *rapprochement* between the Judge and the Accused is felt better, and, although all the chief lines are the same, one feels that they did not bear extension on the enormous surface of the finished picture. In the same way the colour scheme was hardly full enough there, while here in the small study it is simply broad and sombre, effectively lightened by the corresponding whites in the drapery of the Christ and of Pilate. We have heard the great picture called a "leap in the dark," and this original study, clever as it is, indicates that from the commencement there was hardly method enough to carry the artist through so great a venture. Among less known names from foreign *ateliers* is that of D. SKUTETZKY, who has a vivacious picture of a studio incident: an old Italian introduces *The New Model*, a handsome brunette, whose half bashful, half coquettish glance is in pretty concord with the approving look of the artist, turning from his easel to greet

her, and the laughing curiosity of the girls already in possession. The story is told with neat narrative faculty, admirable management of brilliant colour, and a sound, pleasant *technique*. Presumably a Pole by birth is B. KLECZYNSKI, who, under the title *Hunting in Poland*, paints with vigour horses struggling to drag through a snowdrift a sledge laden with sportsmen and hounds. Vivacity is precisely what is wanting to the picture by Mr. BARTLETT of boats on *Return from Lagoon Fishing, Chioggia*. Luminous in atmospheric equality, the far-away objects on the level coast touched in with veracity to the brilliance of Venetian horizons, the figures and boats not ungracefully or very conventionally arranged, one wonders why with such happy features as these the picture as a whole is unsatisfactory. It lacks perhaps the vitality, the spontaneity, which attracted in Mr. BARTLETT'S earlier seen work, when painting in France, and it has not made amends by the perfectly balanced composition, the carefully attuned relations which should result from mature work. Among small interiors, *Bric-à-brac*, by J. BENLIURE, is consummate in setting forth of such a subject as the title indicates, with accompanying figures; nothing could be more sparkling and masterly, even audacious, in play of motley colour and crisp touch. A good specimen of the quiet thoroughness of German *genre*, very complete in character study, and in pathetic sentiment of the kind that hovers between pathos and humour, is the incident picture by A. MÜLLER, a poor professor of music *Parting with an Old Friend*, his violin, as the last resource. Of the couple of large river scenes by CLARA MONTALBA, *H.M.S. Worcester, Nautical Training College, off Greenhithe*, is the best. THEODORE WEBER has a spirited picture of the gale of September last, *The Margaretta Gayser towed into Dover Harbour*, unambitious as compared with much of his work, but clean and true in drawing and tone.

In the Dudley Gallery a few pictures recall the proverbial few grains of wheat in a monstrous amount of chaff. It is something, however, to show a study of *Ocean and Mist*, which is probably the finest thing Mr. WALTER SHAW has yet painted. This artist has gained considerable approbation by the drawing of wave in swell or break on the Academy walls, but he has shown hitherto an inveterate love of chilly contrasts in colour, and a tendency to repeat to monotony an effect of powdery spray and swift-running water. This picture in the Dudley shows close and acute observation of a delicate effect. Over a green expanse of sea, disturbed and heaving from shore to sky, broods a low-lying, soft cloud of mist that colours the further waters with purple shade, through which the white crests sparkle here and there. The air is full of the fine mist, and down below, the white light striking through it on the yellow rocks and thin foam, suffuses both with delicate iridescence. This difficult effect is rendered with a subtle accuracy that is even illusive, while, as the eye passes over the reach of restless water the surface seems to move as one gazes, and one by one the crests seem to twinkle and disappear in the mist. The only fault in the picture is the rock, which, to say truth, is far too much like confectioner's gingerbread. We are the more glad to welcome this work by Mr. SHAW, because we have from time to time given somewhat chilling response to his artistic appeal. From great to small we pass to note a little picture called *A Marshy Coast*, by HILDA MONTALBA, merely lines of brown, sedgy ground, running dark masses with blurred edges between luminous spaces of sky and water, faintly golden with after glow. Perhaps this little bit should be dubbed an "Impression," but it is toned with exquisite sense of light and atmosphere, and moreover impasted carefully as a bit by the "brown masters." Two studies at *Rosenlaui*, Nos. 206 and 239, by M. BERTHOUD, president of the Swiss Academy, are more veracious than interesting. It is a curious thing that no transcripts have less of the real sentiment of Swiss scenery than the works of Swiss artists, perhaps excepting the somewhat conventional art of the famous CALAME, who was trained in the Düsseldorf school.

It is a pity that Mr. ADRIAN STOKES should yield to the prevailing mode of plastering rather than painting; but, although his technical quality has this unpleasant trick, he must be allowed to obtain a distinctly artistic result, and a most singular power of rendering effects of brilliant hot sunshine. *Across the Marshes*, a little upright picture of wet sands and pools of water reflecting the pure blue sky, with red-tiled roofs brightening a horizon of dark buildings, literally glows and flashes with light.

There is not a remarkable figure-picture in the room,

although some of average merit, and one or two which might be noted for unpleasantness. One of Mr. ROOKES' sets of little scriptural designs, painted like a gorgeous missal in richest jewel colours, and with a manner that resembles the work of both a miniaturist and a worker in mosaic, adorns the screen and sets forth with quaint invention the story of *The Apple of Life*, which fruit apparently neither King SOLOMON, the fair Shunamite, nor an Egyptian woman of doubtful morals, desired to retain to prolong their days. The flesh-painting of a nude girl, rosy *After the Bath*, Cairo, by Mr. F. A. BRIDGMAN, must be noted for excellent quality and careful modelling. Amongst miscellanies, the study, *The Pick of the Pack*, by THOMAS BLINKS, is a plucky bit of good draughtsmanship of dogs.

Messrs. DOWDESWELL are wont to invite inspection of series of small water-colours, sometimes intended for engraving. We do not know if such was the origin of a collection of forty little studies on the English coast, announced as a "first series," by Mr. C. ROBERTSON, in what may be called pretty album work. The rough sketches and studies, some thirty, on a larger scale, are far better; one or two, such as the studies of rusted anchors, 63, 70, and 74, are very fresh and crisp. Mr. ROBERTSON, who is sometimes called "Shoes of the Faithful," from a certain well-known picture of his and its *repliche*, appears to have a singularly facile hand, and to attain easily an average of pleasing but not individual art merit. In the same room are grouped thirteen studies by WALTER LANGLEY, some of which have been seen before. Broad, vigorous, vital in rendering of external character, this art of a clever draughtsman and literalist pleases more at first seeing than on continuance. Mr. LANGLEY has been elected a member of the Institute of Water-Colour Painters. He is in youthful prime of years. It will be proved before long whether behind his power of forcible interpretation of fact lies any spring of the higher poetic faculty which makes fact significant and precious. From Venice are sent a couple of architectural sketches, and a study of a girl's head, her shoulders wrapped in a shawl of vivid orange colour, by Mr. W. A. BREAKSPEARE, who is working with Mr. LOGSDAIL, and shows a free emphatic touch, and fine sense of colour.

The loan collection of drawings and pictures by HABLOT BROWNE, at the Fine Art Society's, deserves a closer notice than is compatible with a general exhibition review. Popular as was the art of "Phiz," probably the run of readers to whom his illustrations of DICKENS'S novels enhanced the delights of the tale, and gave realised personality to the actors, yet had not much notion of his rich, inventive faculty and poetic fancy. HABLOT BROWNE had none of the advantages of systematic training, and never sought to mature technical skill as a painter, although he produced water-colour sketches, and even essayed one or two large oil pictures. He was, as it were, born with a certain draughtsman's faculty, as some men certainly are; to transfer to paper the significant lines of the figure, and the suggestive *rappor*t between animate and inanimate nature, came as an easy and natural sequence on the quick mental perception. This spontaneous gift made him so ready and sympathetic an interpreter of other men's thoughts; but nowhere is it more delightful than in his original illustrations. His humour led him up to the verge of caricature, but never beyond it, save, of course, of deliberate purpose. The set of hunting-field incidents lent by Major JAY, 100 to 111, also 33 and 34, might well make Mr. CALDECOT despair, so brimming over with fun are they, so apt in character, so energetic in drawing; the Irish sketches, in slight colour wash, 20 to 25, and the selection from a set in chalk, 191 to 199, lent by Mr. SPOONER, the latter done, with the exception of two, when touring in Ireland with LEVER, show a rich sense of the picturesque and the characteristic with irresistible humour, and one or two, as the *Faction Fight* and *A Wake*, great power in the delineation of passionate action. The genuine pathos of the *Blind Musician*, feebly piping at the gateway of a deserted house, while the stone beasts on the posts seem to sneer derision, shows how much the artist might have done in this way; a way, however, which found expression in very many of the DICKENS'S illustrations. Several graceful designs are scattered about the room, and the design of *Les Trois Vifs et les Trois Morts*, which was elaborated into a large oil picture, and the composition *Sintram following Death into the Dark Valley*, indicate that his imagination thrilled readily to the supernatural. Altogether there is something delightfully genuine about the art; there is humour without vulgarity, and

sentiment without sickliness. If "Phiz" is never so fantastic or so elaborately inventive as CRUIKSHANK, he is never sordid and never prosy.

#### GRAPHIC AND ANALYTIC STATICS.\*

THE first diagram that represented the parallelogram of forces might be said to have anticipated the modern method of computing strains by graphic methods. In the oldest geometry magnitudes are expressed by figures which more or less correspond with them—lines with lines, angles with angles, surfaces with surfaces, and so on. Afterwards the processes which the magnitudes underwent were expressed by algebra. But when in the parallelogram of forces lines were made to express the measure and direction of a series of forces, there was a new idea introduced which seemed almost to combine geometrical expression with algebraic analysis. A long time, however, had to elapse before the idea was developed into the graphic method of arriving at strains which is now very generally adopted, and before long is likely to be universally used. The name of the late Professor CLERK MAXWELL is commonly associated with the extension of the method, but to his credit he acknowledges that there were other investigators who independently arrived at similar conclusions about the applicability of graphic diagrams. After referring to what had been done by RANKINE, he said: "I have since found that the construction of diagrams of forces, in which each force is represented by one line, had been independently discovered by Mr. W. P. TAYLOR, and had been used by him as a practical method of determining the forces acting in frames for several years before I had taught it in King's College or even studied it myself." It is, in a word, to Mr. TAYLOR, a contractor's draughtsman, that we are indebted for the development, as he was the first to prove that the graphic method was something more than an elegant exercise for mathematical students.

Probably Mr. TAYLOR used it as a substitute for the analytic method of ascertaining the effects of a load on a beam. It takes less time, and is easier applied than mathematical calculation. But from this facility in use there is a risk that the graphic method may be employed empirically. The men who are most competent to employ it are those who are practised in the use of the older method of analysis. For this reason we are glad to meet with a book which recognises the fact that one method is the complement of the other, that one is the test of the other, and hence that both may often be applied together in designing the parts of a structure. Mr. GRAHAM'S work is well adapted for use at the drawing-board in offices; but it has also been arranged for class work in colleges and universities. It is a treatise on statics in which the theory of the subject is explained, and examples are given of existing structures. It is of course impossible in the course of an article to give an adequate description of a book of this kind, but a few remarks may have their use.

Mr. GRAHAM begins with an explanation of the principles of reciprocal diagrams, or as they are sometimes called balancing figures. In this part, and indeed throughout the book, he aims at precision of language and at a definite expression of his conclusions. Limits are also set up for the application of the method, in a passage which we extract:—

The criteria by the aid of which it may be decided whether or not any given structure admits of graphic treatment, may be classed under three heads:—

1°. The base figure, on which the science of graphic statics is built up, is the triangle. Now, the sides and angular points of all triangles bear to each other a certain definite relation which can be expressed in the following form:—

$$S = 2p - 3$$

in which formula

S = the number of sides of the triangle.

P = the number of its angular points.

In all figures, however complex, which are subject to graphic treatment, the above relation between the number of sides and nuclei, forming part of the essential framework of the structure, will be found to exist. Many designs, however, in which this relation is non-existent, can be brought under the laws of graphic statics by rejecting certain bars or other elements which do not contribute to the *essential*, but only to the accessory form of the structure. A certain mathematical instinct, or rather a species of intuition acquired only by habit, is necessary to distinguish these cases.

\* *Graphic and Analytic Statics in Theory and Comparison.* By R. H. Graham, C.E. Crosby Lockwood & Co.

2°. Although the triangle constitutes the base of the graphic system, strange to say it is not a figure, which *per se* admits of a reciprocal. This will be at once apparent from the fact that from each apex of a triangle branch only two lines, and since it is impossible that any two lines parallel to these can of themselves form a close figure, the conclusion is forced upon us that for any figure to become directly subject to graphic treatment, *there must radiate from each of its nuclei at least three lines.*

3°. The third condition may be stated to imply the necessity that each line composing the given figure should traverse two nuclei; otherwise the loose end, which did not belong to any pole or nucleus, would *ipso facto* become indeterminate in position; or, in more general terms, the reciprocal line would be indeterminate in length, and therefore could occupy a definite place in the reciprocal figure.

The foregoing criteria suggest the reason why Warren and lattice girders and roof trusses are so often introduced into books on the graphic method. The manner of marking the parts of the diagrams is of as much importance as precision in a geometrical proposition. Mr. R. H. Bow adopted the plan of "assigning a particular letter to each enclosed area or space *in*, and also to each space (enclosed or not) around or bounding the truss, and attaching the same letter to the angle or point of concurrence of lines which represents the area in the diagram of force." This plan is explained by Mr. GRAHAM, but he also adopts another which seems better adapted to intricate diagrams. In the second part the stresses in beams and roofs under various conditions are considered and ascertained by analyses as well as by diagrams. It is shown how results may be tested by taking the trusses separately, and comparing the graphic sum of the component lines with the reciprocal diagram of the frame as a whole. The third part is more abstruse, and, as it deals with couples, moments, gravity, &c., requires a knowledge of mathematics. At the end of the chapters are several examples to be worked out by the student; many of them refer to existing structures, and the answers are given in all cases. This is a novelty in books on graphic statics, and there is no better way of testing progress. Lastly, there is a chapter on wind pressures, derived from papers which have been read at the Institution of Civil Engineers. The diagrams in the volume have been carefully drawn.

#### PARIS NOTES.

THE architectural jury of the Ecole des Beaux-Arts have bestowed the diploma of architect with honours upon the following gentlemen: MM. Albert Berger, Corbineau, Josso, Michelin, Leconte, Montalto, Marcel, Jean B. Maillard, Henri Legrand, Nordet, Redon, and Tondoire.

In the important Jouvain d'Attainville competitions the jury of the Ecole des Beaux-Arts have made the following awards: *Historical painting*.—1st. Prize: M. Bourgonnier, pupil of MM. Cabanel, Millet, and Falguière. Mentions: M. Lambert, pupil of MM. Cabanel, Bin, and Lequien; and M. Trigoulet, pupil of M. Lévy. *Landscape*.—1st Prize: M. Danger, pupil of MM. Gérôme and Millet. Mentions: M. Girardot, pupil of MM. Lehmann and Hébert; and M. Bouvard, pupil of MM. Gérôme, Lefebvre, and Boulanger. The subject for the historical painting was *The Board-room of some great Metallurgical Establishment, showing a lofty carved Chimney-piece, upon which is seen a richly-framed painting of Venus coming to ask Vulcan to make a Suit of Armour for her son Aeneas*. That given for the landscape was *The Repose of the Reapers*. Both prizes are of the value of 2,100 frs., and ten artists took part in each competition, the twenty works being exhibited during the past week at the Ecole des Beaux-Arts on the Quai Malaquais.

At last Saturday's sitting the Académie des Beaux-Arts proceeded to the election of a foreign associated member, in the place of M. J. Felsing, of Darmstadt, lately deceased. On the first ballot M. Paolo Mercury, engraver, of Rome—already a correspondent of the Academy—was elected by twenty-six votes against six given for M. Monteverde, sculptor, of the same city. The Presentation Committee have recommended M. da Silva, the eminent Portuguese architect, to the chair of associated foreign member, left vacant by the death of the Chevalier de Fœrstel. The election will be held on Saturday.

It has unfortunately been found impossible to carry out the proposition, which on the surface appeared so feasible and appropriate, of utilising the ruins and site of the old Cour des Comptes

for the construction of a permanent fine arts exhibition, similar to the South Kensington Museum, under the auspices and control of the Union des Arts Décoratifs. The engineers and architects commissioned to visit and report upon the adaptability of the ruins for the above purpose have unanimously come to an adverse conclusion, and the scheme has accordingly been dropped.

The decorators are now busy upon the frames destined to receive the new mural paintings executed to complete the internal decoration of the Panthéon. Several of these paintings are already finished, and one of the largest, *The Crowning of Charlemagne*, has been exhibited at the National Triennial Salon, which closed on Wednesday last. It is to be placed to the left of the Sainte-Geneviève Chapel, and will thus form a pendant to Cabanel's great work, which covers the whole of one side of the Virgin's Chapel. Two other works are completed by their authors, but in consequence of the dampness of the Panthéon during the winter months, it has been wisely decided not to place them in their positions till May next.

A series of painted glass windows has been placed in the gallery of the Town Council in the Hôtel de Ville. These windows produce a very fine decorative effect, and represent the arms of Paris, and those of many other French cities. Two of them bear the names of all the prefects of the Seine down to and including the last one, M. Oustry.

The sculptor, M. D'Epinay, who is a native of the Mauritius, has received from his countrymen a commission for a group of *Paul and Virginia*, to be set up in the former Ile de France, the scene of Bernardin de Saint-Pierre's charming story.

There is now in course of construction, on the new railway line from Marvejols to Neussargues, a viaduct which, it is claimed by the French press, will be the most stupendous work of the kind ever executed. This *Viaduc de Garraby* will have a total length of 564 mètres, that of the metal superstructure being 448 mètres; the central arch will have a span of 165 mètres, with pitch of 52 mètres, and at its greatest height the top of the bridge will be 124 mètres above the ground. The total weight of the ironwork to be used is 3,200 tons, while the masonry is calculated in the estimate at 20,000 cubic mètres. This splendid work is being executed for the Government by the well-known house of Eiffel & Co., from plans presented to the Government by MM. Boyer & Bauly, State engineers.

#### THE LATE MR. MAPPIN'S PAINTINGS.

THE conditions under which the late Mr. J. Newton Mappin, of Birchlands, Ranmoor, Sheffield, has left his fine collection of paintings to the town of Sheffield, have not yet been disclosed, but it is understood they are such as render it certain that the bequest will be secured to the town. Mr. Mappin has made it a condition that a suitable building shall be erected by the Corporation within five years from the date of his death, and he has left 15,000*l.* for this purpose, but he stipulates that the town shall find the site and also provide the internal fittings, Mr. Mappin's contribution being entirely devoted to the erection of the place. There are also conditions as to the kind of gallery in which the pictures will be displayed, and the Corporation are required to finish the erection to the satisfaction of the executors within the time specified, otherwise the entire collection passes to South Kensington. Mr. Mappin himself estimated his paintings as worth 100,000*l.*, and those who know them best value them at 80,000*l.* at the least. They are insured for a sum of 60,000*l.* Several of the principal works are well known, such as *The Drumhead Court-martial*, *The Sally*, *The Conspirators*, *The Sword and Dagger Fight*, *Hudibras and Ralpho in the Stocks*, all by J. Pettie, R.A. There are also lesser examples by the same artist. John Philips, R.A., is represented by *The Water Drinkers*, and a number of important works. The collection includes works by William Muller, David Roberts, R.A., John Linnell, one of which was painted for Mr. Mappin at a cost of 1,500*l.*; Thomas Sidney Cooper, R.A., B. W. Leader, A.R.A., E. Crofts, A.R.A., T. Faed, R.A. (*Auld Robin Gray*, bought for Mr. Mappin after exhibition at the Royal Academy); W. Q. Orchardson, R.A., a fine figure subject of the historical school, which first brought the artist into notice; Patrick Nasmyth, E. M. Ward, R.A., Branwhite (*The Timber Waggon*), Copley Fielding, John Burr, president of the Society of British Artists, his brother Alexander Burr, Baxter, and Tweedie, portrait painters, James Webbe, Koekkoek, sen., and many others. A noticeable picture is Mr. Frith's *John Knox reproving Queen Mary*. Frederick Goodall, R.A., is represented by four paintings, one of which, *The Halt in the Desert*, was painted by commission for Mr. Mappin at a cost of 1,000 guineas. Of Marcus Stone, R.A., there is a fine example—the cathedral scene from "Much

Ado about Nothing." Another noticeable picture by the same artist represents Napoleon on his way from Waterloo. Mr. Alexander Johnson's *Flora Macdonald's Introduction to Prince Charles* was bought by Mr. Mappin from the artist for 500 guineas, after he had seen it in process of being painted. There are also magnificent examples of Constable, R.A., and Gainsborough, and J. M. W. Turner is represented by *Dunbar Castle*, for which Mr. Mappin paid 1,000 guineas. A large moorland scene by Rosa Bonheur, with dead stag in the foreground, finished by Landseer, cost Mr. Mappin 1,900*l.* His most recent acquisition was a picture in this year's Academy, *When Trumpets Call then Homes are Broken*, by G. Hillyard Swinstead, for which Mr. Mappin paid 1,00*l.* Connoisseurs and artists will be specially interested in a very fine collection of works by Robert Tongue, a painter who died in Egypt twenty-three years ago, and whose pictures are very rare. Mr. Mappin bought his examples from the father of Mr. Edward Hargitt, who was a pupil of Tongue. The chief of these pictures is *The Rainbow*, better known to artists than to the public.

### VENETIAN WELL HEADS.

EVERYBODY who has visited Venice, says Mr. J. C. Robinson, must have taken note of the ornamental well heads which abound on all hands. The famous bronze wells in the courtyard of the Ducal Palace will, of course, be in everyone's recollection; but every piazza, the courtyard of every palace, and, in short, almost every house in Venice, has its "vera di pozzo" of stone or marble, and the collective series forms in itself a veritable school of ornamental sculpture of all ages, from the earliest days of the Republic down to the last century.

These well tops, then, are a notable and distinct local feature, and the term "vera di pozzo," literally "ring of a well," is probably of local application only. They are, in fact, rings, or perforated cylinders of stone or marble, placed over the mouth of the well to fence it in and protect it, and most of them are furnished with flat hinged covers of iron. It is a curious fact that, although the ground on which Venice stands is a mere mud bank, intersected on all hands by a network of salt-water canals, and surrounded by the sea, there is nevertheless an abundance of fresh water at a short distance beneath the surface. The Venetian authorities have at all times paid great attention to the question of the water supply, and innumerable ordinances and regulations have been from age to age formulated respecting these wells.

Like the doorway and chimney-piece of the house, the well top in Venice became a favourite object for sculptresque decoration; it was the fashion, in fact, to have handsome "vere." Some of them are of great size—massive perforated blocks, several tons in weight—and they are often elevated on one or more encircling steps. Some of the earlier types are square or cubical in form, and one of the specimens acquired for South Kensington is of this shape, but the majority are circular or octagonal; the materials are large coarse-grained Greek marble, Istrian limestone, or the red and yellow marbles from the district of Verona. Of these "vere" four specimens have been secured, all of them fine examples of their respective style and date. Two of them were acquired for South Kensington in 1881, and may now be seen placed in the Italian Sculpture Court; the other two were purchased this year for Birmingham. These last are of the largest model—huge blocks of Istrian stone; and one of them is a *chef-d'œuvre*, probably unsurpassed by any other example of its style and period remaining *in situ*.

The earliest in date is the one of cubical shape at South Kensington. This came from the Island of Murano. The ornamentation is purely Byzantine, and the material Greek marble. The date may be as early as the ninth or tenth century, and can scarcely be later than the eleven or twelfth. Byzantine ornamentation soon crystallised, so to speak, into set forms, sometimes repeated for very long periods with but little change. Considerable latitude must therefore be allowed in judging of the date of any particular work of this kind; it is not unlikely, indeed, that favourite types of these "vere" were copied and reproduced for centuries even after their first origination. The ornamentation of this specimen consists mainly of elaborate interlaced work, enclosing on three of the sides square panels, on two of which are different representations of the "labarum," or Christian symbol; the fourth side displays an elegant pattern of linked interlaced circles enclosing stars and wreaths of varied design.

The next in point of date, acquired for Birmingham, is a huge circular "vera," in Istrian stone, of stern and simple Gothic type, somewhat resembling in shape the capital of a massive column; it may, perhaps be referred to *circa* 1350. It came from the courtyard of a house in the *quartiere* or district of San Maurizio, in Venice. Next comes the beautiful octagonal "vera" of the same type, acquired in 1881, and now to be seen in the centre of the Italian Court at South Kensington. This specimen is in Verona marble; the ornamentation consists of an arrangement of acanthus leaves, of an elegant Venetian Gothic character, springing from the lower part, and overwrapping each angle of the octagon, which in the upper part is additionally ornamented by a boldly-carved

lion's head projecting in full relief. On one side is a "stemma," a kite-shaped pavoise shield, bearing the arms of the family to whom the well belonged. Mr. Robinson was not able to ascertain the house from which this specimen was taken, but the arms will doubtless furnish a clue to the original owners. By far the finest of the four remains to be described; this is the other specimen acquired for Birmingham. This is also a "vera" of the largest size, and it is accompanied by its original surrounding steps. It is of Istrian stone, exquisitely wrought in the highest style of Venetian Renaissance art; the date of this piece is probably about 1500. The ornamentation consists of foliated scrollwork in rather low relief, interspersed with birds, fantastic animals, medallions, rosettes, &c.—in short, the richest and most elaborate assortment of the decorative motives of the time, disposed with infinite variety, fancy, and skill. This capital work stood in the courtyard of the ancient Palazzo Molin, and was obtained when, quite recently, the house was pulled down to make way for a modern "casino."

### THE ROMAN OCCUPATION OF BRITAIN.

THE fifth of the present course of Rhind lectures in archæology on the "Roman Occupation of Britain," by the Rev. Dr. J. Collingwood Bruce, commenced with the Vallum of Antoninus, or, as it was generally called in the district that it traversed, Graham's Dyke, the big ditch. Agricola, before leaving the Lowlands of Scotland, found it necessary to place in garrison some troops in his rear, to render all safe behind him. He, of course, could do so most economically by planting his forts in the narrowest part of the country, that which lay between the Firths of Clyde and the Forth. The same reason which influenced Agricola would move Lollius Urbicus to plant his wall there. This general, the representative of the Emperor Antoninus Pius, having dammed back the hostile waves of the Caledonians in the year A.D. 140, thought it necessary to rear a continuous line of defence from the one coast to the other. This he did by carrying a wall from Carriden on the Firth of Forth to West Kilpatrick on the Clyde. It was along the summits of the gentle southern heights that the Antonine wall was carried; and this wall strongly resembled in its general character the great German wall which extended from the Danube to the Rhine—which was an earthen fortification, no masonry whatever being used in its construction. Unhappily for the purpose of the antiquary, Graham's Dyke lay in the district traversed by the lines of communication uniting the two great metropolitan cities of Scotland, and the progress of improvement had done much to obliterate the lines of Lollius Urbicus. It was only here and there that it appeared in its native majesty. In the vicinity of Falkirk, both to the east and west of it, the works were colossal. His (the lecturer's) observation, both on his first visit and one which he paid last summer to the wall, induced him to say, with Gordon, that besides the main rampart to the south of the fosse there was another to the north of it. The northern wall was nearly thirty-seven miles long, and the number of stationary camps placed upon it had been eighteen. From the altars and inscribed slabs which were found in the forts, we learn that various corps of Gauls, Germans, and other foreigners in the Roman service were stationed along the isthmus, besides occasional detachments of the legionary troops. The stations had been placed within the distance of two miles from each other. In the southern wall they averaged four miles, but the southern camps were for the most part larger than those on the northern wall. Barhill Fort seemed to occupy the loftiest position, and from it an extensive view was obtained, the western view being of the utmost importance, for it was needful to have timely notice of the approach of the opposing Scots from Ireland. Lollius Urbicus commanded the Roman forces in Britain during the greater part of the reign of Antoninus, and a stone, which was now in the Museum of Glasgow University, had been found on which his name was carved. Another slab in a perfect state had been found comparatively recently mentioning the name of this famous general, and of his master. Very many of the stones found on the wall did honour to the emperor in whose name and by whose authority it was erected. Having mentioned the inscriptions on some of those stones, the lecturer said the stone of most recent discovery was of peculiar interest. It was large, being 9 feet long and nearly 3 feet broad. It was found at Carriden, the eastern extremity of the wall, and was now in the museum in Edinburgh, and this discovery confirmed the belief that Carriden was the terminus of the wall. The inscription was given in clear, well-formed letters, and was without ligatures, and, in English, it was as follows: "To the Emperor Cæsar Titus Ælius Hadrianus Augustus Pius, the Father of his country. The second legion (the Imperial) constructed the wall through a length of four miles (4,652 paces)." The subjects on either side of the inscription were a battle scene and the performance of a lustration. On the northern wall all the inscriptions, with one exception, represented work done by the three legions then in Britain. On the southern wall there were many inscriptions telling of buildings erected and other work done by Asturians, Batavians, Gauls, and other foreign troops. On the southern wall (Hadrian's) every station and every

mile castle had had a broad gateway opening northwards; on the northern wall the stations seemed to have no northern gates. It would seem as if the northern wall had partaken more of the nature of a barrier against aggression rather than as a line of military operations. The lecturer went on to say that it almost seemed as if the wall of Antoninus was abandoned shortly after the reign of that emperor. The Romans evidently found that the climate of the upper isthmus did not suit them, and for their health's sake they retired to a more genial latitude. Passing to speak of higher themes, the lecturer remarked that an examination of some of the many altars and religious monuments which the Romans had left behind them enabled us to form some opinion respecting their faith and religious practice. They had left abundant evidence to show that they were idolaters; that they worshipped Jupiter, and Mars, and Apollo, and Fortune, and Minerva; that they worshipped the genii which presided over each hearth, each camp, each place; and the nymphs to whom each spring, each fountain, each river was sacred. And eventually, when the rising sun of Christianity rendered it impossible any longer to hold by these vanities, they turned, like some moderns, to the worship of the undefined and mystic thing called nature. Having, in proof of this, described many of the altars, including "dream-altars," which had been discovered, and explained inscriptions, together with the nature of the worship engaged in, and the prevailing superstitions, Dr. Bruce brought his lecture to a close by pointing out that all along the line of the wall of Hadrian they met with traces of Mithraic worship.

In the concluding lecture of the course Dr. Bruce continued his account of Roman relics found in Britain, beginning with some references to their funeral stones. Their burial-grounds, he said, were always outside their cities and camps, and usually by the sides of their roads. In the case of York, the burying-grounds extended for miles along all the roads leading out of the ancient town. In some cases cremation was resorted to; but in many, perhaps in most, the body was returned unburnt to the earth. In the burial of children their toys and ornaments were interred with them; in the case of ladies, rings, armlets, and other cherished objects of taste had been placed in the tombs. The tombstones were invariably dedicated to the *Diis Manibus*. On leaving this life the soul was supposed to assume the position of a minor divinity, to whom offerings, in the shape of funeral feasts, should be offered. It was never said on those stones that the person died; the word "death" never occurred; it would almost seem as if it were a word of evil omen. The formula universally ran that so and so lived so many years, the number of odd months and days being sometimes added. The tombstone often bore the effigy of the deceased, and in the inscriptions there were often found touches of fine feeling, showing that a Roman soldier had a heart under his iron breastplate. One, for example, bore testimony that his wife had lived thirty-three years, *sine ulla macula*, without a stain. It had been remarked that almost all the tombstones were to young persons. Our rough climate had been too much for the natives of southern latitudes. To the question whether there were among the Roman remains any decided intimations of the prevalence of Christianity among them, Dr. Bruce said his answer was that there were no direct evidences, and that there could be none; but that Christianity did prevail to a greater or less extent there was no doubt. Some soldiers in the British legions might have heard the Apostle Paul preach in Rome, and captives from Britain might have heard him too. He doubted not that the seed of the word was faithfully and prayerfully sown by soldiers of Christ who formed part of the Romano-British army. In the absence of positive evidence, he thought they had some negative proofs, which might fairly lead them to think that Christianity had made some way in Britain in Roman times. The principal indication was the occurrence of several altars inscribed *Divis veteribus*, to the old gods. Now, if several altars had been dedicated to the old gods, the conclusion was natural that a new faith had been introduced which had changed the opinions of many; some, however, wished it to be understood that they stuck to Jupiter and Juno, Venus, Mars, and Hercules. Then, again, in the guard-chamber of the north gateway of Borcovicus was found the upper half of a Roman altar, on which could be distinctly made out the letters I. O. M., *Iovi optimo maximo*. Now, if an altar to their chief god had been broken up and used in Roman times as a common building stone, the people of that day had surely found out that an idol was nothing. He had also noticed that many altars had been used as sharpening stones; and an altar to Fortune—a very popular deity—had been turned into a gutter-stone. After referring to other classes of inscribed stones, including the centurial stones, which are very abundant on the southern wall, and are supposed to indicate the portions of that structure erected by such and such centuries of the Roman legions, Dr. Bruce described certain stones bearing sculptured figures. One of these, found at Chesters, on the North Tyne, showed a recumbent figure, supposed to represent the genius of the river. Another had a representation of Cybele, which was a work of considerable merit, the drapery being very fine, and the dress in which the goddess appeared being nearly akin to some of the dresses to be seen in modern drawing-rooms, not even neglecting the arrangements behind. The lecturer next

touched on a class of inscriptions on bronze, which, he said, were documents giving to the persons named in them the right of Roman citizenship, and the privilege of legal matrimony. Of these tablets about sixty had been found throughout the whole Roman world; and of these, four, besides two small fragments of others, had been found in Great Britain. Reference was made to various facts as seeming to show that, for long years before the acknowledged invasion of Britain by the Saxons, they and kindred tribes had been effecting settlements in the island, coming themselves under the influence of the civilisation they found there, and accustoming the native population to their speech. Municipal institutions were well developed under the Romans, and colleges of different classes of workmen were common among them. During the middle ages towns and cities and the trade guilds did much to maintain the liberties of the people, and accustom them to self-government, and doubtless these institutions were but a continuation of those established by the Romans. The architecture of England was greatly indebted to that of Rome. The Saxon and the Norman styles, though each had its own peculiarities, were essentially Roman. The earliest Saxon coinage was a slavish copy of the Roman. Roman law, of course, prevailed in England during the Roman occupation, and it was well known that our common law, particularly the Scotch law, was largely indebted to the Romans for many of its principles and practices. It was curious to notice the influence which the Roman alphabet had upon English literature and that of the world. The prevalence of that alphabet was certainly remarkable, and it was coming more and more into vogue every day. Whilst we could not but bewail the calamities that befell Britain from the departure of the Romans till its settlement under Norman rule, one great advantage resulted: our Continental connection was severed; we were made an independent people; we were taught to rely upon ourselves, and not look to Rome for help. Hence our little isle became the centre of light and liberty and power, rather than the recipient of those blessings from other lands.

### CHESTER CATHEDRAL.

THE Dean of Chester has issued the following circular on the further restoration of his cathedral:—

After a pause of more than six years—during which period, however, some restorative work has always been in progress—it seems reasonable to take courage again, and to hope for the further prosecution of the repair and decoration of Chester Cathedral.

During these years which have elapsed since the general opening of the cathedral on the completion of the restoration of the choir, the following works, besides some minor improvements, have been accomplished: (1) The monuments, which had necessarily been removed during the long process of restoring various parts of the church, have been placed with great care in the positions deemed most suitable. (2) The north side of the chapter-house, which was found to be in a condition of very serious decay, has been made thoroughly strong and secure in its ancient form. (3) The main external roof of the great south transept, which had for some time been in a perilous state, has been replaced by a new roof of the strongest materials. (4) To these things must now be added the disinterment and thorough repair of that Norman crypt on the west of the cloister, the very existence of which was unknown to many, but which is now seen to be one of the most remarkable and precious relics of early times found in the city of Chester. It is satisfactory to add that funds have been received, from various sources, which have sufficed to cover the expense of all these works. The publication of reports in the old form will be resumed this year; and it is hoped that before Midsummer, in the next report, a full statement will be issued of all the money received, with the names of the subscribers, between the close of 1875 and the close of 1882. It is proper, however, to state here in general terms, and with the utmost gratitude, that very large help has been received year by year from His Grace the Duke of Westminster.

Great encouragement is furnished at this moment through the generous gift of 2,000*l.* by Mrs. Platt, for marble mosaics of the best kind on the interior of that north wall of the nave, which has long presented a very dismal appearance. The subjects of these mosaics are to be *Abraham, Moses, David, and Elijah*, with scenes from their lives. A full description will be published at some early opportunity, when this work is further advanced. The hope is now expressed that similar gifts from other donors may follow, so that the projected baptistery, the vaulting of the east aisle of the south transept, and the filling in of the windows of the chapter-house, may be speedily completed. A few words will be permitted separately on each of these three subjects.

The Norman architecture, now for the most part hidden from view, at the western extremity of the north aisle of the nave, is a direct invitation to the construction of a baptistery. The subject has been carefully discussed with Mr. A. W. Blomfield, who is now the cathedral architect, in succession to the late honoured and lamented Sir G. Gilbert Scott: and it does not appear that this

great improvement in the interior of the cathedral, effected in the best manner, need cost more than 1,000*l*. One conspicuous part of the improvement will be the opening out of the whole of the arch now seen in the wall immediately to the north of the western steps of the nave.

The completion of the whole restoration of the south transept will be a great undertaking. But it seems right that it should be directly contemplated now that all the parochial complications of this part of the cathedral church are at an end. A worthy treatment of the south front, including suitable stonework and suitable glass for the large window, cannot be estimated at less than 7,000*l*.: the interior vaulting of the central space of the transept and of the north aisle, with all that is requisite for the cleansing of the walls and repair of the floor, will cost 3,000*l*. more. All, however, that is contemplated to execute immediately is the completion (at a cost of about 700*l*.) of the vaulting of the east aisle, one bay of which was done more than four centuries ago.

Besides the restoration of the north wall of the chapter-house, the glass of one window, of a simple but beautiful design, has been inserted; and another similar window is in preparation. Three others are required. The cost of each of these windows is about 50*l*.; and it is hoped that separately they may be adopted as gifts from special donors. The external roof also ought to be completed, and the cost cannot be estimated at less than 500*l*.

It is proper to add that the roof of the cloisters is in a very bad condition, and that the floor and the drains need careful attention, so that the mischievous effects of damp may be arrested; and it is believed that this can be done without interfering with the picturesque effect of the mouldering mullions. This work (the expense of which would probably be 3,000*l*.) cannot prudently be postponed beyond another year.

This appeal, then, includes a total sum of 15,350*l*. for work which might be spread over three years. For the present, however, all that is sought for is only 1,850*l*., which embraces 700*l*. for the groining of the east aisle of the south transept, 1,000*l*. for the baptistery, and 150*l*. for windows in the chapter-house. Promises of aid will be gratefully received by the Dean, who, as heretofore, will gladly use his best exertions to discharge any trust confided to him by those who desire to promote the dignity and usefulness of Chester Cathedral.

### THE FORTH BRIDGE.

THE following is the second report of inspection by Major-General Hutchinson, R.E., and Major Marindin, R.E., of the works in progress for the construction of the bridge over the Forth:—

Railway Department, Board of Trade,  
August 15, 1883.

Sir,—We have the honour to report for the information of the Board of Trade that, in compliance with the instructions contained in the order of October 26, 1882, and in accordance with the provisions contained in section 6 of the Forth Bridge Railway Act, 1882, we have made our second quarterly inspection of the works in progress for the construction of the bridge over the River Forth at Queensferry.

Both the temporary and permanent works have made good progress since our last report, and their state is now as follows:—

#### Temporary Works.

At South Queensferry—The gas furnaces, hydraulic engines and accumulator, hydraulic bending machine and planing machine for the large plates, two shop engines, shafting, &c., large turning and screwing machine for holding down bolts, one large travelling crane, and one 10-drill machine for the 12-foot tubes are either at work or can be started at a day's notice. Three other large drills and about 200 tons of steel plates are ready for delivery. The temporary stage on the south shore has been advanced to a distance of 1,300 feet, and the inclined approach to this stage and the winding engines for working it have been completed. Several workmen's cottages, a large canteen, reading-room, store, &c., have been erected, and are in use.

At Inchgarvie—The wrought-iron landing stage is nearly finished, a large surface of rock has been levelled as a platform for materials, and a wrought-iron viaduct 250 feet long has been erected to connect Inchgarvie with a detached rock called Craig Sparry, on which are situated the north-east and north-west main Garvie piers.

At North Queensferry—A wrought-iron stage, 95 feet long and 70 feet wide, has been erected over the site of the Fife south-west main pier. This stage carries a traveller, on which are three diamond rock-drills, driven by separate engines for boring the rock, so as to obtain level foundations for the pier. The rock has been levelled round about the Fife main piers to form a platform for storing and manipulating the steel work of the cantilever, and the cottages, workshops, stores, &c., have been completed, and are in use. Eight barges, a steam barge, a steam tug, and steam launch are now in use on the works, and others are about to be delivered.

#### Permanent Work.

At South Queensferry—The concrete foundation of viaduct pier No. 1, averaging 11½ feet in depth, has been completed; at viaduct pier No. 2 the concrete foundation, 5½ feet deep, is complete, and the granite-faced superstructure has been carried up 5 feet; at viaduct pier No. 3 the concrete foundation, 5½ feet deep, is complete, and the superstructure, as above, carried up 8½ feet; at viaduct pier No. 4 the concrete foundation, 3 feet deep, is complete, and the superstructure carried up 14 feet; at viaduct pier No. 5 the concrete foundation, 2½ feet deep, is complete, and the superstructure carried up 6 feet; and at viaduct pier No. 6 (where the foundation is below low-water mark) a coffer-dam is being constructed. A heavy timber dam is also in course of erection at the site of the south cantilever pier, where the depth of water at foundation level is about 20 feet at low water.

At Inchgarvie—The excavation of rock down to the level of low water on the sites of the north-east and north-west piers is well advanced, and a start has been made with the temporary caissons to be used for work below low water.

At North Queensferry—The excavation of rock at the south-west main pier is being proceeded with, diamond drills being employed for boring; the foundation concrete to the north cantilever pier, 2½ feet deep, is finished; at viaduct piers Nos. 10, 11, 12, and 13 the concrete foundations have been completed to the depths of 2½ feet, 2 feet, 8½ feet, and 11½ feet respectively, and the granite-faced superstructure erected thereon to the heights of 7 feet, 3½ feet, 16½ feet, and 24 feet respectively. The excavations for the foundations of the small masonry spans at the north end are in progress.

#### General Remarks.

All the holding-down bolts (576 in number) for the main piers have been delivered; they are from 24 feet to 26 feet long and 2½ inches in diameter, and they have been made (at Landore) of steel stated to have a tensile strength of 30 tons per square inch, and an elongation of 20 per cent. Wrought-iron belting, 18 inches by ¾ inch, has been delivered for looping the Fife piers. The first of the large permanent caissons for the Queensferry main piers, as well as the bulk of the remaining plant required in the shops, is, we are informed, still in progress. The air-compressors for the large caissons are nearly completed and partly delivered, and a large diving-bell for rock excavation below low-water mark is also nearly ready for delivery.

About 40,000 cubic feet of granite have been delivered, of which about 15,000 cubic feet have been set, and about 81,000 cubic feet of concrete are now in position.

The progress and quality of the work, so far as we have had an opportunity of judging on our second quarterly inspection, are in every way satisfactory.

### THE LATE HABLOT K. BROWNE.

IT may not be known generally that the late Hablot Browne was able to draw buildings well, although some of his etchings of old buildings in "Bleak House" and other works suggest the hand of an expert. Canon Venables draws attention to the "Winkles's Cathedrals of England and Wales," in which Mr. Browne's powers as an architectural draughtsman are exhibited in a manner little anticipated by those who know him only or chiefly as an illustrator of Dickens. "Winkles's Cathedrals" was issued in monthly parts; the first two volumes by Mr. Effingham Wilson, during the years 1835–38, followed, after a considerable interval, by a third volume, published by Messrs. Tilt & Bogue in 1842. It was to the first two volumes only that Hablot Browne contributed. The last engraving which bears his name is *A View across the Nave of Norwich Cathedral*, which has date April 1, 1837. Of the twelve cathedrals published up to that date in this series each has several illustrations from his pencil. These are sufficient to prove that if Mr. Browne had devoted himself to this line of art he would have proved himself inferior to none in his power of catching the genius of a building, and accurately reproducing its architectural character without in any way sacrificing its picturesque beauty. His illustrations of that loveliest of all our cathedrals—Wells—may be instanced as an example of his perfect appreciation of quiet beauty and architectural grace. Hablot Browne's sense of the comic appears in some of the groups in the foreground of his cathedral views. For example, the dignified ecclesiastic on horseback, in shovel hat and knee breeches, with his mounted groom behind, reining in his curvetting steed to talk to some rather queerly-dressed ladies, in the engraving of the *East End of Canterbury Cathedral*, and the short fat verger, with his dangling legs, describing the place to a tall, thin, grotesquely-attired stranger in a full-peaked hat, while two workmen sit by smoking their pipes, in the view of the crypt of the same cathedral. In these and other groups we see the germs of the sense of the grotesque which afterwards found its proper field in clothing Dickens's literary creations with pictorial flesh and blood.

## NOTES AND COMMENTS.

MR. WYATT PAPWORTH has issued a pamphlet which will be invaluable to everyone who takes an interest in the history of English architecture. It gives a list of the principal buildings which have been erected in Great Britain between A.D. 1430 and A.D. 1705, and records various events in connection with the progress of Renaissance and Italian architecture in this country. We find laid down, as it were, in it the main points which are most essential for a survey of the style, and the most difficult to ascertain. Simple as they may seem, the forty pages could not have been compiled without years of labour. But why does not Mr. PAPWORTH utilise his materials and undertake an exhaustive history of English Renaissance?

THE Fisheries Exhibition was closed on Wednesday, after several months of almost unprecedented prosperity. In its illustration of the industries allied to fishing the exhibition was complete, and of general interest. But it should not be overlooked, in meting out praise, that to the majority of the visitors the most attractive object in the buildings was the Prince's Pavilion, with its splendid furniture and decorations. A great part of the success of the exhibition therefore belongs to Messrs. GILLOW. In design and workmanship the furniture was not surpassed by anything seen in international exhibitions here or abroad, and it must have exercised a salutary influence on crowds of visitors.

MR. RUSKIN's collection may still be possessed by Sheffield. Hitherto the great difficulty has been the management. Mr. RUSKIN insists on keeping it in his own hands, while the townspeople, who are believers in committees, wish to have a share in the management if they contribute to the expenses. It is now proposed by the mayor that the town should raise a fund wherewith to provide a suitable building for the art treasures, books, and other objects which have been collected or may hereafter be given by Mr. RUSKIN and the St. George's Guild for the museum, the building to be vested in trustees, and to be used for the purpose of the St. George's Museum exclusively. The management, including the selection and arrangement of objects and the custody of the building and its contents, to be in the hands of Mr. RUSKIN and his successors, who will undertake to defray the cost of such management and of keeping up the museum. All objects placed in the museum to become the property of the town of Sheffield for ever, subject, however, to the right of the managers to lend for limited periods from time to time certain of such objects, which shall be specified when handed over to the museum. The proposals seem to be reasonable, but we have yet to know whether they meet with the approval of Mr. RUSKIN, and—his solicitors.

SOMEBODY from Cheltenham rashly invited the Sanitary Institute to hold a congress there in 1884, and, as the prospect was pleasant, the invitation was accepted with becoming coyness. But, unhappily for the gentlemen who take part in the annual excursions from London, the people of Cheltenham are not eager to discuss sewage subjects, and, accordingly, the Institute is open to an offer for next autumn. In the emergency, Dublin has come forth with characteristic hospitality. But it is not easy to say why the Institute should be asked to visit Dublin in preference to any of the numerous societies having offices in London. There has been a congress lately in Glasgow, but, apparently, not the least benefit has been derived by the citizens from all the talking and lunching. The Lord Provost is hopeful that in the remote future something may arise from the visit, and that is all. In other towns, the advantages which were to be derived from the congresses have been no less readily made over to posterity. Yet the illusion continues. No one in Dublin expects that the Liffey will be inodorous after the congress, or that an additional yard of a drain will be constructed. But such is the force of good-nature that speakers are found in Dublin who profess to believe that the Institute "cultivates a taste for sanitary science;" that it teaches what is to be done—which means that it supplies the place of engineers, discovers remedies gratuitously and without the necessity of preparing plans; that it leaves "a residuum of information," and so forth. Now, all this is

absurd; but something like it has to be heard somewhere once a year. Knowing the difficulty of explaining the use of a congress, would it not be well if the very clever committee of the Institute composed a series of pattern speeches which aldermen and other simple-minded philanthropists might repeat on those occasions without becoming ridiculous?

BIRMINGHAM has resolved to possess a memorial of the late JOHN HENRY CHAMBERLAIN, and at a meeting which was held on Wednesday subscriptions amounting to over 1,000*l.* were promised. Many suggestions have been offered as to its form. The mayor is of opinion that a scholarship in connection with the Midland Institute would be the most suitable, while the President of the Board of Trade considers that a room in the Institute Building would be preferable as being a more distinctive memorial. Mr. CHAMBERLAIN's death has called forth expressions of admiration for his character from many notabilities, including Sir FREDERICK LEIGHTON, who wrote from Perugia.

THAT the building trade is not in a flourishing state in Edinburgh is evident from the statistics which were read lately in the Dean of Guild Court. During the year, 381 petitions for leave to build were presented to the Court, of which 353 were passed. Out of that number about one half were for additions and alterations, some being of a trifling character. The year's new work consisted simply of 60 self-contained houses, 63 tenements, 67 workshops and stables, 7 churches or halls, a parcels post office, a bank, and a theatre. This quantity is less than in past years, although the boundaries of the city have been enlarged and the population has increased. The property now unlet in Edinburgh is valued at 82,135*l.* In two years the deficit in the rental has grown to 18,000*l.*

AT a time when so many real and imaginary defects are discussed by sanitarians, it is surprising that no one has called attention to an arrangement that is common in some, if not in all, the public baths of London as well as in provincial towns, and which appears to be a source of danger. It is well known that in them there are second-class and first-class baths; but it is not so well known that the water with which the second-class baths are filled has been used by the first-class bathers. In one public bath in London it is said that water is kept circulating for more than a week before it is allowed to escape. The reason given for this thrift is the cost of water; but when it is found that in London baths pay only sixpence per thousand gallons to the water companies, the fee charged for even a second-class bath might be expected to insure a sufficiency of clean water. There are doctors like the late Sir WILLIAM FERGUSSON, who are sceptical about the risk arising from dirty water, and second-class bathers may escape contagion, but we maintain that it should be made compulsory for the managers of baths to announce the character of the fluid which they supply whenever it differs from pure water.

THE late Mrs. MARGARET SPIER, of Beith, in Ayrshire, some years ago left a large sum of money to erect a school. Certain trustees were nominated, who, according to the deed, were to "found a school in the parish of Beith, and on the lands or farm of Marshalland, and erect the buildings in an ornamental style, to form a suitable monument to the memory of JOHN SPIER, and a memorial of the family of the foundress. The amount to be expended out of the capital fund in the erection of the school buildings, and other conveniences, to be not less than 14,000*l.*, nor exceed 21,000*l.*" This seems a very large sum for a building that is to accommodate twenty-four bursars. But the real object of the foundress was to erect a monumental building, and those who knew Mrs. SPIERS say there was nothing on earth would have moved her from that intention. She had had marble prepared by the late Mr. BRODIE, sculptor, at a cost of between 2,000*l.* and 3,000*l.*, to put into the building. The funds now amount to 41,700*l.*, and the trustees propose to expend 18,000*l.* on the school buildings, and 3,000*l.* on laying out the grounds, if the sanction of the Educational Endowment Commission can be secured.

## ILLUSTRATIONS.

## DESIGN FOR GLASGOW SOUTHERN HOSPITAL.

THE design illustrated is one submitted in the recent competition for the new Glasgow Southern Hospital by Mr. JOHN B. WILSON, A.R.I.B.A., Glasgow. The principal difficulties to be overcome in the scheme were the great fall of the site from front to back, and the limited sum available, viz., 20,000*l.*, for 120 beds, with a required administrative department suitable for the future extension to 250 beds. The first was met in this design by adapting the levels of the building to the natural formation of the site, still keeping the different floors on one level throughout, without inclines or steps in passages; the great fall of the ground from south to north allowing the ground floor of male wing to be one flat lower than on female wing, and the male side of the house being three floors in height as against two on female side, gave the proportion required by the instructions between the sexes. This arrangement would have been of peculiar advantage in the working of the extensions when added, as the kitchen level would then be the middle floor level of the new wards; and also the stepping down of the new buildings would allow the morning sun to reach the eastern side of all the wards. The position of the wards on the site is almost due north and south, so as to give all the available sunshine to the long sides of the wards during the entire day, and the arrangement of corridors is such that while ease of administration is attained, any one of the wards could, when required, be totally isolated.

The present accommodation proposed is for seventy-two males and forty-eight females, or 120 in all, the patients having, in the large wards, 1,600 cubic feet, and in the special wards, 2,100 cubic feet, of air each. The future extension is proposed for seventy-eight males and fifty-four females, making a total of 252 patients.

The building was proposed to be of fireproof construction throughout, ward walls finished in KEENE'S cement, floors waxed and polished, and the ventilation, heating, and sanitation to include the most recent improvements. A careful estimate of the cost was made by an experienced Glasgow measurer, and the probable cost certified by him at 19,000*l.* for the building, outhouses, walls, railings, &c., of the present proposed hospital for 120 patients; and the cost of the extension for 132 patients additional, at 10,000*l.*; being a total cost of 29,000*l.*, or 115*l.* per bed.

The drawing illustrated shows the completed hospital.

## BROAD STREET CHAMBERS, READING.

WE publish this week an illustration of premises recently erected at Reading for Mr. G. W. COLEBROOK, from the designs and under the superintendence of Messrs. CHAS. SMITH & SON, architects, of Reading. The building is divided into sections, the ground floor and basement forming a shop and stores, while the upper floors are let off in suites of offices, with a separate entrance and approach. The internal fittings, including staircase, chimneypieces, &c., are of pitch pine. Externally the facing is of red local bricks, with Bath stone dressings. The upper part of pilasters to shop are of blue Purbeck stone, the lower being of polished red granite. Mr. KINGERLEE, builder, of Banbury, has very satisfactorily executed the works.

## RESIDENCE AT CRICKLEWOOD.

THE building of which we give an illustration is taken from a pen-and-ink sketch by the architect, Mr. EDWARD A. HEFFER, of 6 Victoria Road, Kilburn, N.W. The walls are built of deep red brick for facings, with white stone quoins, mullions, &c. The roofs are covered with tiles. The house being of large dimensions, it forms a conspicuous and picturesque feature on "Shoot-up-Hill."

## FREE LIBRARY, WOODSIDE, ABERDEEN.

THIS building was opened on October 15. It was erected at the cost of Sir JOHN ANDERSON. The site is between the Free Church and the Burgh Hall. The building has been designed by Messrs. PIRIE & CLYNE, architects, Aberdeen.

## MISSION HALL, TROWBRIDGE.

THIS building was opened on October 23. It is constructed of stone from the Atworth quarries, with Westwood dressings, the whole being roofed in with slate. The dimensions of the building are: Length, 72 feet; width, 39 feet; height, 50 feet. There are seats for 500 people, but, if required, a larger number can be accommodated. The architects are Messrs. WEAVER & ADYE, of Devizes and Bradford-on-Avon, and the builder, Mr. GEO. MOORE, of Trowbridge. The hall is a gift to the town from Mr. R. RODWAY.

## SOUTH WRAXALL VICARAGE, NEAR BRADFORD-ON-AVON, WILTS.

THIS vicarage is being erected by the Ecclesiastical Commissioners, from the designs of Messrs. WEAVER & ADYE, architects, of Devizes and Bradford, Wilts. It contains a dining-room, drawing-room, study, &c., and eight bedrooms, together with the usual offices. The total cost, including the stables, will be about 2,000*l.* The builder is Mr. JAMES BURGESS, of Westbury, who also restored the parish church last year, under the same architects.

## THE ARCHITECTURAL ASSOCIATION.

THE annual conversazione of the Association was held on Friday evening, the 26th ult., at the rooms of the Royal Institute of Painters in Water Colours, and numerous attended by the members and their friends. The first business was the distribution of prizes won in the previous session.

Mr. COLE A. ADAMS, the president, having taken the chair in the Prince's Hall, he presented the prizes as follows:—

## The Prizes.

*Architectural Travelling Studentship.*—First prize and medal, Mr. J. G. Sankey; second prize, Mr. G. G. Wallace; honourable mention, Mr. G. G. Woodward.

*Architectural Union Company's Prize.*—Second prize, Mr. Hall.

*Class of Design.*—First prize, Mr. G. G. Woodward; second prize, Mr. Brown; honourable mention, Mr. B. Haylor.

*Elementary Class of Design.*—First prize, Mr. W. E. Potts; second prize, Mr. C. C. Bradley; honourable mention, Mr. R. T. Thomson, Mr. H. C. Smart, and Mr. T. H. Roberts.

*Class of Construction.*—First prize, Mr. F. Ward; second prize, Mr. E. P. Tucker; third prize (given by the class), Mr. M. Collins and Mr. B. Potter.

*Class for Study of Planning and Specification Writing.*—First and second prizes, Mr. W. A. Powell and Mr. H. C. Smart, equal.

*Sketch-Book Prize.*—Mr. Sidney Vacher.

*Essay Prize.*—Honourable mention, Mr. E. P. Tucker.

*Lectures on Construction.*—First prize, Mr. A. L. Hart; second prize, Mr. A. O. Breeds; third prize, Mr. R. L. Cole; an additional prize (given by Mr. Blashill), Mr. M. Collins; honourable mention, Mr. H. C. Brushfield, Mr. M. Fawcett, Mr. J. J. Jones, Mr. W. H. Moxon, Mr. J. E. Newberry, Mr. T. H. Roberts, Mr. E. H. Selby, and Mr. E. P. Tucker.

The president then delivered his

## Inaugural Address.

Ladies and Gentlemen,—It is my pleasant duty, as president of the Architectural Association, to bid all the visitors who do us the honour of being present this evening a most hearty welcome; and I would that my duty ended here; but the office of president has its cares as well as its pleasures, and this evening entails upon me the burden of delivering an address, and upon you the listening to it. I shall endeavour to compress what I have to say into as few words as possible, and ask you to deal leniently with me, and to lend not too critical an ear to my discourse.

For the first time, I believe, in the history of the Architectural Association, since that body took up its quarters in No. 9 Conduit Street, we have been compelled, owing to circumstances beyond control, to hold our annual conversazione away from the old quarters, which have for so many years been the home of the Association, and the word "home" strikes a chord in the breasts of us all, and brings back memories of the past, and those who have year after year accepted the invitation to these conversaciones, will perhaps feel a little strange finding themselves in a new abode, away from the old rooms where so many pleasant memories linger, and where year by year the work done during the session has been exhibited, and where you have cheered with enthusiasm the successful candidates as they came up to receive from my predecessors the reward of their labours. What losses, however, we have sustained by leaving the old home are largely compensated for by the increased comfort of the space offered by the hall we are now assembled in, and by the spacious galleries which we have this year placed at our service, offering facilities never before enjoyed for displaying the objects so kindly lent for exhibition, and

also for hanging the various drawings which tell you that our members have not been idle, but have found leisure out of office hours to devote to the study of their profession, and to the winning of the various prizes offered for competition.

I must ask you to bear with me while I attempt to describe the basis upon which we work, the principles which guide us, and the objects we have in view, as I think there must be many here who perhaps until this evening were hardly aware that there existed an institution connected with the pursuit of architecture, and numbering on its roll nearly a thousand members. Briefly, then, the basis upon which we work is a purely voluntary one. Any student, under certain simple conditions, can become a member on payment of a small entrance fee and annual subscription. The income accruing from these sources is devoted to the payment of the necessary expenses of rent, &c., and for providing the prizes yearly offered for competition; and the funds at the disposal of the committee amply suffice to meet the claims, besides leaving a balance on the right side of the account. The principles which guide us are those of self-help and mutual assistance. We have classes for the study of the various branches of our profession, presided over, conducted by, and carried on by the senior members, who, for the most part, retire year by year, and give place to others, who themselves have most probably passed through the classes, and gradually work up through the different grades of office, so in their turn to impart knowledge to their juniors in the classes—the classes themselves electing the officers. The president, vice-presidents, and general committee are elected by the votes of the whole body of the members; and all who take part in the work of the association do so, as I have said, voluntarily and without payment. The immense amount of labour which is entailed upon some of the members would, I think, astonish those who were not aware of the very serious claims this labour of self-sacrifice, for the benefit of others, involves. But I am not here to ask you for your praise and commendation, and I am prevented from doing so by the presence here of so many who have nobly devoted themselves to the advancement of the art they love by giving their services to help on others to serve it, by instilling the principles of art and guiding the footsteps of those who have just entered the profession. There is one exception to this voluntary principle, if it can be called an exception. For two years past two of our senior members have given lectures upon art and construction, with the view of assisting the studies of those who propose presenting themselves as candidates for the honour of election as associates of the Royal Institute of British Architects. The committee, knowing the expense the lecturers must incur, asked them to accept the small surplus resulting from the fees of those attending the lectures, a sum so small as in no adequate way to represent payment for the valuable services rendered by these gentlemen.

The objects of the society are the education of the student of architecture upon the basis and principles which I have only sketched; and to supplement the instructions which he gets in the office where he may be a pupil or assistant. Too often a lad is placed in an office, and there allowed to shift entirely for himself, getting instruction in a kind of haphazard way. He joins the Architectural Association, and there finds an organised system at work, inducements for study, and, if he enters his name on the lists, friendly rivalry and competition. If he has anything in him, he is sure to get on and win his way without fear or favour, and in the struggle with his fellows finds his level, and measures his strength with his antagonists in friendly encounter.

We possess now a really valuable, though not very large library, and owing to the generosity of the Royal Institute of British Architects, their library is, under certain necessary restrictions, at the service of our members.

During Mr. Ernest C. Lee's year of office, he set on foot a subscription list for the purpose of establishing a travelling studentship, and this year I have the pleasure of announcing that all the money we require for this purpose has been subscribed, and without going outside our own body; including a splendid donation of 100*l.* given by the members of the original series of the Architectural Association Sketch Book, no less a sum than 785*l.* has been invested. This evening you have seen the balance of the prize, 20*l.* in all, taken by this year's successful candidate, and the second prize of 5*l.* by a gentleman who ran neck and neck with his rival, leaving a most difficult task for the judges to decide which should take first rank. I must invite your attention to the work done by the travelling student, during his month's tour, on the walls upstairs.

From the brief account I have just given, you will gather that we are at once the most democratic, and at the same time conservative body existing in the great Republic of art, for we cling to tradition, and would feign save what remains to us. We have no patrons; submit to no interference; we make our own laws and abide by them; we live together as peaceable and peace-loving citizens; such honours as we are able to offer are free to all who aspire to hold them, and who will work to gain them. Real talent is always recognised, and services rendered for the common weal ever meet with appreciation and sympathy. Faults doubtless exist amongst us. We might do more, and achieve, doubtless, more solid and lasting good; but you will pardon me if, as advocate, I dilate upon the sunny side of the picture. At another time

and place, later on, it will become again my duty to address the members of our body only, and, may be, point out some black spots upon our sun. To-day, bask only in its rays.

Beyond the advantages briefly touched upon, are those of smoothing down prejudices, enlarging the mind by intercourse with others of like pursuits, measuring strength with strength, and the discovery that others are capable of doing things as well, and perhaps better, than ourselves. Priggishness and conceit must perforce exist; but the student whose failing it may be to show such foibles will soon be made to feel how foolish and ridiculous they are, and will be obliged to find other opportunities outside the walls of Conduit Street for the full enjoyment of his failings. We possess, in many respects, the advantages which a public school gives to the lad brought up in one.

Before I leave this description, I must add that every session we have courses of lectures on various subjects, generally given by the senior members, and by gentlemen outside our own ranks, who kindly come to impart the special knowledge they have to give.

A president's address should, I believe, touch upon those topics and subjects more or less connected with the society or profession he represents. First and foremost then in interest is, perhaps, the great national competition for the new Admiralty and War Office buildings. Since the competition for the Royal Courts of Justice, now rapidly approaching completion, no greater one has taken place in this country than the one I have mentioned. Any architect, no matter of what nationality, may send in a design for these new buildings, and the Government have adopted the plan of asking, in the first instance, for sketch designs, drawn to a small scale, sufficient to illustrate the author's scheme and design. From the designs sent in a limited number will be selected, and the fortunate selected architects will then be invited to send in fresh drawings to a larger scale, with perhaps certain modifications and more in detail. These gentlemen will each receive the sum of 600*l.* for the revised plans, and from the plans sent in one will be chosen and the author asked to carry out the entire work, under certain conditions; the fortunate winner of the prize to receive 25,000*l.* for the entire work, in which the 600*l.* will merge. The designs will be adjudicated upon by a committee, of whom, we are told, one at least shall be an architect. Various opinions exist upon the wisdom and justice of the conditions imposed by the Government. It would serve but little purpose were I to attempt to discuss them here. One may perhaps express a regret that so little value appears to be placed upon the necessity of having the experience, advice, and counsel of professional men among those whose duties it will be to adjudicate upon the designs sent in. If anyone will only glance at the conditions, they cannot fail to see the enormous amount of labour and the great expense the preparation of drawings will involve upon the competitors, and they have, in all fairness, a right to demand that their labours should be judged by those best competent to do so. And who can be better fitted than those whose lives have been devoted to the science and art of architecture? The assistance of officials well versed in the requirements of public buildings is indispensable; but above and beyond all this is the necessity of the possession of those faculties which long experience and study have developed, giving a grasp and perception of a design, and who, looking through it as a whole, can conceive the result likely to follow its erection. The nation will have to pay the bill for these new offices, and has the right to demand that the best judgment which can possibly be brought to bear should, no matter what the cost. Perhaps when we meet together again next year the problem will have been solved, and the design and name of the successful candidate known, as well as those of the few selected for the second competition. Should he, or any of them, come from the ranks of the Architectural Association, great will be the congratulations and rejoicings in consequence. Will the first prize be taken by one who has already won his laurels, and whose work is now before the world, or shall we welcome a new-comer, destined to achieve a mighty success—one whose name shall rank high in our noble art, together with the honoured names whose work and fame are too well known to you to need repeating here?

Curiosity will be keen to know what style will be selected. A few decades back and one might safely venture the opinion that Gothic would win the day; but no one at all observant can fail to have noticed the tendency towards a Classic revival, and the fact that in the public secular buildings recently erected the Gothic style has been conspicuous by its absence. There are many who think that in the Royal Courts of Justice—that monument to the genius of one, perhaps the greatest master the Gothic revival has produced—we have seen the close of the effects of it, and that our restless nineteenth century life clamours for change, change, when so much has been learnt, such great progress made in a style which is ours by right of birth, and which in days gone by was as natural to our forefathers to build in as the clothes they wore and the food they ate. It is the custom with many to sneer at everything modern, and, indifferently acquainted with the art they set themselves up to be judges of, to say that modern Gothic is simply a copy—and a very bad copy according to them—of the old work. Such criticism is, unfortunately, only too popular, and unfortunately there are so many spurious examples of modern

Gothic to hand to support the opinion. But in all fairness, in judging of art go to the best examples, and, observing in order the buildings of modern times—I mean now those erected since the Gothic revival—notice the progress that has been made by such men as Pugin, Scott, Street, Burges, Butterfield, Pearson, Sedding, and other masters, whose names are familiar to you. These men have produced works which will live, despite the criticisms of to-day; ground has been gained, the stamp of genius is upon what they have done. And now, when a school was rising up, taking note of past failures, gaining daily strength in expressing their ideas, and meeting modern requirements in a common sense way, does it not seem a thousand pities that all this ground and experience gained in the adaptation of Gothic, our national birthright, must be surrendered? If, as architects, our enthusiasm has cooled for the style which only a few years ago seized upon nearly every student who entered the profession, and fired his zeal to excel in that and that only, then far better leave it alone, for no good thing could come from the brain of an artist half-hearted in the style he was working in. But one is tempted to ask, What, then, will be the style which shall represent the present school of thought? And echo answers—what? Queen Anne! one whispers, with almost an apology for mentioning the name of that noble lady, who it has so long been the custom to announce as dead; but the fair Queen has had much offered to her name of late, and the “Queen Anne style,” as we call it, for lack of a better name, has much to commend itself in its piquancy, picturesqueness, and adaptability to modern wants, domestic purposes, and to bricks and mortar. But what, it will be asked, are the guiding principles of this style? Has Queen Anne any principles? Is the style capable of rousing enthusiasm in the student, and teaching the eternal lessons of truth and beauty? Are we destined to see a Queen Anne Admiralty and War Office? The event will show; it would be waste of time now to speculate further; only I will add that if by good chance, as some think, and I go with them, this great work of the century should fall into the hands of the man whose work, perhaps, of all men in this country exhibits, despite some eccentricities of genius, the finest perception of what is beautiful—I allude to Norman Shaw—were he to give his whole mind to the design, then, I venture to think, we should have a building which, despite individual objections, would be the work of a consummate artist; a building brimful of piquancy, rich fancy, and masterly grouping, and a work that we should as a nation be proud of. In the hands of such a master, no matter hardly what style he elects to work in, call it Queen Anne or Norman Shaw, we recognise the stamp of power, which bends to its will whatsoever his hands find to do.

Mr. Ruskin tells us, in his book about building, entitled “The Stones of Venice,” that architects should live among mountains. Perhaps we must take this more in its figurative sense; certain it is that, though the migration of the whole profession to mountainous regions would doubtless be a very grateful relief to a certain distinguished barrister, that great Sir Oracle who, when he opes his lips let no dog bark, still it would be attended with very serious inconveniences to the general public and the emigrants themselves. I am afraid that the colony would soon break up from internal dissensions and differences of opinion, and that the great question of a style for the future would not be one whit the more formulated, promulgated, and adopted. The art of architecture in this country is not practised now under defined rules; we have no one great school of thought to which allegiance is given, but it is left free to every man to do what is right in his own eyes. The result is endless variety in our buildings, frequently too much straining after effects too often disappointing in their realisation; and in the constant struggle after so-called originality, perfection in style must, under such a system, be unattainable. We avoid dull monotony; we miss the results which would follow the bent of the best amongst us pursuing the working out of one style. Some critics lay all the faults of modern architecture upon us as architects; but, if anyone is to blame, the public must take their share. Architecture from all time has been the expression of the wants of the people who practised it. The buildings of antiquity tell us sometimes all that is known of the habits of the men who occupied them; and the New Zealander, looking at what he may find, will say that the people of the nineteenth century were evidently a very prolific race, very eccentric in their habits, very erratic in their ways, most multitudinous in their tastes. Any attempt at the classification of buildings and styles he will have to give up in despair; he will find very few houses at all, and he will write it down that the architecture of these extraordinary people was, like their paintings and sculpture, characteristic of the individual artist and of the people he built for, that his works show he had to serve a restless, hurrying world, who demanded so much and paid so little for it.

Is a national style again possible to us? I cannot venture to answer the question, but I may point out that probably the best way to arrive at such a consummation is, I hope, marked out by the step recently taken by the Royal Institute of British Architects. Now entry into that body must be by passing an examination, which means that only those men who come up to a certain test of the knowledge requisite to an architect will be admitted. This, perhaps, is a step towards making architecture, like law and

medicine, a diplomated profession. When one considers the responsibilities thrown upon architects, they have some right to demand that they should be protected against the blame and odium too often showered upon them owing to the utter incompetence—in science and art—of the men who, without any training in the profession, style themselves architects, and cover the land with buildings, inartistic, unscientific, and unsanitary. No qualified man shirks his legitimate share of responsibility; but, willy-nilly, he must suffer for others. If admission into a profession, second to none in the nobility of its aims and character, meant that the applicant must be a man of education and culture, an *esprit de corps* would speedily spring up, art would be studied on better-defined lines, and science would be pursued as the highway to success. I take it that the tendency of this would be greater unity of thought and action amongst us, and the public would have much the same guarantees of competency in the men they employed as they now have in law and physic.

Before, however, we can have good architecture, modern speculative building as usually practised must receive its death-blow. The greater part by far of London is covered with it; somebody is to blame—blame the architects! Ladies and gentlemen, we are *not* to blame; the blame lies with a public which will have it so, with rapacious landlords, greedy lawyers, and poor builders, who, after paying the ground landlord, the lawyers, and estate surveyor's fees, and scamping his work—poor wretch! more sinned against than sinning—runs up house after house under no really efficient control. Sad to say, the street upon street of speculative houses, are more characteristic of our present national style and modern society than anything else we have. All know the miseries, the expense, the disappointment, and, too frequently, the ill-health and death which follow the taking, purchase, and occupation, too often, of the modern builder's house. Bad taste, bad art, bad building, bad plumbing, bad drainage—it all comes back to plain matter of fact. We want too much for the money, and the middlemen want too much money out of the builder. The public are, on the whole, content to let matters be as they are, and offer prices quite inadequate to procure good work. Landlords, lawyers, and surveyors exact too much money from the unfortunate builder, whose only chance of profit is to save every penny he can upon the buildings. Should an equitable law be passed which shall make it easier for a man to procure a freehold plot of ground, so that he may be tempted to build substantially, we may yet see buildings which, though less pretentious, shall be well constructed, and stamped with the character of honesty and durability.

Until this much-to-be-desired epoch in our history comes, it behoves every one of us who have our art at heart to pursue his way, following in the steps of the great architects who have gone before, striving to grasp the lessons they mastered, and ever striving to master the eternal principles of truth and beauty found in the best art, no matter what the style may be. True to ourselves, and so true to all men, and in the pursuit of the beautiful, not to forget that architecture to be beautiful must be strong, and that this expression of strength can only be gained by mastering the sciences of mechanics and construction, the nature of the materials we use, and the requirements which the building must fulfil. We must remember that simply to copy parts from old work, which, however charming they may be where the student has found them, will in all probability look out of place apart from their surroundings and divorced from the spouse they were subservient to, and that we must study to acquire that too often uncommon sense, common sense; stoop to nothing that is mean or dishonourable, and, endeavouring to the utmost of our powers to lead our employers, and not to drive them, try to serve them with loyalty and uprightness, and to hold the scale of justice in even balance between client and builder; and, in a word, take up the motto long ago adopted by the Architectural Association, and “Design with beauty, build in truth.”

On the conclusion of the address, which the president prefaced by craving the indulgence of the company for the breakdown in the management of the cloak-room department, an adjournment was made to the galleries, where the prize drawings were on view, as also a loan collection of furniture, tapestries, and art needlework. Among them were wall-paper decorations and tapestries manufactured by Messrs. Jeffery & Co., from designs by various architects and others, including the names of Mr. J. D. Sedding, Mr. Brightwen Binyon, Mr. W. J. Muckley, Mr. Walter Crane, Miss Kate Faulkner, Mr. F. V. Hart, Mr. J. R. Harris, and the late Mr. B. J. Talbert, the original drawings being shown. Conspicuous in a collection of art metal-work and fittings, for ecclesiastical and secular purposes, by Messrs. Hart, Son & Peard, was the memorial brass executed by the firm for the tomb of Professor E. H. Palmer, Captain J. Gill, R.E., and Lieutenant Harold Charrington, R.N., who were murdered on August 11, 1882. The band of the 2nd Life Guards, conducted by Mr. M. W. Winterbottom, played various selections during the evening, and the evening's entertainment concluded with a concert in the Prince's Hall.

## LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE opening meeting of this society was held in the rooms in Albion Street on Monday evening, when the medals and prizes offered through the society were awarded to the successful students. The various drawings prepared in connection with the competition were exhibited in the room. Great interest was taken in the measured drawings of Bolton Percy and Sherburn churches, sent in competition for the society's silver medal. The medal was awarded to Mr. James Hardman. Mr. Todd's and Mr. Burrow's drawings were very excellent in quality, and made the competition very keen. A special prize (a bronze medal) was awarded to Mr. Alfred Whitehead for drawings of Sherburn church, and he also obtained a prize for a drawing of the rood screen at Methley church. Mr. C. E. Tute was the recipient of two prizes, the first being for pencil-sketches of objects of local interest, and the second for a design for a lych-gate. Mr. Joseph Hall was successful in winning a prize for the design of street frontage in Burmantofts faience, and a prize was given to Mr. J. H. Roodhouse for his design for a villa residence. The prizes having been awarded, the opening address was read by the president, Mr. Edward Birchall, F.R.I.B.A. A vote of thanks was proposed by Mr. J. Barlow Fraser, F.R.I.B.A., who at the same time tendered his thanks to the society for their efforts in connection with his return at the head of the poll to a seat on the council of the Royal Institute of British Architects. The vote was seconded by Mr. Thorp and adopted. A vote of thanks was proposed by Mr. G. Corson, and seconded by Mr. G. F. Danby, to Mr. W. H. Thorp, A.R.I.B.A., for his services as past honorary secretary, and as one of the original promoters of the society. The vote was unanimously adopted. The arrangements for the session having been duly announced, the meeting was brought to a close. The president, in his address, said the society would be glad to receive as honorary members, artists, sculptors, and other art workers. After suggesting various ways by which young students might improve themselves in connection with their training in architecture, he gave a general review of the most interesting occurrences of the year. Referring to the rapidly increasing number of telegraphic and telephonic wires which are being carried over buildings, he stated that some underground system should be enforced. Channels might be constructed along the kerbstones, which could also be adapted to other requirements so as to save expense, and the municipal authorities might be remunerated for this use by means of rents.

## THE CHURCH OF ST. MICHAEL, CAPUA.

A PAPER on "A Church by the Camp of Hannibal" appears in the *Guardian* from the pen of Dr. Freeman. Hannibal, the friend of Capua, would at Capua, he writes, honour Diana of Tifata; but it was not Diana that had sent him. With what thanks did he honour his own gods, when Capua, second city of all Italy, welcomed the victor of Trebia, Trasimene, and Cannæ? Is it too bold a flight to fancy the mount of Tifata the scene of the same form of Baal-worship as the mount of Carmel? But the gods of Italy lived on, undisturbed by the momentary presence of Semitic rivals. Diana was not the only power worshipped on Tifata; Jupiter also had his holy place. And it may be that the venerable church which now forms the chief attraction of the hill-side represents the holy place of Jupiter rather than the holy place of Diana. It is curious to see how a kind of appropriateness was often sought after in the nomenclature of pagan temples when turned into Christian churches. Thus, at Athens, the Parthenon remained the Parthenon, while the temple of the warrior Theseus or Heracles became the church of the warrior George. We should look for a Santa Maria, or a Santa Lucia at the least, on the site of the sanctuary of Diana. Had we here a San Pietro, we should have very little doubt in setting down the prince of the Apostles as having supplanted the father of gods and men. But at Sant' Angelo in Formis we feel somewhat less certain; St. Michael suggests the Norman, and the Norman has been there. It may well be that the name is no older than his day. . . . The church and the small surrounding village form a kind of distant *arx* to the greater collection of houses which surrounds the amphitheatre; but among the nearer objects which catch the eye from the height, the most prominent is not old Capua with its amphitheatre, but new Capua (Casilinum that once was), with its towers and cupolas, mediæval and modern. We look on many things from the terrace in front of the portico of the archangel, but that which among artificial objects chiefly draws the eye towards it is not the elder Capua of Hannibal and Marcellus, but the Capua which succeeded Aversa as the seat of the elder but the less famous of the Norman powers in southern Italy. As we mark the advance of national union, no less than as we mark the advance of mere dynastic aggression, we have sometimes to think, for a moment perhaps to mourn, that "kingdoms have shrunk to provinces," though in this form of advance and incorporation, we have no longer to add that "chains clank over sceptred cities."

Capua, on both its sites, once the head of an Etruscan, once of a Norman dominion, passed, in one age, under the universal rule of Rome. In another age it again sank from its separate headship to become a member of that greater Norman dominion in Apulia and Sicily, which, after more shiftings, unions, divisions, transfers to distant rulers, than any other part of Europe, has in our days been merged in the realm of United Italy, with Rome as its head but not its mistress.

We reach then the height which, whether that of Jupiter or Diana of old, is now the height of the warrior archangel. The whole history of the church belongs to the independent days of the second Capua; in its present shape it belongs to the days of independent Norman rule in the second Capua. But the days of independent Norman rule were days when the arts of the earlier rulers of the land still lived on. We see signs of the art of Byzantium, so long mistress of southern Italy, and of the art of the Saracen, in Italy only a visitor or an invader, while in Sicily an abiding master. The portico in front of the church is Roman in its general idea; but, instead of the colonnade and entablature of the Laurentian basilica, we see an arcade whose pointed arches at once call up memories of Sicily. They have indeed little of Sicilian grace. Nowhere at Palermo or Monreale do we see such massive columns bearing such massive stilts. Columns indeed we should hardly say, as some of them are plainly mere fragments. But here, just as in Sicily, just as in Aquitaine, the pointed arch is no sign of coming Gothic; the style is still wholly Romanesque, and somewhat rude Romanesque too. And in this region of Italy we can hardly doubt as to attributing the almost accidental shape of the arches to the influence of Saracen models, perhaps to the workmanship of Saracen craftsmen. Hard by, but not joining the building, by an arrangement unlike Sicily, unlike Apulia, but the common rule of northern Italy, rises a bell-tower, or rather the beginning of a bell-tower, which raises our wonder as to what it would have been if it had ever grown to its full height. Two stages only are finished, the lower of hewn stone, the upper of brick; but their bulk is so great that the tower, if it had ever been finished, would surely have ranked among the highest of its class, utterly overpowering even the great basilica at its side, except so far as it would have been itself overpowered by the natural heights above it. As in some other cases, the thought suggests itself, were not those who left off building the tower wiser than those who began it? The tall bell-towers of Italy look well as they rise from the Lombard plain, as they crown the hill of Fiesole, as they skirt the shores of the lake of Como. But we are not sure that a gigantic tower, which, if it was to have any kind of proportion, ought to have been carried up to a height as great as that of Venice, was in its right place when set a little way up a mountain-side, as if simply to show how small man's biggest works look in the midst of the works of nature. But the technical eye is thankful for the fragment that has been built, though mainly on a very technical ground. Professor Willis is gone, but his happy phrase of "mid-wall" shafts has not died with him. The custom of the elder Romanesque towers, the abiding fashion of Germany and northern Italy, was to set the little columns which divided the coupled windows in the very middle of the wall; the later Norman fashion, whether in Normandy, in England, or in Apulia, was to set them nearly flush with the outer wall. In this tower, Italian by geography, Norman by allegiance, two sides conform to the Italian and two to the Norman fashion. Nothing can show more clearly that even such small matters of detail as the use of a mid-wall shaft were made matters of serious thought, and that it was sometimes thought well to come to a compromise between two rival forms of taste.

The outside of this church, except so far as it forms an object in the general landscape, is perhaps chiefly attractive to the technical observer; the inside will surely appeal to every visitor, though the visitor who is technically informed in matters of painting may possibly look upon it with more of curiosity than of positive admiration. But the eye of the more general inquirer will give something like positive admiration to a basilica of eight arches, resting on ancient columns of various marbles, with its original design far less damaged than is common in Italian churches, and with every inch of available space covered with elaborate paintings of the date of the building. Like St. Peter by Pisa, the archangel by Capua trusted to painting for his enrichment, and not to mosaics; and though the Campanian pictures are by far the better preserved of the two, though nearly all the subjects can be made out with the greatest ease, yet Ravenna and Venice rise to the mind to make us think that at least, if endurance be the object, there is a more excellent way.

The walls of this church form almost a pictorial Bible, with a few legendary and local subjects thrown in. The Abbot Desiderius, holding, after the usual symbolical fashion, the church in his hand, is to be seen at the east end along with the archangels and evangelists. At the west end is what connoisseurs tell us is one of the very earliest pictures of the Last Judgment. On the two sides a crowd of scenes and figures from the Old and New Testament cover the whole space. The style of the painting is said to show Greek workmanship; we look towards the west end and mark, hardly above the ground, a single small shaft with a capital of strictly Byzantine character. The ruling Norman seems on this

spot to have pressed into his service the artistic powers of all the inhabitants of the peninsula. Italian, Greek, Saracen, all give their help to adorn the house of the archangel. The Norman himself contributes nothing but the position of two small columns in the tower windows. We cannot even attribute to him the position of the house of the archangel, set Norman-fashion in a high place; for the first church was built before the Norman came. It is not so further east, where a distinctively Norman element is to be seen in the great churches of Apulia. But the gathering together of the best skill of the time from all quarters is a thoroughly Norman function, whether in Italy or in England.

### THE BLENHEIM MANTEGNA.

THE little tempera painting of *Samson and Delilah* by Mantegna, purchased for the National Gallery, at the sale of the Sunderland Collection, contains a quaint inscription on the trunk of a tree in the background, viz. :—

"FOEMINA DIABOLO TRIBUS ASSIBUS EST MALA PEIOR."

In a description of this picture, published shortly after the sale, it was assumed that the letter P must be supplied before "ASSIBUS" to render the words intelligible, and it was suggested that the deficient letter might be supposed to be round the tree trunk, out of sight. Mr. C. L. Eastlake says that an examination of the picture, which is now hung in the gallery, will hardly tend to confirm this supposition. The Latin word *as* was used idiomatically to denote various measures of extent and capacity, besides those of weight and pecuniary value, and therefore "tribus assibus," in this instance, seems to make quite as good sense as "tribus passibus." Indeed, the English expression "three times as bad," signifying not repetition, but intensity, is a parallel idiom. Moreover, the line, evidently intended for an hexameter, despite the false quantity of the I in DIABOLUS, will "scan" as it is written without the elision of the final S in "TRIBUS," which would be necessary to the metre if the P were inserted before the following word. But whether we construe it "A wicked woman is thrice as bad as the Devil," or "by three degrees worse than the Devil," the meaning of the author is equally plain.

### IRISH BUILDING MATERIALS.

THE following are the awards of Messrs. R. Walker and P. Barry and Professor Jaek on the building materials shown in the Cork Exhibition: Wm. Beecher, D.L., freestone from Cape Clear as building stone, hon. mention. C. P. Coote, D.L., limestone suitable for engineering works, hon. mention. R. Collis, specimens of Irish marbles, hon. mention. Cooper & Co., Drinagh, Wexford, for slow-setting cement, ground extremely fine, giving considerable strength under tension, and in concrete slab provided by the company, the manufacture of which is excellent, hon. mention. Thompson Brothers, Cork, Vectis Portland cement for quick-setting cement, finely ground, hon. mention. The Ferrumite Manufacturing Company, Cork, ferrumite as a building material, and especially in slabs for flooring, medal. Benduff and Froe Slate Company, Rosscarbery, county Cork, medal. Victoria Slate Company, Dublin and Carrick-on-Suir, strength, grain, texture, and colour, medal. Wm. Carroll, Cork, for limestone for building purposes and for lime, hon. mention. Healy Brothers, Tralee, large limestone (tomb) monument, for excellence of workmanship and sound material, in cut and moulded limestone, medal. Francis Ritchie & Sons, Belfast, for stone suitable for building purposes, hon. mention. Jas. Fitzgerald, Cloyne, county Cork, for general collection, medal. Rev. Canon Brosnan, P.P., V.G., Caherciveen, county Kerry, Castleisland marble and red limestone, hon. mention. Burns & Hutton, Belfvelly Brickworks, Queenstown, for bricks and tiles, medal. South Wales building and fire-bricks, hon. mention. Fleming & Co., Tourig pottery, Youghal, bricks and tiles, hon. mention. E. O'Shea, Callan, Kilkenny, Celtic cross, after the design of the ancient Irish cross, Kilkis Green, county Kilkenny, for excellence in workmanship, medal. Collection of raw materials, committee of exhibition; sample No. 4, duplicate of building stones of Ireland (146 specimens), collected for the Museum of Irish Industry in 1845-46 by the Royal Engineers, contributed by the Royal College of Science, Dublin (Science and Art Department, South Kensington). We consider the executive committee is indebted to the College of Science, Dublin, for their kindness in contributing those most interesting specimens of Irish building stones. Same stand—Mr. C. S. Parnell, M.P., Avondale, Rathdrum (W. Kerr, agent), specimens crossing channels and pavements, hon. mention.

#### Jurors' Report.

We beg to thank Messrs. Lambkin Brothers for their kindness in placing one of their powerful hydraulic presses at our disposal for conducting tests. We have had much pleasure in observing the general excellence of the majority of the exhibits. The building stones indicate that there is a considerable variety throughout

Ireland suitable for all classes of work in architecture and engineering, for ornament and plain work in small dimensions or in large blocks. The colour of the limestone throughout the country varies from dark grey to bright light grey. Both kinds are often of crystalline texture—even grain, with two or three "freeways"—and capable of being worked to the slenderest proportions in mouldings, tracery, or enrichments, while other specimens of both light and dark colour show a considerable amount of lamination, and can only be laid on their quarry bed without risk. Messrs. Healy Brothers' monument and Mr. O'Shea's Celtic cross are excellently tooled. Mr. Fitzgerald's collection is very good, and the beautiful colour of the southern limestone is seen to advantage in his Celtic cross. The sandstones are especially worthy of comment, and need only to be introduced into the market to insure their being used in building operations. The marbles throughout the country are abundant and of endless variety in colour. Galway and Cork are very fruitful in marbles. The red limestone of Cork is well represented. The specimens of lime are good, but all are not well burned. Care in this respect is necessary to insure the best results in mortar. We are pleased to see an Irish manufacturer taking a good position by the side of a well-established house in cement, an article of varied utility and large consumption. The Drinagh cement, judged as a slow-setting cement, bore the tests with excellent results; and there is no reason why it should not ultimately rank in the market with the best brands of this kind of cement. The testing of the bricks showed very good results, especially the Belfvelly and Youghal. More care in washing the clay in the latter and in moulding the clamp or common brick sticks would show further improvement, and leave nothing to be desired in point of strength and durability.

### THE SOUTH WALES UNIVERSITY COLLEGE.

GREAT activity has prevailed in Cardiff since that town was selected by the Government arbitrators as the site for the college, to keep in accord with undertakings then made, that the college should be in working order by October 1883. An arrangement first made to start the work in the new science and art schools was not sanctioned by the Science and Art Department, and the council of the college have acquired, at a rental, the use of the building hitherto known as the Glamorgan and Monmouthshire Infirmary, which they instructed Messrs. James, Seward & Thomas, of Cardiff, to alter and renovate for college purposes, a new infirmary being on the point of completion, from the designs of the above-named architects. Although a month only was given to the work at the college, it was satisfactorily completed by October 24, on which day it was opened with some ceremony by Lord Aberdare, the first president—a practical key of solid gold, manufactured by Messrs. Chubb & Son, from the design of Mr. Edwin Seward, R.C.A., being used on the occasion.

On the same day the new Cardiff Public Hall, erected from the designs of Messrs. James, Seward & Thomas, was opened by Mr. Edward Jenkins, in time for the inaugural ceremony to be held therein. About three thousand persons were present, including Lord Aberdare, Lord Carlingford, Mr. Henry Richard, M.P., Mr. Lewis Morris, and many of the leading names connected with the movement of higher education in Wales.

The disused infirmary buildings are found to give excellent accommodation both as to space and arrangements for the new college work, and the erection of a new college is thus deferred for several years.

### INTERNATIONAL FORESTRY EXHIBITION.

THE proposed International Forestry Exhibition, which will be held at Edinburgh in the summer of next year, promises to be a great success. The exhibition will be arranged in ten classes, namely: (1) Practical forestry; (2) forest produce, raw and manufactured; (3) scientific forestry; (4) ornamental forestry; (5) illustrations of forestry; (6) forest literature and history; (7) essays and reports; (8) loan collections; (9) economic condition of foresters and woodmen; and (10) miscellaneous. The regulations state that the exhibition is intended to include everything connected with or illustrative of the forest products of the world, and that it will be open to exhibitors from all countries; that the entries will close on March 1, 1884, and that exhibitors will be charged one shilling per square foot of floor space. Arrangements will be made by the committee for the reception of exhibits at a date to be fixed, but all fulminating and explosive substances, and all dangerous materials, will be absolutely forbidden to be sent. Medals, money prizes, and diplomas for exhibits and essays will be awarded by competent jurors. Contributors to the loan department are requested to communicate with the secretary, Mr. G. Cadell, 3 George IV. Bridge, Edinburgh, who will supply special forms to be filled up. The committee, it is further stated, will endeavour to obtain from the various British railway companies special terms for the conveyance of exhibits to and from the exhibition, and such arrangements as are made will be duly intimated to exhibitors.

## THE OLD GLASGOW COLLEGE.

A LETTER has appeared from Mr. A. G. Thomson, architect, advocating the removal and re-erection of the remains of the old University Building in Glasgow. Glasgow, for a city of such great antiquity and importance is, he says, by no means rich in ancient monuments. The cathedral is, admittedly, a matchless example of the ecclesiastical architecture of the middle ages; but in the matter of secular buildings of the olden time we are not so fortunate. One remnant, indeed, exists in the picturesque and impressive façade of the old university in High Street, dating as far back as the commencement of the seventeenth century, and it would be well if public interest were awakened to the necessity of steps being taken for its conservation. The railway company has, on more than one occasion, been urged by the city authorities to carry out the widening of High Street in front of the College Station; but this public improvement, desirable though it may be, would involve the demolition of the street frontage. The company would, in all likelihood, be willing to meet the wishes of the community in the disposal of the materials. On this assumption Mr. Thomson would suggest that the chief decorative members of the ancient stonework should be embodied in the construction of a principal gatehouse or lodge at one of the entrances to the grounds of the new university, say the north-western entrance, opposite Hillhead Street, which is still unprovided with permanent buildings. An inscription should here record the circumstance of the escutcheon (which bears the date of 1658) and principal architectural details having formed part of the original edifice. As a successful instance of adaptation of the same nature, Mr. Thomson refers to the fine old staircase which formerly stood in the quadrangle in High Street, and has been re-erected at the west end of the new university.

## SANITARY INSTITUTE OF GREAT BRITAIN.

A PUBLIC meeting of the local committee and the subscribers to expenses fund, in connection with the recent Sanitary Congress, was held in the Council Chambers, Glasgow, on Monday. The Lord Provost presided.

Mr. Henry Johnston, the local secretary, read the report of the committee, which stated that the recent congress was one of the most successful that had been held in connection with the institute, and that the arrangements made for the reception of the institute were equal to the occasion. For that satisfactory result they were indebted to the citizens of Glasgow. The total amount subscribed was 1,266*l.* *os.* *9d.*, and there was a balance of about 500*l.*; and as the fund was raised in the form of a guarantee, the committee recommended that the balance be returned *pro rata* to the subscribers, that 10*l.* be retained to meet any charges that might have been overlooked, and at the expiry of two months the balance, if any, be equally divided between the Royal and Western Infirmaries. As to the exhibition, during the time it had been opened it had been visited by about 25,000 people, and was one of the most successful ever held by the institute. The report concluded by expressing the acknowledgments of the committee to the directors of the Royal Exchange and the Athenæum for throwing these institutions open free to the members of the institute while in Glasgow.

The Lord Provost, in moving the adoption of the report, said there was one part which was of a very satisfactory nature, and that was the financial. It was extremely satisfactory that the citizens, with their usual liberality, had come forward on this occasion to such an extent that the committee were now able to return to them so much as about 40 per cent. of what was given. That, he thought, would have a wholesome effect in the future when any such necessity arose to aid a useful scheme. As regarded the usefulness of the congress to the citizens, he dared say they were not able at this moment to gauge its importance. He was hopeful, however, that it would show fruit in future years. The only other matter in connection with the congress was that the arrangements were of a character to take away from the discussions that ensued after the reading of the papers many of the eminent men from the south. Some six or eight gentlemen were engaged nearly all the time examining the products that were sent for exhibition, and making their awards. It would have been a matter of great consequence if they had had the advantage of their presence at the discussions that took place in the St. Andrew's Halls, because he believed they would have thrown an amount of light on some of the questions that were brought up that really was not thrown upon them by those who were present. Whatever might be the arrangements in future years, he hoped that in the meetings of the Congress in London some of the subjects introduced in Glasgow would be taken up and ventilated, so that the public might have the opinion of these men upon them. To his own mind—and he hoped to the minds of those present also—the visit of the Sanitary Institute of Great Britain to Glasgow had been a successful one, and, looked at in any way they pleased, it must be of great service to the city.

Bailie Wilson seconded the motion. He congratulated the city upon the success which had attended the Congress in all its

departments, and expressed the hope that the city would reap the benefit in future years. A letter had just been received from Mr. Wallis, the secretary of the institute, in which that gentleman said: "I am desired by the chairman, on behalf of the council, to express to you the great gratification they feel at the success of their Congress meetings at Glasgow, and they would desire heartily to thank the Lord Provost, the local committee, and all those by whom the arrangements for the Congress were so carefully made and successfully carried out. They trust that the Congress will prove an interesting point in the sanitary annals of Glasgow, and that its results may prove a lasting benefit to the town itself, and also to the general advance of the objects which the Sanitary Institute has so much at heart."

The motion was unanimously agreed to.

On the motion of Mr. Wyllie, seconded by Archbishop Eyre, a vote of thanks was awarded to the executive committee, which was acknowledged by Bailie Hamilton. On the motion of Mr. John M'Laren, a vote of thanks was awarded to the Lord Provost. Bailie Wilson acknowledged the vote on the part of the Lord Provost, and the meeting then separated.

## The late Mr. Street and Sir Edmund Beckett.

SIR,—It is as well, perhaps, that the *Times* has closed its columns to a correspondence which it took care to make as one-sided as possible; but it does not seem right that Sir Edmund Beckett should be left wholly unanswered.

His reckless misstatements cannot be substantiated, as he seems characteristically to think, by simple reassertion, still less by fresh fabrications and darkly-hinted innuendo—his favourite weapon. With what ease and force that weapon might be turned against himself all who know anything of his career must be well aware; but so long as he confines himself to butting at the living his attacks are best met with silence. Architects can well afford to contemplate with calmness the familiar spectacle of the voluble (if somewhat slipshod) baronet running amuck. He has done it before, and he will do it again when the fit takes him. Like the hen-pecked navvy, we are happy in the knowledge that, while it amuses him (and the public), it does not hurt us; and we may feel well assured that, after his wildest onslaught, all people of ordinary common sense will continue to think the profession of architecture neither worse nor better than any other. When, however, not content with attacking the living, he goes on to misrepresent and abuse one who can no longer defend himself, but whose name will doubtless be held in honour long after Sir Edmund Beckett's is buried in oblivion, I am sure that not only every architect, but every man of decent feeling, must be ready to protest against such a system of warfare.

October 31, 1883.

Yours obediently,  
ARTHUR W. BLOMFIELD.

## Exhibition of Works in Wood, 1884.

SIR,—I shall be glad to be permitted to draw your readers attention to an intended Exhibition of Works of Carpentry and Joinery, which is to be held in Carpenters' Hall next summer, under the direction of the Carpenters' Company and the Joiners' Company of the City of London. These companies, acting in concert, have arranged a series of prizes for models and specimens, and others for drawings of carpentry and joinery, which are announced more in the hope that during the winter persons interested in these arts may prepare specimens of their skill. Full particulars of these competitions can be had by applying to the clerk to the Carpenters' Company, Carpenters' Hall, London Wall, E.C.

It is in addition proposed to form a museum of every sort of illustration of both arts. Drawings, models, photographs, specimens of such subjects as roofs, timber spires, half-timber construction, the stall-work or tabernacle-work of churches, or household joinery will all be welcome, and it is to be hoped that many of your readers may be willing and able to place such objects at the disposal of the companies, who are very well situated both for space for exhibition purposes and for the aid of men familiar with the practice of both arts on the courts of the two companies.

Yours obediently,  
T. ROGER SMITH.

## The Dublin Museum Competition.

SIR,—A paragraphist in "Notes and Comments," whose hand may be recognised as having been at this subject before, is, allow me to say, just as ill-informed about it as in former instances, and has as little justification for an unfair fling at "Dublin architects." The Dublin architects have nothing to do with the stinginess or liberality of the Government in the abstract. It is their business only to know the size which the Government has prescribed for the

*buildings.* Dublin architects know that it foots up to some 3,900,000 cubic feet. They best know the cost of building in their own city, probably the dearest to build in in the kingdom, and they think that at even 8*d.* per cubic foot this looks like 130,000*l.* rather than 110,000*l.* Anything undefined about this, is there? In the face of facts and figures, what nonsense it is to lecture Dublin architects about "considering Kildare Street." Many of the influential persons concerned in this competition agree in the inadequacy of the money for the size of the building, and are doing their best to get over this difficulty at the instance of the "Dublin architects," and so remove an embarrassment from English competition rather than create one. When anyone says Dublin architects are "preparing the way for indignation meetings," he circulates an unfounded and unjustified libel.

The Dublin architects have never in the past had anything to say to indignation meetings, and in the late competition refrained from criticism and comment on the successful designs.

As to the assessorship question, your paragraphist's insinuation of a slight on Mr. John McCurdy is quite as unfounded, as honest Mr. John McCurdy, who has the esteem and respect of all his brother architects, would be first to tell him; but what the Dublin architects—Mr. McCurdy included—object to, and what the Dublin public disapprove of and resent, is the assessorship of *Royal Engineer officers*. "Colonels, *mon Dieu!*" said a worried official here, a Frenchman in a Government department, "why come these colonels at all to my department? Why are your British colonels not with their regiments?" No architects like Royal Engineers as "professional" assessors, and all the lecturing in *The Architect* for a hundred years to come would not make them do so. Colonel Festing and Colonel Ray—if you must have it out, and the names—are very distinguished men and Royal Engineers, but the architects did not like them as assessors in the last competition, and would prefer an independent civil architect. That is what their expression means—neither a slight nor depreciation of any of the honoured and respected Irishmen who constituted the committee of selection.

No "indignation" will be heard from any part of Dublin if the committee be reappointed; but *The Architect* may be prepared for a good deal of indignation, and plainly expressed too, if architects' plans are not submitted to an architect as assessor. The time does not require the defenders of our country at this juncture, however clever specialists they may be, in matters which are not their proper business.

Yours obediently,  
DUBLIN ARCHITECT.

SIR,—A good many competitors must be indebted to you for calling attention to the unsatisfactory state of the competition for the Dublin Museum. Judging from the past, it is of course an advantage for the Dublin architects if designs are not sent over from England, and for all we know the late declaration may be only a ruse to gain that end. If the members of the Royal Dublin Institute believed that the sum named in the conditions was inadequate, why have they been silent for so long a time? Knowing what labour and materials cost in Dublin, they ought to have been able to advise the Government much sooner of the difference between the profits expected in Ireland, and those with which an English builder has to be satisfied. A building like that proposed for Dublin could be erected anywhere in England at the price that is stated in the conditions. Why should the cost be more exorbitant at the other side of the channel? It has been often said that Ireland abounds in excellent building materials, and that her workmen can do as much masonry or carpentry as English workmen; with those conditions a building should be as cheaply erected in Ireland as in England. I have taken some pains to ascertain for my own guidance the relative cost of work in both countries, and I have made inquiries of men who carried out railway and other contracts in Ireland, but I have discovered nothing that confirms the statement of the Dublin architects about the exceptional expensiveness of Irish work. If they possess evidence derived from practice, they should have produced it. On the other hand, I think it is fair to assume that the authorities when they fixed the sum of 110,000*l.* were advised by the Commissioners of Public Works, who were aware of the real cost of Government buildings in Ireland.

My advice to English competitors is to go on with their designs, and not to be daunted by any efforts which may be tried (of course from patriotic motives) to bring about another failure or a merely insular competition. It is disheartening to an English competitor when he finds the *Times* (October 19) announcing that the museum "seems destined to be, in one form or another, a perpetual subject of contention," and that "no one will venture to predict when it will be finished." But from the difficulties of the case it becomes incumbent on the Government to have the project realised, and under the circumstances it is hardly possible that if the best design should come from England it will be again set aside to gratify Dublin and its Royal Institute. According to the *Times*, the Lord Lieutenant "has acted all through these disputes as a peacemaker, and has succeeded in getting the competition reopened to Irish architects, who had been practically excluded by

the conditions imposed by the Treasury and the Science and Art Department"! Peacemaking performances are probably expected from every Irish Viceroy, although they seem to lead to nothing that is profitable to actors or spectators; but it is to be humbly hoped His Excellency will remember, the next time he undertakes that line of character, that it is seldom good policy to sacrifice a piece for the applause of the noisiest part of the house.

Yours faithfully,  
A COMPETITOR.

#### The Architectural Association Hat and Coat Scramble.

SIR,—Will you kindly allow me to air a grievance? I want to complain of the treatment that several gentlemen experienced at last Friday's conversazione. I want to know, on the one hand, why one should be invited to spend three hours pleasantly occupied in listening to instructive eloquence, hearing high-class music, or gossiping with artistic and literary friends, whilst on the other hand one had to spend two of those three hours in a lobby, amidst cold draughts and pointed elbows, trying to catch the eye of the man whose duty was to "take care" of the hats and coats.

With a friend, and accompanied by two ladies, I arrived at the rooms of the Institute of Water-Colour Painters about eight o'clock. My friend and I doffed our hats and coats and struggled for forty-five minutes at a temporary counter, when we were at last relieved of the charge of our superfluous apparel and were enabled to join the two ladies (who had all this time been waiting on the stairs) and to mingle with the company.

Well knowing how difficult it had been to be relieved of one's hat or coat, my friend thought it advisable to be "wise in time," and try and obtain possession of them again, as he had a last train to catch (11.15); so he went at a quarter to ten to the caretaker's counter, vainly thinking that there would be no rush. I followed twenty minutes later on a similar errand, and after a half hour's struggle secured my hat and coat; but my friend, after an hour and a quarter's pushing and shouting, had to give up his search as hopeless, and at eleven o'clock had to leave to catch his train, to go a journey of thirty miles, hatless and coatless, and minus his umbrella. I lent him my hat, as I had not a long journey to do, and improvised for my own head a covering formed of my pocket-handkerchief, and by the aid of a cab got home.

My friend sent on Saturday to Piccadilly for his belongings. The officials found his hat, which, by the way, was originally designed to be a "tall hat," or "tile," but had been converted by Friday night's pressure into a "crush" hat. His coat and umbrella were not forthcoming; some rather short-sighted or colour-blind guest had mistaken them for his own property, leaving others of another colour behind; but they were promptly returned last Monday.

I do not know who is responsible for the miserable mismanagement which led to Friday's undignified hat scramble; whether it be the proprietors of the building in which the entertainment was given, or the committee of the Architectural Association. Surely it cannot be the latter body, as they, being architects, naturally know better than other people what cloak room conveniences are desirable to have made; they must also remember the Conduit Street fiasco of four years ago, when it was almost a free fight for hats and coats.

If it is not possible to get cloak room accommodation for more than 400 guests, and that 1,200 be expected, would it not be as well to dispense with dress coats altogether, and let the guests appear in shirt sleeves, a costume more fitted for a fighting fray in a small space, where hats are numerous and tempers are ruffled? Or else, let the male guests promenade about the rooms in tall hats and overcoats.

Yours truly,  
AN ILL-USED MEMBER OF THE A.A.

#### LEGAL.

Court of Session, Edinburgh.  
(Before Lord M'LAREN.)

ANDERSON AND BROWNE v. J. B. HOWARD.  
THE NEW LYCEUM THEATRE, EDINBURGH.

This action has been raised by Messrs. Anderson & Browne, architects, to recover from Mr. J. B. Howard, Edinburgh, payment of 542*l.* 10*s.* 6*d.* in respect of architect's fees, commission, and outlay, said to have been incurred on the defender's employment in connection with the building of the new Lyceum Theatre, Grindlay Street. Of this sum, 26*l.* 5*s.* is said to be due in respect of preliminary meetings and examination of sites; 24*l.* in respect of visits to and inspection of various English theatres in London and the provinces, including Manchester, Leeds, and Liverpool, from January 6 to 14 last; 462*l.* 10*s.* in respect of designs, &c., for the new theatre, at the rate of 2½ per cent. on the estimated cost of 18,500*l.*; 5*l.* 5*s.* for plans in the petition to the Dean of Guild for warrant to take down Cooke's Circus; and 6*l.* 10*s.* 6*d.* for travelling and incidental expenses. On February 12, it is added, the defender terminated his employment of the pursuers, on the alleged ground of their rejection of his proposal to appoint

a London gentleman to be joint architect, instead of consulting architect, as had been arranged. Otherwise, they would have been entitled to a further commission of 2½ per cent. on the estimated or total cost of the theatre. In defence, it was said that Mr. Browne, a member of the pursuers' firm, had been informed of the defender's intention, in the event of his not getting a renewal of his lease of the Theatre Royal, to erect a new theatre in Edinburgh, and that the preliminary visits and inquiries were made by Mr. Browne, not on defender's employment, but on his own responsibility and to suit his own purposes. The visits and inspections in England were undertaken on the same footing, the defender, having to be in London on other business, having agreed to accompany Mr. Browne, who had not previously had any experience in such work, and to facilitate his admission to the various theatres he proposed to visit, and at the same time to furnish him with any suggestions that might occur to him from his experience in the management of theatres. The defender also denies liability for the incidental and travelling expenses, but admits employment in regard to the Dean of Guild petition, and as to sketch plans for the new theatre. His instructions to them, however, were to prepare plans for the building at a cost not exceeding 15,000*l.*, and to be ready for occupation not later than September 1. He made no other arrangement with them regarding their further employment. After the lapse of six weeks, they submitted sketch plans at a cost of 3,500*l.* beyond the sum named, and defective and insufficient in many of the details requisite in a theatre. As they then rejected a renewed offer to appoint them joint architects with Mr. C. J. Phipps, architect, London—a gentleman of great experience in the construction of theatres—he entrusted the preparation of plans and the construction of the building to that gentleman. Though, the defender says, the pursuers' plans were entirely useless to him, he has, to avoid litigation, offered to refer the question to any one on whom they and he might agree, but this proposal was declined. The charge of 462*l.* 10*s.* for the preparation of said plans is in any case excessive.

His Lordship on Tuesday closed the record, and appointed proof to be taken in the case.

## CHURCH BUILDING AND RESTORATION.

**Bulwell.**—The Bulwell Wesleyan chapel is now opened for Divine worship, and has been completed with great credit to the builders, Mr. Joseph Munks, of Hucknall, and Mr. Thomas McCulloch, of Bulwell. The chapel occupies a very commanding site, and is much admired. The total cost is 3,435*l.* The architect is Mr. Councillor Wills, of Derby.

**Farnworth.**—The memorial-stones of the Congregational church, Francis Street, Farnworth, were laid recently, and the works are progressing rapidly. The design is a twelfth-century Gothic. The chapel has a chancel and transepts. There will be accommodation, including end gallery, for about 400 adults. The cost will be 2,470*l.*, and the architect is Mr. Councillor Wills, of Derby.

**Dewsbury.**—The corner-stone of a new church for the parish of Boothroyd has been laid. The church is being erected by Mrs. Hague, of Crow Nest, as a memorial of her husband. The plans have been prepared by Mr. Swinden Barber, of Halifax. The ground plan forms a parallelogram, 108 feet long and 48 feet wide inside the walls, divided by arcades of seven bays, forming a nave and chancel, with aisles 12 feet wide throughout. The columns of the arcades will be of Dalbeattie granite, with octagonal stone bases. The seats throughout will be of oak, substantial and plain in character. In the chancel, the floor of which is raised three steps above the level of the nave, open stalls will be placed for a choir of about forty-eight voices. The works have been let to the following: Messrs. W. & J. Milner, masons, of Mirfield; Messrs. J. Charnock & Sons, carpenters, Halifax; Mr. John Naylor, plumber, Halifax; Mr. T. Newton, slater, Ambleside.

## GENERAL.

**The Earl of Elgin** will open the Dunfermline Fine Art Exhibition on December 1.

**Mr. Richard Tangye**, of Birmingham, has presented, on the part of himself and his brother, Mr. Albert Moore's *Dreamers*, purchased by him from the Exhibition of the Birmingham Society of Artists, to the Corporation Art Gallery, in memory of the late Mr. Chamberlain.

**Mr. Sidney Cooper, R.A.**, last week distributed the prizes to the students of the Canterbury Sidney Cooper School of Art.

**Manchester Art Gallery.**—The following resolutions were passed on Wednesday: "That the offer of a water-colour drawing, *The Invincible Armada*, by Mr. Albert Goodwin, and of four drawings by Mr. R. Caldecott, *The Three Jovial Huntsmen*, be accepted; and that thanks be given to Mr. T. C. Horsfall for the presentation." "That the following pictures be purchased: *Nancy Lee, of Great Yarmouth*, by Phil. R. Morris, A.R.A., and *Old Putney Bridge*, by C. Napier Henry."

**Mr. J. E. Boehm, R.A.**, has completed the recumbent statue for Dean Stanley's tomb in Westminster Abbey.

**The Cathedral of Florence** has been reopened after restoration, and the new façade has been uncovered.

**The Liverpool Cathedral Sites Committee** have adopted a recommendation to engage skilled advice and assistance to report on the sites of Kensington Fields and St. James's Mount and Cemetery.

**A Piscina** has been found imbedded in the wall on the south side of the chancel at Great Orton church. The exterior resembles a Norman capital. The cavity in the wall was found coated with a close and very white cement.

**The Interior Roof Decoration** at St. Michael's Church Wandsworth Common, has been completed. It was carried out by Mr. Clay, from designs and cartoons by Mr. William White, F.S.A.

**A Stained Glass Window**, of four lights, has been erected in Sleaford church as a memorial of Mr. Thomas Parry, architect. It was executed by Messrs. Ward & Hughes, of Frith Street, Soho.

**Mr. Ruskin** will give two lectures at Oxford on the "Art of England," in completion of the series begun in the spring term. The subjects will be—(1) The Fireside: John Leech and John Tenniel (Wednesday, Nov. 7, repeated on Saturday, Nov. 10); (2) The Hillside: George Robson and Copley Fielding (Saturday, Nov. 17, repeated on Wednesday, Nov. 21).

**Mr. F. R. L. Edwards**, of Manchester, has been selected as architect by the Burial Board of Poulton-le-Fylde for the new cemetery and buildings in connection.

**Monsignor Consitt** will read a paper at the next general meeting of the Durham Architectural Society on "St. Godric."

**Professor Baldwin Brown** has agreed to deliver a course of four lectures to the members of the Edinburgh Architectural Association. The subjects are "General Survey of Christian Ecclesiastical Architecture up to the Thirteenth Century," "The Basilica and Domed Churches of the Fourth to the Ninth Centuries," "The Romanesque Church," and "The Rise of the Gothic Style in Northern France."

**Excavations** made by the French Tunisian Archæological Expedition in the neighbourhood of Bograra, El Kantara, have brought to light ruins of great buildings belonging to the Roman times. A marble temple, believed to have been dedicated to Zephyr, is remarkable for the great size of the blocks of which it is constructed.

**The Cambridge Union Society** have resolved to obtain specifications for a new hall for discussions. The cost will be about 6,000*l.*

**Messrs. John King, Limited**, of Liverpool, have received directions to heat Shandon church with their "small tube" hot-water heating apparatus.

**The Estimated Value** of the new buildings, alterations, and additions brought before the Greenock Dean of Guild Court during the past municipal year is 87,000*l.*

**The Derby Co-operative Society.**—This society has appointed Mr. Councillor Wills, of Derby, as their architect; and building operations are being carried on in several parts of the town, including a large grocery and provision store, in Leman Street.

**Labourers' Cottages** will shortly be erected in Ireland at the public expense. The Limerick Board of Guardians have resolved to erect one thousand. The cost is expected to be about 80*l.* each.

**Extensive Gasworks**, costing 150,000*l.*, have been opened at Bradford by the mayor. At present the works will produce two million and a half cubic feet of gas daily; but when fully finished they will be capable of producing eight million feet of gas a day.

**The Ottawa Canal Project** is being revived. The route was surveyed by the Canadian Government over thirty years ago, when it was proposed to utilise the French river to Lake Nipissing, and cut through a low ridge to the Montreal river. The navigable reaches of the Ottawa river now interrupted by rapids are to be connected by canals. The object of the new project is to make a waterway for sea-going vessels from the upper lake ports.

**Messrs. Vaughan & Brown**, gas engineers, of Farringdon Road, E.C., are executing the whole of the gas arrangements for the lighting of the new Alhambra Theatre, Leicester Square, including massive chandeliers and brackets for the auditorium, passages, and entrances. Their patent flash-light system has been applied to the stage. It enables the gas-man at the index plate to light or extinguish the whole of the stage arrangements instantaneously.

**Silver Medals** have been awarded to the following local exhibitors at the Derby Art Gallery: For workmanship and design in china, Mr. T. M. Lambert; for the best painting on china, Mr. A. J. Keene; for design and manipulation (a bronze medal given by Mr. J. Haslam), to Mrs. E. Bird; for detailed design and drawing in ecclesiastical works, Mr. F. J. Robinson; for the best architectural design, Mr. A. Macpherson; for measured architectural drawing (bronze medal), Mr. G. M. Coulson; for the best design for house decoration, Mr. G. Potter; and for modelling from life, Mr. H. W. Hogg.

# SUPPLEMENT

TO THE

# ARCHITECT

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, NOVEMBER 3, 1883.

### EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

### TENDERS, ETC.

*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*\* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—“Contract Supplement to THE ARCHITECT.”*

### TO AMERICAN SUBSCRIBERS.

*All subscriptions are payable one year in advance, and may commence at any date.*

*The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.*

*Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED to GILBERT WOOD, 175 Strand, W.C., London, England.*

*In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—*

*To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order.*

### COMPETITIONS OPEN.

**BIRKENHEAD.**—Dec. 1.—Plans are required for Laying-out Bidston Hill for Building Purposes. Premiums of 100 guineas and 50 guineas; and four of 15 guineas each. Messrs. Davies & Stephen, Estate Agents, Mollington, Chester.

**BRIDGEND.**—Nov. 20.—Plans are required for Disposal of Sewage by Filtration in the most economical and beneficial manner. Mr. T. Stockwood, jun., Clerk to the Local Board, Bridgend.

**BRISBANE.**—Nov. 30.—Plans are invited for the Erection of a Town Hall. Messrs. Gordon & Gotch, 15 St. Bride Street, E.C.

**CAPE TOWN.**—Jan. 30.—The Town Council of the City of Cape Town invite Plans and Specifications, accompanied with approximate estimate of cost, of a System of Drainage. Selected Plans and Specifications to become the absolute property of the Corporation. All others will be returned free of expense. Premium of 250*l*. A plan of the City, with levels, may be seen, and further information may be obtained, on application to the South African Loan, Mortgage, and Mercantile Agency, 9 King William Street, London, E.C.

**LONDON.**—March 1, 1884.—The Commissioners of H.M. Works and Public Buildings are prepared to receive Designs for New Buildings proposed to be erected in Whitehall for the Admiralty and War Office. Mr. A. B. Mitford, Secretary, H. M. Office of Works, 12 Whitehall Place, London.

# The Architect.

## THE OPENING MEETING OF THE INSTITUTE OF ARCHITECTS.

THE second session of what we may be excused for calling the jovial presidency of Mr. HORACE JONES was inaugurated on Monday evening by a characteristic address. No one, be he ever so cynically inclined, can help feeling pleased when Mr. JONES speaks. An orator he is not. His style of language is not that of the literary world. His occupancy of the supreme position he happens to hold, as head of the architectural profession in the empire of Her Majesty QUEEN VICTORIA, and representative for England in the face of the world of a world-wide historic brotherhood of art and science, may be said without offence to have come about somewhat by chance. The *régime* under which he takes the chair once filled by COCKERELL, TITE, DONALDSON, and SCOTT, may be regarded by many as a mistake and a failure—now, by the way, perhaps to be rectified. But nevertheless, when the end comes, it will, we have no doubt, be universally acknowledged that the worthy City Architect has done his best to make his reign at Conduit Street not only honourable, but—what we are forced in some cases to consider quite as worthy of commendation in the world as we find it—cheerful and happy. We will even venture to take so much of a literary liberty with our readers as to assert that in times to come the “jolly” presidency of HORACE JONES will long be remembered by that very title, and perhaps favourably contrasted with more brilliant but less enjoyable times.

Commencing with a pardonable if unexpected allusion to the near approach of Lord Mayor's Day, and a kindly reference to the losses recently suffered by the Institute through death, the President proceeded to business like a man of business. The contrast which he could scarcely help drawing between the “Two Palaces of Justice”—on the same line which was taken in this journal a week ago—was followed out with commendable spirit; and we are glad to find that Mr. HORACE JONES, as a practical man who has had much to do with large outlay in building, and in a field where commercial considerations hold the supreme place, is soberly of opinion with ourselves that the habitual niggardliness of the English Government in respect of architectural enterprise is not only shabby, but financially mistaken. In this, indeed, as in so many other things, there are those who scatter and yet increase, and there are those who withhold their hand and it profiteth them not. A short step took the President from his lamentations over Mr. STREET's Law Courts to the hopes he entertains regarding the embellishment of Blackfriars Bridge with sculpture. Judging by his semi-official account of this matter, we are disposed to think that the resolute way in which our public authorities seem to persist in following the process of “How Not to Do it,” is being once more exemplified in this case in the proceedings of the City Corporation—just once more before the grand display in the business of the new War Office shall come on. The length to which, if we can credit our ears, the proceedings have in this case gone, is that a model is about to be set up for public criticism on one of the pedestals of the bridge, which is to be supposed by critics to represent chivalry or cavalry in the abstract. The group is so devised, the worthy President thinks—this is his own personal impression apparently—as to be taken to represent any subject we like; we pay our money and we have our choice. Some of us may take it for the Constable BOURBON and his war-horse, or the Chevalier BAYARD and his charger; some for Don QUIXOTE and Rosinante; some, perhaps, for a new edition of our own Duke and Copenhagen. The peculiar, and, so far as we know, unprecedented virtue of this piece of statuary is that it has no special purpose whereby to provoke rivalry of sentiment. The profane may be reminded of poor ARTEMUS WARD, one of whose most admirable and useful wax-works, having in turn served for MARY, Queen of

Scots (if we do not mistake), OLIVER CROMWELL, and General JACKSON, was now doing duty as Sir EDMUND HEAD—we beg pardon, but we had almost written by a sort of instinct Sir EDMUND BECKETT. A sceptical observer, at any rate, having questioned the likeness to the new original, the words of the great showman were firm and conclusive—“I call it Sir EDMUND HEAD; *you* may call it what you darn please!” It is the avoidance of all such difficulties, we understand, that the civic mind of the Guildhall is now bent upon, and we will only say that we hope success may crown an effort so laudable in a direction so novel.

The President's lengthy representations respecting the proposed new line of communication across the Thames below London Bridge seemed to be listened to with some amount of polite impatience; but on reflection most of us will perceive that it was quite within the rule of the fitness of things that the City Architect should take the opportunity of making a statement to the profession at large of his views upon a question of such great moment, in which he was known to have taken so important a part. His arguments and figures may be left to speak for themselves.

The very interesting subject of the examination test recently set on foot in the Institute had little, if any, additional light thrown upon it by the presidential address. We may remark that the admission, at an earlier stage of the sitting, of two new associates who had entered by examination, was received with some enthusiasm; which at any rate indicates a certain hopefulness as regards the practical operation of the new regulation. We also observe with satisfaction that a provincial examination is about to be held at Glasgow if a sufficient number of candidates come forward. The Council are feeling their way cautiously and slowly, but those who regret that examinees are so few must be urged to exercise patience. An educational test, if to be of any real value, is a thing that always takes time to develop.

The cry of the country members has at last been heard within the sacred penetralia of the Council, and steps are to be taken to allow them, in some sort, that participation which they are so obviously entitled to demand in the election of officers and the discussion of by-laws. The legal adviser of the Institute, however, gives it as his opinion that the accidental phraseology of the charter absolutely prohibits every member from voting who is not “present in person” at the moment. We are sorry for this; and we venture at any rate to remind the members of the shrewd axiom that before you act upon counsel's opinion you ought to peruse the “case.” But, be this as it may, what the Council offer to that half or more of the general body who cannot possibly be “present in person” is that they shall have some privilege of “nomination,” which we confess we cannot understand to be worth anything at all. In some similar way the “non-metropolitans” are to be permitted to make representations about the by-laws. All this seems simply childish; and we can only advise interested members to persist in their agitation for a *real* share in the administration of affairs, all legal quibbling notwithstanding.

On the delicate question of the “nomination” of the men who are to hold office—an act which in present practice enables a small coterie virtually to compel the constituency to accept them in a body as irresponsible and secret rulers for ever, the elective process being so hedged about by artificial restrictions as to be only a palpable sham—the President announces that the Council have at any rate so far yielded to universal pressure as to recommend that the nomination of a president—their own nomination, of course—may be made in the person of “any fellow or honorary fellow” whatsoever. But inasmuch as it has always been open to every member outside the Council to propose of his own accord “any fellow or honorary fellow” as an opposition candidate—a course which was actually pursued with success in the case of Mr. STREET only two years ago—we fail to see what boon is supposed to be here offered. In the next place the Council propose to be allowed to nominate for the vice-presidency any three members they please, provided they are chosen from within their own body. Lastly, as regards “the retirement of members of council by rotation,” they declare with singular *naïveté* that this “is not desirable.” Vice-presidents, however, they acknowledge, ought to withdraw after six years' service. With reference to all this, we will simply say that we are tired of discussing such shameless trivialities. Imperialism like this is a very small game, and had far better be given up with a good grace while it can be. In these days the prosperity of any learned society—nay,

even that of any respectable trades-union—is in direct proportion to its freedom from invidious personal distinctions of the kind which these gentlemen are determined to maintain. We cannot consent to endorse what Sir EDMUND BECKETT has been saying lately in the *Times* about the decadence of the Institute, but neither can we venture to deny that he has some ground for even the worst of it. The kind-hearted president himself was constrained to say in winding up his discourse that the Institute is “in a critical position,” owing to the want of “unity and fraternity”; and we are bound to acknowledge that this is only too true. But how can “unity and fraternity” be compatible with the ungenerous system of false exclusiveness which has of late years come to be foisted upon the society no one knows how? Let the freedom of former times be restored, and the “unity and fraternity” of former times will reappear. Complaints of the impracticability of everything are universally heard; and it is high time the main body of members aroused themselves to the real danger, not only to the guild in Conduit Street, but to the profession all over liberty-loving England, which is involved in the continuance of an incomprehensible reaction which none can profess to understand, and none but the least dignified and most accidental members of the Council can desire to uphold. The Institute requires simply to be freed from a system of clumsy artificial restrictions, by which individuality and personal earnestness are repressed, and not even the false dignity of histrionic authority is substituted—by which no one but “the Council” is permitted to say or to do, while “the Council” says and does—nothing.

#### LABOURERS' AND ARTISANS' DWELLINGS.

LORD SALISBURY'S paper in the *National Review* will be chiefly valuable as a means of extending, and at the same time intensifying, the interest which is now taken in the important subject of which it treats. It is not a practical paper; but its advocacy of more exact and full inquiry is well-timed, and likely to have a useful influence on public opinion. That such additional inquiry is needed no one who has attempted to master the subject can deny. “The subject is very complex, and requires the light of fuller information than has yet been collected;” and, it may be added, we require an “investigation by authority” which shall take a much wider range than would suffice for merely ascertaining “the real extent and circumstances of the overcrowding that has to be cured.” If Lord SALISBURY'S remarks do nothing more than give an impetus to the general demand for such investigation he will have well merited our gratitude. It must be confessed, however, that the paper, as a whole, is somewhat disappointing. It is characterised by the narrow provincialism of the mere Londoner rather than the breadth and comprehensiveness of the great statesman; and in much that has been written by our contemporaries the same spirit predominates. It is the London poor who are commiserated; it is they who are to be helped, and much is to be done towards the complete solution of the whole labourers' and artisans' dwellings difficulty by an expenditure of Government money through the agency of a purely local charitable organisation—the PEABODY Trust! This indeed is the only practical suggestion made. The necessities which exist, and the peculiar difficulties which beset the question in other great centres of population are not referred to, and are probably not understood; and yet it would argue an amount of ignorance almost inconceivable to suppose that the call for remedial measures is less clamant in the great provincial cities than in London itself, or that they are easier of accomplishment. What then has Lord SALISBURY to say about them? Absolutely nothing; for of course it cannot be seriously intended that Government aid is to be administered in Manchester or Edinburgh through the agency of the PEABODY Trustees. And sharing as we do his lordship's objection to the intervention of municipal corporations, we are left by him without the slightest indication of a policy to cope with the evil which presses on one portion—and that the largest portion—of the wage-earning classes of the country. His only practical suggestion, indeed, is inapplicable on the extended scale which the exigencies of the case demand, and does little more than touch the fringes of difficulties which the national, as distinguished from the local, reformer has to face.

Besides, preponderating as in some respects the claims of

London undoubtedly are, it is not to be supposed that the country will consent to meet them by exceptional legislation in the advantages of which Liverpool, Manchester, Glasgow, and other large towns shall have no share. If it be so that “the increase of prosperity tends rather to aggravate the existing evil than to lighten it,” that “it is in fact directly caused by our prosperity,” may it not be pertinently asked if there is any reason why this exuberant prosperity should not be taxed to mitigate the evils which it causes and aggravates? It can hardly be argued that the prosperity of Glasgow, for instance, has any tendency to overcrowd the dwellings of the London poor; still less can the prosperity—or adversity—of the agricultural classes throughout the country have anything to do with it; so that in whatever way we look at it, it would appear that if the case of London is to be treated exceptionally, the people of the metropolis, creating and aggravating the evils which beset their poor by their own prosperity, may most reasonably be asked to do what is necessary, not perhaps without State interference, but certainly without State money. But we prefer to take a broader view of the national need and the national duty. There is no important town, nay, hardly a village, in the land where the same miserable conditions of unwholesome overcrowding do not in some measure—we may say in a proportionate measure—exist; and although in certain phases of it this deplorable state of matters may with some propriety be connected with the prosperity of our cities as well as with the steady increase of the population, yet it may well be doubted if it is not rather more truly and largely due to increasing extravagance, profligacy, and—last, not least—indifference; an indifference which must be dissipated before any adequate impression can be made on the arrears of work which we have allowed to accumulate before our eyes with callous unconcern. Nothing is more remarkable in Lord SALISBURY'S article than his testimony to the efficiency of Miss OCTAVIA HILL'S method. He admits that she has done more than the PEABODY Trustees or any of the other wealthy organisations towards ameliorating the condition of the poorest classes, and he sees and acknowledges the vast power of the principle on which she relies. But the labourers are few. Miss HILL and her noble associates are indeed the pioneers of what may almost be called our forlorn hope. She has not only perceived the narrow practicable breach in the unobliterated human aspirations and sympathies of the most neglected and debased, but, planting her foot firmly there, she has come into personal contact with the suffering and the oppressed; and like some good angel, in many a loathsome slum has, almost literally, “lifted the beggar from the dunghill.” She has given us a good lead, and her achievements go far to prove that the efforts of such sympathetic volunteer workers, if wisely directed and sufficiently extended can, even without State aid, do much to elevate even the poorest, and to bring sweetness and light into their dwellings. But Lord SALISBURY doubts if such an army of volunteers can be obtained. It seems a disgrace to our humanity—a disgrace it certainly is to our Christianity—that there should be any difficulty about it. Is there anything to hinder the godly unity of all Christian churches in the prosecution of such practical beneficence? Surely there is some possible way of getting over the difficulties, sentimental and imaginary, which spring from mere sectarian prejudice, or a jealousy of interference with the arbitrary boundaries of ancient parishes, now for all practical purposes of systematic oversight absolutely useless; so that to each congregation may be allocated a workable portion of the vast field where earnest labourers are so sorely needed. By such means, without any being overburdened, the whole might be covered. It is, perhaps, not too much to say that without the co-operation of such disinterested caretakers, the most stringent laws and the most zealous official supervision will alike prove unavailing.

But the need of more exact information before Parliament or our municipal bodies take further action is really more urgent than even Lord SALISBURY may imagine. There are two ways by which authorities, whether imperial or local, can, and do, with equal certainty retard the amelioration of the working classes. One way is by doing too little, and the other is by doing too much. It has hitherto been too facily assumed that there is only one, namely the first, and the necessity for investigation throwing light upon the second has not been recognised; and yet it is not only easy to imagine an amount of interference which must infallibly lead to an increase of the

difficulties which the poor experience in getting dwellings, or in getting dwellings which they can afford to pay for, but it is a fact, which was brought out at the recent congress of the Sanitary Institute of Great Britain, that in some localities such a mischievous amount of interference actually exists now; and it may perhaps surprise Lord SALISBURY and many others to learn that the provisions of the Police and Health (Scotland) Bill, which was before Parliament last session, and which, no doubt, will again be introduced, would make it impossible for the PEABODY Trust, or any of the improved dwellings companies, to erect one of their excellent blocks of workmen's houses in any town in Scotland. Lord SALISBURY points out that these associations, with their exceptional facilities and experience, and with all their care, have found it impossible to bring down the cost of their dwellings to suit the requirements, the necessities, of the poorest wage-earning classes; and yet Parliament is asked to decree that throughout Scotland, at all events, no dwellings so cheap as theirs shall be erected. It is hardly possible to exaggerate the evil consequences of such a prohibition. What is needed is the regulation, not the annihilation, of private enterprise; unless, indeed, the State is prepared to face the responsibility of itself providing houses for the working classes, not in London only, but everywhere else—an alternative at once unjustifiable and impracticable.

### THE TEMPLE OF DIANA AT EPHEBUS.

THE biblical associations with the temple of the great goddess DIANA of the Ephesians, and of "the image that fell down from JUPITER," have always been lively. There are few pages in history which set before us with such force, and in so few words, the points of contact and conflict between rulers and their subjects, between religious and civil interests, as the short chapter in the Acts describing the tumult raised by the makers of silver shrines, and the lull which ensued upon the mingled conciliation and warning of the address of the "town clerk." The explorations of the site of the tumult by FAULKNER and others, and lastly, of the temple itself by Mr. WOOD, have contributed still further and more distinctly to localise the narrative. It is, therefore, not to be wondered at that the zeal for more complete excavation natural in Mr. WOOD has been responded to so far as to enable him to resume his labours. A committee has agitated the subject not without obtaining support—though more will still be useful—and it is understood that Mr. WOOD is now on his way to ply spade and barrow again as soon as the great heats have subsided. According to STRABO (641) CHERSIPHON was the architect of the first temple of ARTEMIS at Ephesus, which another architect afterwards enlarged—or rather superseded—by a new temple on more extensive plans. After this was burnt by HEROSTRATUS, another still better was built by CHEIROCRATES (or DEINOCRATES) the architect of ALEXANDER THE GREAT, in which the columns of the previous temple were utilised. STRABO was familiar with the temple, and it is safer to rest in his account than to rely on PLINY, who makes CHERSIPHON the architect of the last temple. VITRUVIUS, so far confirmed by STRABO, says that the temple in the Ionic style was first built by CHERSIPHON of GNOSSUS, and his son METAGENES, and that it was afterwards completed by DEMETRIUS and PÆONIUS, of Ephesus. This may suffice as an example of the differences among those whom we have to accept as authorities, and for warning against accepting even their uncontradicted testimony too implicitly. But what we are chiefly concerned with is to note that the succession of these structures on the same site is confirmed by the excavator. Mr. WOOD found that the platform on which the pillars of the last temple stood was  $3\frac{1}{2}$  feet above the highly-polished white marble pavement of its predecessor, which was that burnt by HEROSTRATUS, 356 B.C.; and that this again was four feet above a podium of three steps belonging to the original temple. This was raised only two feet above the level of the court of the peribolus, a level which Mr. WOOD appears to indicate was maintained throughout, so that the platform of the last temple was 9 feet  $5\frac{1}{2}$  inches above it. These discoveries agree with the notice by PHILO that the last temple of all was approached by the unusual number of ten steps, and with the expression of CALLIMACHUS, in his hymn to ARTEMIS, which implies that it was raised upon a peculiarly conspicuous and solid platform.

That the style of architecture was the Ionic, is another

point in which the ancient authorities agree with the recovered remains. It is indicated on coins, and distinctly stated by VITRUVIUS (who is also authority for a double row of columns on the sides), that the temple was octastyle, that is, had eight columns in front. Both these particulars—that it was octastyle and dipteral—are confirmed by the excavations. The coins also exhibit sculpture on the shafts of the columns, as referred to obscurely by PLINY, and finally certified by the noble fragment now in the British Museum. We have, then, the important statement by PLINY, that the *universum templum*, or the temple at large—as we may understand the expression—measured on the full outside plan, was 425 feet long and 220 feet broad. These were probably Greek feet, equivalent to  $430.70 \times 223$  (exactly 222.95) English by the ratio  $1 = 1.0134$ .

The breadth of the front portico from angle to angle of plinths was determined by Mr. WOOD from remains *in situ* as  $163.9\frac{1}{2}$  English. It does not appear that he obtained positive data as to the length and number of columns on the flanks; indeed, for anything he has published, it is clear that his plan as regards these points is purely conjectural. On the other hand, we have a definite statement that he found parts of an extreme lateral step resting upon the level of the courtyard, which gave him a breadth for the entire building on the very lowest step of  $239.4\frac{1}{2}$ . This exceeds PLINY's dimension, and if we are to set aside the possibility of error in his text—original or in transmission—we must assume with Mr. FERGUSSON that his dimension was taken on an inner line, giving a margin of  $8.2\frac{1}{4}$  at each side.

We are left in uncertainty whether Mr. WOOD found any certain data for the dimension  $418.1\frac{1}{2}$  which he gives for the length of this lowest step, or whether it is only inferred by him from an antecedent free assumption as to the number of columns in the flank colonnade. This dimension is not more but less than PLINY's by 12.6 feet, which, to agree with it, should have been 236 Greek feet ( $236.23$ ). If we assume that the breadth given by PLINY should be corrected by Mr. WOOD's measurement, while his length is accepted, we have English  $239.4$  ft. :  $430.7$  ft.; we have a numerical ratio of 5 : 9 nearly—

$$\begin{array}{r} 5 : 9 :: 239.4 : 430.9 \\ \quad \quad \quad 9 \\ 5 \overline{) 2154.6} \\ \underline{430.9} \end{array}$$

Following this forth, we find from the dimensions ascertained by Mr. WOOD that the difference of the breadths of octastyle portico and lowest step is of the podium  $239.4 - 163.9\frac{1}{2} = 75.4\frac{1}{2}$ , giving a margin on each side of  $37.8$ , to be distributed between the platform on which the columns stand and the steps forming the ascent to it. It does not appear on the records that Mr. WOOD found distinct evidence that the margin on front was equal to that on flanks, or as his plan shows it, somewhat broader.

He was enabled, as we have seen, to decide that the height from the courtyard to the level of the plinths of the peristyle was 9 feet 5 inches. This is in perfect accordance with the ancient account that the temple was raised upon a stylobate of ten steps. Mr. WOOD convinced himself that the risers were on an average 8 inches, and the treads 18 or 19 inches, and also that the interval from the edge of the stylobate at the top of the steps to the plinths was 15 feet 3 inches. But we are left in too much uncertainty as to the grounds of these inferences for us to venture to reason upon them. The possibility is open that besides the proper ten steps of the stylobate the temple may have been raised again above the platform by more or fewer steps. The steps, again, may not have been continuous all round the temple; they may have been superseded in parts by a vertical podium—a conclusion arrived at by Mr. FERGUSSON—or else by those degrees of steeper and broader dimensions which, as in the Parthenon, gave dignity and admitted in parts of intermediate steps for convenience.

As regards the number of columns we have the statement of PLINY that they were 127, "made by individual kings, 60 feet in height, thirty-six of them enriched with sculpture, one by SCOPAS." There can be no excuse for interpreting the text, as some have proposed, as if it ran "120, of which seven by kings," &c., as the next clause would then read absurdly that thirty-six out of the seven columns were sculptured. That the entire number were contributed by as many kings is out of the question; the statement may be taken as one of the

exaggerations which are wont to infest accounts of Wonders of the World. But the work was far from finished when, according to STRABO, ALEXANDER offered to defray all future expense of it as well as all past, and the numerous kings who succeeded to his broken-up empire may easily have been animated by his example. It does not appear likely that the columns of the cella are included in the 127. The odd column, however, is a serious difficulty, in addition to that of finding places for so large a number in the ordination of an octastyle temple according to any recorded precedent.

Let us take, in the first instance, the most customary exemplar, and suppose that the temple had on the flanks one more than double the number of columns on the fronts—namely, 17. This rule in an octastyle dipteral temple will be found to give us only 92, and if we add another range of eight columns, to distinguish the eastern front, we have only 100, or 106 if we include the columns of the pronaos and posticum. We are thus left with 21 columns to spare.

This is not the only trouble which is reserved for a restorer who, like Mr. FERGUSSON, accepts the responsibility to make the very best of the best evidence available, as far as it goes. We have the ancient notice that the stylobate or podium of the temple had ten steps. This is the number of those which in the small Ionic temple of the Smintheum, recently published by the Society of Dilettanti, are continued uniformly on all sides, with a total breadth of 12 feet and height of 8. This temple is pseudodipteral, and the spreading basement harmonises with the unusually broad ambulatory. The columns of the peristyle here have their bases close to the margin of the upper step. But the case at Ephesus is very different. If we take Mr. WOOD's measurement of the steps found as applicable to all, and assume with him that, as at the Smintheum, they were unchanged and uninterrupted for the entire circuit of the temple, the nine treads of ten steps up to the platform would give a total breadth of 14 feet 3 inches (19 inches by 9 = 14 feet 3 inches), to be deducted from 37 feet 5 inches, the full margin on plan from the bases of the peristyle, and giving 23 feet 2 inches for the upper platform.

The measurement of the risers of the steps found is given by Mr. WOOD as about 8 inches, and the total height for the ten would therefore be about 7 feet at the utmost. But the height from the courtyard pavement to the bases of the columns is given as 9 feet 6 inches, and we have therefore a height of 2 feet 6 inches to spare. There is a choice of expedients for disposing of this difference. The risers of the steps may possibly not have been all uniform, yet this is exceedingly unlikely. It was consistent with the solid Doric style of the Parthenon to obtain dignity by the so-called three steps forming the basement, to have risers exceeding  $1\frac{1}{2}$  feet high, and so admitting occasional intermediate blocks for convenience of ascent. But such proportions would not harmonise with an Ionic building of any scale; and if ever they could be admitted, it would have surely been in the very lowest steps of all, which were precisely those that are found of the moderate dimensions.

A more plausible conjecture is that the spare dimension of 2 feet 6 inches is to be assigned to three steps from the upper platform to the colonnade. Mr. WOOD found the base of one column of the outer row on flank *in situ*, but we have no definite account of how far the substruction or adjacent remains were or were not consistent with the plinth being set upon the level of the general platform or at the edge of a step, or of any indications existing to determine the height of this upper platform above the court or peribolus pavement. The present assumption would have one advantage of considerable value: it would give additional elevation to the sculptured lower drums of the columns, which seems urgently required. It is not easy to believe that the architect of a temple on which the best Greek art of the day was to be lavished would rest in a design which destroyed all its effect for visitors and spectators from the very court and sacred precinct of the temple itself. Yet this must surely have been the result if they were to look up at a façade of which the bases of the columns were not only 10 feet above their level, but set back 23 feet from the margin of the supporting platform.

A third solution, or at least alleviation, of this difficulty has been ingeniously, if we should not rather say sagaciously, hit upon by Mr. FERGUSSON. It certainly goes some way to happily harmonise the fragmentary ruins and the ancient descriptions with artistic requirements. By this theory it is assumed that the breadth was reduced from Mr. WOOD's 239 feet to the

220 Greek feet of PLINY, by deduction of the breadth of the two lower steps of the original building, and a broader berm above them. The ten steps of PHILO, starting from this berm, would finish nearer to the bases of the pillars of the portico, which, especially if raised upon their conjectured subsidiary stylobate, would be much more favourably within view. Mr. FERGUSSON does not continue these steps to the full extent of the front. He considers that the solid basement was finished at intermediate spaces all round by a vertical face. There are analogies in other monuments of Asia Minor which point to this, and the recent discovery of the sculptures which enriched the enormous altar at Pergamus suggests how these piers and surfaces were likely to be made available by the sculptors.

The next variation from the restoration set forth by Mr. WOOD is to renounce his conjectural length of the temple in favour of the larger dimension given by PLINY—430 English feet instead of 418. This gives the enlarged platform, which is absolutely requisite unless we are to set aside the number of columns, 127, recorded by PLINY in favour of some purely conjectural smaller number. Here comes into consideration the peculiar spacing of the columns of the east front. The antæ of the pronaos, of which the positions were found, must have ranged in line with fronting columns; but the ascertained width of the pronaos proves that the intermediate pair of columns must have been much more widely spaced than the others, which corresponded with the spacing of the peristyle. The three central architraves, if equal, must have measured at least 25 feet. It therefore appears that the coins truly represent, only with inevitable exaggeration, an abnormal central spacing, of which it is known that the temple at Sardis—of which we may one day hope to know more—exhibited another example. The precise dimensions on Mr. WOOD's plan are conjectural; but there is little doubt that, as at Sardis, the central columniation was the widest of the three. It may probably have required an architrave over 28 feet. This inconveniently wide span was adopted with a view to give dignity to the entrance to the cella; but no such motive constrained the adoption of like extravagant spacing at the rear of the temple. Here, accordingly, Mr. FERGUSSON—boldly enough, no doubt, but fairly and happily—conjectures that there were nine columns spaced uniformly, but still in the three ranks which he assigns to the chief front. He extends the colonnade westward to within some 10 feet of the space at command, and thus accounts for the full and the odd number of the 127 columns. His distribution of the thirty-six sculptured columns between the two fronts may be accepted as at least as probable as any scheme which has been hitherto propounded, or more so. One possibility is not adverted to; it is that the tale of columns intended to be so enriched may never have been completed, but remained open to extension as benefactions accrued. If this were so we need not trouble ourselves to seek for a symmetrical form of distribution that would accommodate the exact number.

One word in conclusion. It is very much to be desired that in the renewed excavations of which we have promise, attention will be devoted as earnestly to the recovery of authentic details of the plan and construction and design of the temple as to the unearthing of fragments of sculpture worthy or unworthy of being transported to the national museum. Curators of museums may be excused for being chiefly concerned to further the acquisition of specimens which can be exhibited, to have something to show. The more reason is there that others should insist on explorers taking to heart the duty of saving from destruction and oblivion what memorials may remain of architectural history and architectural genius. That Mr. WOOD has not published the detailed authoritative measurements which he had an opportunity of making, does not justify the inference that he failed to make and record them; but at least it justifies the expression of a hope that the duty of making and of publishing them too will be well kept in mind. Lovers of Greek architecture and students of its history have their reasons for apprehension. The galleries of the Museum are rich in statues and busts and reliefs from Cyrene—from Cyrene where Hellenic arts and architecture were already flourishing before the age of PERICLES, but not one detail of the architecture of the temples has been put on record by the explorers who turned over the ruins to obtain transportable relics. LUCIUS MUMMIUS was quite content to leave Corinth a mass of ruins provided he could collect from them productions of art sufficient to make a show at his triumph; and the tendency of

collection in this spirit appeared in his warning to the contractors for the transport of his spoil in works of genius to Rome, that he would hold them bound to replace any they might lose or damage.

### PARIS NOTES.

THE unveiling of Alexandre Dumas' statue on Sunday last was made the occasion of an extremely imposing ceremony. This worthy monument to the memory of the great writer was the last work of Gustave Doré, and the spot selected for its erection—the wide space on the Boulevard Malesherbes, where it branches off into the Avenue de Villiers—is one of the most advantageous that could have been chosen. The Place itself was crowded by a large assemblage of the general public. On a platform, heavily draped with crimson cloth and gold fringe, were gathered the speakers, the friends of the late author, and all the notabilities of art, literature, and the drama now present in Paris. The space reserved for the more privileged assistants at the ceremony was also thronged, and the whole enclosure of the site, formerly known as the Place de Villiers, now renamed Malesherbes, was kept by the cavalry of the Republican Guard and a numerous body of police. Dumas is represented as seated, the head raised with a radiant expression upon the features, which appear lighted up by a passing idea, whilst the right hand holds the pen, as if about to impart the thought to the manuscript on his left knee. The statue, though of heroic size, is somewhat dwarfed by the height of the pedestal, which about half-way up is further weighted with three figures. A young woman is represented in the centre of the group, reading one of the works of the novelist, whilst a youth follows her on the page; the other figure on the right is a brawny workman, his eyes fixed on space, and eagerly listening to the recital of the adventures of the hero of the tale. On the three other faces of the pedestal are inscribed the titles of the prolific author's principal works. Behind is a figure of the Chevalier D'Artagnan. M. Edmond About spoke very feelingly and effectively on behalf of the literary body; M. Jules Claretie for the Society of Dramatic Authors, of which he is vice-president; M. de Leuven, as president of the committee entrusted with the erection of the monument; M. Kaempfen, Director of Fine Arts, on behalf of the Government; and M. Halanzier, as president of the Artists' Society. The ceremony was almost as much a demonstration of respect for the memory of Gustave Doré, the sculptor, as for that of Dumas.

From some figures lately published by the authorities of the Jardin des Plantes, that pleasant resort—a mixture of our Kew and Zoological Gardens—would appear to be considerably frequented by members of the art world—painters, sculptors, and designers—bent not upon pleasure, but upon finding models. During the year 1882 no less than 176 free passes were issued by the Horticultural Department to artists, trade designers, and makers of artificial flowers; while 255 similar cards were given to enter the portion of the gardens containing the living animals.

A most interesting exhibition was opened on Tuesday by a *soirée* given by the Association Artistique pour la Décoration des Tissus, at the Salle Georges Petit, in the rooms lately occupied by the Exposition des Cent Chefs-d'Œuvre. The exhibition has been organised with the laudable motive of assisting the Society for Succour to the Wounded of the French Army and Navy. On entering the spacious and richly-furnished hall in which the various specimens of painting as applied to textile fabrics of every kind are displayed, the first impression of the visitor is that a mistake has been made, and that he has been brought to see some choice examples of needle and old tapestry work. In fact, a very minute examination is required to determine and realise the nature of the decorative agency, so admirably is the illusion carried out. On every kind of woven material the painter has imitated the various styles of ancient and modern needlework—the coarse embroidery and patchwork of Bayeux tapestry, the laborious worsted of Gobelins and Flemish hangings, contrasted with the fine silk stitch and elaborate braiding of Eastern curtains and screens. The deception is complete, whether the brush has copied the needle on cloth of gold, silk, velvet, cloth, or rough canvas. The subjects illustrated by this novel and clever process are as varied as the materials on which they are delineated, and the exhibition is altogether noteworthy for its evidence of artistic skill and pictorial effort.

Some interesting experiments took place on Saturday last in

one of the inner courts of the Grand Opéra, for the purpose of trying an invention by M. Gaspard Meyer, for preventing fires and accidents from burning in theatres. Among those interested in the subject who were present, were M. Vaucorbeil, director, and M. Garnier architect of the Opéra; M. Camescasse, Prefect of Police; the chief of the Paris Fire Brigade; and several theatrical managers. The invention is intended to anticipate fires by rendering the material used in theatres—the scenery and hangings, by which the flames spread with such rapidity, and the gauze dresses of the ballet-dancers, the source of frequent accidents—absolutely unflammable. The experiments made were a complete success. Several light deal frames filled with painted paper, canvas treated with M. Meyer's composition, after being exposed for more than an hour to a fierce fire and gas, the flames of which licked the surface, came intact out of this severe ordeal, the paper and canvas being neither cracked nor broken, excepting where spectators had run their sticks through it to ascertain the effects of the heat, and even the fibre was found to present a certain resistance. The frames themselves were covered with the prepared paper, and also stood the test perfectly. Under a great heat it was found that the wood might become reduced to a state of charcoal, but could not burst into flame, owing to the presence of the prepared envelope. By mixing the substance with the paint used, the colour of which is unimpaired, M. Meyer claims that the whole woodwork of a theatre may be rendered unflammable. The applications of the invention are, of course, manifold, and are a mere matter of detail for the stage-machinist, now that it is proposed to render wood and drapery absolutely proof against fire and flame. From the terms of approval expressed by MM. Vaucorbeil and Garnier it is probable that the invention will be adopted at the Opéra; and the Prefect of Police would perform one of the most useful acts of his administrative career in prevailing upon the other Paris theatres to follow the example. After the success of these experiments it is very probable that, before long, similar trials will be given in London.

### MR. HERKOMER ON ART TEACHING.

AN address was delivered by Mr. Herkomer, A.R.A., at the opening *soirée* of the Nottingham Arts Society. In the course of it Mr. Herkomer said that, according to a French writer, a work of art was "a corner of creation seen through temperament." There was no doubt that the reproducer of art work was a reproducer of the corners of creation, as influenced by temperament, and, consciously or unconsciously, every artist imparted to his picture his own feelings. The question with which the art world had chiefly to deal was what was the best way in which to regard nature, and in whom the originality of the artist might best be brought out. There could be no doubt that a strong man who gathered strength and persevered in his study might well be left alone; but, in spite of that, he (the speaker) would fain see a return to the old custom of mediæval Germany, and have the "meister" back again; but the student of to-day scorned the thought of apprenticeship, and wished to leap into artistic merit at one bound. The number of students at the present time had enormously increased, owing to the facility with which the child of every artisan who could scribble might be sent to an art school, where his scribbling could be directed into some system; but in former times the art of tuition was rare, difficult of procuring and expensive, consequently the number of students was comparatively small. The speaker then alluded to the various systems of teaching, and pointed out the danger which arose from the student imitating his master's works, and he insisted on the necessity of every student following the bent of his own individual idiosyncrasy. The student should know with what works his own temperament was in harmony. They had seen the result of the neglect of careful consideration of this matter by the loss of individuality which had so often taken place, the originality of the student being swallowed up in the art of the tutor. The question of the art of tuition was a most difficult one, for to teach willingly was to give the efforts of years of study in one moment; there was much of love and tenderness in it. But it did not follow that the greatest artists must of necessity be the best teachers; the greatest men had achieved greatness from the power within and not from the power without. There were men who had never made a position in art who had at the same time secured great success as teachers, and it was rather a constant watchfulness than a strong personal influence which was needed to direct the artistic mind. History showed that the great souls had often to shake off the opinions which their teachers had left on them before they could create the works which had made them immortal. The speaker then touched on the question of originality, and asked why that quality should not be held up to the student as a thing to be aimed at; but, on

the contrary, the master was often too apt to force the students into an imitation of his own art. To guard against that danger the master ought to wait until he found out with which his pupil was most in harmony, and then direct his energies to them. It might be asked what was to be done with the mediocrities who formed the bulk of the students of the present day. He could only say they belonged to the evils of the world which had to be borne, and which added to the friction of life. The speaker then adverted to the distinct types of art exhibited in conventionality and originality. It was an interesting question as to how far the painter was bound to be conventional in order to produce comprehensive works. What they wanted was an interpretation of nature, and in this, while they were bound to preserve a certain extent of conventionality in conforming to certain recognised rules, yet originality was none the less necessary, and the great artist was he whose privilege it was to read the secret that nature possesses, and make it intelligible to his less gifted fellow-men. The happy medium in an artist was a strict admixture of conventionality with originality, for when the latter was altogether unqualified it sooner or later degenerated into a feverish eccentricity, and then the end was not far off. They should take this, and note as a grand truth that all the great master minds had their art most perfectly under control. The speaker then illustrated his remarks on this subject by describing the works of thoughtful subject painters and of "bit" painters, the pictures of the latter never appealing to the heart as the former did. Mr. Herkomer then contrasted the arts of etching and engraving, and said that although the followers of the former art were more numerous than the engravers, fewer painters ever being found able to engrave their works than were found able to etch them, yet engraving was a source of greater artistic pleasure than etching. He thought that the art of engraving might very well be extended and encouraged by painters. The speaker then touched on the influences of art on the surroundings of daily life, and said that though there had been of late a revival of art furniture, still he was sorry to say that they had not yet got any further than the reign of Queen Anne. After touching on the qualifications needed in portrait painting, Mr. Herkomer said that no matter what branch of art, or what course of tuition the student might follow, if he looked for the best in nature he would easily recognise the best in art, and when the best things only in art were wanted, then and then only would they have the best power and creations of the artist.

#### MODERN LIFE IN MODERN ART.

A LECTURE on "Modern Life in Modern Art" was delivered on Monday by Mr. F. Wedmore at the Manchester Town Hall. After stating that he did not feel any hesitation in dealing with such a subject in Manchester, Mr. Wedmore asked, What are the claims of modern life, so much of which is ugly, to be treated in modern art, so much of which ought to be beautiful? What had art to record now if it neglected modern life, and what could be the place of art in English life if it turned from the story of that life in indifference or contempt? A painter could not arrest the changes wrought by time, not upon the work itself, but upon the minds that had to understand it; all he could do was to adapt his art to the newer conditions and to the new minds. In so doing there was much his art must leave behind. It was pretty generally conceded it must leave behind the painting of religious subjects. With certain notable exceptions the paintings that were directly and in an accepted sense religious were not those which had impressed our generation most strongly. The themes of such works were hackneyed, and what we wanted from art was freshness. A few exceptional men, poets of the studio, such as Burne-Jones, Rossetti, Mr. Watts, and now and then Mr. Poynter, had endowed ancient fancies with new life, and had shown that the realms of allegorical and classical mythology had yet something to yield. Of historical painting, with its often artificial dignity and erroneous pride, a style of painting in which the archaeologists counted for more than the artist, our private galleries now showed but little trace. A mere theatric revival of the past was no longer held in the highest esteem by our younger painters or thinkers who looked at life freshly; and such revival could only be ignored by that "severe to-morrow" which would ask us what we had of our own in the art of 1883. What did the audience think was the historical painting of the present time? It seemed to him that it was to be found in a record of the characteristics of English life—a record of its labour, its pleasure, and its principal personages. He found it perhaps most of all in the noble portraiture of Millais. So great a period in portraiture had only once before been vouchsafed to the English school. Sometimes in the world of imagination the achievements of the past might become a terrible burden to the creative mind, which cried out for freshness and liberty. Perhaps at the present moment, when in artistic circles there was so much pitiable discouragement of the characteristics of the age in which we live, one of the best lessons to be learnt was this, that the art of the past accepted its own time. One half of our poets and painters did not know the Muse when they met her; they remained in an

attic and sighed in vain for a goddess to drop from the sky. It was said that contemporary life was so ugly that a poetical man could not endure it. But one of the most poetical men who had ever manifested himself in English art, Turner, soon after the opening up of railways, painted *Rain, Steam, and Speed*, which was drawn from scenes presented by the Great Western Railway. And that was not a solitary picture of the kind, for Turner also painted the fires of the Black Country, the mill chimneys of Leeds, as well as pictures of Margate and Brighton. And as if the more to confound the artist who wanted to get away from life under modern conditions, Turner put into the forefront of his picture of Brighton the new pier, while the tower that rose into the sky at the background of Margate was not a venerable ruin, or even the tower of the parish church, but was the tower connected with the Margate waterworks. We were too much influenced in art, as to what we liked or disliked, by the tradition of association. We ought to be content to be influenced by our own associations, and not by the associations of our great grandfathers; and scenes based upon our own associations must, if we had any sympathy with modern life, be brought into modern art. If an artist recorded such outward aspects of English life as his draughtsmanship could seize, he discharged appropriate service, for he taught others to see that which he portrayed by his art. It was the constant struggle of the artistic man to reduce the number of those who had eyes but saw not. Pictorial art must be content to belong to its own time, and that artist would be most in sympathy with the thought of to-day, who, instead of sighing for that which had gone by, should be content with things around him, and who should hold that no century, take it altogether, was likely to be better for richness and variety of human life than the nineteenth century, except the twentieth.

#### THE VIKING'S TOMB, TAPLOW.

IN front of Taplow Court, near Maidenhead, on the Thames, at the angle of the hill, the slopes still bear the name of the "Bury Fields," showing that there the British Celts had their *beorh*, or fortified hill-top, and, says a correspondent of the *Times*, the rich dark soil contains fragments of pottery and artificially-formed flakes of flint. When the ancient Norman church that once stood there was removed to its present more central position in the village, the traces of the old ditch and *vallum* which formed this British stronghold were exposed. The very pond which, just below it, formed its only source of water supply, is said by local tradition to have been that in which heathen Saxons were baptised by St. Berinus. The very name of the village itself goes back into early history. Taplow, or Tap-hlewe, is but the "Mound on the hill-top," and in the heart of the old Norman churchyard the mound still stands. It was an old occupation-site, and possibly a holy one, in the earliest days. Celt and Romano-Briton certainly lived there; and early Christendom consequently placed its church there. Such survivals are common. Puttenham Church, on the slopes of the Hog's Back, near Guildford, stands on a Celtic burial-place; and the great temple of Avebury, in Wiltshire, now contains within its precincts the Christian Church of St. James. Pope Gregory rightly recognised the value of old associations when he directed the missionaries he sent to the far-off land of Britain not to destroy British temples or holy places, "so that while the nation sees that these very same fanes belonging to it are not destroyed, it may sincerely renounce its error, and, discovering and adoring the true God, the inhabitants may assemble together within places which they have been usually accustomed to frequent." The old Norse Viking who, using the silent highway of the Thames in search of plunder, must have died down by Maidenhead, hence found his resting-place here. On the commanding height overlooking the shallows where his ship was beached, his men found a place lofty enough for their leader, and rich even then in memories; and so, with many a wild chant, he and his treasures were placed beneath the "hlewe" of Taplow, to remain even until now. They raised a tomb worthy of their leader and his wealth. The mound is 240 feet in circumference and about 15 feet high, and on its summit are the dead remains of an ancient yew-tree, whose knotted trunk is nearly 6 feet thick, and whose age may certainly be estimated at possibly 600 years.

All archaeologists must feel that they owe a debt of gratitude to Mr. Grenfell, lord of the manor of Taplow, and to the Rev. Mr. Whateley, vicar of the parish, for their freely-accorded permission to ascertain the real meaning of the ancient mound; and still more to Mr. J. Rutland, secretary of the Berks Archaeological Society, for personally undertaking the laborious task of superintending and carrying out the excavation. It was felt very desirable to disturb the form and character of the tumulus as little as possible, so that it might be eventually restored to its former external condition; and, irrespective of the enormous weight of the old yew tree, which rendered its removal extremely difficult, it was decided that, if possible, it should remain undisturbed. But the results have very fully repaid the care taken, and probably no richer or more instructive discovery has been made in the south of England than that which is now in progress. A line having been

traced due north and south on the surface, a cutting 6 feet wide was made about 4 feet above the ground level on the south side of the mound until it reached the foot of the tree, and thence a shaft was sunk downward and underneath the root, and united with a second vertical shaft sunk on its north side. The earth material throughout the whole of the excavation was very loose and friable, and showed traces of the way in which it had been piled up. It was composed of the natural red sandy gravel of the surface, mixed and intercalated with black earthy matter; and throughout it contained fragments of bones and teeth of horse, pig, and ox, and broken pieces of British and Romano-British pottery. One fragment of Samian ware, at a depth of 16 feet, showed that Roman vessels had been brought there, and some pieces of coarse brown ware had their surface pinched up into rough knobs similar to those designated "grape cups" by Sir Richard Colt Hoare in his "History of Wiltshire." Flakes of flint and used "scrapers" were also numerous, but there was no decidedly human bones. All this pointed but to one conclusion—that whatever the tumulus was erected for, it was *post-Roman*.

At about 20 feet from the top of the barrow its sepulchral character became at last clear. In the dark brown earth were uncovered lines of gold, and these, on being carefully removed, proved to be the remains of gold fringe, about an inch wide. They lay as if forming the edge of a garment extending diagonally downward from the shoulder across the body. But all doubt as to the nature of the interment was set at rest by finding close to this a magnificent gold fibula, weighing about 4 ounces. In length about 4 inches, as rich in colour as if just manufactured, enamelled and most richly chased with Scandinavian ornamentation, it seemed to have suffered little by its long entombment. Just below it was the owner's iron sword, heavily rusted in the sheath, and so friable as to break into fragments when it was removed; and near to this latter were two other gold fibulæ, smaller in size than the shoulder brooch, but equally beautiful, in one of which was a fragment of stamped leather. From the impression in a fragment of decayed wood which enclosed this, it seemed as if the upper garment had been composed of woven woollen fibre, gathered round the waist by a leather belt fastened by two buckles, and over all an upper gold-fringed cloak or tunic, fastened on the shoulder by the heavy brooch of gold. On the right of the sword were the remains of an iron knife, probably the "sceax." There were scarcely any traces of bone. The scarce fragments were very friable and broken; but from the presence of numerous decayed fragments it seemed as if the entire body, clad in its royal robes, had been covered over by broad planks of wood. Over the middle of the interment was a large pile of archaeological treasure. Underneath was the heavy wood-lined and bronze-plated circular shield, resting on which were two drinking-horns, the small ends of which were encased in gilded bronze, and the mouths encircled by embossed rings of silver. Remains of armillæ, or bracelets, silver-rimmed and of bronze, with deeply serrated edges, lay near; and on the north-west side of the shield were the relics of a wooden bucket, encased with richly-stamped bronze. Mingled with these were the fragments of at least two vessels of thin, greenish glass, ornamented with parallel horizontal lines, similar to modern "Venetian" glass, and decorated with broad, projecting spikes of glass. Such vessels are known to be of Saxon times. Mr. Llewellyn Jewett pictures them, and their forms are well known; but the fragments of these at Taplow certainly show a larger and richer variety than those which have been hitherto found. The largest was certainly 4 inches wide at the mouth and 11 inches high. There was yet another vase of a similar character close to the large gold fibula; but all these were in fragments, and so friable were the remains that it was impossible, even with the utmost care, to remove them other than piecemeal. It is probable, too, that, judging from the number of the bronze and iron fragments, some of them may be found to form portions of a helmet or of body armour; but this is at present merely conjecture. Over the wooden plank that undoubtedly protected these relics—for it was found completely enclosing and covering them—was placed the spear, which in this case had the point towards the west, and, moreover, had a barbed point, with a very long iron socket. As at present so few fragments of bone have been found, it is almost impossible to define accurately the race to whom the "mighty dead" belonged, or the date of the interment. Apparently the body lay a little south of east and north of west, with the head towards the east; and that the decorations are Scandinavian admits of little doubt. From the presence of so much treasure, under so great a mound of earth, its owner must have been a man of note. From the bronze bucket, which was used in Saxon ships of war, he probably was one of those hardy pirates who ravaged the coasts and rivers of Britain when the Romans had deserted them. And, lastly, he was a pagan—a Viking of the northern seas, possibly, who left his Scandinavian home some thirteen hundred years ago. He was brought up from the pleasant river valley on the shoulders of his men, and buried on the site of the old Celtic village, amid the wild chants of his brave sea-dogs, and, as became him, after *was-hal* to his memory. There is much to be learnt from the discovery, as well as interesting relics to be treasured. Gold ornaments of exquisite workmanship are placed with bronze armour and with iron arms. The

under side of the shield was strengthened with a ring of iron, as was also the bottom of the bucket. With gold for decoration, bronze for defence, and iron for offence, the discovery affords another and most satisfactory proof of how difficult it is to distinguish between, or argue dogmatically about, definite "ages of bronze and iron." Whoever the chieftain was, he lived on the borderland between the two.

The excavation has already taken many days, and is not yet completed. The nature of the soil renders the shoring it up essential for the safety of the workman; and even now, with all the care that has been taken, the ancient yew-tree has sunk into the shaft. But the labour has been well repaid by the richness and variety of the discovery so far, even if no other treasures reward Mr. Rutland's labours. He has had the valuable advice and assistance of Dr. J. Stevens (of Reading) and of Mr. W. Money, F.S.A. (of Newbury), in the excavation; and large numbers of persons, including their Graces the Duke and Duchess of Westminster, from Cliveden, have inspected the very valuable and interesting relics. It is impossible at present to do other than theorise on the date of the interment. The facts of the discovery give food for theories. Only careful examination can furnish hypotheses. But, so far, all things tend to the belief that the remains are Norse or Scandinavian. From the quantity of bronze armour, it would point to an early date when that metal was more commonly used for defensive purposes than iron. The later Anglo-Saxon was more of an iron-using man, and his armour of metal plates or rings, sewed on a leather or woollen fabric, resembled in character that of the Norman soldiers of William. Certainly he must have belonged to that great Northern Teutonic race of which the Danes, the Saxons, the Angles, and the Normans themselves were all offshoots. The decoration of the gold fibulæ is certainly Scandinavian, and the bronze bucket may well be that of a Norseman's ship of war. Even the barbed spear partakes rather of the nature of a harpoon than of a javelin; and its position, with the point towards the feet of the dead, is singular. So complete an example of the method of interment of these early invaders of Britain has probably never been found in the southern counties of England. It will be interesting to see what conclusion Mr. Rutland and those who are working with him will come to as soon as they have found time to arrange and place in order the mass of relics that has been so strangely brought to light.

#### RESTORATION OF CHURCHES.

THE following report on the proposed restoration of the church of St. John and St. Alkmund, Shrewsbury has been addressed to the vicar by the Society for the Protection of Ancient Buildings:—

Repairing a mediæval building without destroying any of its interest is, however, a difficult task, even when there is the strongest desire by those in authority to have the work carried out in a thoroughly conservative spirit. The committee therefore think that they will probably be rendering you the greatest assistance in their power by making a report on the building, according to their usual custom, on the chance that by so doing they may throw fresh light upon the good work which you have in hand.

The first part of the building which calls for attention is the upper part of the tower. On the south side there is a somewhat serious crack. This crack is clearly not due to the foundations having given way, for it does not show itself until above the bottom stage. The walls of the tower are of unusual thickness, being 6 feet thick, and they would seem to be well built. Before repairing this crack, therefore, it would be well if possible to ascertain its origin, and the committee suggest that the hanging of the bells should be carefully examined. If any of the upper timbers of the bell-cage run into the wall, or touch it, the bells should on no account be rung until the cage has been so arranged that there is a clear space all round it. Only the timbers of the floor upon which the cage stands should be permitted to rest on the wall. Care should be taken not to destroy the old tie-beam which has been used to form the bell-cage, as it is an interesting evidence of a previous roof of the church.

One or more iron tie-rods should be placed along the inside of the south wall of the tower, and should run through the east and west walls, and be secured to an S piece on the outer face. The rods should have union screws (inside the tower) by which they could be made "taut." A strong bonding-stone might be let into the wall across the crack about every 6 feet in height, and liquid cement and sand should be poured into the crack at several points on the way up, beginning at the lowest, the surface being covered with clay so as to prevent it from running out. Water should be poured in before the cement and sand, so as to clear the way and wash away all dust. The west wall of the south aisle of the nave has cracked and needs repair. An open drain should be formed all round the church 6 inches below the level of the floor. The drain, whether formed of brick or stone, should be bedded on concrete.

The lead-work of the nave and north aisle roofs is in much too bad a condition to repair, and it should therefore be taken off, recast, and relaid in narrow widths and short lengths. The com-

mittee recommend that no more of each roof should be uncovered at a time than can be properly protected by tarpaulin. When the lead is removed, the timbers, especially the wall-plates, should be carefully examined, and such parts as are decayed should be replaced with sound oak, properly spliced, and, if necessary, bound with iron to the old work. A great effort should, however, be made to preserve all the timber of the nave roof which can be seen from the interior of the church after the removal of the plaster ceiling, which latter should certainly be taken away. Rather than remove any of the old oak in this part of the roof, it would be better, in the opinion of the committee, should it prove to be decayed, to back it with new oak and strap it up with iron.

Thoughtful people feel that age of itself gives a dignity to any building, more particularly a church, and therefore the question of how your parish church can be repaired for longer use without modernising its appearance should be always before those entrusted with the direction of any work of repair. The committee would therefore advise that the parapet on the south side of the nave, which is all of wrought stone well weathered, and by no means unsightly, should be permitted to remain.

It is reported that there are signs of a niche for a sanctus-bell having once existed on the east gable of the nave. The committee consider that the right way of treating this will be to put a plain apex stone and coping upon the gable, and, if possible, leave whatever remains there are of a niche for the sanctus-bell exposed to view. No attempt should be made to put a new bell-cot in the place where the old one might have stood. One of the main objects of this society is to call attention to the importance of repairing, or, if necessary, adding to our buildings in such a manner as in no way to destroy their history. The addition of such a part to the church could only be misleading. The date of all architectural work (previous to the Gothic revival), if not restored, can be fairly accurately determined; and we should strive to make the date of work done by us equally clear to future generations, for it must be remembered that buildings are admitted by historians to be one of the most valuable and trustworthy evidences of history.

Before the lead is relaid on the roof of the north aisle of nave, the timbers should be examined and repaired, as in the case of the nave roof. If it is found that the timbers are wrought, thus proving that it was always exposed to view, the plaster might be removed. The roof of the south aisle of nave, which is covered with thin purple slates, is probably modern. If, upon removing the plaster for examination it is found to be of oak and in good repair, it would be wise to leave it as at present, but if it is of deal, it would be well to replace it by an oak roof of simple design, covered with cast lead. The same remarks which have been made upon the nave and aisle roofs may be applied to the chancel roof, excepting that the chancel roof, unlike the south aisle roof, is covered with grey slates and is of a good pitch. It would be therefore unnecessary to cover it with lead.

The porch on the south side of the nave, although comparatively modern and devoid of architectural features, should not be removed, as it helps to keep the weather from the door, and is simple and unobtrusive.

The present seating is probably found inconvenient, and might be replaced by new seating. As a large portion of the present seating is of oak, the committee suggest that it should be placed against the walls of the church as panelling. The committee also suggest that the new seating should be of an original and simple design and not imitative of any mediæval work; and they trust that oak only will be used for this work and for any new woodwork which may be required.

The two chantries, formed by screens at the east end of the north and south aisles of nave, should on no account be done away with. Although they are no longer needed for the services of the church, they are historically interesting, and the screens forming the chantries are beautiful and original work. If the number of sittings provided in the church is of importance, new benches might be arranged within the chantries without interfering with the screens.

The committee would be sorry to see the gallery at the west end of the nave removed, although it might perhaps be reduced in projection. The pillars which support the gallery have richly carved capitals, and the two wrought iron brackets are particularly pretty.

The magnificent oak chancel screen can hardly be touched without loss of interest, and the committee feel that, when all things are considered, it would be wisest to leave it as it is with the Jacobean pulpit, which is well placed, standing against it. At first sight it might seem desirable to insert new muntins to the screen, but they clearly could not add to the interest of the screen, and therefore should be omitted. It would be well if the paint could be removed from this screen and also from the chantry screens. If this is done, great care should be taken to ascertain if there is any mediæval decoration (under the paint) which can now be seen. If this should be so, the paint should most certainly not be removed, unless it can be done without destroying the mediæval decoration, as some method might be found, at a future date, of exposing the mediæval work without destroying it. If there is no mediæval work underneath, the whole might be

removed without destroying the woodwork, which is very fragile, by using Hayhoe's paint solvent, to be obtained of Hayhoe & Co., Stowmarket.

The old oak communion-table and rail will, of course, both be retained. It is often found that these late communion-tables are too short for present requirements. This, however, can easily be obviated by placing a new oak slab of the required length on the top of the table. With regard to the paving of the church, the committee consider that it would be best to repair and make good the present stone paving, which is completely in harmony with this mediæval building. Care should be taken that none of the glass in the windows is destroyed, as it is of much better quality than any modern glass. The walls should be brushed down, and covered with a wash composed of pure whitening and a little size. None of the plaster should be removed, as there may be mediæval decoration under the many coats of old whitewash. The royal arms, escutcheons, &c., should on no account be removed, as they are interesting, and help to furnish and give colour to the building.

## SOCIETY OF ARTS.

THE one hundred and thirtieth session of the Society of Arts will commence on the 21st inst. with an opening address from Sir William Siemens, the chairman of the society's council. Previous to Christmas there will be four ordinary meetings, in addition to the opening meeting, and for these the following arrangements have been made: November 28, A. J. R. Trendell, "The International Fisheries Exhibition of 1883;" December 5, Thomas T. P. Bruce Warren, "The Manufacture of Mineral Waters;" December 12, Thomas Fletcher, F.C.S., "Coal Gas as a Labour-saving Agent in Mechanical Trades;" December 19, W. H. Preece, F.R.S., "The Progress of Electric Lighting." There will be six courses of lectures delivered during the session, under the bequest of Dr. Cantor. These will be: (1) "The Scientific Basis of Cookery," by W. Mattieu Williams, F.C.S.; (2) "Recent Improvements in Photo-Mechanical Printing Methods," by Thomas Bolas, F.C.S.; (3) "London Houses," by Robert W. Edis, F.S.A.; (4) "The Alloys used for Coinage," by Professor W. Chandler Roberts, F.R.S., Chemist of the Royal Mint; (5) "Some New Optical Instruments and Arrangements," by J. Norman Lockyer, F.R.S., F.R.A.S.; and (6) "Fermentation and Distillation," by Professor W. Noel Hartley, F.C.S. The usual short course of juvenile lectures will be delivered during the Christmas holidays. The subject will be "Crystals and Crystallisation," and the lecturer Mr. J. M. Thomson, of King's College, London.

## WATT'S ROOM AT HEATHFIELD.

A PAPER by Mr. E. A. Cowper was read at the meeting of the Institution of Mechanical Engineers, in which the "Watt Room" at Heathfield Hall was described. The room, it was stated, was about 20 feet by 16 feet 6 inches in size, and really was a good attic and nothing more, with one low long window only 5 feet 4 inches from the top to the floor, so that it was a bad light for any machine a few feet from the window; and it was a wonder that Mr. Watt did not devote a better room to his purposes. There were numerous shelves with drugs and parcels on them, and nests of small drawers with tools in them—some very excellent tools. Watt's small lathe and bench stood at the window, with his tools about, and his old leather apron on the vice, and his centre-punch tied with a piece of catgut to the vice, to save him the trouble of looking for it, or picking it up. There were now a number of busts on a bench in the room, and some marble and alabaster for working on. At the fireplace there was his old frying-pan and his Dutch oven or "hastener"; and outside the door, on the landing, a little shelf, on which, it was presumed, his meals were placed. Besides those things there were two large machines for sculpturing marble, alabaster, or wood, and a few smaller half-finished models, such as the semi-rotary engine and a "counter," of which a print was in the hands of the members, for counting and recording the number of strokes that an engine made. In the room Mr. Cowper also found a large number of little slips of copying paper, with various recipes for making copying-ink, and in one corner of the room a small "letter-copying screw press." Many of the drugs on the shelves were for the purpose of making "the copying-ink powders" that Watt used to sell at ninepence a packet, and of which there were now some dozens at Heathfield Hall. Mention having been made of the sculpturing machines, Mr. Cowper, in conclusion, drew attention to the general effects produced by the inventions of James Watt.

Mr. S. Timmins hoped the relics of James Watt's genius might long be preserved. A few years ago they nearly passed into the possession of the town, but the permission given was withdrawn, and they were returned to the room where they now are. The first son of James Watt, Gregory, died in early manhood and the full maturity of his powers; but the second son, James, survived

his father, and took a most filial and reverent interest in all his father had done. He lived many years at Aston Hall, and did all he could that the law allowed, by entailing the land and making heirlooms of the property, to keep his father's models from being disturbed. Happily, they had been undisturbed, to a very great extent. Many people in Birmingham were anxious that those relics should be preserved in the house in which Watt's son lived, and they trusted that that desire would some day be realised, and that the priceless relics might be preserved for ever. He thanked the engineers for the kindly care they bestowed on those relics when producing drawings of them. From long personal knowledge, he could assure them that the treasure-house of James Watt, Heathfield Hall, had not yet been exhausted, nor thoroughly explored. If that important association could see its way to appoint some competent person to thoroughly overhaul the room at Heathfield Hall, they would not only be pleased and instructed by the results, but posterity would thank them for handing down still further tributes to the memory of one of the most illustrious followers of science and greatest benefactors of the world. Aston Hall, the residence of the second James Watt, was now public property, and therefore any possessions placed there would be, so far as they could speak, absolutely and permanently preserved.

### BIRMINGHAM MASTER BUILDERS' ASSOCIATION.

THE annual dinner of the Birmingham Master Builders' Association was held on Monday night. Mr. H. Sapcote, president of the association, was in the chair. Mr. H. Parton proposed "The Town and Trade of Birmingham," and remarked that twenty-five years ago, to speak of the Market Hall and the Town Hall was to enumerate nearly the whole of the public buildings of Birmingham; but at the present day, thanks to the energy of their public men, the town possessed some of the finest architecture in the country. Every member of that association, he was sure, would feel the great loss that had been sustained in the death of one who had done more than anyone else to beautify the town—the late Mr. J. H. Chamberlain. Every master builder should join that association, in order that the employers might meet the workmen on equal terms. They had an example in the workmen's association, which they might well follow. If the master builders of Birmingham could form themselves into a strong union, they would be able to meet the men firmly at an arbitration board, and so save much misery by preventing strikes which would otherwise occur.

Mr. O. C. Hawkes responded to the toast, remarking that whenever there was depression in other trades the building trades suffered. Such a depression had existed during the past few years; but there was every reason to believe that was now passing away.

The Chairman, in proposing "The Birmingham Master Builders' Association," said they wanted the young members of the trade and small employers of labour to join the association. He believed that, with the committee they had elected, the association was likely to go on successfully. One evil they suffered from was the lowness of prices. Owing to the excessive competition prices for builders' work were at least 5 per cent. too low. Union in the trade might do something to remedy this. They should meet oftener, and the committee should come together more frequently.

Mr. C. W. Barker responded, and referring to the work the association had done, said that for ten years there had been no disturbance between masters and workmen in the building trade. The last strike was the labourers' strike. With the aid of the Builders' Association, the Labourers' Association, which till then had seemed all-powerful, had been defeated, and practically annihilated. Then, instead of having to pay the men in the winter—for they could not employ them—from six o'clock in the morning they now had to pay them only from seven o'clock. Another good thing was the fact that the wages were not now subject to arbitrary and sudden alterations.

Mr. Barnsley, sen., proposed "The National Association of Master Builders of Great Britain." He said one of the prominent advantages of the association was that it promoted intimacy and good feeling among the builders of the kingdom. Competition did not necessarily involve antagonism. He hoped the time was gone when they looked upon such associations as a force needful against other force, though, as with standing armies, the existence of one still rendered the other needful. Happily for some years past in Birmingham the prevailing condition in the trade had been one of good feeling between the operatives and employers. The late Mr. J. H. Chamberlain, during his professional career in Birmingham, did his utmost to promote this good feeling. He had often, when visiting works with Mr. Chamberlain, been struck with the respect, he could almost say with the tenderness, with which that gentleman treated the workmen, and the ready approval he always gave to their work when its quality called it forth. In Mr. Chamberlain's relations with employers, whilst his keen eye and correct taste never failed

to enable him to detect imperfections and mistakes, and his conscientiousness would never allow the interests to suffer, he was always ready to acknowledge that if ever there was a trade that was surrounded by difficulties and vexations, it was theirs, and nothing delighted their deceased friend so much as to see indications of builders and their workmen working in harmony, and possessing each other's confidence and regard. The National Association watched over their interests in Parliament, having during the past session successfully opposed two or three Bills that would have been damaging to master builders; and it provided them with the means of insuring against the claims to which the trade was peculiarly liable under the Employers' Liability Act. Good legal assistance was also one of the benefits placed at their disposal by the National Association.

Mr. W. Knox responded, and added to the list of advantages given by Mr. Barnsley, the contract and apprentice forms provided by the association, which were being generally adopted in the trade.

The health of the president was proposed by Mr. J. Bowen, and drunk with musical honours. The "vice-president and officers," proposed by Mr. Barnsley, sen., and other toasts, followed.

### THE ROMAN WALL.

A PAPER was read by Dr. Bruce at the last monthly meeting of the Newcastle Society of Antiquaries on the recently-discovered turrets on Walltown Crags. It was as follows: At a recent meeting of our society I mentioned that a specimen of that nearly obliterated class of buildings, the turret, which originally were thickly set along the whole line of the Roman wall, had been found upon the westernmost height of the Walltown Crags. Through the kindness of our friend, Mr. Lamb, I have been supplied with an accurately-drawn ground plan of the building, from which I glean the following particulars: The wall at this point of its course is 7 feet thick. The turret is let into the wall to the extent of 2½ feet, leaving the wall immediately to the north of it of a thickness of only 4 feet 6 inches. The interior measurement of the turret from east to west is 13 feet, from north to south 11 feet 10 inches. The thickness of its walls is 3 feet 2 inches. The present height of its walls varies from 3 feet to 6 feet. The wall which forms the north wall of the turret stands nine courses high. In my recent notice of this turret I expressed a hope that further investigation would be made in order to ascertain whether some more turrets could not be found to the east of it, so as to settle the question how many of this class of structures there were between two neighbouring mile-castles. I am glad to say that further light has dawned upon us. Our vice-president (Mr. Clayton) sent the other day his chief excavator (William Tailford) to examine the spot. I give the result of his inquiries. At a distance of 578 yards eastwards, measuring closely by the wall, he found another turret in all respects similar, so far as appearances went, to the previously discovered one. Following the line of the wall closely for a distance of 412 yards a mile-castle is reached. This mile-castle is laid down in Mr. McLauchlan's survey of the wall. Proceeding eastwards again for a distance of 522 yards our explorer found a third turret. This turret stands on the top of the hill on the east side of the gap in which King Arthur's Well is situated. Ordinary observers would not have detected the presence of a turret or other building here, but the experienced eye of Tailford noticed that the herbage on this spot was richer and of a different colour from that of the contiguous parts; he, therefore, put down his spade, and found the turret. Like all the others it was let into the wall, and it measured from east to west 11 feet, and from north to south 9 feet 6 inches; until a thorough excavation is made the height of its walls cannot be given. Horsley thought that there were four of these turrets, or, as we may call them, stone sentry-boxes, between each mile-castle. So far as we can at present see there were but two. It seems desirable that a little further exploration should be made with a view of settling the point. If the wall be carefully examined between this third turret and the mile-castle that lies to the east of it, and which is laid down in Mr. McLauchlan's survey, remains may be found which will tell us whether there were two, three, or four turrets in the interval between two neighbouring mile-castles. In the meantime we are gratified with the thought that we now know of five turrets—the three of which I have now spoken, and that on the Black Carts farm, and that at East Brunton, both of which have been excavated by Mr. Clayton—whereas a few years ago we could not point to one on the whole length of the wall. In due time these newly-discovered turrets will doubtless be thoroughly excavated and protected by iron railings from the destructive tread of cattle, in which case the Nine Nicks of Thirlwall, always specially interesting, will have acquired a new glory.

A Mortuary Chapel has just been built in Brunswick cemetery, Bury, from the plans and under the superintendence of Messrs. Maxwell, Tuke & Hurst, architects, Southport.

## NOTES AND COMMENTS.

MR. RUSKIN has been lecturing on book illustration by means of woodcuts at Oxford. As was to be expected, he disapproves of the American examples, which indicate how far machinery is invading the province of art. It is far easier to cover a surface with fine lines by means of a multiple graver than to produce perfect outlines. When the Americans reproduce open-work the failure is remarkable. Mr. RUSKIN referred with some horror to an attempt to express a sunset by means of lines, which, singly, are mechanical. The illustrations in *Punch* by the late JOHN LEECH, Mr. DU MAURIER, and Mr. TENNIEL found more favour with Mr. RUSKIN. They were described as having exercised an influence on English character. It would be difficult to determine whether Mr. RUSKIN is right in saying this. The young English women drawn by LEECH almost seem to belong to a different species, compared with those which are represented every week; but is not the change to be attributed to some other cause than a difference in the draughtsmen?

MR. POUNTNEY SMITH, who died at Shrewsbury on Monday, was an admirable type of the old school of provincial architects and gentlemen. In his early days he was a builder as well as an architect, and he was proud of his skill in using tools. A few years ago a fine pulpit and some elaborately-carved bench-ends were illustrated in *The Architect*, which had been designed by Mr. SMITH. But he was not satisfied with preparing drawings: a good many of the figures were modelled by his hands. Mr. SMITH became a resident in Shrewsbury in 1840, and important works in the district have been carried out by him. He restored the noble church of St. Mary, the old church at Battlefield, and designed the churches of Uffington, Downton, Pool Quay, Hope Bowdler, Preston Gubballs, and Morton, in Shropshire; Llandrillo and Llandderfel, in Merionethshire; and Llantysilio, in Denbighshire. Mr. SMITH was the architect of several large country mansions. Illustrations of one for Mr. ROBERTSON, M.P., and another at Llantysilio, appeared in *The Architect*. Mr. SMITH was mayor of Shrewsbury in 1873, and for many years he was a member of the town council and a justice of the peace. It must be recorded to his credit that he never made use of his position in the corporation or on the bench for professional purposes, and architects who were engaged on public works in Shropshire could always depend upon him as a friend.

CLASSES for design and construction have been opened in connection with the Edinburgh Architectural Association. In the class of design the attention of students will be directed to the principles and forms of the best old examples of the various styles under study, and they will be assisted and guided in the preparation of designs based upon these. Each subject will be conducted throughout its continuance by one or more practising architects. The first subject, "A Modern House in the style of Scottish Houses of Circa 1600," will be undertaken by Mr. R. ROWAND ANDERSON, A.R.S.A. In the class of construction the subject selected is, "Iron, Cast and Wrought, in Pillars, Girders, and Roofs." Practical examples will be investigated with the aid of Mr. FAIRWEATHER, C.E., of the University of Edinburgh. The fee for both classes is only five shillings to members.

THE report of Mr. PEARSON, R.A., was read at a meeting of the Peterborough Cathedral Restoration Committee on Wednesday. It recommends taking down the western arch and the two remaining piers of the great tower, as the foundations are in a very unsound condition, and altogether unfit for supporting the heavy piers and tower. The pulling down of these will necessitate the demolition of fully one-half of a bay of the clerestory on both sides of the nave and transepts, and similar extensive work of demolition will have to be carried on in the triforium and aisle arches below. The estimate of the cost of this work, in addition to the 55,000*l.* required for the other work, is 5,797*l.* The meeting recommended that the work should be carried out. The total amount promised and received is 18,482*l.*

IT is not often that so important a case as that of LEIGHTON *v.* Royal Courts of Justice Chambers Company (Limited) is heard in the first week of term. People who pass along the Strand are familiar with the immense building opposite the Courts, the construction of which is the cause of

the action. The Company purchased some houses in the Strand and the whole of Palsgrave Place as a site for their chambers. The plaintiff owned an adjoining house, and he alleged that during the progress of the works his house was injured, owing to fissures which were caused by inefficient shoring and underpinning. He was compelled, for safety, to remove his machinery and business elsewhere. Damages amounting to 4,128*l.* were claimed. The plaintiff's case was supported by Mr. SHOPPEE, Mr. CLIFTON, and Mr. WHICHCORD. The defendants, on the other hand, ascribed the injury to the subtraction of underground water, which could not be avoided, and to the use of heavy printing presses and other machinery, which the house had not been originally calculated to bear. The defendants called for witnesses Mr. T. CHATFIELD CLARKE, Mr. PORTER, Mr. P'ANSON, Mr. CURREY, and the architects of the building, Messrs. WIMBLE & CUTHBERT.

BARON POLLOCK, before whom the case was tried, proposed to be guided by the decision in *ANGUS v. DALTON*. His lordship left four questions to the consideration of the jury—viz. (1) Whether the plaintiff had acquired a right to support with his machinery and warehouse as it existed at the time of the defendants' excavations? (2) Was the plaintiff's warehouse badly built, as the defendants said it was, so that what occurred arose from its own defect? (3) Admitting that an injury had arisen, did it arise from any works carried on by the defendants? If so, what specific work caused it looking at excavation, improperly "underpinning" or "shoring up," the vibration of the heavy cranes, or the subtraction of the water? (4) Assuming the plaintiff had a ground of action, and the defendants are liable, what damages was he entitled to? Was the plaintiff bound to leave the premises in question? The premises being easy of access, were examined by the jury during the trial. After a short consultation the jury answered the first question in the negative, adding that they thought the house had not lapsed through its own defect; and they negatived all the grounds of injury except the subtraction of the water. Judgment was therefore entered for the defendants. The result is important, as it shows that the original purpose of a plaintiff's building must be taken into account, and that a shop or dwelling-house when converted into a factory, is at the owner's risk in regard to questions of lateral support.

THE article by Mr. LELAND in *Longman's Magazine*, with the title "An Opening for the Unemployed in Ireland," will of course excite curiosity. The author, whose name is not unknown in England, has had experience in conducting an industrial art school in America. He has found that the Irish children are easily taught, and can be employed in the production of various ornamental objects. Mr. LELAND accordingly concludes that what is practicable in the States is also practicable in Ireland, and he suggests that the cultivation of the minor arts might with advantage be introduced into Irish households. At present there is little encouragement in his own country for an Irish student of industrial art. It is true that a large sum of money is expended every year on metal-work, sculpture, and vestments for the Roman Catholic Church, but Belgians and French have all the benefit. The heads of that Church could without difficulty do much for industrial art in Ireland. What Mr. LELAND desires is the introduction of English and Continental capitalists. There is undoubtedly a fine field for a few enterprising men who would be prepared to wait for a return until they had instructed apprentices. All the native efforts are frustrated by the desire to gain profit at once. One notable example is the Fermanagh pottery, which was thrown on the market before the mysteries of modelling and colouring had been mastered.

THE master builders of Birmingham have passed a vote of sympathy and condolence with the family of the late Mr. JOHN HENRY CHAMBERLAIN, who, "as an eminent and enthusiastic member of his profession, was brought into frequent and agreeable intercourse with them." The School Board have also acknowledged their sense of Mr. CHAMBERLAIN's loss. The thirty schools which he had designed for the Board were described as the work of "a man of genius, a man who loved the people, a man who knew what their wants were and how they could be obtained." Mr. KENRICK, a member of the Board, has offered 1,000*l.* to found a JOHN HENRY CHAMBERLAIN Memorial Scholarship. A bust of Mr. CHAMBERLAIN is also to be placed in the Corporation galleries.

## ILLUSTRATIONS.

DECORATIVE PANELS, BY M. MAZEROLLE.

THE four panels which we publish this week, although not painted at the same time, have some relation to one another, as the subjects are fishing, wine, cookery, and hunting. The originals are painted on a large scale, and have been exhibited. The figures have the grace which is characteristic of M. MAZEROLLE's lightest work.

THE NEW WAVERLEY HOTEL, EDINBURGH.

ONE of the few large buildings which are in course of construction in Edinburgh is the Waverley Hotel at the corner of Princes Street and St. David Street, of which we give an illustration. The ground floor will consist of commodious shops. The hotel entrance is from Princes Street, from which ascending a few steps the first floor is reached, containing a spacious dining-room, 66 feet by 26 feet, finished in accordance with the same style as the outside (which is a free treatment of the Renaissance), smoke-room, drawing-room, commercial-room, lavatories, &c. This floor is constructed of fireproof material, which, from the situation, will be out of danger from fire arising in any of the premises underneath. The roof is also constructed of the same material.

The façades to Princes Street and St. David Street have slightly projecting bays, three of which are circular in plan, and are carried up to the roof through five storeys, and surmounted by a balustrade. The corner one has a dome, upon which is placed a gilt figure of a crane with a stone in foot, being the crest of the proprietor, Bailie CRANSTON, J.P., D.L. The bays are broken by horizontal courses of cornices and mouldings, which break the upright lines of shadow, giving breadth and massiveness to the building. The foundation is on rock and hard boulder clay, upon which are constructed large piers of stone in the basement, from Hailes quarry. The ground-floor is constructed with cast-iron stanchions, and polished red granite piers, upon which are fixed malleable iron girders, and the fireproof floor construction. The stone used for the building is from Gunnertown quarry in Northumberland. The slates on the mansard roof are Westmoreland green, which will harmonise with the red granite columns and pilasters on the two elevations. The hotel is fitted up with electric bells throughout, and the ventilation of the rooms has received special attention, in several of them, as in the smoke-room, large shafts have been provided for the extraction of the foul air and suitable inlets provided for fresh air.

The hotel occupies one of the best sites in the city of Edinburgh, and the effect will be in keeping with the surroundings, as one of massiveness on the whole, combined with grace and elegance in the details.

The contractors for the work are Messrs. W. & D. MACGREGOR, builders' work; Messrs. DAVIDSON & CHISHOLM, carpenters' and joiners' work; Mr. BAIRD, plaster work; Mr. BARTON, plumbers' and gasfitters' work; Mr. SLATER, slaters' work; Mr. THOMAS TAIT, ironfounders' and smiths' work; Messrs. CUNNINGHAM, glaziers' work; Messrs. CRANSTON & SCOTT, painters' and decorators' work; Mr. DAWSON, the electric bells, speaking-tubes, &c.—all of the city of Edinburgh; and, in addition to the above contractors, the granite work is supplied by the Great North of Scotland Granite Company, Limited, Peterhead; the ornamental ironwork by Messrs. MACFARLANE & Co., of Possilpark, Glasgow; iron windows, &c., by Messrs. CARLOW, COULSON & Co., Glasgow; the wrought-iron girders and fireproof work by Messrs. HOMAN & RODGERS, of Manchester. The whole of the work is being carried out under the direction of the architect, Mr. JOHN ARMSTRONG, 2 Queen Street, Edinburgh.

WESLEYAN CHAPEL, HORBURY, NEAR WAKEFIELD.

THE chapel is now being rebuilt on the old chapel site, which is a very good position, fronting the turnpike-road to Wakefield, and surrounded by trees. The buildings comprise body of chapel, with galleries at each side and one end, entrances, recessed organ-chamber, band-room, ministers' and stewards' vestries, water-closet, and lavatory accommodation. The accommodation in all is for 526 persons, allowing 20 inches for each in length, being 307 on ground floor and 219 in galleries. All internal woodwork exposed to view will be in pitch pine, varnished.

The roof is in one span, but divided internally into nave and side aisles by ornamental clerestory arches of wood, with tracery fillings, all supported on ornamental cast-iron columns. The ceiling is half open, and divided by arched wood bindings and moulded purlins, the spaces between being plastered. The covering of the roof will be of the best Bangor blue slates, with dressed stone ridges. The choir will be seated in front of the organ within the organ-chamber, the floor of which is 4 feet 6 inches above level of ground-floor. The rostrum is about 6 feet 6 inches by 5 feet, in pitch pine, with panelled and moulded fronts and tracery fillings. The communion will be protected by a brass railing supported on ornamental wrought-iron standards. The seat framing throughout will be 1½ inches thick, with ornamental stop chamfered bench ends, 2 inches thick, and each line of seating provided with a book-board and hat-rail, &c. The glazing will be in cathedral leaden lights, slightly tinted, with small border round in strong colour.

The style of architecture adopted throughout is Decorated Gothic of the thirteenth century. The height of the building from ground floor to eaves of roof is about 21 feet, and from ground floor to apex of roof about 42 feet. The small tower and spire is of solid masonry, 7 feet square, pierced in places by small tracery-headed windows, and its total height from ground floor is about 70 feet. The front wall is of pitch-faced delph wall-stones, 2 feet 6 inches thick, with Holmfirth ashlar dressings. The side and back walls are of chopped delph wall-stones, 2 feet thick, with Holmfirth ashlar dressings also.

The chapel will be ventilated by TOBIN'S inlets, WADDINGTON'S syphon ventilators, and extracting grates in ceiling conveying the vitiated air into false roof, and from thence to outside by means of louvres in gables.

The building was let in one contract to Messrs. J. & W. BEANLAND, of Bradford, for the sum of 2,414*l.* This amount does not include heating apparatus, varnishing and decorating, stoves, gasfittings, or architect's commission. The carving will be executed by Mr. HARRY HEMS, of Exeter. The heating apparatus is not yet decided, but very probably PERKINS' high-pressure system of hot-water piping will be adopted. The whole of the works will be carried out from the designs and under the superintendence of Mr. WALTER HANSTOCK, A.R.I.B.A., architect, Batley.

RESIDENCE FOR THE HON. A. C. B. BANNATYNE, WINNIPEG.

THIS building has been lately erected from the designs of Messrs. ROWAN & PAYNE, and is published with the object of suggesting the class of mansions that find favour with Canadian proprietors.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE first ordinary meeting of the session for 1883-4 was held on Monday evening, the 5th inst., the president, Mr. Horace Jones, in the chair. Various donations to the library were announced, and votes of thanks awarded to the donors, after which a ballot for new members took place, when the following gentlemen were declared duly elected: Messrs. J. F. Wood, C. F. Moore Cleverly, C. H. Brodie, and W. Scott, candidates who had passed the examination in architecture, as associates; and Messrs. F. T. Wilberforce Goldsmith and F. Johnson, also as associates, and who had passed the voluntary architectural examination in the class of proficiency.

The following is an abstract of the opening address delivered by the President.

## The President's Address.

THE PRESIDENT alluded to the losses sustained and the inroads which a year had made in the ranks of the Institute since the opening meeting of last November, the number being no less than twenty-two. Among the foremost he mentioned the great Viennese master, one of the recipients of the gold medal given by Her Gracious Majesty the Queen on the recommendation of the general body of fellows, Heinrich Baron von Ferstel, who died on July 14 last, after a long and painful illness, at the comparatively early age of fifty-five. Two days afterwards his body had been conveyed to the Votive Church—the work of more than twenty years of his life—where the funeral service was performed previous to its interment in the family vault at Grinzing, the place of his residence when alive. A list of his principal works was to be found in the Proceedings of last session, and a memoir of him would in due course be printed in the Transactions. Three other honorary and corresponding members had also died during the session, viz., Professor de Fabris, architect, of Florence, for some

time president of the Royal Academy of Fine Arts in that great city; Christian Hansen, of Copenhagen, a brother of Theophilus von Hansen, of Vienna, honorary and corresponding member, and the Count Vespignano, architect to St. Peter's at Rome.

Though in this country, as if to afford a contrast to the events of 1881, death seemed to have spared the elders, a more than usual number of young professional men had fallen; two even of those who a few months ago were among the first to enter the ranks of the associates under the terms of the by-law which enforces examination, had passed away, namely, Samuel Cuthbert Rogers, at the age of forty-five, and Cecil Haden Stock, in his twenty-fifth year, the latter of rapid consumption in New Zealand, whence he was ordered in the hope of benefit from a sea voyage. Besides these, there are other cruel losses, such as R. M. Marnock, associate, a young man of promise, who died in Australia, and R. C. Page, associate, whose recent death has evoked sincere regret, neither of whom had reached to forty years. The other associates lost by death were A. W. Archer, W. A. Baker, B. W. Cummings, J. W. Forge, F. P. Hughes (Madras), W. Moffatt (Aberdeen), B. A. Paice, and T. E. C. Streatfeild. Two fellows had passed away—viz., R. L. Sibley, a well-known district surveyor, and C. N. Tripp, of Gloucester. Four honorary associates had also succumbed—viz., W. G. Harrison, the well-known and highly-esteemed Queen's counsel; J. Gascoigne Lynde, of Manchester; Sir Edward H. Scott, the banker; and William Spottiswoode, who as president of the Royal Society held a position of special honour. His loss could not fail to be felt by a larger circle than his own personal friends, and it was a mournful gratification to know that, as in the case of the late Mr. Street, a fitting resting-place had been found for the remains of the late president of the Royal Society among the highest worthies of the nation, in Westminster Abbey.

An important event of the year was the opening in state of the Royal Courts of Justice on December 4 last by the Queen, and with a befitting ceremony, including a deputation and address from the whole body of the workmen who had been employed upon the works. He was aware—at least he had often noticed—that in the reports given at various times by the public journals of laying the foundation-stones, and also at the completion of the public buildings, when a royal dedication took place, the names of the architects were generally omitted, and the buildings might have been raised by the touch of some fairy wand as far as regarded any allusion to the hands, hearts, or heads of those who had laboured for perhaps years over them. It was therefore an act, in accordance with the kindly spirit of Her Majesty, to graciously express her pleasure at the loyal address presented by the workmen of the various crafts employed upon the buildings, and congratulate them upon the successful results of their honourable toil. He would not attempt to review that building; but they were all aware that, shortly after its opening, a good deal of criticism was evoked upon several points, especially the temperature and ventilating; and he need scarcely remind them, though he would wish to remind the public, that a newly-built and recently-finished building required some little time to dry and season, and that many of these defects of heat, ventilation, and even acoustics, loudly complained of at the moment, would cure themselves in a very moderate period by the natural effect of use, of wear, and of time.

The opening of other royal courts of justice was soon to take place, namely the Palace of Justice at Brussels, and he remarked with feelings of some regret that the British did not emulate the Continental peoples in their willingness to bear the expense of liberal contributions for public buildings and national monuments. Let them reflect that Belgium, a country not much more populous than the English metropolis, and Brussels, less populous than some of the London parishes, had readily found treble the amount for a palace of justice that the English did. Had the same liberal scale been applied to those Royal Courts opened in December last, he felt sure that many unkind criticisms of the edifice would have been changed into "pæans" of praise and admiration. Among other buildings completed and opened during the past year, he would mention the new Galleries in Piccadilly of the Royal Institute of Painters in Water-Colours, the work of Mr. E. R. Robson, a fellow and colleague; also the new City of London Schools in Blackfriars, by Messrs. Davis & Emanuel, architects.

Last year he had touched upon the question of the safety from fire of public edifices, theatres more especially, little thinking that within a few short weeks the daily papers would be full of the catastrophe at the Alhambra Theatre. The original building, a clever and praiseworthy attempt to use Arabic architecture, the work of their respected friend and past vice-president, Professor Lewis, was intended as a home for science under the name of the "Panopticon." But as was too often the case it had been "the alchemist's search," and instead of turning smoke into gold, it turned the gold into smoke, falling in the end into other hands. The sad and terrible calamity which happened at Sunderland, although not from the same cause, furnished another incentive for some such course being taken as he suggested last year, viz., that competent men of different nations, should take the matter into serious consideration, so as to improve the efficiency of construction, the convenience, economy, and safety of public buildings.

One source of danger was the use of doors opening only one

way, and when these by any chance got clogged, or were subjected to pressure by a number of people pushing against them, thus preventing their being opened, the likely and obvious result would be a serious catastrophe, to which of course any building might be subject equally with the one mentioned. Doors intended merely to shut off divisions might be made to open both ways upon spring hinges, or where on account of draught, &c., they could only be made to open one way, such as in passages, stairs, &c., they might be framed with an inner stile and rail to open in an emergency the contrary way to that which they generally did. Such a system would be particularly applicable to the iron fire-resisting doors separating one section of a building from another.

He had now to allude to the proposed completion of Blackfriars Bridge, and the desire of the Corporation of London to adorn the four pedestals or piers at each end of the bridge with ornamental sculpture. In July 1880, the matter was referred to the Bridge House Committee for the purpose of obtaining designs for the proposed work, which in due course were produced. The committee had availed themselves of the courteous advice and the high talent of Sir Frederick Leighton, the president of the Royal Academy, William Calder Marshall, R.A., and George Frederick Watts, R.A., who had considered the various works sent in competition, and reported their opinion thereon to the committee. He (the president) had had the honour of being associated with them, and unfortunately they had been compelled to report that among the various designs recommended for premiums none were adapted for execution; a decision which was endorsed by the Bridge House Committee, and approved by the Corporation. At the end of 1881 the matter was again referred to the committee to proceed further, when they conferred with the same gentlemen, who gave a unanimous opinion as to a certain mode of procedure, but one which involved considerable alteration to the pedestals of the bridge. To that opinion, from various reasons, the members of the committee objected, and they came to the conclusion to leave the piers or pedestals unaltered in size; in fact, to follow the original suggestion of Mr. Cubitt, the architect of the bridge, as to an equestrian statue; and further, to obtain, if possible, an equestrian statue from which a cast could be made, whereby an opportunity would be afforded of appreciating the size and judging the effect of the same upon one of the pedestals of the bridge. An equestrian statue had been obtained from the hand of the clever French artist, M. Clésinger, representing a gallant soldier or commander, of royal or of noble race, of the sixteenth century. Its extreme length was about 23 feet, and the extreme height nearly the same. He hoped that in a short time that model would be placed in position; though, indeed, it was quite understood by the committee that there were many points in the work which would have to be altered or avoided in any fresh production or design intended to be permanently put up, nor was the model intended to be any indication of the proposed treatment or subject other than as regards size and general dimensions.

In alluding to the proposed communication across the Thames below London Bridge, he would observe that an inquiry into the various schemes and reports placed before the Corporation and the public had tended to confirm the views held by many who had had this question long before them. In the first place with regard to communication by ferries. However appropriate in less crowded streams than the Thames, and when the tide is less strong, ferries had been, and continued to be, and would continue to be useful means of communication between opposite banks, yet in the Thames they would serve more as an indication of what the intercourse between the two shores consisted, than a permanent substitution for other modes of communication, and perhaps their real benefit would be to show the approximate necessity or obligation of forming the proposed communication. Secondly, with regard to high-level bridges, it had been clearly shown to be probable that people would just as soon make a round or circuit as mount a considerable height only to descend again; that the actual distance to be travelled, whether by mounting and descending, or taking the round of London Bridge, would not be very different in going to or from the East End of London and the Elephant and Castle, Kennington Gate, &c.; and it had also been clearly demonstrated that a tunnel would require the same length and the same gradients as a high-level bridge, only that of course they would be reversed. Both these methods were considered by their principal supporters to be considerably ameliorated by the ample means of giant lifts and other machinery worked either by hydraulic or steam power, but there were some who looked less kindly on such appliances. Thirdly, a low-level bridge, which, in respect to the land traffic, was of course unexceptionally the most economical, meant, as regards the river traffic, which was really many times greater than the land traffic, absolute annihilation, as far as sea-going vessels were concerned, west of any such proposed bridge, though the nearer it was placed to London Bridge the less serious would be such annihilation. A low-level bridge with openings would not cost more than one-third of the others, and if the waterway were left open, with occasional closures, for say two or three hours during each tide, that would be the maximum interference with the river traffic. At night the opening of the bridge at high water would be continued, as the occasional closures would not be required.

Various statistics had been taken, but none which absolutely showed the exact number of vehicles which pass from the north end of the Minories and more distant points to, say, Tooley Street or Bermondsey Street. From those statistics of vehicular traffic and foot passengers the one taken on July 3, 1876, showed that about 99 was the number of vehicles that passed in this direction, and about 156 in the direction of Bricklayers' Arms and Old Kent Road; but the gain to these latter would have been very slight even had there been any other communication on either the east or west side of the Tower. Therefore it might be assumed that there were not more than about 260 vehicles for which this bridge was to be made. If, however, they doubled the number, and made it, say, 500 each way, that would be a very liberal, if not an extravagant, estimate of the present position of the traffic. It had been assumed by Sir Joseph Bazalgette and Colonel Haywood, and many others who had considered the question, that that traffic would very quickly rise to between 4,000 and 5,000 per diem; but it must be kept in mind that public money should only be spent in the improvement of present thoroughfares, trade, &c., and that to spend money for the future and speculative improvement of any district is not to improve the interests of the added number of the inhabitants, because they are not there, but only to improve the value of the landowners' property, on the future improvement of special trades or commerce, improvements which common political economy most plainly indicated should be borne by individuals and not by the public any more than the public should pay the expense of new roads, sewers, railings, &c., of agricultural or waste land in order to permit the freeholder to reap the advantage of it as land ready and laid out for building purposes.

A temporary steam ferry had been estimated at from 10,000*l.* to 20,000*l.* per annum; and if one could be substituted for a year or two at 14,000*l.* or 15,000*l.*, it would demonstrate the propriety or non-propriety of expending a capital sum, the annual interest of which would be equal to 30,000*l.* per annum at the lowest, and under certain circumstances up to 120,000*l.* or even more.

In regard to a high-level bridge it had been already demonstrated that a height sufficient to leave the river traffic uninterrupted would render the bridge utterly useless on account of the length of the ascents and descents. Lifts, say 70 or 80 feet high, might mitigate this to some extent, but would of themselves be an unsatisfactory solution of the problem. Then, as to cost, Sir Joseph Bazalgette estimated the cost of a high-level bridge at between two and three millions. A tunnel would be equally inconvenient, incur much the same expense, and, without lifts, would be equally useless. One scheme, devised by private enterprise last year, was lost before Parliament. It had, however, the inconvenience or convenience, as the case might be viewed, of twelve lifts, six on either shore, and their estimate appeared to promise some considerable economy.

A low-level bridge appeared now to be the only matter to be dealt with. First let them take that which would be most convenient for land traffic, viz., an uninterrupted one. The nearer it was to London Bridge the less damage would it do to the river traffic. One had been designed, keeping very nearly on a level with Fenchurch Street, the upper floor of Billingsgate Market, the departure platform of the London and Brighton Railway, London Bridge, and running again into High Street, Southwark. The cost of that would be considerable, probably approaching two millions, and it would receive serious opposition from the owners of Fresh Wharf. The one proposed to be erected upon the site east or west of the Tower would cost, if continuous, about half a million of money, but it would be the ruin and annihilation of all the wharves westward of it to London Bridge, including Billingsgate, and it would be pursuing a diametrically opposite course to that pursued by Manchester and other important commercial centres, viz., bringing seagoing ships as near the heart of their trade as possible. It would interfere with and stop the reception of thirty or forty millions per annum which would be gladly welcomed by the wharves at Ratcliffe, Limehouse, Blackwall down to Gravesend, as also by the docks which had been and were still being made; and when a trade was once displaced it might seek other and more distant localities. To obviate that—a serious and imperative reason—a low level bridge must be made with openings readily worked and thoroughly adapted to passing an average of about twenty seagoing steamers to and fro per diem (say ten each way each tide). The present line of berthing ships gives a clear space of say 300 feet, and if that, or even if desired or deemed necessary a few feet more were given, no more inconvenience need arise than existed now in passing the line of boats and ships berthed as at present. If that 300 feet space were maintained, and the bridge kept open at high water, at a slight inconvenience to the land traffic, no complaint of obstruction could be made as to the river traffic. Such a low level bridge could be constructed either as a swing or lever bridge, or a bascule or lifting bridge, designs for all of which have already been before the committee and the public. One proposal made by an eminent engineer was to put a pivot bridge in the middle of the stream; that appeared to be a mistake, as it reduced the maximum of the opening to only about 180 feet clear of the berthing line of barges, &c. There were several other methods which had been submitted and which might probably be remembered, such as the shooting bridge to be

shot out or slid from each side to meet in the centre; also a scheme for raising the centre portion bodily 100 feet high, and another to sink it down into the depths of the water, &c. Of those, time would not permit him to speak further.

To revert now to the more immediate concerns of the Institute, the president was glad to be able to state that arrangements had been made with the Glasgow Institute of Architects, a society constituted on the same bases of professional obligation and motive as the metropolitan chartered body, whereby an examination of candidates desirous of qualifying for candidature as associates of the latter would be held at Glasgow, provided only sufficient number of applications be received before the end of this year. He anticipated ultimate success for this attempt to spread architectural education, and he went so far as to hope that similar examinations to those already held in London might be annually conducted by local societies of architects, not only in Glasgow but also in Manchester, Leeds, Birmingham, and, the fates being propitious, in Bristol. As a proof of the increasing interest in teaching and examination, he would remind his audience that in his address last November he had mentioned the City and Guilds of London Institute as coming into use and worthy of support. He was pleased to be able to state that this year the candidates for examination in that technical college numbered 2,397, as against 1,972 in 1882, giving an increase of 425.

Last year he had also alluded to the privileges of non-metropolitan fellows of the Institute as compared with those of the metropolitan fellows. Since then considerable progress towards an understanding in the matter had been made. A special committee of the council was appointed to confer with the Manchester Society of Architects on the subject, the result being that a communication was made to Mr. John Holden, the hon. secretary of the latter body, of which the following is a verbatim copy:—

"Referring to the memorial dated August 16, 1882, in respect to the position and privileges of non-metropolitan fellows of the Royal Institute of British Architects, submitted on their behalf by your Manchester Society of Architects; referring also to the conference held in London on December 3, 1882, between the representatives of your society and a sub-committee of the council of the Institute, whose report, dated January 6, 1883, containing resolutions agreed upon by the Manchester society and the sub-committee, offered suggestions for ascertaining the sense of the whole body of fellows in respect to the annual election of officers and the affairs of the Institute generally, without compelling every non-metropolitan member to travel to London in order to record his vote in person: we have to state that after long and careful consideration the council have decided to meet the views of the memorialists in the matter of eliciting individual opinions and advice in writing from the general body of fellows. For this purpose, with regard to the next annual election, it has been decided as a tentative course to forward prior to the first issue of the balloting list a circular letter to every fellow throughout the United Kingdom, inviting him to fill in on a blank form (to be enclosed with the circular) the name of any fellow, or the names of fellows not exceeding four, whom he would suggest to the consideration of the council for nomination in such list as ordinary member or members of council for the ensuing year of office.

"With regard to the enactment of any new by-law, or the alteration, repeal, or suspension of any existing by-law proposed under the terms of By-law LXXII., or with regard to professional questions of general interest, the council propose to adopt a similar tentative method of previously ascertaining the views thereon of the whole body of fellows. Before this decision was arrived at, the council sought legal advice in respect to the true limit of interpretation to be given to that clause in the charter, which states that, 'At all general meetings and meetings of the council the majority of the members present, and having a right to vote thereat respectively, shall decide upon the matters propounded at such meetings.' The hon. solicitor was good enough to devote much attention to the subject, and the result confirmed the council in their opinion that a fellow, in order to use his privilege of voting, must be present in person, while any suggestion which might nullify or even evade that law would be in opposition to the true intent and meaning of the charter.

"Imbued with these convictions, but feeling at the same time a sincere desire to satisfy, as far as lies in the power of the corporate body, the wishes of non-metropolitan fellows—anxious also to see the latter engaged equally with their metropolitan colleagues in the work of the Institute, the council trust that this proposal for previously obtaining the advice in writing of the whole body of fellows, in respect to the annual election and the affairs of the Institute generally, will be accepted by fellows resident at a distance from London in the spirit in which it is offered, and that the tentative efforts to be made next year for the purpose may prove useful and beneficial to the Institute at large."

At the same time a slight modification of By-laws Nos. XXVI. and XXVII. in regard to the election of officers had been proposed and accepted, particulars of which it might be desirable to mention. In January last a friendly requisition was submitted under the terms of By-law LXXI., signed by William White, F.S.A., fellow; Ewan Christian, vice-president; Thomas W.

Cutler, fellow; Robert W. Edis, F.S.A., fellow; R. Phené Spiers, F.S.A., fellow; John Noyes, fellow; Alfred Waterhouse, A.R.A., member of council; and Joseph Peacock, fellow; asking the council to consider the By-laws XXVI. and XXVII. on the grounds that, in the opinion of the requisitionists, the nomination to the highest offices of the Institute ought to be in the unrestricted discretion of the council. A conference between them and the council was held on February 26 last, when on their behalf two resolutions were offered to the council as suggestions in respect to the alteration of the by-laws in question; and after careful and protracted consideration of them the council arrived at the decision contained in the following extract from the minutes of meetings of council held on June 11 and 12.

"That as regards the nomination of the president the council shall be empowered to nominate for election any fellow or hon. fellow of the Royal Institute of British Architects; that present and past members of council alone shall be eligible for nomination as vice-president; and that no vice-president who has filled the office for six successive years shall be eligible for re-election as vice-president until the expiration of twelve months from the termination of his office. Further, that the enforced retirement of members of council annually by rotation is not desirable."

In accordance therewith the president added that the council proposed to take the earliest opportunity of recommending to a special general meeting of the Institute the alteration of By-laws XXVI. and XXVII., and, if necessary, of other by-laws relating thereto.

Some time during the session opened to-night, probably about July, continued the president, the Institute would enter upon its fiftieth year of existence; and though the president had no wish to forestall the interesting remarks which would be more appropriate in the mouth of his successor, he thought it an agreeable duty to intimate the near approach of so interesting an event. Of those worthies who met in 1834, their excellent and venerable friend, Professor Donaldson, was the only survivor. He trusted that when they were called upon to celebrate their full half century, the professor would be with them in health and spirits to point a moral and adorn a tale of interest and importance, he ventured to believe, to the profession of architecture. At the jubilee of the Institute a large number of architects from all parts of the United Kingdom would probably be gathered together in London, and, following the precedent of 1881, the conference would take place at the period of the annual meeting during the first week of May. He trusted that the gathering would be not only national, but even international, for he had reason to know that more than one foreign corresponding member would on the occasion gratify their British *confrères* with their presence in this country.

Mr. ALFRED WATERHOUSE, A.R.A., proposed a vote of thanks to the president for his address. Mr. Waterhouse said he should not attempt to follow the arguments of the president, particularly in regard of improved communications across the Thames, below London Bridge; as it was a subject he did not understand, though a most important matter. They would all join with the president in regret at the loss of Baron Ferstel. Certainly all who were personally acquainted with his work must have esteemed him as an architect of eminent power. It was sad to find so many leaders in the profession dropping off by death; but, looking at the excellence shown by younger members in the profession, an excellence which was on the increase, they need feel no fear for the future.

Lieut.-Colonel PRENDERGAST seconded the vote, and spoke of the blocking of traffic on London Bridge; he thought a great deal of the existing traffic could be reduced if arrangements were made with the great carrying companies for the purpose. He brought forward, as an instance, the fact of one of the railway companies bringing in goods to a dépôt without there being any sort of necessity for so doing.

Mr. HYDE CLARKE cordially supported the motion.

The vote having been then put to the meeting, it was carried by acclamation, and the meeting was adjourned to the 19th inst.

**Bank at Leek.**—A new building has been erected for the Manchester and Liverpool District Banking Company at Leek. The walls are built of thin dark-fired Ladderedge bricks, with Roche stone dressings; the exposed timber framing and cornices, and principal windows and outer doors, are of teak; Broseley tiling is used for the roofs; and the glazing generally is patent plate in lead quarries. The interior of the portico is faced with bricks of russet Burmantofts faience under a frieze of Mr. D. Morgan's tiles. The length of the banking-room is 48 feet; width, 24 feet; and height, 15 feet. The walls are lined in arcading with St. Sylvester and Napoleon marble and white marble concrete, with Scagliola decorations. Below this is a wainscoting of polished American walnut, and the same wood with Spanish mahogany is used for the doors and the extensive furniture of this room. The ceiling is coffered by moulded beams and ribs, and is mainly executed in American whitewood. The works have been carried out to the plans and under the superintendence of the architects, Messrs. W. Sugden & Son.

## MANCHESTER SOCIETY OF ARCHITECTS.

THE report of the Manchester Society of Architects for 1883, being the nineteenth, states that the number of members on the books is now thirty-five. The council have not yet succeeded in obtaining such a revision of the regulations of the Royal Institute of British Architects as would justify them in recommending the members to join the Institute. An interview was held in London with a committee of the Institute, but a legal difficulty is supposed to be an impediment to any new regulation which would give provincial members a voice in the conduct of the affairs of the Institute. The question of "easements of light" has occupied the attention of the council of the society during the session. In the competition for students' prizes, the first society prize was awarded to A. N. Wilson for drawings of a part of Cheetham Hospital, and a supplementary prize to J. W. Belhouse. Mr. J. P. Holden's prize was obtained by H. Harrington for drawings of a portion of Lyme Hall, Cheshire, and the supplementary prize by A. N. Pearson. The prizes for students of the Manchester and Salford Building Trades' Institute were awarded to T. Bowden, A. E. Little, and J. A. Ruddock. The council call the attention of the members to the competition for the Dublin Museum, and the treatment of Mr. R. Knill Freeman, one of the members of the society. "A new competition," it is said, "has been arranged, in which architects generally are invited to send in drawings, and it is presumed that the next selection of architects will be in accordance with the wishes of the residents." The opinion of the society has been sent to the council of the Royal Institute, urging them on behalf of the profession generally to enter a strong protest against the transaction. The report next refers to the destruction of the Gaiety Theatre, Manchester, by fire. It was a building which should never have been used for public purposes. The council say that at different times they have directed attention to the dangerous character of certain buildings—the Queen's Theatre among others—but up to the present their efforts have been fruitless. After some terrible disaster a move may be made in the right direction, if the sufferers are of sufficient local standing to compel attention. The following officers and council for 1884 have been elected: Messrs. John Holden (president), J. W. Beaumont, R. J. Bennett, R. Knill Freeman, James Murgatroyd, Ed. Salomons, J. Steven, and J. Ely (hon. secretary).

## THE DWELLINGS OF THE POOR.

ONE of the subjects introduced by Mr. Goschen in his lecture on the *laissez-faire* policy, which was delivered in Edinburgh on the 2nd inst., was "The Dwellings of the Poor." He said: I cannot conclude this review of the causes of the present intense demand for Government interference without alluding to the burning question of the housing of the poor. In this case nearly all the causes which I have noted combine to create the demand—a public sense of moral responsibility, dissatisfaction with the present distribution of wealth, complications arising from the crowded state of society, and the belief that Government is the *deus ex machina* to solve an almost insoluble problem. I include dissatisfaction with the existing distribution of wealth, for no candid observer can ignore that the high profits realised by the landlords and the extreme poverty of many of the tenants are strong elements in the present agitation. But what will carry this movement forward to an actual experiment, as it has carried others, will not be expediency, though arguments based on expediency will be most powerfully urged, nor the agitation of those who have to pay exorbitant rents, but a wave of deep and strong feeling passing over the public mind. I agree with Lord Salisbury that the principle of *laissez-faire* cannot be pleaded in bar of any action in the matter. A most complicated situation has been created, partly by acts of the Legislature itself, in which "natural liberty" scarcely exists; and it is clear that there are many parts of the subject with which, under any theory of *laissez-faire*, the State is competent to deal. But the first question to be decided will be whether the State is simply to appear on the stage in a benevolent character, placing national resources, in loans or otherwise, at the disposal of persons prepared to build houses for the poor; or whether the true beginning is not to insist on a sterner and more thorough enforcement of individual responsibility. To my mind the argument is almost irresistible, that it is as just to prevent, and, if necessary, to punish house-owners who let out rooms unfit for human occupation as tradesmen who offer putrid food for sale. Tenants may knowingly, in their inability to procure other accommodation, take such rooms and pay famine prices for them, just as the extremely poor might knowingly buy bad food. But this does not relieve the owner of his responsibility, nor can the State permit the evils of a virtual monopoly to be intensified by that monopoly being used in a manner destructive of health and morality. Two evils have to be met—the existence of vast tracts of buildings, partly themselves dangerous to health, partly so occupied and crowded as to be dangerous to health; and secondly, the absence of sufficient suitable dwellings. The State is more

capable of dealing with the former than with the latter, and here is the key to the situation. No element in the whole matter is more important than how, and at what price, sites can be obtained. The readiness to embark capital will depend on the cost of sites. It is possible that when purchasers, armed with loans from the State, enter the market, the value of building sites will rise still further if the owners of the filthiest dens commanding monopoly rents are to be allowed under a compulsory sale to value the profits of their own wrong. The principle of *laissez-faire* has never been extended to prevent us from prohibiting the sale of noxious food. It cannot be invoked to forbid the valuation of house property according to its value for legal use, and for legal use alone. It remains for the State to define what, looking to the requirements of health and the prevention of crime and immorality, such legal use shall be. Whatever action the State may ultimately take, it is to be hoped that while the duties of the community are enlarged on and pressed, the duties of individuals, and the propriety of enforcing them, may not be neglected. The general question is obviously too large for treatment on my part to-night, and there is a certain inconvenience in dealing with a topic of such grave importance in an incidental manner; but looking to the interest it excites, and the degree to which the principle of Government interference is sure to be discussed in connection with it, some allusion to it was indispensable.

### DISCOVERY OF AN ANCIENT CHURCH IN JERUSALEM.

AN account of the newly-discovered church, north of the Damascus Gate, Jerusalem, appears in the "Quarterly Statement" of the Palestine Exploration Fund. The author is Dr. Selah Merrill. The ruin has proved to be one of great extent, and of special interest. The way in which it was brought to light is worth recording. In an uneven field, which rose considerably above the land about it, parts of which appearing, indeed, like little hillocks, the owner of the soil tried to maintain a vegetable garden, but the ground was so dry that neither grain nor vegetables would flourish, and even irrigation did little or no good; besides, here and there large holes appeared in the ground which could not be accounted for. At last the owner determined to dig and see what there was below the surface of his field, and to his surprise he very soon came upon fine walls and a pavement. The excavations being followed up have laid bare a church with some of the surrounding buildings. The amount of *débris* which had accumulated above the floor of these buildings was 10 to 20 feet in depth. To remove this mass of earth has required much time and labour, and the work is not yet completed. The piece of ground in question has about 60 yards of frontage on the main road, and extends, so far as the excavations go, about the same distance back from the road, that is, to the east.

The church itself is situated on the south side of this plot, and is very near the street. The ground in front of the church is paved with fine slabs of stone. The steps by which the church was entered were 5 feet wide, but the doorway itself was somewhat wider. From the entrance to the altar-step, or platform, the distance is 55 feet, and from that point to the back of the apse 15 feet 6 inches; the width of the apse is 16 feet 6 inches. The width of the church is 24 feet 6 inches. Nine feet in front of the altar-step a wall has been thrown across the church, in a manner similar to that in the church of the Nativity at Bethlehem. This wall, also those of the church, of which several courses remain, and the interior of the apse, show that the building was originally painted, and some of the figures and designs can still be traced. At the south-east corner of the church, leading from the apse, there is a narrow but well-built passage-way to the buildings in the rear. The character of these buildings is not very evident; certainly they did not stand on a line with the church, but at an angle of 25 deg. with that line. Between the church and what appears now to have been the main building in the rear, there was a passage not over 3 feet wide. The main building in the rear of the church is 47 feet 6 inches long, but to this must be added 20 feet more of a special room, which seems to have belonged to it, and which had a beautiful mosaic pavement. Thus the extreme length from the entrance of the church to the (present) east side of this mosaic floor is 140 feet.

On the west side of this mosaic floor, where it joins the wall of the main building, there is a threshold of a single stone 9 feet 6 inches long, with a step 6 feet 9 inches in the clear. This is considerably wider, it will be seen, than the steps, and even the entrance of the church. Several patches of mosaic pavement have been found, but in one place two or three square yards have been preserved, enough to show that the work was extremely beautiful. The coloured tracings resemble those in the church on the Mount of Olives, and on one side are the large Greek letters  $\Theta\epsilon\omicron\upsilon$ . North of this mosaic floor, and of the main building which joins it, and running alongside of both, there is a watercourse or channel cut in the solid rock, which has been levelled to accommodate the buildings above. This can be traced in an east and west line for

a distance of 37 feet; it is 2 feet 3 inches deep, 20 inches wide at the top, and 12 at the bottom. From about the middle of the mosaic floor this channel turns a right angle and runs 20 feet or more to the north; it is possible that it led from the north, and at the point indicated turned a right angle and ran to the west. Piles of stones and *débris* prevent us at present from deciding as to the length of the channel or where it came from. In the bank of *débris*, which rises on the east side of the mosaic floor to a height of 20 feet, there is, about 6 feet above the floor, a watercourse formed of cement, running north and south at right angles to the line of the church and the other buildings, which must have belonged to a much later period. In fact—and this is an interesting circumstance—the mosaic pavement appears to extend under and beyond this canal and the mass of *débris* which is yet to be removed.

In the north-west corner of the room, where the mosaic floor is found, very near the angle (already mentioned) of the rock-cut channel, there is a tomb about 6 feet below the surface or level of the floor. The tomb is 10 feet long and 9 feet wide, and is entered by a doorway 26 inches wide, which is well built, and in the sides of which are grooves for a door to slide up and down. On the wall of the tomb at the east end there is a raised Greek cross, 22 inches long and 13 inches wide. One cannot stand erect in its highest part, but it is to be considered that the loculi are two-thirds full of *débris*, composed chiefly of decayed bones and bits of glass. Those in charge of the excavations have not, up to the present time, allowed the tombs to be cleared out. The loculi are 2 feet in depth.

What Captain Conder speaks of as "vaults north of the church," turn out to be the tops of houses. They are four in number, each 75 feet long by 28 feet wide, and faced the street. They were divided (one or two of them at least) into apartments by means of arches. The lower courses of the walls, to the height of several feet, are of squared stones, while the upper portions and the roofs are of rubble-work, which was covered with a heavy coating of plaster. The threshold of one has been exposed, which is 6 feet in the clear, and the sides of the doorway show excellent work.

Among the ruins there are two sections of marble columns, each 33 inches in diameter. Three large cisterns have been found, two of which were nearly full of water; the mouths of these, which were closed, were many feet below the surface of the ground before the excavations began, hence no one knows how old the water in them may be. Some of the slabs with which the church was paved were 6 feet long by 2½ wide. In the church two pieces of cornice were found, each 8 feet in length. One is entire and quite plain, while the other is broken in the middle. It is upon this that the figures of Christ and His twelve Apostles were painted. They can still be traced, although exposure has nearly obliterated the colours. Pottery and a considerable quantity of broken glass have been found, and some small articles in marble of no great value. The top of a certain block of marble has been formed into a basin, and a hole drilled the entire length of the block for the water to run off.

South of the mosaic floor and of the east end of the main building there is a large underground chamber with seven openings (each the size of a man's body) to the surface. The chamber is 12 feet wide and nearly 20 feet long, but the depth is not yet ascertained, owing to the accumulation of *débris* on the bottom. On the west and north sides a wall of solid rock appears to a depth of 6 feet, showing that the chamber was excavated in part at least in the solid rock. The use of this chamber does not appear evident, unless it may have been a store-room. The place within the city shown as "Peter's Prison" consists of a similar chamber (not dug in the solid rock, however), with similar openings in the ceiling or roof. The ruins extend underground some distance to the east of the mosaic floor, and efforts are being made to purchase the land in that direction, in order to allow of the excavations being extended there. It is almost equally certain that the buildings extended to the south and south-east of the present plot of ground. But the owners of the land are jealous, and everybody is superstitious; consequently excavations must be abandoned, or move with aggravating slowness.

Dr. Selah Merrill, in a note describing a late visit, says that the west wall of what he called the "main building," towards the apse of the church, has been removed and the floor cleared, exposing a fine pavement. This pavement, the threshold before mentioned, and the mosaic floor all belong to one period, and to a structure very much older than the date of the "main building." It puzzled the doctor, because the threshold west of the mosaic floor was not square with the east wall of the "main buildings," but the reason is now clear. Captain Conder says of this church, with such of the ruins about it as were exposed when he was there, that "the whole is evidently of the Crusading period." As regards the church itself this is not clear, and the mosaic floor especially may belong to a time many centuries previous to that era. At the south side of the floor of the "main building" a new mouth to the largest cistern has been discovered; over the mouth there is a thick stone 5 feet in diameter. This was eight sided, and was built against the wall, so that five sides are exposed. The stone was cut in such a way as leave on two of its sides small brackets shaped like the two halves of the utensil called a

"tunnel." It may be of interest to state that this piece of land was offered for sale a few years since, and for a long time went a-begging for a purchaser; at last it was sold for 40 napoleons. During the present year it has passed into the hands of the French for 2,000 napoleons.

### SOCIETY OF ENGINEERS.

THE second ordinary meeting of this society for the present session was held on Monday evening, November 5, at the Westminster Town Hall, where the council of the society have arranged for the holding of the ordinary meetings in future, the society having outgrown the limits of its previous meeting-place, in Victoria Street; the offices, library, and reading-room of the society will, however, for the present be at 6 Westminster Chambers. The president, Mr. Jabez Church, M.I.C.E., F.G.S., occupied the chair, and a paper on "The Dundee Street Improvements and Drainage of Lochee," by Mr. Andrew Greig, was read. The following is a synopsis of the paper:—

The population of Dundee in 1831 was 45,355, and in 1870 it was 118,900. The assessed rental in those years was 78,821*l.* and 370,728*l.* respectively. The town having thus greatly increased in population, and also in mercantile importance, the Police Commissioners, who are also the local authority, obtained an Improvement Bill, in 1871, to enable them to take down various buildings, to construct several new thoroughfares, and to drain the suburb of Lochee, &c. The value of the property bought was 395,000*l.* The principal improvements were in the centre of the town, where several streets were widened, and a new street opened up from Seagate to Meadowside, where stands the Albert Institute, containing the Free Library, Picture Gallery, and Museum. This new street is named Commercial Street, and is the continuation of the street of same name leading from the docks. Buildings, four storeys in height, and consisting of shops, offices, and dwelling-houses, have been erected on the greater part of both sides of the street. The style of architecture is Italian, the corner buildings partaking more of the nature of Italian Renaissance, and the general character of the whole being dignified and massive rather than ornate. These streets have been paved with granite and whin setts.

Lochee is a suburb of Dundee, and has a population of about 12,000. The area to be drained contained over 500 acres. A large portion of the village lay too low to be drained into the sewers at the north end of Dundee. An outfall was therefore constructed from the west end of Lochee to the sewer in Perth Road, thus bringing the sewage to Dundee. Power was obtained in the Bill to purchase land for sewage utilisation and irrigation purposes, but nothing has yet been done in this matter. The outfall is egg-shaped, and built of brickwork in cement. It is 2 miles 1,252 yards in length, and cost, exclusive of surface damage and wayleave, 6,615*l.* The pipe sewers in Lochee are 5 miles 386 yards long, and cost 7,506*l.*

### The London Atmosphere.

SIR,—When reading a paper, on the evening of November 1, at the Parkes Museum, Mr. Ernest Hart used the following words: "The floating particles of soot did great damage to public buildings. Mr. Shaw-Lefevre stated that the damage done to the Houses of Parliament alone was 2,500*l.* a year." As this amount represents a capital of 70,000*l.* invested for the purpose of the restoration of a modern building which living persons saw rise from its foundations, it is, I think, the duty of anyone, in the face of such a stupendous fact, to propose a remedy if he knows of one.

Every architect must wish success to the Smoke Abatement Institute, which is struggling manfully to substitute for us an Athenian instead of a Cimmerian atmosphere in winter—at least, so far as our eyes are concerned. It is highly desirable, however, that the public should not rest satisfied with the abatement, or even with the perfect combustion, of visible and palpable smoke alone. Bad as this nuisance is, there is something behind more noxious, destructive, and costly, though it is not seen. The invisible gases that are slowly corroding alike our finest buildings and our own mucous membranes should be attacked with no less determination than the defiling soot nuisance; and it is the fear that the importance of this part of the question is not quite realised that now prompts me to venture to urge its due consideration.

A little circumstance occurred the other day aptly illustrating this suggestion. The chimney of a certain greenhouse emitted black smoke. The neighbours complained. The owner then substituted coke for coal. The chimney now poured out in bountiful profusion carbonic acid, sulphurous gas, and carbonic

oxide—all perfectly invisible. The complaints were more bitter than before. The first evil was preferred to the remedy, for the palpable smoke could in some degree be excluded from the houses, but exclusion of the invisible mephitic gases was impossible.

It is therefore evident that the use of smokeless fuel, or of ordinary coal-gas itself, for heating purposes (the latter containing 17 grains of sulphur per 1,000 cubic feet), would only very partially purify the London atmosphere, and would quite fail (though Mr. Hart, judging from his quotation, seems to think the contrary) to prevent the destruction of the stonework of our public buildings.

There is something appalling, in more senses than one, in the rapidly-increasing annual consumption of coal in London. It is now 7,400,000 tons. There is at least 1 per cent. of sulphur in it, so that 74,000 tons of this gas are yearly discharged into the air, which gives 200 tons on an average day, but much more on a winter day.

Mr. Hart's telling example, then, rather proves that it is necessary to adopt some means for saving future public buildings from destruction by invisible but not less powerful acids than that smoke abatement is necessary, however much that is to be wished for on its own account.

Here are a few more examples of the relentless work of these powerful enemies. Only recently St. Paul's required a new column to one of its porticoes. Lambeth Palace was recently restored. Westminster Hall and the Treasury are now in the hands of the masons. Of ancient buildings, scarcely an original stone exists of the Abbey, Henry VII.'s Chapel, or the Temple Church. The solution, then, of the problem presented to us by Mr. Hart's lamentable statement of the costly restoration of our most important national edifice, will demand bold and uncompromising action, if the nation is to be saved from a repetition of such an enormous and—as I trust—unnecessary outlay. Mr. Shaw-Lefevre is a very active First Commissioner of Works, and has the courage of his opinions, but if he should determine to introduce structural durability during his ædileship, he will doubtless be glad of external support. One thing at least is absolutely certain, if we are ever to have durable buildings in London. Limestone, dolomite, and sandstone must be vetoed without mercy, for they all absorb moisture, and with moisture various destructive gases in solution. Analysis of old stone shows hydrochloric acid some inches below the surface, and to that extent nothing but silica remains. The cementing ingredients had perished. Terracotta is durable in London if well burnt, but it absorbs soot, and is not a material presenting an appearance good enough to entitle it to use in important national buildings. For this purpose the volcanic rocks—porphyry, granite and serpentine—offer, to my mind, the only worthy material and at the same time the true remedy against future decay. Nearly one hundred years has proved them to be of everlasting durability in the London atmosphere. Bridges, monuments, and architectural details remain as perfect as when the workmen departed. Powerful and ingenious machinery enables us to use them at little, if any, extra cost upon perishable Portland stone, if, like true artists, we only adopt an Italian style of architecture adapted to the nature of the material. It is true that there could be no elaborate carving and moulding, no deeply cut foliage, but there could be richness and splendour of another sort, the charms of colour in tracery, panel, and frieze—indestructible never-fading colour. This would amply compensate for the loss of moulded details, which in London are only so many soot-traps for the defilement of freestone façades; and, last but not least, we should look upon an imperishable edifice exactly adapted in its construction to the unfavourable character of the London climate, and therefore characteristic of this practical and scientific age.

Yours, &c.,

H. T.

### Mr. Blomfield and Sir Edmund Beckett.

SIR,—It is easier to stand up against Sir Edmund Beckett than to overcome him, and I fancy impartial lookers-on will say that in the late encounter, Mr. Blomfield and Mr. Seddon were not the victors. Mr. Blomfield thinks he has not had enough punishment. His circular of October 31 is a challenge, but this time the ground proposed is the professional press, probably because it is supposed to be a softer field in case of accident. The document contains very long and very bitter words, but I doubt if it will bring Mr. Blomfield many backers. Why should men like myself, who are of the rank and file of the profession, wish to see Sir Edmund defeated? He has never done harm to us, and the "Book on Building" is far from being terrible to architects whose work is not done by deputy. On the contrary, I maintain that we should desire the success of Sir Edmund Beckett, for he is the only man living who has the courage to criticise the works of prosperous architects. Criticism is a lost art as regards their work, for the Antisrape Society avoids meddling with new buildings. In town and country papers, we meet with nothing but eulogies when one of their buildings is the subject. There is no longer a "Candidus" like the late W. H. Leeds, who demands and is allowed as large a charter as the winds for his remarks. Painters, although the value of their works in auction-rooms and elsewhere depends upon what is said in newspapers, have to endure every objection that can be

invented by raw youths, or by imaginative geniuses who fancy they are in possession of the secrets of the old masters. The same thing is seen in literature. But it is now held to be flat blasphemy should any one doubt the infallibility of an architect when he attains a prominent position, or appear to forget that Sir Gilbert Scott and Mr. Street were the greatest of architects and the best of men. We are all expected to make their cause our own, and to have no mercy on any one who says that an ill-proportioned reredos could be designed in Mr. Street's office or that drainage was not the forte of Sir Gilbert's young men.

It is not, however, so plain why this should be our duty. So far as I remember, neither Scott nor Street ever acted in defence of their less renowned brethren, and both have said harder things of the ordinary practitioners than has Sir Edmund Beckett. Scott at one time applied to them Mr. Bright's phrase, and denounced the "residuum" who were destroying our beautiful England with their buildings. Remembering this, why should we discard common sense and believe that the Parliament Street offices are a model of planning, effective drainage, and of the Italian style, or that the Albert Memorial exemplifies Mediæval construction? Why should it be thought disloyalty to the profession if one of us should agree with the public and say that the Law Courts are not a success? We are not asked to spare the works of Wren or Jones, of Barry or Cockerell, but we are expected to be awe-struck when we stand before one of Sir Gilbert Scott's or Mr. Street's churches. The reputation of Street and Scott is henceforth to be a sacred thing, with which criticism is not allowed to deal, and we are to imagine that their shades are surrounded by an aureole which may blind irreverent eyes.

Just now another instance of the same kind of beatification is to be witnessed in Birmingham. If I may judge from what has been said in the pulpits of that town, it would seem that the late Mr. Chamberlain is to be enthroned with Sir Gilbert Scott and Mr. Street, and it will be to our profit if we fall down and worship him. But, however heretical I appear to his admirers, I do not believe that Mr. Chamberlain was so wonderful an artist. Forget the political harangues, the addresses at the Midland Institute, the impromptu replies at the Debating Club, and the prestige that was derived from Mr. Ruskin's patronage, then look at his buildings simply as examples of architecture, and I think it will be admitted that they are not better than the buildings which are to be seen in a great many towns, and by architects who are not considered to be shining lights by the clergy and advanced thinkers. One thing is certain, that Mr. Chamberlain's artistic ability was never sought after in places where his political zeal could not be utilised. But he, too, was inflated by success, and esteemed himself as a superior personage among the petty men of architecture. I once heard him lament his lot. He was, he said, oppressed by the amount of work which was thrust upon him because there was not another artist in Birmingham, and he may have been sincere in saying this. There is a good deal of the same kind of stuff in Scott's autobiography. With this example before us, I believe, no matter what Mr. Blomfield may write about "fabrications and darkly-hinted innuendo," there is an advantage in an "Advocatus Diaboli," who will suggest that idols are sometimes formed of clay.

Yours, &c.,  
A PLAIN SPEAKER.

## LEGAL.

High Court of Justice.—November 5 and 6.

TURNEY v. HATTON AND ANOTHER.  
LIGHT AND AIR CASE.

This case involved the simple question as to whether or not a substantial diminution in the light enjoyed on the premises of the plaintiff, who is a needle manufacturer, carrying on business in Tooley Street, Southwark, previously to 1882, had been caused by buildings recently erected by the defendant Hatton, the builder employed by the other defendant, Mr. Brigham, who is the lessee of the property adjoining that of the plaintiff. The case lasted almost the entire day, and in the result the jury, after deliberating half an hour, found a verdict for the plaintiff. Damages 25*l*.

Mr. Justice Cave gave judgment accordingly, refusing to make an order under which each party would have been left to pay his own costs. This he was asked to do by the learned counsel for the defendants, on the ground that the plaintiff had failed in recovering any really substantial sum in the action.

MILLER v. GARDNER.  
THE EMPLOYERS' LIABILITY ACT.

This was a case under the Employers' Liability Act, and had been tried in the Westminster County Court. The plaintiff was in the employ of a firm in St. Martin's Lane, who had a "job" at Whitechapel, the job being to put up an ornamental fabric of iron trellis-work over the door of a public-house to support a sign. The plaintiff, by the direction of the foreman, went to do the work

there, and was met there by the foreman. No scaffolding or ladder had been taken from the premises of the firm (probably on account of the distance), and the foreman told the workmen to go and borrow a ladder, which they did, and the ladder so borrowed was used by the plaintiff under the foreman's direction, and used in safety. On the next day the ladder was again borrowed and used by the plaintiff, he being only told by the foreman "to do his best" about it somehow or other. While the plaintiff was on the ladder the two top rungs or steps of the ladder broke or "started," on which the two sides of the ladder came apart, the ladder gave way, and the plaintiff was thrown down and sustained serious injuries, for which he sued. The judge thought there was no case under the Employers' Liability Act, there being, in his view, no evidence of any "defect" in "works or plant" of the firm by the negligence of the firm or their foreman, and so he directed a non-suit.

Mr. Crispe moved, on behalf of the plaintiff, for a new trial, on the ground that there was a case for the plaintiff, as the ladder borrowed by the foreman's direction in the place of the ladder of the firm was to be considered as their "plant" for the purpose, and that their foreman was bound to see that it was safe before he allowed it to be used, and that there must have been a "defect" in it or it would not have given way as it had done.—The Court, however, thought otherwise, and held the County Court judge right in holding that the plaintiff had no case.—Mr. Justice Grove thought the ladder borrowed could not be considered as "plant," and at all events there was no evidence that there was a defect in it by reason of the negligence of the firm or their foreman.—Mr. Justice A. L. Smith was not clear on the first point, but quite concurred as to the second; and so the non-suit was upheld.

## CHURCH BUILDING AND RESTORATION.

**Northampton.**—The foundation-stone of the church of St. Crispin has been laid. The works included in the present contract comprise the erection of the main portion of the church, which consists of a parallelogram 91 feet by 25 feet inside measure, which forms a nave and chancel under a continuous roof. The north side of the nave will have an arcade of arches provided for the purpose of opening into a north aisle, at some future time; for the present, all these arches, except the westernmost one, will be walled up. One bay, however, of the future aisle will now be erected, and also the ante-room to St. Crispin's Hall, and this ante-room will serve the purpose of a vestry and class-room. The design included a tower and spire of modest dimensions, but only the basement and a few feet of the ground stage will now be built to contain the stairway and coal-store to the heating chamber, which will be under the ante-room. The exterior of the walls will be built of hard local stone, with Bath stone dressings, and the interior will be finished partly with stone and partly with plaster faces. The roof will be of open timber work of wrought pitch pine, and covered on the exterior with Broseley tiles; the junction of the nave and chancel being marked on the exterior with a tall flèche of timber and tile work set upon the ridge, which will serve as a ventilator, and also contain the bell. Accommodation is made in the present undertaking for about 280 persons, and the north aisle, when erected, will accommodate nearly a hundred more. The style of the church is a simple treatment of Early Gothic. The architect is Mr. M. H. Holding, of Northampton, and Messrs. Reynolds & Son, Derngate, Northampton, are the contractors.

**Sherborne.**—The tower of the abbey church is to be restored. It is proposed, after bracing together the other walls, to take down part of the east wall and rebuild in it a new arch, to relieve the existing panelled arch from the pressure. The new arch will rest on the north and south piers, and tie the walls together. On the upper part of the east side the exterior stonework has nearly all perished, but only partially so on the other three sides. The defective facing of the lower part under the slope will be replaced almost stone for stone. On the other sides of the tower the defective work will be made good, and the parapet will be rebuilt in Ham stone, replacing the sound old stones and reproducing the ancient design of the pinnacle tops. Messrs. Carpenter & Ingelow are the architects.

**Selborne.**—The reparation of the south aisle of Selborne Church has been completed, and opened with the harvest thanksgiving. It was necessary to rebuild the east wall, and most of the south wall, which had gone as much as 16 and 18 inches from the perpendicular. The roof had slipped still more, and continued to spread. Every feature has been exactly replaced; and the old surface of the stone-work, except where whitewashed, has been left as far as possible, untouched. In taking down the work, jambs of old windows were discovered *in situ*, together with pieces of tracery heads built into rebuilt parts, and these have been reconstructed in the place of the two modern windows. It was not possible to re-use any of the old oak roof except the braced wall plate on the north side which, though presenting serious difficulties from its crookedness, has been retained and repaired. The work has been carried out under the direction of Mr. Wm. White, F.S.A., the grand-nephew of the great naturalist of Selborne.

**North Wootton.**—A new church, built at the expense of the late Mr. G. D. W. Digby, of Sherborne Castle, has been opened. The old church, which was in a ruinous state and inconveniently situated, has been demolished, with the exception of the tower, where the bells will remain until a tower has been added to the new church. Mr. R. H. Carpenter is the architect, and the work was carried out by Mr. W. Sealy, contractor, of Sherborne.

**Kilpeck, Hereford.**—A new and particularly commodious rectory house has just been completed for this benefice. The style of the building is a plain adaptation of that called after the name of Queen Anne. The walls are of brick construction, and the roofs are covered with Broseley tiles. The principal staircase is of pitch pine, and the chimneypieces of oak, with tile linings and hearths. The architect was Mr. T. Nicholson, F.R.I.B.A., diocesan architect, Hereford, and the builder Mr. James Morgan, of Kington, the total amount of whose contract was 1,365*l*. Kilpeck is widely known for its unique Norman church—a building of intense interest to the architect, antiquary, and ecclesiologist; the more especially as it has escaped much alteration, and has been but little mutilated by the hands of the restoring architect.

### NEW BUILDINGS.

**Market Hall, Burton-on-Trent.**—This building was lately opened by the mayor. The area is close upon half an acre. The front or west side is two storeys high, and comprises four shops, superintendent's office, and market and office entrances on the ground floor, a suite of three offices and room for care-taker on the first floor; and the market hall, which is at the rear, and attached to this front two storey building, with a floor area available for stalls of 1,090 yards superficial. This portion has an iron and glass roof in three spans, supported on iron columns and girders. One-half the floor space is set apart for thirty-two fixed stalls in groups of four, divided by avenues. The other half is fitted with fixed and movable stands and seats, to be used for the sale of eggs and butter. Opening into and on three sides of the hall are twenty fireproof shops. There is a gallery on three sides of the hall, approached from the floor of the market by a wide staircase. Ventilation is secured by having the upper portions of each of the three roofs by which the building is spanned fitted with continuous open louvres. The style of the architecture is Renaissance. The contracts amounted to about 12,000*l*. They were secured by Messrs. Chamberlain Bros. for building, the executors of Mr. Mason for woodwork, Messrs. Gough & Felgate for ironwork, Mr. Ryle for plumbing and painting, and Mr. Roddis for carving. The architects of the building are Messrs. Dixon & Moxon, of Barnsley.

**King's Lynn, Stanley, and St. Margaret's Libraries.**—The mayor of King's Lynn has laid the memorial-stone of this building, which the corporation are erecting for the reception of the Stanley Library, the gift of the present Earl of Derby when Member of Parliament for the borough; and also the St. Margaret's Library, a collection of very valuable books of the thirteenth and fourteenth centuries. The style of architecture is Classic, of the Roman-Doric order. The front elevation will be faced with red pressed bricks, and the stone ornamentation of red Dumfries stone. Over the centre bay will be a device in stone, upon which will be carved in relief the Stanley and borough arms. The new building will contain a library 52 feet by 30 feet, a reading-room 21 feet by 14 feet, and the St. Margaret's Library 17 feet by 16 feet. There will be also a committee-room, lavatories, stores, &c. Messrs. William Adams & Son, of King's Lynn, are the architects, and Mr. W. H. Brown of the same place is the builder.

### SCHOOL BUILDINGS.

**Cockermouth.**—The foundation-stone of the new Board school has been laid. The ground floor contains infant school with classrooms, entrance-room, lavatory, &c. The upper floor is devoted to the boys' school, accommodating 240 boys. The infant school is 42 feet by 22 feet, and will accommodate 214 children. The schools will be heated with Musgrave's (Belfast) stoves, and will be ventilated on the Tobin's principle, with five of Boyle's cowl on the roof to extract the foul air. The walls are to be built of stones from the Brigham quarries, and in each room will be a cement dado 5 feet high. The total cost of the school is estimated to be about 3,000*l*. Mr. Borrowdale, of Cockermouth, has the contract, and Mr. R. S. Marsh, of Cockermouth, is the architect.

**Leicester.**—A new Methodist chapel and schools have been opened in Belgrave Gate. The building is constructed of red brick with Bath stone dressings. The main entrance to the chapel is from Belgrave Gate. It is capable of seating 1,000 persons, with additional provision in case of necessity. At the back of the chapel is a large school-room for girls and three class-rooms for separate teaching, with other offices and the heating apparatus. On the basement is a boys' school-room capable of accommodating 500 children, an infants' school with room for 150, besides class-rooms. Minister's and stewards' vestries. The architect was Mr.

Edward Burgess, of London and Leicester; the clerk of the works, Mr. W. Cayless, Leicester; and the contractors, Messrs. W. & A. Rudkin, of Leicester.

### GENERAL.

**Mr. Havell**, from the South Kensington School, has been appointed superintendent of the Madras School of Art. There are now four of the Department masters attached to the India Office.

**The Burlington Fine Arts Club** propose to exhibit examples of ancient Greek and Greco-Roman art from private collections.

**Mrs. John Collier** has presented to the General Infirmary and Eye Institution, Gloucester, *The Rehearsal*, the painting recently exhibited by that lady at the Grosvenor Gallery.

**The Hawick Fine Art Exhibition** has just been closed. The sum realised by the sale of pictures amounted to 1,600*l*.

**Mr. Wilfrid Meynell** has presented to the Manchester Art Museum an artist's proof copy of M. Rajon's etching of Cardinal Newman's portrait by Mr. Oulless.

**Mr. Ford Madox Brown** on Monday delivered a lecture to the members of the Literary and Philosophical Society, Newcastle-on-Tyne, on "The Connection between the Fine Arts," and a second lecture on Wednesday on "The Idea in Painting."

**The Church of St. John, Carlisle**, has been enriched by a painted window from the studio of Mr. Taylor, of Berners Street. It is the gift of Dr. Hodgson, and an illustration of the parable of the Good Samaritan.

**A Reredos** was dedicated at All Saints, Stoke Newington, on the 2nd inst. It was designed by Mr. F. T. Dollmans.

**The Mayor of Sheffield** has received a letter from Professor Ruskin practically accepting the proposals of the mayor for the establishment of the St. George's Museum at Sheffield. The town is to erect a building, all art treasures, books, &c., placed in which will be the property of the town for ever. The building is to be vested in trustees, and the management is to be in the hands of Professor Ruskin and his successors, who will have power to lend, for limited periods, certain of the objects in the museum.

**Mr. J. D. T. Niblett**, who died lately at Haresfield Court, Gloucester, was a local antiquary and an amateur architect. He copied the designs on the most interesting of the ancient tiles in Gloucester Cathedral, and superintended the production of the facsimiles used in the restoration. He designed the memorial brasses placed on the tombs in Tewkesbury Abbey. Mr. Niblett was for a time the secretary of the Gloucester School of Art.

**A Part of the Atrium Vestæ** in the Roman Forum has been excavated, and it is esteemed to be an important topographical discovery. The portion uncovered reveals three large pedestals *in situ*, at equal distances apart, and on them are long honorary inscriptions to three of the superiors of the Vestal Virgins, one of whom had ruled the Order for twenty years. For the moment, however, there is some doubt as to whether these pedestals occupy their original positions.

**Shrewsbury School** is to be converted into a county museum and free library.

**Mr. Carrick**, city architect, Glasgow, has been presented with an honorarium of 300 guineas, in recognition of his services in the preparation of the plans of the new Municipal Buildings, and as joint assessor in the selection of the competitive designs.

**A Large Hay Store and Pressing Establishment** is being constructed at the western end of the Royal Dockyard, Woolwich, close to the dry dock and basin. Its dimensions are 202 feet long by 89 feet wide, with nineteen doors, each 10 feet 6 inches by 11 feet 6 inches, with wooden frames and corrugated iron panels. The roof is supported by thirty-two iron columns 17 feet in height, and is covered with slates with glass ventilators on Rendle's patent system.

**The Remains** of one of the oldest bridges in the world have been met with by engineers at Mayence—no other than the bridge erected by Charlemagne over the Rhine near the close of the eighth century. It rested on twenty-eight buttresses, and was eventually struck by lightning and burnt down to the level of the water. The engineers have been busy taking away its remains, and have already removed over fifty piles of 5 to 6 yards in length. The timber is well preserved, though nearly 1,100 years old; so well, indeed, that it is still fit for building purposes; while the iron, which was rivetted to the posts, is also capable of being used, being covered by only a thin layer of rust.

**The Panama Canal.**—A despatch from Panama, dated October 26, gives an account of the progress of the work on the Panama Canal. The total length of the canal will be 74 kilometres, from the Atlantic to its mouth in the Pacific. It is divided into twelve sections, in which are employed daily 30 steam excavators, 40 locomotives, and 800 tip-wagons. There are 90,000,000 cubic feet to be excavated. The grand cutting, about two-thirds of which has already been excavated, is that between Obispo and Paraiso. The number of men employed upon the work exceeds 10,000, and the excavations up to October 15 amounted to more than 2,500,000 cubic metres. The working force will soon be augmented, and will form a total of 15,000 men.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, NOVEMBER 10, 1883.

### EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

### TO AMERICAN SUBSCRIBERS.

*All subscriptions are payable one year in advance, and may commence at any date.*

*The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.*

*Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED to GILBERT WOOD, 175 Strand, W.C., London, England.*

*In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—*

*To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order.*

### COMPETITIONS OPEN.

**BIRKENHEAD.**—Dec. 1.—Plans are required for Laying-out Bidston Hill for Building Purposes. Premiums of 100 guineas and 50 guineas, and four of 15 guineas each. Messrs. Davies & Stephen, Estate Agents, Mollington, Chester.

**BRIDGEND.**—Nov. 20.—Plans are required for Disposal of Sewage by Filtration in the most economical and beneficial manner. Mr. T. Stockwood, jun., Clerk to the Local Board, Bridgend.

**BRISEBANE.**—Nov. 30.—Plans are invited for the Erection of a Town Hall. Messrs. Gordon & Gotch, 15 St. Bride Street, E.C.

**CAPE TOWN.**—Jan. 30.—The Town Council of the City of Cape Town invite Plans and Specifications, accompanied with approximate estimate of cost, of a System of Drainage. Selected Plans and Specifications to become the absolute property of the Corporation. All others will be returned free of expense. Premium of 250*l*. A plan of

the City, with levels, may be seen, and further information may be obtained, on application to the South African Loan, Mortgage, and Mercantile Agency, 9 King William Street, London, E.C.

**LONDON.**—March 1, 1884.—The Commissioners of H.M. Works and Public Buildings are prepared to receive Designs for New Buildings proposed to be erected in Whitehall for the Admiralty and War Office. Mr. A. B. Mitford, Secretary, H. M. Office of Works, 12 Whitehall Place, London.

**NORTHAMPTON.**—Dec. 1.—Designs are invited for the Erection of a Board School, with Class-rooms and Out Offices, to Accommodate 1,150 Children. Mr. John B. Hensman, Clerk to the School Board, 4 St. Giles's Street, Northampton.

### CONTRACTS OPEN.

**ABERDEEN.**—July 1, 1884.—The Testamentary Trustees of the late Mr. John Steill, of Edinburgh, hereby notify that they will Receive Models for a Colossal Statue of Wallace, in Bronze, with Basement of Granite Blocks, to be placed on the Mound in the North-West part of the Duthie Public Park, near the City of Aberdeen, in conformity with Instructions left by Mr. Steill, at a cost not exceeding £3,000. Intending Competitors, on Application, accompanied with a Remittance of 10*s*. 6*d*. to Mr. John Otto Macqueen, 19 Bridge Street, Aberdeen, will be supplied with Copies of Mr. Steill's Instructions, Conditions of the Competition, and Lithograph Plan of the Duthie Park, showing Sections of the Mound. The Author of the Accepted Model will be employed to Execute the Work; and the Author of that next in order of merit will Receive a Premium of £50.

**ACTON.**—Nov. 13.—For Supply of Blue Guernsey Granite, Kentish Flints, and Repair of Private Streets. Mr. C. Nicholson Lailley, C.E., Surveyor to the Local Board, Acton, W.

**ACTON, CHESHIRE.**—Nov. 15.—For Construction of Works of Water Supply for the Township. Mr. H. J. Bennett, Surveyor, Norwich.

**BANBURY.**—For Iron Palisading and Stone Kerbing to enclose the Cross. Mr. W. E. Mills, Architect, Banbury.

**BASSENTHWAITE.**—Nov. 10.—For Additions and Alterations to Scarness Cottage, for Sir H. R. Vane. Mr. George Richardson, 18 Bank Street, Carlisle.

**BECCLES.**—Dec. 7.—For Building Temporary Bridge, Removing old and Building new Bridge. Mr. F. S. Rix, Clerk to the Beccles Navigation Commissioners, Beccles.

**BLACKBURN.**—Nov. 12.—For Execution of Street Works. Mr. J. B. McCallum, Borough Engineer, Victoria Street, Blackburn.

**BOULTHAM.**—For Forming Streets. Messrs. Goddard & Son, Surveyors, Lincoln.

**BURNLEY.**—Nov. 14.—For Supplying 700 tons of Cast-iron Socket Pipes, 15 inches diameter, and for Carting, Laying, and Jointing 9½ miles of 24-inch and 15-inch Pipes. Mr. Edward Filliter, C.E., 16 East Parade, Leeds.

**BURNLEY.**—Nov. 15.—For Building the Burnley and District Hospital. Messrs. William Waddington & Son, Architects, 5 Grimshawe Street, Burnley, and 25 Cross Street, Manchester.

**BURRADON.**—Nov. 10.—For Building Methodist Chapel. Mr. Green, Colliery Office, Burradon, Northumberland.

**CHATTERIS.**—Nov. 15.—For Painting Exterior Wood and Ironwork of The Limes. Mr. John Nix, Holwood House, Somersham.

**CHEVINGTON.**—Nov. 17.—For Alterations and Additions to the Chevington North Schools, Broomhill. Mr. William Webb, Clerk to the Chevington School Board, Newgate Street, Morpeth.

SOLE ADDRESS.

Note Trade Mark.

SEWER GAS.

AS AN ABSOLUTE PREVENTIVE  
of the entry of Sewer Gas into Dwelling  
Houses by way of the most dangerous inlets,  
viz., the waste and overflow pipes from cisterns,  
baths, lavatories, and sinks, DOULTON & CO.  
strongly recommend the use of

MANSERGH'S  
IMPROVED GULLY.

By the insertion of this Gully in the line  
of drain OUTSIDE the house, the common and  
UTTERLY USELESS bell-traps may be dispensed with,  
and direct communication with the sewers is  
effectually broken.

"This is undoubtedly a most important and  
effective trap for preventing the entrance of sewer  
gases into dwelling-houses."—LANCET.

PRICE 10s. 6d. EACH, COMPLETE.

MANUFACTURED BY

DOULTON & CO.  
High Street, Lambeth, S.E.

DEPOTS:—

GRANVILLE STREET, BIRMINGHAM.  
AND

CLOSE BAR SASH (obviating use of Window Guards)

The Patentee begs to call particular attention to the great strength of this construction. The Bars and Bosses, being of malleable wrought iron, form an exceedingly firm joint at the intersection of bars. They are durable, and of light appearance, the Bosses being small and not unsightly. They can be made at very short notice, and at the price of an ordinary cast iron sash.

PRICES UPON APPLICATION.

ORDINARY WAREHOUSE AND SCHOOL SASHES.

CABLE LIGHT.

Back view of Boss, full size.

Section through Boss, full size.

These can be glazed flat, like ordinary wooden sashes, without the corners of the panes being chipped off.

Front view of Boss, full size. Obscuring no appreciable light.

# The Architect.

## THE CHANGE OF ARTISTIC FEELING.

T seems probable enough that we shall find ourselves before long involved in a vital revolution of taste, when possibly Greek may come to the front again. We do not say this because a Lord Mayor is heard quoting HOMER in the original at a Guildhall banquet. Nor do we place too much reliance upon the circumstance that a Lord Chief

Justice, just returned from the land of free citizenship, speaks his mind plainly, "as a free citizen of the republic of taste," about the Gothic Law Courts, roundly declaring the building to be "uncharacteristic, inappropriate, and inconvenient"—of course because of its Mediæval style. The very remarkable furniture-fashion which has found its way at present into a certain ascendancy in English architecture under the name of "Queen Anne"—more properly Low Dutch, and sometimes very low Dutch indeed—shows no sign of turning out to be anything better than the stepping-stone we have all along regarded it to be, between the picturesque of the spurious secular Gothic of a few years ago, and a better picturesque, it is to be hoped, which will presently be the precursor of a calmer method, wherein the picturesque may at length be dispensed with. It is not unlikely that the competition for the new War Office—if the multitudinous competitors insist, as they ought to do, upon the unrestricted public exhibition of the designs—may produce a few specimens of advanced Classical work—not necessarily the "selected"—to serve as way-marks of progress; the Glasgow competition having entirely failed, for various reasons beyond the competitors' control, to produce this effect. The President of the Architectural Association, touching upon these competitions the other night, significantly expressed regret that the Mediæval style seems to be losing its vantage-ground, thinking, no doubt, of the difficulty in which competitors are placed at the present moment who cannot turn quickly enough from the thirteenth century in Kentish rag to the eighteenth in red brick; but the President of the Architectural Association may well be allowed to be sympathetic, although we are inclined to think he will in this case sigh in vain for any return of the palmy days of the mode he mourns. On the whole our architects are very much in the condition just now of a crew of some old-fashioned sort of mariners in a calm, whistling for the wind to blow from no matter what quarter, and some of them tugging a little wildly at the oars—wildly and to no purpose.

What will be the effect of the coming change of sentiment upon the question of the protection of ancient buildings it is impossible to say so soon; but there is a new hazard in the air, namely, this—that the national and parliamentary agitation which many good people are resolutely bent upon setting afoot with reference to the dilapidated houses of the poor may pass into some form which shall throw discredit upon dilapidated structures generally, and, in fact, give a serious shaking to the public reverence for those historical relics of the building kind altogether, which people who have not to occupy them are so anxious to maintain intact for the accommodation of those who have. At such a juncture, therefore, we may direct attention with more than ordinary pleasure to the interesting "report," which we published last week, delivered by the Society for the Protection of Ancient Buildings upon the proposed restoration of the church of St. John and St. Alkmund at Shrewsbury. For certainly there are leading points of doctrine in that document which, whatever may happen, we should be sorry to see set aside, and which, indeed, are laid down with such an amount of judicial discretion that we think there must be almost no one, be he ever so prosaic, who would wish to deny their force.

It is a most commendable instance of that kind of return to first principles, which is so often of essential importance as a refresher in a good cause, when the authors of the report rely, as they do, upon the simple observation that "thoughtful people feel that age of itself gives a dignity to any building."

This is, in fact, the great, however humble, fundamental principle upon which, in the eyes of "thoughtful people" generally—as distinguished from the thoughtless people who in many cases support the dictates of ultra-sentimental archæology—the entire scheme of the Society for the Protection of Ancient Buildings must exclusively rely; and this it is, and this alone, which is recognised by the English public at large as the reason why (to pursue the language of the report) "the question of how your parish church can be repaired for longer use *without modernising its appearance*," ought always to be regarded as a practical question for sensible men seriously to consider. Even men who are so impatient of the poor little superstitions which are the playthings of our day and generation that they would whip them all away like evil spirits, and leave us nothing but the driest of dry "truth" to keep ourselves awake by, may well consent nevertheless to admit that our veneration of the withered and grey may be extended without any harm from the old man to the older building, and that the respect we pay to fourscore years in the flesh may safely be carried indeed much further when we stand before what remains of the handiwork of our forefathers of many centuries ago. That the actual authenticity of such relics of the past—say a more or less obsolete and objectionable past if you must be so particular—should be surrendered to a mere desire to be dandy, is not good philosophy but bad; and it is not the philosophers of our time, but—indeed we know not who—that would so far ignore the pleasures of memory.

"The date of all architectural work," says the report in another paragraph, with a mixture of sorrow and sarcasm which will be delightful to many—"the date of all architectural work (*previous to the Gothic revival*), if not restored, can be fairly accurately determined." In other words, when we would preserve the genuineness of any ancient English building, as an act of kindly grace due to its antiquity, we are, alas! met on the threshold by two formidable and archæologically scandalous considerations. The great function of "the Gothic revival" is now at length seen to have been, in the first place, the confounding of all legitimate characteristics of date—surely one of the most irrational of all architectural motives—and, secondly, the "destruction of the history" of our most cherished remains by the process of dandifying them. Little did they think, our PUGINS, SCOTTS, BUTTERFIELDS, and BERESFORD HOPES, bursting with divine afflatus only a few years ago, straining every nerve to do religion a service, and to impose the saintly smile of the olden time upon the bad new world they unhappily belonged to, that they were only labouring to furnish one more illustration of the futility of all human effort when directed to the correction of natural development—upon whose inevitable stream PUGINS and BERESFORD HOPES of all shapes and sizes are mere floating straws! What have they really done? Built hundreds of churches in a style (so at least says our Society) which, being a confessed make-believe, is only to be acknowledged, now that our eyes are open, as an artistic, and perhaps even a religious, *fiasco*; and "restored" hundreds more by means of a process of "destruction of their history" which on the face of it is sheer Vandalism. If we are misinterpreting the Society's words here, we hope it may be put down to an unintentional misconception of its declarations, which we further beg the spokesmen of its policy plainly to correct. But if we are not misinterpreting the Society's words, what then?

What will probably come out of it all is that we shall pass presently into a new phase of mere fashion and forget the old, as we have been doing, of course, ever since the foundation of the world's history. The career of any artistic enthusiasm is always very much the same. A certain preceding enthusiasm has come to pall upon the appetite, and a reaction of some incidental sort—perhaps a struggle of nature, perhaps a mere freak, just as chance will have it—gradually sets in. For a time there is hesitation, doubt, perplexity. At last chaos settles down into something like form, and a new doctrine, a new school, may be discerned, fighting with the obsolete and the chaotic, under a seemingly smooth surface, perhaps, or one but slightly ruffled by the anxiety of sober minds unwilling to be disturbed but unable to keep still. A new enthusiasm is acquiring force, and, by the time its older votaries are dead, and its younger ones grey-headed, it has become recognised as a discovery and a victory. The language of its advocacy, which yesterday was the vague declamation of despised and furious adolescents, to-day is the oracular eloquence of serene professors and famous academicians—the same language, but

vibrating in another atmosphere, and addressed to another world. All men now fall at the feet of the prophets. The one final revelation has been received at last, and grateful humanity has no more to do but to enjoy it for ever. Alas for the mutability of all mundane things, cycle after cycle ceaselessly revolving! No sooner have we arrived at this beatific peace than the struggle beneath the surface begins. We get tired of perfection and long for change. The process has to be recommenced. The old enthusiasm is moribund; hurrah for the new!

Such is the world we live in. But we confess to a feeling of sadness at any rate, and somewhat unphilosophical shame, when we are so bluntly reminded by this very respectable Society for the Protection of Ancient Buildings that the "Gothic revival," like all other enthusiasms, has had its day of prosperity and praise, and must now have its long night of—we do not like to say obloquy, but what shall be the word? Never mind; amongst the eccentricities, if so they must be called, of human genius, those of modern English Mediævalism can scarcely fail to secure from the artistic historian for many ages to come no small meed of sincere admiration.

### ITALIAN PAINTERS AND ITALIAN POTENTATES.

WHAT is to be said of the relation of the artistic faculty in its highest development to the society in the service of which this faculty has been exercised? The consideration of the question is urged upon us by conclusions respecting it which are enunciated without hesitation in a recent graceful and thoughtful little book by Lady EASTLAKE—a republication of review articles on LEONARDO DA VINCI, MICHAEL ANGELO, RAPHAEL, TITIAN, and ALBERT DÜRER. These conclusions are so introduced and supported that vigilance is required to keep the judgment suspended for attention to a counter argument, otherwise there is risk of being hurried into premature assent to views which are not agreeable to rest in, although there is much excuse for them on a superficial survey of the circumstances.

True it is that almost all that was best in art during the years covered by the life of MICHAEL ANGELO—and that is as much as to say all that was greatest and best in art in modern Europe—came into bloom along with all that was worst in the social condition of Europe. Are we really put thus in presence of a true relation of cause and effect? Was the flourishing of art the natural result of this stimulative atmosphere of all that was hateful? So it appears we must be content to believe, unless it shall appear that the accomplished critic has only said in her haste that "the condition which gives birth to art is precisely that under which true civilisation has never yet flourished . . . that the conditions which experience shows us to have been conducive to art are exactly those most prohibitive of civilisation."

If this be really the lesson of experience, to what a dilemma are we not reduced? The appearance of a great work of art must be greeted by a true lover of his species with all the alarm awakened in an Eastern city by the first symptoms of the plague. The philanthropist is bound to rouse and join hands with the statesman in tracking the mischief and in stamping it out. Civilisation, which, if it mean anything, is the secured establishment of a state of society, not torpid, but progressive in happiness and morals, must be saved at all costs, and under such a compelling necessity fine art must go.

If this were the case, we should, indeed, be required to choose between noble art and civilisation; but that it is not the case is proved by the very statement of such a consequence. When we are brought up to the question of such sacrifice of high art and fine art, it appears at once that we are asked to consent to rescue the ideal of human life by a mutilation, which would be to destroy it; for what worthy ideal of civilisation can be created to which progressive enjoyment, and even production, of elevated art is not essential?

And let those speak of the characteristics of "the great and wealthy of the earth" at any particular time, who know them best, but not extend their experience to a universal rule. That rich, reckless, profligate tyranny, as mere vulgar sensual, and ignorant wealth, may encourage a swarm of professors—of practitioners—of art, who are little if at all

superior to sycophants and parasites, and fill the world with productions that are adapted to the degraded or trivial or uncultivated predilections of their patrons, is no doubt possible—has no doubt from time to time been the fact. But this does not touch the case of the great period of Italian art. It may apply to some of the characteristics of French art of the monarchy. There is no inconsistency between the courtliness of Versailles and Marly, and the special perfection of the upholstery and porcelain that is so vehemently competed for at CHRISTIE'S. We can imagine the charming Madame DE SÉVIGNÉ inditing her immortal letters on one of these exquisite *escritoires*, without being surprised at her adding a callous postscript of satisfaction at the hanging of some dozen poor peasants for acts of not very gross insolence. But the case is otherwise at Rome and Florence in the age of MICHAEL ANGELO. Here the difficulty—a difficulty which our fair authoress fails even to perceive much less to grapple with—is to account for the astounding contrast between the spirit of the art and that of the class or the men with whom rested the patronage of art. Consider the matter thus: let us suppose that the works of art were the sole historical memorials of this period; what sagacity could, by the study of them, recover the characteristics of LEO X., JULIUS II., the BORGIAS, SFORZAS, LORENZO DI MEDICI? Who will pretend that these works, if submitted to the strictest analysis, would be resolvable into the elements of treachery, profligacy, sensuality, coarseness, superstition, and a whole train of other vices, with of refinement—a trace? So little were these artists in any sense whatever "sure thermometers of the atmosphere in which they breathed," that inasmuch as they breathed in such an atmosphere and were not stifled—that causes which mortally affected too many did not injure their inspiration or their moral and truly patriotic aims—herein lies the proof that they were not of that atmosphere, though perforce they were in it, proof of the constitutional vigour of their artistic endowment which could preserve health in the midst of miasma.

It is true that "MICHAEL ANGELO's Sistine ceiling was commenced in the same year with that first transaction of European diplomacy—the League of Cambray; an alliance," it may be, though that is hard to say, "unmatched in history for rapacity, cruelty, and perfidy, and the signal for a ten years' reign of devastation and carnage." But neither the League of Cambray, nor its causes or consequences, can be seriously reckoned among the conditions which were conducive to the perfection of the art of MICHAEL ANGELO or RAPHAEL, or that gave birth to the art at the expense of civilisation. We must look for the favouring conditions isolated elsewhere, or entangled amongst conditions which were the reverse of favourable, and having a hard fight to maintain against them. MICHAEL ANGELO gained his own way as to the scope of the design of the Sistine ceiling with great difficulty against the scheme of the author of the League of Cambray, and he treated it throughout with the loftiest independence. It is much if we casually notice that the DELLA ROVERE (*robore*) oak leaves and acorns of JULIUS II. are prevalent in quite subordinate decorative borders and festoons. It would be as rational to ascribe the elevated tone, the dignity of devotional feeling, and aspiration after all that is pure and refined, which pervade the painter's sonnets and other poetry—art as sacred as that of the chapel ceiling—to conditions involving "such universal depravity and immorality, such cowardice and perfidy, such effeminacy and sensuality, such sloth and such vices—in short, such vilenesses and corruptions as hardly appear credible in a time of so-called Christian institutions."

The crimes, sensualities, and superstitions were so far from fostering the arts, that they were, in fact, the influences which constantly interfered with the exercise of them when in full vigour, as evidenced in many an indignant wail of MICHAEL ANGELO, and are so far chargeable with the final catastrophe of their extinction in Italy.

RAPHAEL was taken away early from the evil to come; but who shall wonder if MICHAEL ANGELO, after his experience of the years which succeeded, was moved when the time came at last that he could paint his *Last Judgment*, to make the predominant sentiment that of wrath against wickedness. Those who have given due time to the contemplation of this immense and awful picture, may well have felt that the indignation at "the conditions" of his time, which "*il terribile*," so pathetically expressed in his response to the verses on his "Night" at Florence, had since only gathered force, and at last in this picture found irrepressible expression.

No! we must not look to all that was worst in a corrupt social system for the causes and conditions of all that the world has seen that is most excellent in art. The healthy root which developed this bright consummate flower lay lower down in the social strata; and when the plant of promise did emerge it was favoured by influences far different indeed from the blighting airs of sensuality and superstition. One of these may be recognised in the enthusiasm roused by SAVONAROLA. That this affected MICHAEL ANGELO is on record; that RAPHAEL also was not untouched by it, however indirectly, we have under his hand by his introduction of the martyred Dominican side by side with DANTE in his *Theology*. And here allowance must be made not only for SAVONAROLA's preaching, but for the pre-existing healthy dispositions which caused it to touch so many human hearts. Another influence was that of PLATO, not through the spurious revival of FICINUS, but through the translation which he made into Latin of the entire works of the philosopher. The true and admirable influence of the Platonic ideal Beauty is too large a subject to be entered on here. It is a subject on which the author of the sketches of painters may be, as the examiners say, "referred to her studies."

### PARIS NOTES.

M. BORNICHE, an ardent connoisseur in oil paintings of the modern school, has recently died in Paris. The deceased, who had made a large fortune during his lifetime as a timber merchant, has left a collection of no less than 17,000 pictures of more or less value and merit. He was a large owner of property, and lived on the first floor of a house in the Rue de Rivoli, near the Halles. From time to time he would purchase some work that took his fancy, until finally the taste became a veritable mania, and he took to buying whole batches and collections at a time. His apartments at length were found much too small to contain the immense quantity of paintings he had thus gathered together, and the collector then conceived the idea of erecting a vast building on some waste ground belonging to him near the Boulevard St.-Germain, for the purpose of exhibiting his accumulation of canvas; but death put an end to his project. Dying intestate, this veritable pile of fine art has become the property of his daughter, who has resolved upon the sale of the entire collection. The number of lots to be brought to the hammer will necessitate the extension of the auction over a lengthened period. Eight thousand paintings are to be offered for sale during the ensuing winter, and the remainder disposed of at the rate of 250 lots four times a week, or 1,000 every eight days. The auctioneers, who will certainly have substantial reasons to bless the memory of the defunct collector, will consequently require upwards of two months to complete the sale of this extraordinary hoard.

The Municipal Council has approved of the scheme for the artistic decoration of the Mairies of the Fourth, Fourteenth, and Twentieth Arrondissements of Paris, at a total cost of 164,000 frs. The designs will be selected by public competition, and must be sent in, made to 1-10th scale, before April 1 next. The prizes allotted to the successful competitors will be in the case of the Fourth Arrondissement—first prize, 2,500 frs.; second prize, 1,500 frs. In the Fourteenth Arrondissement—first prize, 2,500 frs.; second prize, 1,500 frs. And in the Twentieth Arrondissement—first prize, 3,000 frs.; second prize, 2,000 frs.

The Triennial Salon finally closed on Thursday, the 15th inst. Contrary to what was announced by some of the Paris papers, there was no ceremony for the distribution of prizes, from the very simple reason that, by the regulations of the exhibition, no prizes or notices of any sort have been awarded. The attendance was very large on the last two free days—Thursday and Sunday; but the remark is generally made that throughout the duration of the exhibition the respectable labouring element, which as a rule eagerly avails itself of every opportunity of visiting similar exhibitions, has been conspicuous by its absence. Altogether this first experiment of a Retrospective Exhibition under Government auspices can hardly be termed a popular success.

One of the very oldest buildings in Paris, the Tour de Clovis, was lately declared to be in such a perilous state as to necessitate its removal. This tower, which is enclosed in the buildings of the Henri IV. Lycée, and has long been classed as an historic monument, is supposed to have been erected about the year 486, by the

king whose name it bears. Being adverse to the demolition of so interesting a relic of the past, the authorities called in several architects to consult upon the possibility of its repair, with the result that a plan of M. Ruprich Robert has been adopted to this end, and is to be carried out at a cost of 25,000 frs. Half of this expense will be borne by the City of Paris, and the remainder by the Department of Public Instruction.

At the last meeting of the Académie des Inscriptions et Belles-Lettres an important letter was read from M. Olivier d'Espina, of Sfax, in Tunis, announcing the discovery of a Roman funereal monument raised to the memory of Consortiola, and, near the same spot, the ruins of a Roman bath, containing an immense mosaic of very beautiful design. These discoveries have been made on a waste tract situate about four miles to the south-west of Sfax.

A decree of the Minister of Public Instruction and Fine Arts, published in the *Journal Officiel*, names the following professors at the Ecole Nationale des Beaux-Arts: (1) For simultaneous instruction in the three branches of art—M. Yvon, painter; M. Thomas, sculptor, and member of the institute; and M. Coquart, architect. (2) For the evening drawing and modelling classes: M. Bonnat, painter, and member of the institute; M. Delaunay, painter, and member of the institute; M. Boulanger, painter, and member of the institute; M. Lenepveu, painter, and member of the institute; M. Guillaume, sculptor, and member of the institute; M. Chapu, sculptor, and member of the institute; MM. Mercié and Barrias, sculptors.

Another decree authorises the Ecole des Beaux-Arts to accept the important bequest made by Madame Daupeley, to found five annual prizes of 1,000 frs. each, to be awarded to the most deserving among the architectural students.

In the first stage of the competition for the Prix Chaudesaigues, open to all French architects below thirty years of age, forty-six took part. The subject selected by M. Questel was a sketch of a *Triumphal Arch for a great Public Rejoicing*, and the following ten competitors were admitted to enter *loges* for the final stage, which consists in completing and elaborating their original designs: Armand Hourlier, pupil of M. Douillard; Merland, pupil of MM. Vaudremer & Kaulin; M. Dourgnon, pupil of M. Pascal; Eustache, pupil of M. Ginain; Robert de Massy, pupil of MM. Coquart & Gerhardt; Portal, pupil of M. André; Maistresse, pupil of M. Guadet; Debrie, pupil of M. Guadet; Chedanne, pupil of M. Guadet; and Hié, pupil of M. Ginain. They remain *en loges* the whole of the present week—from Monday morning to Saturday evening—and the award will be made on Tuesday next, the 20th inst. This competition is one of the great events of the year for architectural students, the prize being a scholarship of 2,000 frs. per year for two years. The winner is bound by the terms of the foundation to go to Italy to complete his studies, and remain there as long as he holds the scholarship.

### MR. RUSKIN ON "PUNCH."

IN the lecture which was delivered last week at Oxford, Mr. Ruskin began by reference to what is called cheap art. The phrase contained, he said, a dangerous fallacy, for there is no such thing as real cheapness. Everything has its just and necessary price, which we can no more alter than we can alter the course of the earth, and whenever we boast that we have bought anything for half-price we may be assured that someone else has had to pay the other half. Still there are obviously some forms of art which, as involving less labour and less rare genius, are more generally attainable than others, and it is this kind of art which necessarily has most influence over simple minds. Of all instruments of cheap art in this sense the woodcut is the most important, and there is no limit to the mischief it can do by encouraging vulgar and vile modes of design. Indeed, no entirely beautiful representation is possible in a woodcut, whereas everything vulgar and ugly is. Mr. Ruskin said he had framed a selection of woodcuts, ignorantly drawn and vilely engraved, from a book on "The Races of Southern America," representing whatever is savage and sordid, ridiculous and vicious, in human nature, and next to them he had placed some scientific studies by Tintoret, in which are to be seen all that is graceful in form, true in instinct, and cultivated in capacity. Mr. Ruskin exhibited also some woodcuts from a recent book "La Pourquoi de Mlle. Susanne," which purports to "amusingly instruct" a young girl in the elements of science. There was a woman struck by lightning for her instruction, a liver exposed for her satisfaction, and a nightmare described to her entertainment, and whatever monstrosities known to science were there collected in one black company by cheap engraving. Of

another result of this cheap art a critic wrote the other day that "by a series of bands of black and red paint the demoniac beauty of the sunset was entirely successfully reproduced"—a remark, said Mr. Ruskin, which contains everything that is wrong, call it demoniac, diabolic, or æsthetic, as you will.

From these general remarks Mr. Ruskin turned to the English artists who had put the woodcut to a better use. The title of the lecture was "The Fireside: John Leech and John Tenniel;" but although he had given these names to those of the real founder, and of by far the greatest illustrators of *Punch*, he took rather the work of Mr. Du Maurier as typical of entirely classic wood-engraving. For samples to be placed in the standard series, Mr. Ruskin had selected Mr. Du Maurier's favourite heroines, Mrs. Ponsonby de Tomkyns and Lady Midas; and he pointed out how the beauty of the younger lady depended on eight or ten strokes across the cheek. It is an optical law that transparency depends on dark over light; a snowstorm seen over a dark sky is not transparent, rain seen between us and a rainbow is. Mr. Du Maurier sometimes carries this law to an excess, and his drawings are often more like a chessboard than a picture. But nothing can be more perfectly true and right than the workmanship in many of his smaller studies, and Mr. Du Maurier's faithful representation of beautiful faces is one of the chief glories of "the immortal periodical." The kindly and vivid genius of Leech saw a jest in everything, and his loving wit covered the whole range of social life. Mr. Tenniel has given a graver scope and a steadier tone to the license of political controversy. Mr. Du Maurier's work has been to illustrate the law on which Mr. Ruskin insisted in a former lecture, and to which he alluded again in *Fors* the other day, that "on all the beautiful features of men and women, throughout the ages, are written with solemnities and majesty of the law they knew, with the charity and meekness of their obedience, and on all unbeautiful features are written either ignorance of the law or the malice and insolence of their disobedience." And from this point of view Mr. Ruskin exhibited enlarged copies of "Alderman Sir Richard" (with his "very expensive cast of features") and "the Colonel," in which Mr. Du Maurier has shown with accurate delineation, never degenerating into caricature, the permanent deterioration of feature, on the one hand, which results from self-indulgence, and the noble type which comes, on the other, from habitual self-control and just self-respect.

It is only *Punch's* business to be for a moment serious, but there are lessons worth learning for all that. *Punch* has always been a polite Whig, with a sentimental respect for the Crown and a real respect for property, steadily flattering Lord Palmerston and Mr. Gladstone, and having for his ideal of human perfection the British hunting squire, the British colonel, and the British sailor. The hunting squire: and the most beautiful sketch by Leech, or, indeed, in the whole of *Punch*, is Miss Alice on her father's horse. But is it not a remarkable thing that Leech should never have stopped to ask whether all girls can be like Miss Alice, and that *Punch* should never have seen any beauty in the poor? Nor is that all. Mr. Du Maurier's children, with whom the ladies reclining in elegant attitudes are generally too idle to play, are extremely pretty; but have you not noticed how much their prettiness depends on the dressing of their back hair and on their boots? The girls are beautiful, too, but there is a look of somewhat defiant pride in them all; and there is not a single girl in *Punch* with humility or enthusiasm written on her face. The popular voice is strong in *Punch*, and is it not remarkable, too, that the incarnate John Bull should always be a farmer, and never a manufacturer? and that *Punch's* ideas of civic majesty should be this repulsive picture of *Sir Pompey*? Look, too, at this characteristic type of British heroism—*John Bull guards his Pudding*. Is this the final outcome of King Arthur and St. George, of Britannia and the British lion? And is it your pride or hope or pleasure that in this sacred island that has given her lion hearts to Eastern tombs and her pilgrim fathers to Western lands, that has wrapped the sea round her as a mantle and breathed against her strong bosom the air of every wind, the children born to her in these latter days should have no loftier legend to write upon their shield than *John Bull guards his Pudding*? It is our fault, Mr. Ruskin continued, and not the artist's; and I have often wondered what Mr. Tenniel might have done for us if London had been as Venice or Florence or Siena. In my first course of lectures I called your attention to the picture of the Doge Mocenigo kneeling in prayer; and it is our fault more than Mr. Tenniel's if he is forced to represent the heads of the Government dining at Greenwich rather than worshipping at St. Paul's. But I have been too long, said Mr. Ruskin, in carping, and let me bear tribute, in conclusion, to the charm which these artists have given to the hearth and the fireside. With whatever restrictions you should receive their flattery, this at least you may thankfully recognise, that it contains evidence enough of the beauty and crescent strength of the young generation. At no period—and I speak after careful and minute comparison—has there ever been anything so refined, so innocent, so dainty pure as the girl beauty of the British islands. And I know from my own experience of help received from young members of this University that there was never a time when the country could more securely trust her destiny to the genius of her sons and her honour to their hearts.

## THE NEW BALL-ROOM AT SANDRINGHAM.

THE new ball-room which His Royal Highness the Prince of Wales has had erected during the past summer was used for the first time at the county ball given by the Prince and Princess on the 9th inst. Formerly the entrance hall of Sandringham House was used for the purposes of a ball-room, but the Prince has had a new wing constructed at the south side of the mansion, at right angles, between the house and the offices. This has been carried out from the designs and under the superintendence of Mr. Robert W. Edis, F.S.A. In this wing a spacious and elegant ball-room has been constructed with a corridor connecting it with the remaining portion of the house, and behind it have been provided new telegraph and post-offices. The principal portion of the wing is occupied by the ball-room, the general effect of which suggests great purity of design and perfection of execution. Externally the wing is in harmony with the rest of the house, being faced with red brick, with Ketton stone dressing. Entering by the old private entrance, which has been incorporated in the new work, the visitor reaches the ball-room by passing through a small ante-hall, 21 feet by 14 feet, into a corridor which leads away by the right hand to the dining and other rooms of the house and the principal entrance, opposite being the tea-room, 21 feet 6 inches by 17 feet, while on the left is the principal entrance to the ball-room. The corridor, which is about 60 feet in length, has been constructed in part out of a portion of the house, and is in strict harmony with the interior of the ball-room. The general style of the constructive decoration is Elizabethan freely treated. The ceiling of the corridor is elaborately panelled, and on each side of the walls is wood panelling 5 feet high, and it is lighted from gas brackets formed of cherry metal and hammered iron. The stove in the ante-hall is of a very tasteful design, with cherry metal *fleur-de-lis*, the hearth being in mosaic. The floor is of oak, and under each window in the corridor, as well as in the ball-room, is a seat beneath which ventilation is obtained by means of cold air passing over hot air pipes, and so through copper panelled gratings, combining heat with ventilation. Passing out of the corridor into the ball-room the visitor might almost imagine himself in the interior of a Russian ball-room as regards delicacy of colour, and there is a delightful sense of light, airy coolness. The room is 66 feet long by 30 feet 6 inches wide, the walls being 18 feet high from the floor. The ceiling, which is technically described as wagon-headed in shape and elaborately panelled, is 23 feet high in the centre. On either side of the room are deep recessed alcoves, 25 feet long by 4 feet deep. The south alcove is filled with windows, and the north with a magnificent fireplace. There are large bay windows at each end, and at the east end is the minstrel's gallery, the front of which is an open white arcaded balustrade, and it is covered with moulded ribs filled in between in low relief, in the form of a very perfect specimen of stamped leather paper. The ceiling is elaborately panelled after the manner of sixteenth-century houses in England, of which Crewe Hall is so fine a specimen. An elaborate cornice and frieze nearly 2 feet deep goes quite round. The plain surface of the walls is painted a delicate fawn colour, the lower portion being panelled as a high dado, with mask and scroll ornamental frieze, in all 7 feet high. The two central alcoves are supported by columns and pilasters of a composite character, the upper portion being fluted and the lower elaborately carved with mask and scroll ornaments. The south alcove is filled up with the fire-grate and mantelpiece, which is a very imposing work. The grate, which is a very fine design, is constructed of brass and iron; the sides of the fireplace are lined with tiles painted with figures and foliage in delicate tones of brown and yellow; and the whole is enframed with bold mouldings of Siena marble, which is carried round the basis of the carved trusses which support the columns of the superstructure, the whole being elaborately carved and furnished with a pedimental head. A projecting centre panel has been arranged to receive a picture. The whole height of the mantelpiece is about 16 feet, within a couple of feet of the cornice. The hearth is laid with mosaics with Siena marble fender. All the windows in the ball-room are internally arched, with recesses in which the blinds and curtains are hung to render unnecessary ordinary curtain poles. The floor is of oak with simple-parquet bordering. The whole of the ceiling and decorations are white, and the latter have all been designed and moulded specially for the room. For dancing purposes it is lighted by three large-centre gaslights in the roof specially designed by Mr. Edis, which serve for the purpose of ventilation as well, the foul air being pumped into a central external turret. There are also seven two-light gas brackets projecting from the walls, fitted with opalesque globes, which throw out a soft light. The walls are at present being decorated with the Prince's Indian collection of arms, arranged in various trophies, and the windows are curtained with heavy gold-embroidered Indian silk.

As before stated, the whole of the work has been carried out from the designs and under the personal superintendence of Mr. R. W. Edis, F.S.A., but great assistance has been derived from the taste of Colonel A. Ellis, Mr. C. S. Beck rendering efficient aid as clerk of the works. Mr. Purdon Clarke, C.I.E., of the South Kensington Museum, has arranged the trophies of arms. A considerable portion of the work has been carried out by the estate

workmen, and, as far as possible, the tradesmen of the county have been engaged. The ironwork has been supplied by Messrs. Barnard, Bishop & Barnard, of Norwich; Messrs. Hawes & Frazer, of Norwich, being also employed. Mr. Thompson, of Lynn, has supplied the wood, Messrs. Hewetson and Woodhouse, of the same town, the slating and plastering respectively. The carving and plaster decorations have all been supplied by Messrs. Jackson & Son, of Rathbone Place, London; the stamped leather paper by Messrs. Jeffery & Co., Islington; the gas brackets by Messrs. Hart, Peard & Co., of London; the gas and ventilating shaft by Messrs. Strobe, of London; and the parquetry by Mr. Steinitz, of the London Parquetry Works, Camberwell.

### THE ADMIRALTY AND WAR OFFICE COMPETITION.

A LETTER has appeared from Mr. W. White, F.S.A., on the forthcoming competition, in which he says that the excessive privacy proposed in the adjudication is indicative of suspicion and moral weakness, and has been supposed to show a fear of adverse criticism in the final result. There is to be no exhibition of the unsuccessful designs. They are to be returned to the competitors under the most strict secrecy; and all who take part in the competition, at enormous toil and considerable expense, are to be deprived even of the one poor solitary recompense of the bare fame of having shown what they can do. It will be also a disappointment to the public. In the first competition, immediately after the selection of the first ten or less than ten to be submitted to a second competition, all the unsuccessful designs ought to be publicly exhibited. In like manner after the second competition all the remaining designs should be exhibited except the one finally selected. By these means, though the judges accept the public responsibility, the final decision would not be liable to be called in question, while all would in a manner be contributing to the general final result through the publication of their solution of some of the difficult problems to be solved, whether in the arrangement or in the architectural treatment, and no competitor in such a case would grudge the possible aid contributed by him, through his design, towards the production eventually of the most satisfactory result. Thus we might hope the fabric, when carried out, would represent to this extent the combined force of the profession instead of the imperfection of the individual in debatable points.

### THE ATRIUM VESTÆ, ROME.

THE exact value of the highly interesting discovery connected with the Vestal Virgins made on the Forum, where it touches the flank of the Palatine close beside the church of Santa Maria Liberatrice, has yet to be ascertained, but in the meantime it has, says a correspondent of the *Times*, at once aroused general local interest to a degree that was strangely wanting in connection with the discoveries of the Rostra, the Curia, the Regia, the exact line of the primitive Sacra Via, and the other important results obtained through the excavations Signor Bacelli has carried on, and continues to carry on, with untiring energy. It must be admitted that those results were only obtained by a slow and gradual process, and were only fully recognised, especially as regards the Rostra, after patient study and mature consideration. There was nothing sudden about them; nothing to kindle instant excitement in the public mind, and afford ready material for general conversation and discussion. With the late discovery, however, the case was diametrically opposite. It fulfilled, moreover, those requirements, in the form either of sculpture or important inscriptions, without which the Romans have become accustomed to consider an excavation fruitless. It was made at once. Some of the workmen had been busy for a couple of days clearing the accumulation from around several equidistant slight brick piers. The construction marked a somewhat late period, and they attracted no special notice, but the difference of an hour revealed the fact that they stood upon rectangular marble pedestals with inscriptions on them of which the first lines were just visible above the earth. Extra hands were at once set to work; a few hours more and the débris around three pedestals, each about 5 feet in height, was removed. The evening papers announced the discovery of the celebrated Atrium Vestæ with inscriptions in honour of three of the Sisters Superior (Vestalis Maxima), and this corner of the Forum has since been a general centre of attraction to learned and simple.

That in these pedestals supporting brick piers we have positively one side of the Atrium Vestæ cannot, however, be positively affirmed as yet. They certainly stand in regular order on the exact spot where all authorities, ancient and modern, agree in situating that Atrium; they are in close contiguity to the remains of the temple; they have been discovered where other important inscriptions relating to the Vestals were found in the sixteenth century, but there is the strange circumstance that they had

apparently been moved from the position in which they were originally placed.

Apart, however, from this particular, which demands closer examination and study, and the light more complete excavation will throw upon this subject of the highest topographical interest, the inscriptions alone constitute a discovery of the first importance. The first, which is fifteen lines in length, was inscribed in honour of Flavia Publicia, Virgo Vestalis Maxima, by her niece "Aemilia Rogatilla, Carissima Foemina," and of her grand-nephew, "Minucio Honorato Marcello Aemiliano Carissimo Puero," in testimony of her sanctitude and piety and of the holy and religious care with which through all the sacerdotal grades she laudably administered in sacred things to the approval of the Most Holy Mother Vesta. The second was placed by the "Pontifices Virginibus Vestalibus Curandis," in testimony of the chastity and modesty of another "Virginis Vestalis Maxima," but who she was the inscription no longer tells. She had through some unknown reason incurred public dislike, and her name has been erased from the inscription, which fills eight lines. The date, which is uninjured, on the side of the pedestal, was placed between the years 363-364 A.D. The third is inscribed to Coelia Claudiana, another sister superior, who had filled her high office for no less than twenty years, by her client, Aurelius Fructosus.

### BIRMINGHAM ARCHITECTURAL ASSOCIATION.

THE annual meeting and conversation of the Birmingham Architectural Association was held at the Queen's College, Paradise Street, on the 7th inst. Mr. J. J. Bateman, the president, occupied the chair. There was a large attendance. The ninth annual report, which was read by the secretary, Mr. Franklin Cross, recorded a considerable increase of both ordinary and honorary members during the session, which had been one of the most successful which the association had enjoyed since its inauguration. The committee, however, was led to urge upon the members the necessity for continued and increased individual effort, so that the true object of the association might be attained and the profession generally benefited. The ordinary meetings held during the year had been more largely attended than those of the previous sessions. The classes too had been more numerous attended, but the committee desired to impress upon the younger members of the association the benefit to be derived from contributing papers and preparing designs. The designs which had been contributed were fairly satisfactory. Archæological and sketching excursions had been made during the session to Knowle and Packwood. The balance-sheet showed that the financial position of the association was in a much better condition than a twelvemonth ago. Instead of having a balance against the association of 15*l.* 2*s.* 8*d.*, as was the case last year, there was now only an adverse balance of 4*l.* 16*s.* 3*d.* The liabilities were 7*l.* 15*s.*, as compared with 25*l.* 2*s.* 8*d.* in 1882. The report and balance-sheet were adopted. In his address the president said he proposed to throw out a few hints upon professional practice to young architects about to enter upon a professional career. He dealt at length with what should be the mode of procuring business, and with the legal position and responsibilities of the architect. One source of evil, he said, was the too anxious desire to commence practice before a sufficient sound knowledge had been obtained to render the young architect fit to undertake the competent discharge of professional responsibilities. The student should cultivate that branch for which he felt himself more especially fitted, and to this end should, after his pupilage, enter into one or more offices in which this special line of practice was most fully carried out. If the mode of obtaining business were conducted on the lines laid down by the institute it would at least afford the student an opportunity of proving his metal. The law required that an architect should be qualified for his work, and he was liable for damages for negligence and unskilfulness. The architect's duty was to protect the building, the owner, and also to see ample justice done to the builder. In conclusion, he said he should like to add a word of warning, and bid all beware of restless ambition, which, like a circle in the water, never ceased to enlarge itself, till, by broad spreading, it dispersed to nought. Amid all the changes of a chequered professional career he would suggest the motto for their professional shield, "Purity and strength."

There was a large number of drawings on view, which had been lent by London and Birmingham architects. Ecclesiastical metal work was contributed by Messrs. Jones & Willis, and specimens of stained glass by Messrs. Winfield & Co. The latter part of the evening was occupied by a promenade concert.

A Brass has recently been erected in King's College Chapel, London, to the memory of the late Professor Rymer Jones. Upon it are represented animals, birds, &c., in illustration of the sciences of comparative anatomy and physiology, to which the professor was devoted. The work was designed and executed by Mr. T. J. Gawthorpe.

## TURNER AND THE "LIBER STUDIORUM."

A LECTURE on "Turner and his 'Liber Studiorum'" was given on the 8th inst. by Mr. Frederick Wedmore, in the mayor's parlour at the Manchester Town Hall. Mr. Wedmore, after stating that through the kindness of Mr. T. C. Horsfall he was able to show to the audience some prints in the "Liber Studiorum," remarked that a pictorial artist expressed his conception by colour or line. Some great artists were masters of the one and some of the other, and a fortunate few, Turner amongst them, were masters of both. Turner was, of course, a great colourist. Whenever Turner's colour failed it failed because it was some unheard-of experiment made by a genius familiar with success. He doubted, however, whether Turner's command of colour was greater than his command of line. His colour would gradually disappear, but his works in black and white would remain; and fortunate indeed was it that Turner executed and caused to be executed by others so much engraver's work. Turner etched little, but that little was done with immediate mastery. It was a happy chance to have lived at a time when the English school of engraving was at its height, for shortly after he died engraving became a lost art. The "Liber Studiorum" was the first issue of serial prints which Turner published. It was distinguished from his other publications by its general plan, and also by the medium employed. The aim of Turner in the "Liber Studiorum" was that each print should have the effect of a finely-washed drawing in bistre and sepia, strengthened by pen work, which pen work indicated now the leading lines of the landscape and now the heavier masses of shadow. To accomplish that he decided to employ both etching and mezzotint, and to employ them together; and the combination enabled Turner by his own hand to accomplish much of the work. Turner never was a line engraver. He made himself a great etcher, but the etching he performed was never intended to be a finished work of art. Turner meant the "Liber Studiorum" to express the full range of his accomplishments. He was fettered by no inevitable connection with this or that locality, as he was in other works of his, and in it he challenged comparison with all the landscape artists who had gone before him and all his contemporaries. Claude was a great influence on Turner, but when he seemed to be delivering a message that was Claude's he delivered it with an accent of his own. The finest of Turner's critics, Mr. Ruskin, had said that message was a melancholy one. Its dominant note was the note of pathos which was somehow inseparable from the highest beauty. Turner's finer landscapes were distinguished by much adjustment; they were never mere reproductions or transcripts. As a literary artist dealt with society and made the comedy or novel more brilliant if he could than the real scenes he professed to depict, and as the satirist's pencil made Mrs. Ponsonby de Tomkyns fuller of tact than we knew such lady to be in real life, so the landscape painter improved a little upon nature, or rather seemed to improve in representing that which lay within the scope of his art, feeling very sure that much beauty must lie for ever outside of it. Turner's secrets of composition were of the most intricate kind. There was no end to the devices by which he gave scale, led the eye to that point at which the picture's beauty was focussed, and removed it from the accidental yet necessary detail which had its own humbler service to fulfil. To know the work in the "Liber Studiorum" minutely was practically to know Turner; and to know Turner minutely, even if one knew no other master, was to enter into the temple of art by one of the very greatest of its portals.

## THE LATE MR. JOHN LESSELS, ARCHITECT.

ON Monday last Mr. John Lessels died in Edinburgh, after an illness that had lasted off and on for about six months. Mr. Lessels, who was born at Kirkcaldy in January 1809, attended the school of his native place at the time when it was successively taught by Edward Irving and Thomas Carlyle. His early ambition (says the *Scotsman*) was to be an artist, and a marked fondness for drawing was one of his early characteristics. His father, however, on the recommendation of Mr. Ferguson, of Raith, sent him to Edinburgh to be trained as an architect. The first office he entered was that of Mr. Burns, where, by-and-by, he became inspector of works, and in that capacity was employed in various parts of the country. In 1846 he began business on his own account, and in course of time attained to the front rank of his profession, by the members of which he was held in high regard. On the passing of the Edinburgh Improvement Act he and the late Mr. Cousin were appointed architects to the trust, and as such were called upon to take an important part in the carrying out of the scheme that had been devised for ameliorating the sanitary condition of the Old Town. In the work of reconstruction undertaken by the trustees Mr. Lessels had opportunities of leaving his mark on the architecture of the city, among the streets which he specially designed being Jeffrey Street, whose effective elevation now forms so prominent a feature in the eastward view from the North Bridge. By the Im-

provement Trust his opinion on any matter under discussion was always received with the greatest deference, the members of that body having the highest confidence in the soundness of his judgment, which they knew was never influenced by other than the most upright motives. Among other works accomplished by Mr. Lessels should be mentioned the laying-out of the feuing plan for the lands of Drumsheugh and the designing of St. Leonard's House, Edinburgh—considered a fine specimen of Scottish baronial architecture. (See *The Architect*, July 2, 1881.) Messrs. Nelson's works at Parkside; the Smith Institute, Stirling; the Palace Hotel, Princes' Street; the handsome pillars at Hope Park; and Charter Hall and Blackadder House, Berwickshire, may also be specified as testifying to his professional taste and skill. He was one of a number of leading architects selected to furnish competitive designs for St. Mary's Cathedral, and it was said that his drawings were within one vote of being accepted. In leisure hours Mr. Lessels continued through life to cultivate painting, and he from time to time exhibited water-colour drawings of church interiors or street views that had attracted his attention in holiday rambles on the Continent. As a critic of works of art he showed excellent discernment. Mr. Lessels was for some years president of the Edinburgh Photographic Society, an office which he only resigned quite recently on account of failing health. He also took a leading part in promoting the very successful exhibition held some time since under the auspices of the society. As a member of the Architectural Association, Mr. Lessels did yeoman service in connection with the exhibition which that society was instrumental in organising in Edinburgh about a year ago. He was vice-president of the Scottish Society of Arts, and an honourable member of various societies in Belgium with which he became connected in early life in the course of frequent visits to that country. As a practical architect, Mr. Lessels is said to have been among the first, if not the very first, to introduce open iron fronts into Edinburgh shops—a change which, whatever may be said of it from an æsthetic point of view, was no doubt the result of an honest effort to meet modern business requirements. By a large circle of friends Mr. Lessels was held in high esteem for his many excellent business and social qualities, not the least noteworthy of which were sterling uprightness of purpose, an equable balance of mind, and a quiet, unassuming manner which rendered intercourse with him easy and pleasant. To an inner circle he could on occasion disclose a vein of genial humour; and he had ever at command a fund of anecdote, chiefly derived from his own shrewd observation of men and manners.

## MESSRS. MACFARLANE'S PATTERNS.

THE action of interdict which was taken by Messrs. Macfarlane & Co., of Glasgow, against the Oak Foundry Company, has been concluded. The complainers maintained that the respondents had infringed the copyright of their catalogue, which they had got up at an expense of about 12,000*l.* (the patterns for which had cost 25,000*l.*), and they asked for interdict. The application was resisted by the Oak Foundry Company, who argued that the catalogue was a mere compilation, and that it contained the designs of many articles which had not been registered.

The hearing of the evidence occupied several days. Complainers' witnesses proved that the designs said to have been infringed were their own invention, and by means of drawings, tracings, &c., they endeavoured to establish that many of respondents' designs had been copied from Messrs. Macfarlane's book. Amongst the witnesses was a draughtsman who had been in the employment of the respondents when the catalogue was being prepared. He stated that complainers' catalogue had been used to trace the designs from.

For the respondents the four partners of the firm gave evidence. Their statements were to the effect that if there had been any tracing from complainers' catalogue it was not by their instructions, and was not with their knowledge. They had instructed their draughtsman to copy from patterns, and these had been supplied for that purpose.

The Lord Ordinary said that the first question was whether there had been in fact an infringement of the complainers' copyright publication, assuming it to be a proper subject for copyright. Complainers contended that the catalogue had been prepared partly from original designs furnished by architects, partly from patterns in their own establishment, and partly from suggestions made by Mr. Macfarlane, the head of the firm himself, and that one distinguishing feature of the book was that it was desired to impart to the illustrations something of an artistic character to make it attractive to customers. This probably was a novelty, and it was easy to see, at all events, that in treating these subjects—most of them simple enough—there was an approach to something like individual character in the drawing and the shading. It was not necessary that a work should be original to have the protection of copyright. If that were so his lordship supposed very few publications would be entitled to protection; but the particular view, speaking of letterpress, in which an author presented the

subject on which he treated was entitled to protection, however old it might be, and however deficient in literary form or merit. However useless the work might be in a higher sense, if the author chose to publish his ideas in a certain form, he was entitled to this protection, that no one should either print the same words or give the same information in the same order, so that the Court or a jury would pronounce the two works to be substantially the same. His lordship was not aware of any distinction between literary and artistic work in this respect. The illustrations might not be original, but if any one, without the permission of the author, reproduced these illustrations either in facsimile, or with only such variations of outline and shading as would not prevent the two designs being recognised by competent judges as being substantially identical, then, in his lordship's opinion, that was an infringement of the copyright in the illustrations of the complainers' work. The Lord Ordinary then went on to point out that the evidence on the subject was of three descriptions—the impressions made upon the persons who saw the two books for the first time, and who had previous knowledge of the designs contained in them; the opinion of experts testing the drawings by various modes of comparison; and the direct testimony of persons engaged in the respondents' establishment in the preparation of the catalogue in question. On all of these three points the Lord Ordinary gave his opinion in favour of the complainers; and in connection with the last point he observed that the fact that the respondents had not put their head draughtsman into the box was too significant to require any comment. Coming to the two legal questions that had been argued, his lordship said the first was that the respondents being entitled to use Macfarlane's design for the purpose of their manufacture, they were also entitled to circulate copies of these designs among their customers. His lordship quite assented to the view that the respondents were entitled to use Macfarlane's catalogue for the purpose of their business within their own establishment. They might make patterns from it, and from these patterns produce castings, which they were free to sell to all the world; but the mistake which the respondents had made was in not recognising the distinction between the two things—that, while they had the right to use the designs in trade, they had no right to circulate copies of these designs among the public. The only remaining question was whether the complainers' work, being a mere trade catalogue, was a proper subject of copyright, and on this his lordship agreed with the judgment recently pronounced by the Master of the Rolls (Jessel) and Lord Justice Lindley, who held that a trade catalogue was a proper subject for copyright. On these grounds his lordship granted interdict against the respondents. He had a little difficulty as to the precise terms of the interdict, but his present impression was that he would interdict the publication of the section of the respondents' catalogue in its present form, reserving to them to re-issue such of the designs contained in it as were not an infringement of complainers' copyright.

### LABOURERS' DWELLINGS IN IRELAND.

THE following circular has been addressed by the Secretary of the Local Government Board to the executive sanitary officer of every rural sanitary district in Ireland:—

Local Government Board, Dublin :  
9th November.

The Local Government Board for Ireland have received several communications from sanitary authorities relating to the plans of houses to be erected under the Labourers' (Ireland) Act, 1883, and, while the board desire to interfere as little as possible with the discretion of sanitary authorities in regard to the plans and designs of such houses, they think it advisable to make known to them some of the conditions which the board will deem essential in arriving at their decision as to the sufficiency of any scheme, after the inquiry which may be held under the provisions of the seventh section of the Act.

I. The number of rooms must be sufficient to provide for the due separation of the sexes, and there should be a kitchen and at least two bedrooms in every house.

II. Every habitable room should have a height of not less than eight feet throughout, except in the case of a room constructed in the roof, when one-half of the area of the room should have a clear height of seven feet.

III. Each habitable room should have one or more windows of a total area of glass of at least one-twelfth of the floor space, and all bedrooms should be floored with boards or tiles; the ground-floor should be raised not less than nine inches above the level of the external ground.

IV. A proper privy should be constructed in each case separate from the dwelling-house, and distant at least ten feet therefrom; the floor should be flagged or otherwise rendered impervious, and raised at least four inches over the adjoining ground.

The plans and specifications which may be prepared by the architect or builder employed by the sanitary authority must be handed in to the inspector conducting the inquiry, who will submit them to the board for their consideration and approval, but the conditions specially mentioned above will be a guide to the sani-

tary authority in regard to the accommodation which should be provided in each house, and the sanitary arrangements which are deemed necessary.

### EXAMINATION PAPERS FOR ARCHITECTURE.

THE following are the sections relating to construction in the examination papers which were used at the last competitive examinations for draughtsmen in the Engineering and Architectural Department of the Admiralty, and surveyors' assistants in the Office of Works, and assistant surveyors in the War Department:—

#### Admiralty and Office of Works.

#### *Drawing and Design of Civil Engineering and Architectural Works. (Obligatory.)*

##### (a) CIVIL ENGINEERING WORKS. (Time allowed, 4 hours.)

1. A main line of railway runs at a sharp curve through a clay cutting; a public road is to cross it at a point where it is 40 feet deep. The material for the structure is a good laminated sandstone, but the arches are to be of blue Staffordshire bricks. Give a cross-section, to a scale of 10 feet to an inch, showing at least half of the cutting and line of way, with the roadway over it in elevation.

2. Give a line diagram of an iron roof truss over a 35-foot span, and make working drawings, half full size, of the joints at the head and one foot of the truss, showing the latter resting on the top of a cast-iron column 5 inches diameter at the neck.

All dimensions to be figured, and the drawings to be carefully coloured.

##### (b) ARCHITECTURAL WORKS. (Time allowed, 4 hours.)

A building is required for a village school without master's residence, to accommodate twenty boys, with school-room, class, and necessary conveniences. Give plan, elevation, and section to a scale of 4 feet to an inch. The plans and sections to be coloured.

The design may be in any style of architecture.

#### *Building Construction. (Obligatory.)*

##### PART I. (Time allowed, 3 hours.)

1. What limes and cements are best for employment in hydraulic works.

2. Give a section to a scale of 1 inch to a foot of a cast-iron girder to bear a safe distributed weight of 30 tons, the distance between the supports being 25 feet.

3. Show the best form of wrought-iron rivetted girder to support 60 tons in the centre, the distance between the supports being 38 feet.

4. Give section showing 18-inch wall and footing and concrete thereunder, and sleeper walls and sleepers and joists.

5. Show to 1-inch scale the best method of supporting the girders of a floor when supported by iron columns being continued to support the floors above.

6. Give the different character of foundation you would adopt in gravel, sand, and clay.

7. Give section showing dry area wall and proper tumbling in at top to keep the ground from main wall of building.

##### PART II. (Time allowed, 3 hours.)

1. Explain the meaning of the following terms, giving illustrations: Rebate, grove, tenon, joggle, scarf, dovetail, matched, and beaded joint.

2. Draw to ¼-inch scale section of a king post roof 25 feet span, showing to 1-inch scale the ironwork to the head and foot of king and foot of rafters.

3. Give sketch showing the form of bond to 9-inch, 14-inch, 18-inch walls, giving quoins in Flemish bond.

4. Give section showing double-framed timber floor to 1½-inch scale with scantlings of the timbers, the girders being 20 feet between the points of supports and the binders 8 feet apart.

5. Give horizontal section and vertical section of a part of double-hung sashes and frame to a 1-inch scale to a foot.

6. Give plan and section of a lead flat, the section to pass through a roll and drip showing the method of laying the lead.

7. The drain falls from the front of the house to the sewer 10 feet in a distance of 45 feet; explain how you would prevent the sewer gas rising into the house.

#### *Rudimentary Calculations of Strength of Materials of Construction. (Obligatory.)*

##### (Time allowed, 3 hours.)

1. Explain how the dimensions of a column under compression affect the ultimate resistance of the material per unit of area.

What are generally considered to be the limiting lengths of short columns under compression, both in wood and in wrought iron?

2. A short, solid, round bar of wrought iron has to resist a compressive stress of 24 tons. Determine its diameter

3. A beam over a 32-feet span is loaded with  $1\frac{1}{4}$  cwts. per foot run, with the exception of 8 feet at one end; determine the reactions of the supports.

4. A fir beam, 9 inches by 4 inches, spans a 10-feet opening; what central load would break it, taking the ultimate tensile resistance of the wood at  $1\frac{1}{4}$  tons per square inch?

What difference would it make if the load were distributed?

5. Explain the difference between cast and wrought-iron, and state their respective merits for constructive purposes.

6. Explain the action of sand in mortar-making, and why the purest limes carry the most sand.

7. Is it admissible to use salt water with limes and cements, and does it affect their strength?

8. Describe the characteristics of good bricks, and state the relative merits of kiln and clamp burning.

9. Describe the different classes of limestone used by builders, and the purposes for which they are most suitable.

10. What timber would you select for the following purposes?—Treads of stairs, floor boards, pile foundations, dock gates, planking of earth waggons, roof trusses.

*Measurement of Quantities in Building Works and Estimates of Cost. (Obligatory.)*

(Time allowed, 3 hours.)

1. In accepting tenders what is the usual arrangement for the adjustment of extras and omissions?

2. Show calculation and make estimate of cottage wall shown in accompanying section and elevation. The arch over window to be axed, sill to be of York stone 8 inches by 3 inches. The wall to be built of stock bricks with over-sailing courses under eaves as shown.

3. Give the mode of measurement of the stone cornice shown in sketch, assuming it to be 40 feet in length, and the stone of the average length under scantling.

4. What will be the cost of plastering a room 12 feet square and 10 feet high, having one window 3 feet by 5 feet 6 inches, and one door 2 feet 8 inches by 6 feet 8 inches, including walls, ceiling, and cornice 10 inches girt. The work to be three coat and the ceiling lathed.

5. The length of a wrought-iron girder is 20 feet, and the section is as shown in sketch; give the quantity of metal.

*Specifications for Building Works. (Obligatory for Works Office Candidates.)*

(Time allowed, 3 hours.)

1. The ground floor of a house front is required to be taken out for the purpose of inserting a shop front. Give a specification of the necessary works required in shoring up and for carrying the superincumbent wall. The frontage being 20 feet, the height of ground story 12 feet, and three upper storeys of a total height of 30 feet.

2. Give a specification of a lean-to shed, the roof a quarter pitch. The width of shed 10 feet, the bearing between front supports 12 feet, the parapet of end walls and back wall carried 1 foot 3 inches above the roof, the roof to be "Ladies" slating on battens and to be flashed and to have iron eaves, gutters, and down-pipe in front. The floor to be asphalted on proper foundation.

3. Write a specification of the best form of trussing a timber girder.

**War Department.**

*(a) Architectural Drawing. (Obligatory as alternative with b and c.)*

(Time allowed, 4 hours.)

1. Draw, to a scale of  $\frac{1}{4}$  inch to the foot, a front elevation and section of the upper portion of a Doric column with its entablature. The diameter (d) of the foot of the column to be 6 feet, and the proportions of the upper members may be approximately as follow:—

Diameter at top of column, about	$\frac{3}{4}d$ .
Depth of capital	$\frac{1}{2}d$ .
" architrave	$\frac{3}{4}d$ .
" frieze	$\frac{3}{4}d$ .
" cornice	$\frac{1}{2}d$ .

2. Draw, to a scale of  $\frac{1}{4}$  inch to the foot, the plan, half external elevation, half internal elevation, and section of an oriel window to be executed in stone with joinery fittings. The opening in wall of room to be 9 feet wide, the room 11 feet high, and its floor 14 feet above the ground. The style adopted, as also whether the window is fitted with casements or sashes, is left to your option.

Give details one-fourth full size of various parts.

N.B. The drawings may be finished in pencil.

*(b) Engineering Drawing. (Obligatory as alternative with a and c.)*

(Time allowed, 4 hours.)

The enlarged details of the iron roof truss on the accompanying plate (design for covered shed) are to be drawn to one and a

half times their present scale, commencing with the iron column, and going on to the details of the head of the truss, &c.

The drawings are to be inked in, and, at least the two first mentioned, to be carefully coloured.

*(c) Preparation of Working Drawings for Details of Builders Work. (Obligatory, as alternative with a and b.)*

PART I. (Time allowed, 3 hours.)

NOTE.—All drawings to be fully dimensioned.

1. In getting out the foundations of a four-storeyed building, it is considered advisable to carry the walls over a certain part, where the ground is treacherous, on a bed of concrete supported by 8-inch piles, 10 feet long. The walls above foundations are of masonry, 2 feet thick.

Give a section, to a scale of 2 feet to an inch, showing how you would propose to carry out the work.

2. The accompanying figure represents an iron roof truss over a 28-feet span, trusses 8 feet apart. Make working drawings, one-half full size, of the joints at a and b, assuming the form and dimensions of the different members.

3. Give working drawings showing all the details connected with the method of carrying the front hearth of a fireplace on an upper floor—1st, in the ordinary way; 2nd, using cement concrete, independent of the joists.

4. Give the central section, and a small portion of the elevation, one-fourth full size, of a wrought-iron plate girder to carry a wall, weighing three-quarters of a ton per foot run, over a 20-feet span. The girder not to be over 12 inches deep.

5. Give, to a scale of one-twelfth—1st, a section through four steps at the head of a wooden stair, suitable to a good dwelling-house, showing the method of carrying them; 2nd, a cross-section through the handrail, stair, and a 9-inch wall.

PART II. (Time allowed, 3 hours.)

NOTE.—All drawings to be fully dimensioned.

1. A French casement window, leading from a sitting-room into the garden, is required to be weather-tight. Give sections, one-sixth full size, through the frame, set in a 14-inch wall, the meeting styles, and sill.

2. A brick chimney-shaft, 7 feet 6 inches long, runs up through a slate roof, parallel to the ridge, and a little below it. Show, by plan and sections, how the gutter in rear would be formed. The cross-section to include three courses of slates.

3. A boiler is to be fixed to a kitchen grate to supply hot water to a bath and housemaid's closet on the first floor. Taking an imaginary section of the house, show, by a skeleton diagram, every detail connected with the proper working of the system, naming the object of each part.

4. Give, to a scale of 1 inch to a foot, a section through the panels of an internal door suitable to a first-class house; also through one jamb, showing a lath and plastered stud partition.

5. A 6-inch drain runs under a house, from back to front, to join the sewer beneath the road in front. The drain is not to be disturbed within the house. Give a detailed drawing of whatever you may consider advisable in order to render the house secure against sewer gas, with any written explanation you may think necessary.

*Theory of Construction. (Obligatory.)*

(Time allowed, 3 hours.)

1. A beam AB 20 feet long, supported at both ends, is loaded as follows: 8 cwt. at 4 feet from end A; 12 cwt. at 8 feet from A; 14 cwt. in centre; and 16 cwt. at 15 feet from A. Determine the shearing stress at a point 6 feet from A.

2. A traveller, consisting of two Memel beams, trussed with timber struts and wrought-iron ties, as in the annexed diagram, is required to carry a load of 5 tons.

Determine the stresses on the different parts when the load is over a strut, and give the dimensions necessary to take these stresses safely.

3. A cast-iron cantilever of uniform strength and uniform breadth is required to support a uniformly distributed load. What should be its longitudinal section? Show by a figured sketch the distribution of the metal in the cross-section.

4. An ordinary slated roof, with common rafters and purlins, is supported by timber queen-post trusses of 36-feet span. Rise one-fourth span; 10 feet centre to centre.

Determine (by graphic process if you can) the stresses produced on the different parts by the ordinary allowance per foot super. for roof and snow.

5. A buttress of masonry weighing 140 lbs. per cubic foot, of the form of the accompanying diagram and 5 feet uniform thickness, with a pyramidal top, has to sustain the two thrusts shown.

Is the buttress liable to overturning about either point A or B? If unstable, show how the defect could best be remedied.

*Strength and Quality of Materials. (Obligatory.)*

(Time allowed, 3 hours.)

1. What are the distinguishing characteristics of the following bricks: Common stocks, blue Staffordshire, malm bricks, and for what purposes are they respectively used?

2. A pier of ordinary brickwork in blue lias lime mortar, 16 feet high, has to carry a load of 30 tons. What should be its section?

3. Write a specification to govern the supply of Portland cement for concrete work; and state what precautions you would use in storing a large quantity of it.

4. What description of stone would you employ for the following purposes: Stable paving, internal stairs, external stairs for heavy traffic?

5. Describe a natural and an artificial process of seasoning timber. State the object of the process, and the length of time required to fit timber for carpenters' and joiners' work respectively.

6. Distinguish between the following classes of timber, and state the uses to which they are respectively put: Red fir, spruce, yellow deals, American yellow pine, pitch pine.

7. What advantage is gained by cutting and reversing the halves of a timber girder, without inserting a fitch?

8. Write a specification for the iron tie-rods of a roof, and state what tensile strain may safely be put on them.

9. What materials are used for the different coats on an ordinary lath and plaster ceiling, and in what proportions are they mixed?

10. What is the composition of plumber's potmetal, and also of a solder for brazing? State what flux would be used for soldering tin and brass respectively.

*Description of Workmanship, Tools, and Plant. (Obligatory.)*

(Time allowed, 3 hours.)

1. In bricklayers' work what is the meaning of the term "larrying," and how is it performed?

2. Of what members does an ordinary builders' scaffolding consist, and how are they put together?

3. What means are usually adopted for lifting and setting heavy stones?

4. Describe shortly the different stages in the reduction of a roughly rectangular block of stone to the form of a groin-stone about half-way up the intersection of two vaults.

5. What is the distinction between carpenters' and joiners' work; and what difference is there in the tools used by them?

6. What is the essential difference between a jack-plane and a trying-plane, and how does the difference affect the work for which they are intended?

7. For what purpose does a smith use top and bottom swages, and how?

8. Describe the process of forming an ordinary wiped joint on a lead pipe.

9. Mention the tools commonly used by a slater, and their respective uses.

10. What is the meaning of "render, float, and set?" Describe the processes.

11. Describe in order the different processes involved in painting and flattening a new deal door.

*Analysis of Prices. (Obligatory.)*

(Time allowed, 3 hours.)

1. Determine the cost, per rod, of  $1\frac{1}{2}$  brick walling in lias mortar, built of hard stocks, faced with good red facers, neatly jointed outside and left rough on inside.

2. Work out the cost of eighteen ordinary window-sills of Portland stone 4 feet by 12 inches by 6 inches.

3. Determine the cost of a wooden floor to a first-floor room 15 feet by 20 feet. The boards to be in batten widths, grooved and tongued, and cut out of 3-inch deals; and the joists to be 10 inches by 2½ inches, cut out of the log.

4. Determine the cost in materials and labour of re-painting 500 yards of walling, two coats common colour.

5. Estimate in detail the cost of 500 yards of lath plaster float and set, in ceilings.

6. Estimate the cost of two heel straps for the principals of a timber roof truss. The depth of strap to be 13 inches, the breadth of the tie-beam being 5 inches.

*Measuring and Estimating Builder's Work, Taking out Quantities from Drawings, Preparing Abstracts and Bills of Quantities. (Obligatory.)*

PART I. (Time allowed, 3 hours.)

1. Describe, briefly, the different methods of arriving at the probable cost of a proposed building.

2. Explain the ordinary arrangements entered into for carrying any large work into execution.

3. How are the following items of bricklayer's work usually measured up and paid for? Well-sinking and steining in ordinary ground, concrete in foundations to paving, gauged arches to openings, brickwork to coppers, setting grates, raking and pointing to lead flashings.

4. In mason's work state how the following items are measured and paid for: rail-holes and cramps let in with lead, common sections of curbs and window-sills.

5. How are the following items measured and paid for? Plaster cornices, cement skirtings, staff-bead in cement, rough-cast.

6. How would the painting and glazing of circular fan-lights be measured and paid for?

7. Estimate the cost of subsoil draining a field 250 yards by 150 yards, the soil being a stiffish clay. There is gentle fall across the breadth of the field.

8. Measure up and give an estimate of the cost of making a new ordinary window in a room, the outer walls of which are 14 inches brickwork. To be properly finished with a window-board, and splayed and moulded jamb-linings.

PART II. (Time allowed, 4 hours.)

Measure up, abstract, and make out a priced bill of quantities of all the work required to be performed in the erection of the covered shed shown on the accompanying plate. (Design for covered shed.)

LOCAL BOARDS AND NEW BUILDINGS.

THE following information respecting the authority of local boards, in dealing with new buildings, has been prepared by the clerk of the Ealing Local Board at the desire of some of the members:—

What is the practice with reference to buildings of which plans are sent to the board for approval? Is it lawful for such buildings or alterations to be proceeded with before the plans have been approved by the board?—*Answer*: The Public Health Act, 1875, sec. 150, provides that where plans are required by any by-law made by an urban authority to be laid before that authority, the authority shall, within one month after the plan has been delivered, or sent to the surveyor or clerk, signify in writing their approval or disapproval to the person proposing to execute the work. If, before the expiration of the month, the work is commenced without such approval, and is in any respect not in conformity with any by-law, the authority may cause the work executed to be pulled down. It, therefore, seems that persons, having sent in plans, may at once proceed with the buildings or alterations, but do so at their own risk. The board cannot interfere, so long as nothing is done contrary to the by-laws or the Act of Parliament.

In the event of violations of the by-laws for new streets and buildings, if such violations have been shown on the plans submitted to the board and passed inadvertently, what is the remedy?—*Answer*: No provision is made in the statute or in the by-laws for such a circumstance as that contemplated by the question, and a very difficult point arises as to how far the approval by a local board of plans, &c., which show violations of by-laws, will relieve the persons executing works from the consequences of such violations. My opinion is that, if persons execute works so as to commit breaches of the by-laws, they render themselves liable to the penalties pointed out as applicable to such cases, notwithstanding the fact that the board may have inadvertently passed plans showing the violations, because the board cannot legalise that which the statute and the by-laws declare to be illegal; but it is very doubtful whether, under such circumstances, any Court would exercise its process in cases of this kind. It appears to me there are two states of affairs which may exist when plans have been so passed. (1) Where nothing has been done by the person executing the works which will seriously affect him, should the by-laws be enforced. In this class of cases I should advise that a notice be at once served, calling attention to the by-laws, and requesting compliance therewith; and in the event of failure to comply, there would probably be no difficulty in obtaining a conviction. (2) Where the plans, having been passed, showing breaches of the by-laws, and work has been done by the person sending in the plans, and he would suffer loss if the by-laws were then enforced. In such a case I am of opinion that, although it might be open to the board to prosecute the offender, still no Court would inflict more than a nominal penalty, if any.

In the event of violations of the above-named by-laws, and such violations have not been shown on the plans, what is the remedy?—*Answer*: The remedy is by proceedings before the Justices, as provided by the 98th by-law and the Public Health Act, 1875, sec. 251.

In your opinion is it necessary for a street to be open at both ends to be considered a carriage-road? (See clause 8, page 5, by-laws on new streets; see Stratford Place, Oxford Street.)—*Answer*: There is no definition of the word carriage-road either in the Public Health Act or in the by-laws, and the ordinary meaning of the term must therefore be considered as applicable. I am of opinion that carriage-road *primarily* means a road capable of accommodating carriage traffic; and, further, that it is not necessary for a street to be open at both ends in order to be a carriage-road within the by-laws; but, from the other point of view, it must not be taken for granted that *every* street laid out as a carriage-road, and less than 100 feet in length, is subject to the provisions of the by-laws relating to streets intended to be used as carriage-roads.

## NOTES AND COMMENTS.

THE subject of illicit commissions has again cropped up, and will give journalists an opportunity for publishing a great many articles in which slanders against architects will be insinuated, or stated in terms so general that no legal remedy is possible. The letter from the editor of *Truth* differs in character from the letters which were printed a couple of years ago. We may be sure that it is not rashly penned, but is based on information which has been supplied to the editor, and in which he believes. Now, we know that a few firms who have been disappointed in obtaining orders have lately stated that their failure can be attributed to their opposition to the system of giving commissions to architects. It is possible that some of those letters have reached the office of *Truth*, and have inspired the statements which to outsiders appear so circumstantial. It will be seen that the Institute repudiates the charges, and lately similar charges were more publicly repudiated at Glasgow. The editor of *Truth* is not wanting in courage, and he has torn the masks off many living shams and rogues. He has now an excellent opportunity to do us all a good turn. Let him give the particulars of one case in which an architect has taken a commission from tile-makers or stove-makers, and he need have little fear of the consequences. He would find enough supporters among architects to secure him against loss. Mr. LABOUCHERE will of course say that in the address of Mr. COLE ADAMS there is evidence to show that the practice is common enough. When the President of the Architectural Association is heard to speak of the system as "a cancer, which, when once it has fastened on the system, grows and sends its poisonous fangs in all directions, until all that is best and noblest in a man's nature gives way to it," he must have been satisfied of the power of the evil with which his auditory had to contend every day.

THE Bishop of LIVERPOOL appears to be desponding about the success of the cathedral scheme. At the present time the services in the pro-cathedral have entailed an additional expense of about 500*l.* a year, and to obtain that sum the honorary canons have to canvass their friends. The bishop considers that the indifference of Churchmen in the matter is one of the "black spots" in the diocese. Under the circumstances, it is not clear how the more expensive services in a new cathedral can be undertaken. "I sometimes doubt," the bishop says, "whether the zealous advocates of a building worthy of Liverpool have ever considered that the building will be useless without an endowment to support its services, and that to provide a suitable endowment for deans, canons, organist, choir, and other officials will require a capital sum of at least 100,000*l.* Now where is that endowment likely to come from when we cannot get such a paltry sum as 500*l.* a year for our present cathedral service?" But, in spite of the anticipated poverty of a cathedral, the organising committee are engaged in seeking a site for the new building.

THE sacredness that is attached to trees in a proprietor's eyes has been diminished by a decision which has been given in the Scottish Court of Session. A merchant took a lease of some ground on which was a cottage. The latter was overshadowed by trees, which were an obstacle to light and air, and the dripping of the rain from them kept the roof damp. The leaseholder, naturally regarding the trees as being detrimental to the amenity of his house, cut down four of them, and claimed the right to remove as many as should be necessary. The owner took an action, and claimed 100*l.* damages. The judge before whom the case was tried assessed the damages at 10*l.*, and made an order prohibiting the tenant from interference with the remaining trees. There was an appeal from this decision, and it has been set aside. That a proprietor had generally a right to the timber on his property was not questioned; but inasmuch as in this case the lease was a building lease, the rule was supposed to be inapplicable, because the tenant was entitled to the reasonable enjoyment of that which was the primary purpose of the ground, and therefore could remove whatever interfered with his rights.

AN interesting festival was lately held in the Waterloo Road. The parish of St. Mary, Lambeth, possessed in 1818

but one church for about 50,000 inhabitants. At that time the Exchequer was enriched by a windfall, which came from some mysterious source abroad, possibly from the Austrian Government, and in consequence the large sum of one million was set aside for church building. Four buildings were erected in Lambeth parish. One of them is the mongrel Doric Church of St. John, which stands nearly opposite. The site was a horse-pond, and it was only by piling that a foundation could be obtained. The foundation-stone was laid on June 30, 1823, and the church was opened on November 3, 1824. The architect of the building was Mr. F. BEDFORD, who designed some others of the South London churches. The only noteworthy feature in the church is the monument of ELLISTON, the comedian and manager.

A BILL is to be introduced into Parliament during next session to authorise the purchasing of additional premises for the site of the proposed Museum of Science and Art in Dublin. The Commissioners of Public Works in Ireland seek for power "to purchase and take, by compulsion or otherwise, within three years from the passing of the Act, the fee-simple and inheritance in the dwelling-houses, offices, grounds, and premises known as Nos. 7, 8, and 9 Kildare Street, and part of the laneway at the rear of same; also the laneway known as Kildare Lane on the south side of the dwelling-house No. 9 Kildare Street; also part of the house and ground of the dwelling-house known as No. 1 Kildare Place; and also a certain out-office and ground at the rear of the dwelling-house No. 1 Upper Merrion Street." The premises have been shown on the diagram-plan supplied to competitors.

WHAT meaning is to be attached to the word "elevation," when it appears in a deed relating to houses? Is it height, or appearance? The only technical definition of the word by JOHNSON is as an astronomical term. But in DYCKES'S Dictionary—which was also compiled in the last century—elevation is said to signify "the scenography or perspective view of a building; it is also used for the orthography, or plan of the front of a building; by workmen vulgarly called the upright of the building." In the "Imperial Dictionary" of 1882, it is said to be "a geometrical representation of a building in vertical section, as opposed to the ground plan." How far are definitions like the above applicable to a clause which says that "one corner tenement shall be of the same or similar elevation as nearly as may be with the houses already built"? A firm of builders in Glasgow have been erecting a house in Athole Gardens, of four storeys in height; but the remaining houses are only three storeys, and the proprietors of them—to the number of eighteen—relying on the clause, endeavoured to obtain an interdict against the obnoxious fourth storey, and thus to insure uniformity of appearance. The builders relied on another deed, which authorised the erection of two corner houses of four storeys, which were to be similar to the other houses, "so far *inter alia* as elevation is concerned." One Sheriff interpreted the word elevation as favouring uniformity of height, and ordered the fourth storey to be instantly removed. But the Sheriff Principal when appealed to arrives at a different opinion, and legalises the fourth storey.

ACCORDING to the Sheriff Principal the word elevation does not necessarily mean height and number of stories, but rather "the appearance and fashion of the edifice as seen above the ground, in opposition to the ground or sectional plans, so that when the building is said to be of the same or similar elevation with another, this merely means that it is to be of the same or a similar architectural design." The Sheriff Principal considers that his view is confirmed by the very words of the original deed, which provided for the erection of three storey and four storey houses. The height and number of the former had been fixed, and similar elevation must therefore mean something else, which can be nothing but external appearance, fashion of architecture, and the like. As the case is to be brought to a higher court it is hardly safe to discuss the point that is involved. Although among architects the word elevation is sometimes used in the sense suggested by the Sheriff Principal, that meaning is not found in dictionaries. As the word in its popular sense is associated with height, there is ground for the assumption that the lawyer who drew the deed was thinking of height, and not of effect.

DESIGN FOR CHURCH OF ALL SAINTS, IPSWICH.

By SYDNEY VACHER, A.R.I.B.A.

HOUSES & SHOPS, NEWCASTLE, STAFFS.

MESSRS CHAPMAN & SNAPE, ARCHITECT.

## ILLUSTRATIONS.

STAIRCASE FOR MR. FREDERICK SCORER.

THIS staircase was designed for a house just completed, from the designs of Mr. MERVYN E. MACARTNEY, for Mr. SCORER, at Westerham. The material employed was oak.

INGLENOOK, HOLMBROOK.

THIS drawing shows a portion of the Inglenook designed by Mr. MACARTNEY for the billiard-room, Holmrook Hall, Cumberland, the seat of Major FLETCHER LUTWIDGE, J.P. The chimney-piece is to be executed in marble, and the panelling and seats in walnut.

THE LIVERPOOL ZOOLOGICAL GARDENS.

THE close of this century seems likely to be distinguished by its crusades against the myriad material ills that civilised flesh is heir to. To-day social reformers and political party chiefs are unveiling the foul recesses of squalid life in large towns and cities, revealing a state of things which only needs to be fully known to be doomed, and South Kensington is busily promoting the study of the newly popular science hygiene in her *alma mater* and its numerous affiliations. Whilst the Free Library and Museum have taken the field against the gin palace, the preservation—for dear life's sake—of public parks and open spaces, and the formation of zoological and botanical gardens, is carefully regarded.

The land secured by the Company for the Liverpool Zoological Gardens, about thirty acres in extent, is easily accessible from a populous neighbourhood, and lies within quite a network of railways of the principal northern companies. Over these picturesque views are obtained of the open country beyond. As it is within about a mile of the sea, and occupies an elevated position at Walton-on-the-Hill, freedom is insured from those atmospheric impurities which injuriously affect animal and vegetable life alike. The preliminary contracts for the enclosure of the Gardens are now let, and this week the "first sod" was cut.

The entrance we illustrate will be used pending the undertaking of the large crescent entrance block, for which plans have been prepared, and which is to include hotel, temperance refreshment house, shops, and accommodation for learned societies for the study of various branches of natural history, with their libraries and collections. The lodges are built of rubble stone, rough cast on the outer face, with red brick pilasters. All the stone is from the Everton quarries. The decoration in the gables is to be simply and boldly modelled on the wall in Portland cement. The architects to the company are MESSRS. WILLIAM SUGDEN & SON, of Leek.

CARRUBBERS CLOSE NEW MISSION, HIGH STREET, EDINBURGH.

THE foundation-stone of the mission hall which is illustrated this week was laid on April 24 by Mr. D. L. MOODY, and the building is now in progress. The site is at the head of High Street, a continuation of the well-known Canongate, and adjoins the house of JOHN KNOX, the reformer. The frontage is nearly 60 feet, and the building, with its cut stone front, will form a marked contrast to the adjoining houses, which are occupied in tenements by a humble class of people. The lower part is arranged as shops. There will be a large hall capable of seating 1,400 or 1,500 people, and two smaller halls. The rooms will include drawing-room, committee-room, and other offices on the first floor, while on the second and third flats ample accommodation is to be provided for conducting various classes. There is also a janitor's house. Due attention has been paid to ventilating and heating arrangements. The sum of 11,000*l.* has been collected towards the cost of the buildings. The architect is Mr. JOHN ARMSTRONG, of 2 Queen Street, Edinburgh. The contractors are as follows: GEORGE ALEXANDER, mason and bricklayer; DAVID GREIG, carpenter and joiner; JOHN WHITE, plumber; THOMAS TAIT, ironfounder; Messrs. DOBIE, painters; Messrs. GRAHAM, slaters; Mr. LAWSON, glazier; Messrs. MACLELLAN (Glasgow), iron girders. The stained lead lights are by Mr. GRAHAM ROSS—all of the city of Edinburgh. The plaster work is by Mr. DEWAR, Portobello. The works are carried out under the superintendence of Mr. WILLIAM PATISON, clerk of works.

DESIGN FOR THE IPSWICH CHURCH.

IN this design, which was submitted by Mr. S. VACHER, A.R.I.B.A., care has been taken to keep the expense as low as possible consistent with good church arrangement and building. The chancel would be large enough for the nave, and has only splayed angles for the chancel arch to spring from. The windows are placed as high up as possible, thus giving a grand effect, and enabling the largest number to see. The pulpit is placed so as to command the greatest possible number of people sitting in the aisles. The gangways at either end of the nave work satisfactorily in practice, the door at east end of aisles being used for exit only. The chief aim has been to get effect by caring for the proportion.

HOUSES AND SHOPS, NEWCASTLE, STAFF.

THIS terrace of houses has been lately erected from the designs of Messrs. CHAPMAN & SNAPE, of Newcastle, Staffordshire.

## THE ARCHITECTURAL ASSOCIATION.

THE first ordinary meeting of the association for the present session was held on Friday evening, the 9th inst., Mr. Cole A. Adams, president, in the chair. The following gentlemen were elected members: Messrs. J. M. Townsend, A. C. Couldery, and B. A. Slade.

A vote of thanks was passed to the gentlemen whose labours had so greatly conduced to the entertainment of the members at the late conversazione, and especial mention was made of the name of Mr. H. D. Appleton.

The PRESIDENT announced on the part of Mr. Tarver that a prize would be offered in connection with his class for the best series of illustrated notes.

The following vote of condolence on the death of Mr. Paice and Mr. Page was, on the motion of the president, unanimously adopted:—

"That the Architectural Association desires to place on record its feeling of indebtedness to the late Bowes A. Paice and Richard C. Page, for much good service, marked by courtesy and consideration, rendered by them in the past; and its sense of the loss to the profession of two men of such ability cut off before they had opportunities of permanently showing their talent; and it tenders its respectful sympathy to the relatives of those gentlemen. And further, that a copy of this resolution be sent by the hon. secretary to the friends of each of them."

Mr. J. DOUGLASS MATHEWS presented the annual balance sheet, which was adopted. He then proposed a vote of thanks to the auditors, Mr. Cuxon and Mr. York, which was carried. In the course of his remarks Mr. Mathews alluded to the arrears due in the way of subscriptions, and said that the greater part of the subscriptions at present paid for the past session had only come in three weeks previous to the audit.

## The President's Address.

The PRESIDENT said:—

Last Friday week we had the pleasure of meeting together in social intercourse; to welcome and entertain our guests; to applaud the recipients of the prizes, and study and admire the objects displayed on the walls of the galleries. It was, so to speak, the last day of the holidays—the last day of carnival—when the Architectural Association holds high festival. To-night we meet together in our working clothes; holidays are over; prizes have to be won, and the drawings to cover the walls for the next conversazione have yet to be made. This is the first night of the new session—the first night for work.

It is well on such an occasion as this to take a general review of things, so that before we start on the march of another session, we may with what calmness we possess look back over the ground of the past session, and see whether the progress has been real and direct. Then, dwelling not too long upon what is passed and cannot be retraced, to turn our eyes steadily in front, and scan the country and the goal which lies before us. Retrospection has its great value, if we use it rightly, for teaching what to avoid in the future, and I propose to the best of my ability to review the work and its results done in the association during the session which has become part of our history, and to do so, I must refer to the rather dry details afforded by the very useful statistics published in the Brown Book.

It may not be out of place here to say a few words on the subject of this said Brown Book, with which we are all so familiar. You are aware that the secretaries of the various classes prepare the statistics and reports which they forward to the secretaries of the association, but perhaps very few of you are aware of the enormous amount of labour the compilation of the work throws upon these gentlemen. I had not myself, until from my official position I could peep behind the scenes, and see what it meant to bring out this useful little book. The demands made upon the

time of these gentlemen are very large, the labour very great, and the sources from which the necessary information has to be gathered, the numerous people who have to be consulted, written to, and got at, so large, that the wonder is that men living the busy life our secretaries do, not only perform their duties, but do so cheerfully, sacrificing, I much fear, paying work to voluntary labour in our service. I think we do not sufficiently appreciate, I believe through ignorance of the facts, the immense obligation the Architectural Association is especially under to our secretaries; and I cannot let this opportunity go by without testifying my, and I believe your, sense of gratitude, not only in this compilation of the Brown Book, but in whatever work comes before them. The growth of the Architectural Association has so added to the labour of carrying on the work of it, that I think the time must shortly come, when the least we can do in acknowledgment of such services will be to find some paid assistance to do such routine work as could be taken off the shoulders of the gentlemen for the time being serving in the capacity of secretaries to the Architectural Association, leaving them more leisure for the discharge of duties requiring that tact and courtesy which in my experience have never been wanting. With this digression, for which I make no apologies, I must return to my starting-point.

Taking the list of members from the last edition of the Brown Book, we find that 786 are resident in London, 174 elsewhere—total, 960. Out of this list a fair deduction must be made of men who are in practice, or who have in previous years passed through the classes, but still remain members. What this proportion is I am not able to say. From statistics kindly furnished me by the gentlemen acting as secretaries to the classes and lectures, I have ascertained that last session 190 members, or thereabouts, including country members, availed themselves of the advantages offered by the classes and lectures, and thus, out of 960 on the list, about one-fifth. It must further be noted that this number includes all the names supplied me as having attended at some time or other; but experience goes to show that, though at the beginning of a session men attend the various classes and lectures in strong numbers, towards the middle and end they drop off. A further analysis of the lists supplied me show that, out of these, two gentlemen attended five classes and lectures, six attended four, nineteen attended three, and forty-one attended two.

Are these results as satisfactory as they ought to be? I hardly think so. There is sometimes a danger in multiplying advantages, and doing too much to make the paths easier; it removes that spur to self-help which some natures need. I, however, strongly appeal to all students to-night to hasten and avail themselves of the privileges open to them, and to remember that, apart from what is offered you here, you have a large field for improvement offered you at University College, King's College, and at the British, South Kensington, and Architectural Museums, where careful and serious study would fit you for great things.

Looking through the statistics given in the Brown Book, we find that "design" numbers 479 attendances, "construction" 784, as against the previous session, when "design" scored 711—being 232 more attendances—and "construction" 763, or 21 less than last session. In looking at these statistics it must be remembered that in this past session none are given for the "colour" class, which in the previous one recorded 52 attendances. But the fact remains that "construction" is 305 ahead of "design," as against 52 the session before—which is certainly rather startling—a majority six times larger.

No one will grudge "construction" such very satisfactory results. The importance of science in relation to architecture no one will dispute; and those who have the management of the classes and lectures devoted to this branch are to be heartily congratulated, and we can only hope that this present session may swell the numbers still more. Why is it, however, that "design" falls so far below the standard of the former session, and, I fear, far below previous ones, if the statistics were worked out? It is a question which we ought to face seriously. That the science of construction should claim the attention of more students than the art of design need surprise no one, I think, inasmuch as most minds are attracted to what can be demonstrated and proved—science accepting nothing on faith; and with ordinary ability, coupled with perseverance, the principles and practice of construction may be mastered without much difficulty, though to succeed in the higher branches requires, of course, a higher order of intellect. The faculty of design is, it will be generally conceded, a much rarer gift, without which a man cannot be an architect in the true sense of the term. He may be able to raise a building, fulfilling every condition of sound construction, but destitute of every quality which pleases the cultivated eye. Design not only demands the inventive faculty, but also the higher gift of imagination and the qualities of the poet and artist, and such gifts are rare.

If you admit this brief definition to be a correct one, we are still brought face to face with the problem, Why has our society so fallen in its "art" results this past session? A review of the progress of art generally, throughout all its branches, does not to my mind give a solution of it. The progress in architecture, sculpture, painting, and the decorative arts during the last quarter of a century has been great, and in our own art especially so. I

think perhaps one—if not the chief—cause of the falling-off we are now considering, is due to the rather chaotic and transitional state which is now existing in the school of thought as applied to architecture. The great Gothic wave has spent itself, and though we have works and men of whom we may be justly proud, we cannot, enthusiasts though we may be for our first love, say that she claims the devotedness which characterised our admiration of a few years back; and, pursuing the metaphor, the heart has grown cold in many, and nothing has yet risen up to fill the void. History is again, in Gothic art, repeating itself. Our masters of the revival preached that the only salvation was in the pursuit of the earlier, and as they thought, purer styles of the Christian art; and in these latter days a school has arisen which forsakes that teaching and preaches that the better art is in the later styles, and in the "flat and pointed." Others worship at the Jacobean shrine, make votive offerings at the tomb of Queen Anne, find even something to admire in Georgian relics, until maybe the student shall wander into Gower Street, sketch-book in hand, and there, let us hope, stop. What shall the poor student of architecture do, where shall he go, who guide his weary footsteps in the pursuit of the true and the beautiful? With the decline of the Gothic revival, enthusiasm, the great spur to good architecture, is dead, and we need some Peter the Hermit to rise up and preach a new crusade against all that is false, and to lead to victory over it. We need a great rekindling of dead bones. Looking across the horizon, dull clouds obscure the sun, and the prospect appears bleak and uninteresting. But, it will be said, buildings are rising daily pleasant to look upon, and the improvement in planning, variety of design, and absence of fussiness, is remarkable, and I admit it; but is not a great deal of this upon lines which spring from impure sources, and due as much to quaintness, piquancy of effect, and a large amount of conceit? Can we, from most that we see nowadays, conscientiously teach the principles of beauty, breadth, proportion, simplicity, and refinement? I think not. Is such work followed with a tithe of the enthusiasm and love with which Gothic was? Is it a style at which the student of to-day can start on his career, feeling that he has found the truth, and, girding up his loins, through good and evil report follow in its path? I do not think so; and in the present unsettled state of our art I trace the coldness which has fallen upon the members of this society of late years, paralysing what should be the highest aim of its existence—nobility of design. I take it another cause may be a too great tendency to thoughtless study of ancient work. I mean by that that students think the one great aim is to fill their books with pretty sketches, jotted down because they took the fancy of the moment. This is very much like dipping into a book and indulging in desultory reading; picking out the light and amusing parts, but missing the author's teaching; skipping the chapters which imparted the great lessons the author had to teach. Depend upon it, if you want the secret of success, which has produced the works of great architects, you must seek it in a different fashion to the one too usually adopted.

Mr. J. D. Sedding, discoursing "about modern design," expressed his opinion that he thought it a mistake to begin to design too early. I will not open that question for discussion here now; but I would say this. I believe it would be far healthier and better if you would confine your experiments to the subjects given in the classes, where you will have the benefit of criticism from your fellows, and not seek outlets in other channels, where you will miss the advantages of having your faults pointed out, and learning what others think of your design and method of treating it.

How can enthusiasm be once more kindled in this association? I hardly know. What would be the best course to adopt in teaching design? To this I would venture to say, let us in our classes commence with teaching those styles of architecture which, by a general consensus of authoritative teaching, are recognised as the *Classics* of art, and, taking one of these styles in a session, let the student devote his whole energies to obtaining something more than a smattering of it. Looking at the syllabus for 1883-84 of the elementary class of design, is it not rather appalling? Designs in eight styles, to be worked out in so many months! Is this the best system we can adopt? Would it not be wiser to take one of them, and learn its grammar with a little more thoroughness? I only express this as an individual opinion, which, however, forces itself the more I have thought over the subject. I think it is one well worthy of the most careful consideration. Work, to be of any real service, should be "thorough"; under our present system it cannot be. Then, if it is a wrong system, let us set to work and reconsider the whole basis upon which instruction in the art of design should rest. Any real acquaintance, except in one or two cases, of a consistent and intelligent knowledge of style has been more noticeable by its absence in the designs which have of late been submitted in competition. There must be some cause for this.

We must not sit with our hands in our pockets waiting for the next great tidal wave of fashion, but in the meanwhile devote our energies to the study of all that is best in art, be it Classic or Gothic; so that, being well grounded in the grammar of architecture, we may at least compose in language which shall be intelligible and appeal to cultivated minds.

I must now refer to one feature especially noted in this year's

report. I mean the colour-decoration class. It could not present a much worse account than the last one. No good can result from shutting our eyes to facts; let us face this unpleasant one, and consider how we may remedy it. No one who aspires to excel in the profession of architecture can dispense with colour-decoration. The charm of a building is as much in its colour as in its form. Incongruity of colours, violent contrasts, and absence of effective contrasts may mar an otherwise fine design. An eye for colour, an ear for music, are gifts which can perhaps hardly be acquired; but unless the gift is cultivated you can with no certainty achieve success; whereas some measure of success can be achieved by the patient cultivation of any art where the will exists to master it, and so obvious blunders may be avoided. If colour, then, plays so important a part in architecture, no student can afford to neglect the study of it. The association has recognised this, and included a class for those who desire to learn something about it; the subjects generally given are for interior decorations, but the principles underlying that are capable of universal application, and I would strongly urge, in the words of the "Note," which tells you of the want of success which characterised last session in this branch of study, "that the prosperity of this useful class depends materially upon your individual support." It must have been a disappointment to the president and officers of the class last year to experience the failure that their efforts met with, and I can only express the wish and belief that, under the reformed regulations, a success may be recorded this session. I hope that those whose predilections are for colour will join the new class at once, and throw all their energies into it, persuading others to a like course. With the progress which is taking place in the decorative arts, it is of the highest importance to the student who aims at excellence that he should be acquainted with colour-decoration, and cultivate a knowledge which will enable him not only to build with materials which shall, by their happy contrast, add to the beauty of his design, but also be able to advise his client in the internal decoration of the building, instead of leaving it to the too often vulgar taste of the painter and decorator. The art is too little cultivated amongst us in the present day, and a source of legitimate income lost to a profession which should possess it by every right.

What is the future of architecture in this country? What is the future of the men who are crowding into the profession of it? Difficult questions to answer. But let us, at all events, try and read some of the signs of the times, and each one for himself endeavour to solve the problem of how to meet the difficulties which in the struggle for existence become greater to master year by year.

One thing is clear, if we will only look at it steadily, and that is that the architect of the future must be much better educated and trained for his duties than he is at present. We all know the strides which education has made of late years. Why, a lad now for a few shillings' payment gets a better teaching than many of us got a few years ago and our parents paid a high price for it. The words of the great poet ring now with greater truth than ever they did: "The age is grown so picked, that the toe of the peasant comes so near the heel of the courtier, he galls his knee." The whole scale of acquirements considered necessary for the fight of life has so risen that, to hold any position at all, a man must be above his fellows, above the average scale. Mr. Aston Webb, in his presidential address, foreshadowed the time when we should possess an institution for the proper and more systematic education of young men for the profession of architecture; and though that day is distant, I believe it will come, and if we had more *esprit de corps*, more unity, more belief in the greatness of our art, we could hasten that day, and not let the century close without leaving behind us a college devoted to the teaching of architecture. But you must not wait for that: take what you can get, and see that you make good use of it. You have the association: join the classes, and do so now, attend the lectures, take off your kid gloves and coats, and—work. Your client of the future will exact more: merely calling yourselves architects will not be enough, nor is it enough merely to study the art side of architecture on the comparatively easy method of pretty sketching. To many that is the most enticing, but it will only make you good draughtsmen and designers upon paper; work executed on such lines never can be really successful. Good architecture must be strong, and, as I ventured to say in another place, to be strong you must know how to make it so; hence the study of science is a necessity. And the student must not only indulge his fancy when studying examples of architecture; he must also take note of their construction, the purpose of the building, the motive of the designer, the materials, colour, and all else which has brought the work about. He must not be satisfied with perspective sketches; those are of course useful, but too often delusive and apt to spoil one for the less attractive but far more useful pursuit of measured drawings. Never mind about clean paper and pretty sketches to show to your friends, but bend your minds to a close study of parts on the principles I have suggested. They are not my own, but those of men who, by their work, have shown how true they are. A thorough acquaintance with mechanics is necessary, and in the reach of all, and if you will make them, opportunities for the study of works in progress are at hand. All of you have some leisure; you must make up your minds in these days to give up a great deal of that to your work. In this great city

building is constantly going on, and much may be learnt by spending odd quarters of an hour in watching the men at work, seeing the construction of the building as it goes on to completion. May be in your walk to the office you pass a work in progress; manage to spend a little time each day, and note down what you see and learn. I think it was Professor Roger Smith who suggested this course of study the session before last; it is well worth your attention. Try by all means in your power to see the works carried out that you have been engaged upon in the office, and endeavour to persuade your principals to forward your wishes in this direction whenever practicable. The many ways open for acquiring knowledge to young men resident in London are laid before you in the Brown Book. Blame no one if you neglect to use them. If any aim at following the profession in its highest branches, it behoves them not only to master the art and science of their profession, but to fit himself for the society of the men he must be thrown amongst. An architect in good practice will be called upon to mix with men of the highest refinement and culture, and to hold his own in society it is necessary that he be fitted for it. I note with satisfaction the entrance into the profession of more men from the universities. Such a training should give them an immense advantage in their intercourse with the world, and on social grounds also. The architect of the future will have to pursue the study of many things, which at the present time he has not devoted so much attention to as he ought. A thorough knowledge of the principles and practice of sanitary science is simply indispensable, unless you are disposed to see this work drift into the hands of the outside specialists, and be looked upon by your clients as simply designers, who cannot be trusted with matters affecting the health of the people you build for. Is it wise to let a class of work of such paramount importance as life-saving go out of your hands? Then a knowledge of iron construction, building in concrete, electricity, warming and ventilation, will become more and more essential. Engineers recognise this, and it seems to be looked upon as their peculiar province to deal with whatever modern science has added to our list of important building materials and appliances for modern building. So many architects, wedded to the old forms of construction, seem to think it derogatory to their art to expend any time or thought upon new materials, &c., and the science of using them; of course if we do not the engineers will, and so little by little the field of architecture will be invaded still more, and the reproach of not being practical and up to the requirements of modern times will not be unmerited. An intelligent study of the architecture of past times teaches how endless is the combination of materials, forms and modes of construction; the old builders appropriated always what came most readily to hand—follow on these lines, and you will no longer neglect to use those means which modern discovery has placed ready to our use. We must use them, however, intelligently, and not be ever striving, in our love for what is old, to try and make the new materials represent what is foreign to their nature. We must endeavour to get rid of this eternal plagiarism and imitation, which is the curse of so much modern design.

I have given a long list of requirements, but I challenge anyone who has given thought to the subject to say whether it is an exaggerated one. It certainly is enough to make the thinking student pause and ask himself whether, if to accomplish so much is necessary, he is strong enough for the fight. Look well to it now. Unless you are strong in your determination to do this, you had better give it up, or you must be content to count only among the rank and file; a leader you never can be. To be a leader will require all your best energies, unflagging zeal, and a natural bent for your profession, together with that indispensable accompaniment for a life of work and hardship, a strong constitution; and you must make up your mind to endure many hardships and disappointments. Better face this at the outset.

I cannot help thinking that the tendency of modern times will, as I endeavoured to show in a paper that I had the honour of reading here some time back, be to create a class of specialists in our profession, and in collaboration, the latter view the late Mr. Page held very strongly. Take sanitary science for example. We architects neglected it; a class of sanitary engineers arose, and have taken a great deal of such work out of our hands. Had we not better try and get it back again? An architect should be better able to do such work, in so far as it relates to architecture, than an engineer; and there is, as far as I can see, no reason why he should not. Here is an opening for special study and profitable practice. A man who has made a speciality of sanitary science, may collaborate with a brother professional who cannot, perhaps, give his attention and time to a subject demanding so much. Colour-decoration, again, demands special study, and an architect in large practice frequently finds that he cannot, if he would, give to it all that is demanded, and so the painter and decorator is called in, who, unskilled in architecture, applies his decoration on no defined principles, and too often spoils a fine work by unintelligent use of colour. Is there not a field here for the specialist to collaborate with his brother architect? Numerous other ways in which this principle could be brought to work will occur to you; time will only permit me to suggest them here.

When acting as president of the class of design, I was struck with much of the draughtsmanship which I saw. I can only use

one word to describe it—it was *slovenly*. There was too much attempt at picturesqueness, and that at the sacrifice of good line and accurate delineation. Designs for new buildings were drawn in the roughest manner, coloured like a sketch of an old building, and the lines of the roof, &c., positively drawn irregularly, so as to give the building the appearance of being old and weather-beaten. Surely this is an error. Would not such drawings puzzle the clerk of works or foreman when he reads in the specification, “No deviation of any kind is to be allowed from the drawings”?

Our roll call this session omits, among others, the names of two men who for so many years had their names upon it, familiar in our mouths as household words. I allude to Bowes A. Paice and Richard C. Page. Both of them served in the capacities of secretaries and vice-presidents of this society, the former as president; both men were deservedly popular, for they possessed those qualities in the offices they held which always command respect and affection. Many of us here knew them more or less; you who knew them well will bear me out when I say that they were courteous and honourable gentlemen, who discharged their various duties to the association with kindness, judgment, skill, tact, unceasing attention, and with no self-seeking interests. What such duties involved, in their claims upon time, I have lightly sketched. Mr. Paice, who is just dead, had for some few years past retired from any active work in the association, so that comparatively few of the present members knew him, except by name; his friends, however, will long cherish the bright cheerful smile and genial manner of old days.

Mr. Page's death touches us in one way more closely. Only last session he was one of our vice-presidents, and on one occasion occupied this chair. At the council-table we shall miss him, for his judgment was sound and his opinions expressed with characteristic decision and truthfulness, and we shall miss him at these fortnightly gatherings, for whenever able to attend he was pretty sure to come. I dwell more on this loss we have sustained by Page's death because I was the last of his professional friends who was with him before he was stricken down by the fever. We met at Wells, the same day that the Architectural Association excursion terminated. I noticed then that he was not so bright as usual, but it was not until the Tuesday following, at Barnstaple, that I saw he was really unwell, and then insisted upon his seeing a doctor. For the first few days no serious end was anticipated, but on the Saturday his symptoms decided the doctors on removing him to the Infirmary, where skilled nursing could be obtained. Duty compelled me to leave on the Monday, and I never saw him again. He was then only just conscious, for the fever had told upon his strength, and not long after, conquered him. While in the hospital he won the affection of those who nursed him, and all that care and skill could do were freely given. His sisters and personal friends were with him the last few days, and Mr. Robins, whose name is familiar to us, has left us an example. Mr. Page had for years assisted him in his work, and a strong mutual esteem existed between the two men, and Mr. Robins's respect and gratitude to his old assistant led him to play the brother's part, and leave no stone unturned to promote if possible his recovery, and to reward those who had ministered to his wants. At the conversazione were exhibited some of Mr. Page's “Pugin” drawings and architectural designs; by the courtesy of the editor of *The Architect* some of the latter will be shortly illustrated, and a committee has been formed for publishing a series of the Pugin sketches, as a memorial to him, particulars of which will shortly be before you. I hope you will give your support to the project, and subscribe liberally to the memorial.

Mr. Page was not, as outsiders would view it, a successful architect. He was an excellent draughtsman, well versed in the Gothic style, which he had the advantage of studying in Mr. Street's office, and he was a quick and elegant designer in that style. Eventually, had he been spared, I believe he would have come to the front, but, like so many, he had to fight his way alone, without influential friends, and about his only chance apparently lay in competitions. And here again he fell short of his aims, and much because of his integrity and truthfulness, which would not allow him to design a building which might be more attractive, but which would be contrary to the advertised requirements. Be that as it may, though he won honourable distinction, he never succeeded in taking a first prize. I fear he was a disappointed man. He saw men a long way his inferiors enjoying a good practice, and himself behind in the race; but he kept a good heart to the last, and only to his personal friends would express now and again the bitterness his want of success caused him. His story is like that of many, and has its teaching for all. Loving his art and believing in it, true to himself and to all men, he passed away, leaving behind him a name which will, I trust, be respected and kept green amongst us; more, perhaps, than if he had been only self-seeking, caring only for what money he might make, no matter how or from what source.

I am tempted by recent remarks in the press, and circumstances which have come under my own notice, to refer to an ugly charge frequently made against us, and broadcast; one which makes the hot blood tingle in the veins of honest men. I mean that of taking commissions from others than the client. It is said that the custom prevails largely amongst architects. I do not

believe it. That it does exist to some extent is, I fear, too true. The temptation is a strong one, and so insidious that no great surprise need be felt that some men give way to it, and thereby swell their incomes. We have in our ranks young men in their articles, others acting as assistants, and some who are starting in practice, and I would fain, for their sake, raise a warning voice against this cancer, which, when once it has fastened on the system, grows and sends its poisonous fangs in all directions until all that is best and noblest in a man's nature gives way to it. Most of us who have had any experience of a professional life know that some tradesmen, in their desire to secure custom, offer the most advantageous terms to architects as a bait. It must only be met in one way, and that is absolutely to decline receiving payment in any form whatever except from your employer. Once pocket the bribe and you lose self-respect; you have accepted hush money, and you become the servant of the briber. In electing to follow the profession of architecture you have chosen one which, with fair success and hard work, will give you a moderate income—very rarely a large one—but do not seek to swell it by illicit gains. You belong to the oldest and noblest of the arts, for she is the mother of them all; then, as true sons, refuse to bring discredit on her. Should you, as I hope you will, join the ranks of the Royal Institute of British Architects, you will undertake not to accept payment from anyone but your clients; to do otherwise would lay you open to discovery to expulsion from that society with a lost reputation, besides giving the enemy occasion to blast the good name of the profession you have adopted. If this evil does exist to any extent among architects—and I repeat I believe it is a libellous and untruthful statement—any words of warning that I may raise may not be without value to those who will be sure to have the temptation, sooner or later, thrust upon them.

I hope I have not wearied you with this rather long address, but I may never again have the opportunity of saying my say; and in placing me in the position which I have the great honour to hold—and I do consider it an honour—I claim to have some right to speak openly and plainly. I believe so thoroughly in the great work that the Architectural Association has in its power to do, that I would fain try to help it on. If what I have said contains some truth in it, weigh it well; do not accept any advice I have given without testing it; if it appeals to you as just and good, endeavour to follow it; a great future is before you, and if you mean to succeed you must be up and doing. Remember that the success of the Architectural Association and the responsibilities of it depend upon every individual member, as well as upon those whom you have elected to serve you. Show your sympathy and interest in the work by crowding into and keeping up your attendances at the classes and lectures; support with loyalty and enthusiasm your teachers, and do not sit tongue-tied at these meetings, but speak out your thoughts. If you have anything to say, do not hesitate to speak; do not always leave it to the front benches; be sure of this, that we seniors are always glad to welcome a new speaker. You have, as members of this body, advantages far greater than our predecessors had; you belong to a profession which, rightly followed, will kindle the highest and purest enthusiasm if you possess the capacity to receive it, and are gifted with the ability necessary for success. If you are, you may leave behind you names written in stone.

And now, with a few words personal to myself, I will conclude. I feel, in the advice I have ventured to give, how comparatively easy it is to say, Do this. How very difficult to perform it! I do not, believe me, for one minute point to success in my own person; but I have rather spoken as I have done, hoping to see you successful, and the Architectural Association accomplishing its mission to the full. A sign-post, where many roads meet, is a most useful director, though it cannot move one step of the many ways to which it points the traveller; but the sign-post has its value, and I hope my discourse of to-night may have served the humble purpose of starting you in the right direction, though I may not travel it with you.

Mr. J. D. MATHEWS proposed a vote of thanks to the president for his address, and said he trusted the members would show their appreciation of it by taking advantage of the opportunities offered in the Association to the utmost of their power. Mr. Mathews then spoke in kindly terms of the valued friends whose loss the Association now deplored. Both Mr. Paice and Mr. Page were well known to him personally. Those present were probably better acquainted with Mr. Page. That gentleman had been working with them so recently that it was hard to realise that he was gone from them for ever. Mr. Mathews also alluded to the amount of work Mr. Page had done for the Association, and said that no one who had not experience of it could tell the amount of work done by the hon. secretaries—it really was enormous; but he hoped there would be no change made in the work of the Association being carried out, as hitherto, on the honorary principle. It had always been a distinguishing mark of the Association that members were always forthcoming who were willing to give their time and labour to the Association, and it was a matter of pride amongst them to perform the work gratuitously. Mr. Mathews said he thoroughly agreed with the sentiments expressed by the president on the subject of specialists in the profession, and it seemed to him desirable that there should be specialist architects in the present

times. Architects had not, he said, half the opportunities that other professions enjoyed. Some men were, it was well known, better on some one thing than another, and he did not see why they should not be consulted. It would be of advantage to the clients, and assist them in their own profession.

Mr. E. J. TARVER seconded the vote of thanks, and said he must be allowed to add his testimony to what had been previously said in memory of the friends the Association had so lately lost. He then said that he did not share in the hopeless view taken by the president of modern architecture. On the contrary, he would venture on the proposition that much of the domestic architecture of the time was essentially modern, and that we only awaited a similar development of ecclesiastical architecture to possess an emphatically English nineteenth-century style. Church restoration had probably been a bar to our advance in ecclesiastical architecture, for architects had not had the courage to make their work as different from old styles as these old styles were one from another. Old work must be studied, not as a basis for practice, but in order to get behind the style and see the reason for this or that particular feature. Restoration for its own sake was, he considered, a mistake, as, for instance, the proposal to pull down the store-house at the Tower of London in order to replace it by a copy of an ancient building. The result of this system of restoration was that the Society for the Protection of Ancient Buildings bid us prop up rather than rebuild, and recommended props of the plainest character; whereas we found from straining arches and flying buttresses how beautifully props might be treated. In conclusion, Mr. Tarver said several eminent church architects were now practising in a more modern fashion, the "They-all-do-it Style," as might be seen in the Church for the Blind in Oxford Street, stables in Down Street, Park Lane, and an elaborate house at Sydenham. Twenty years ago the cry among such men was one style for all buildings. Gothic was right for churches, and therefore for houses. We merely wanted these gentlemen to be consistent, and show us that what was right for houses was therefore right for churches, and then all would be modern.

Mr. BLAGROVE, Mr. STANNUS, Mr. ASTON WEBB, and Mr. W. H. ATKIN BERRY supported the motion, which was put to the meeting by Mr. Mathews, and carried by acclamation.

The PRESIDENT responded briefly, and the proceedings terminated.

### "TRUTH" AND ILLICIT COMMISSIONS.

THE following correspondence appears in *Truth* this week, and has reference to certain remarks recently made by the editor of that journal concerning architects and commissions:—

Royal Institute of British Architects,  
9 Conduit Street, Hanover Square, London, W.  
November 6, 1883.

Sir,—The attention of the council of the Royal Institute of British Architects has been called to a paragraph in *Truth*, of the 18th ult., in which you inform your readers that "almost invariably the architect is paid a second commission by those whom he employs;" that he does not consider such a course of procedure to be a fraud; and that "whenever an architect particularly recommends mantelpieces, or grates, or any other such articles, which are made by some particular firm, it is about fifty to one in favour of his having a personal reason for the suggestion."

We are directed by the council to state, in the most unqualified manner, that the accusations thus brought against architects are, as far as they regard the members of this institute, calumnious and untrue.

On the assumption, however, that, before venturing to make accusations so sweeping, and so damaging to an honourable profession, as those to which we refer, you were in possession of facts injuriously affecting individual architects, we are directed to invite you to communicate to the council their names and addresses, in order that some action may be taken thereon. Every fellow and associate of the Royal Institute of British Architects is bound by a written obligation *not* to receive or accept any pecuniary consideration or emolument from any builder or other tradesman whose works he may be engaged to superintend, and *not* to have any interest or participation in any trade contract or materials supplied at any works the execution of which he may be engaged to superintend. The proved infraction of these fundamental rules involves immediate expulsion from the institute.

We beg leave to enclose for your information a list of our members, and we are to request that you will accord to this letter publicity equal to that given to the serious accusations it refutes.

We remain, sir, your obedient servants,

J. MACVICAR ANDERSON, Hon. Secretary.  
WILLIAM H. WHITE, Secretary.

Sir,—I am in receipt of your letter, in which you refer to certain paragraphs which have appeared in *Truth* respecting architects, and in which it is alleged that many are in the habit of receiving a second commission from those whom they employ, in addition to that paid to them openly as architects, and you ask me

to communicate to your council the names and addresses of any architects who are members of your institute, and who have received such commissions.

It must be obvious to you that if the allegations be correct, it is impossible for me to accede to your request, for the tradesmen who give the commissions would not wish in their own interests to have their names made public.

I shall, however, have much pleasure in publishing your letter, which you say is a refutation of my statement, so far as the members of your institute are concerned. But in doing so, I shall also publish my reply.

As I understand the position of an architect, it is this: He is employed by an individual who is about to build a house: He receives a commission of 5 per cent. on expenditure. In return, he is expected to make plans, to see that the work be well and efficiently performed, and to protect his employer against all undue charges.

Is it not the "custom of the trade" for articles required in the building and decorating of houses to be subjected to most extraordinary discounts? Take, for instance, ornamental tiles, now so popular. They are bought by the builder subject to a discount varying from 10 to 20 per cent. Grates and mantelpieces are subject to a discount of 20 to 33½ per cent. Wall papers are subject to a discount of 50 per cent. Many other articles, which it is needless to enumerate, are subject to like discounts.

This being unquestionably the fact, I would venture to ask 1. Why this extraordinary "trade custom" prevails? 2. Whether the members of your institute are in blissful ignorance of it? 3. Whether they, or some of them, do not certify to the correctness of a builder's account when it contains items on which these discounts are allowed without their being deducted? 4. Whether architects do not invariably insert the names of houses where these discounts are allowed in their specifications, and insist upon the builders dealing with these houses, and whether in these cases the builder does not receive from such houses a smaller discount?

Let us assume, for the sake of argument, that the architect in no case receives any portion of these discounts directly from the houses which are in the habit of giving them. By the rules of your institute he is permitted to receive 5 per cent. on expenditure. If the builder is allowed to receive 50 per cent. on wall paper, besides a cash discount, it is evident that the architect receives a commission on this 50 per cent. You can hardly imagine that an employer has the remotest idea when he chooses a wall-paper—say at 12s. a piece—that the cost to the builder is 6s. a piece, less cash discount, or that the architect who is employed to protect him is certifying to the 12s., and receiving a commission not only upon the real price, but upon the artificial price.

So long as the trade custom prevails, so long as architects insert in their specifications the names of particular houses, instead of allowing builders to deal in the open market, I, for one, shall continue to believe that many architects take more care of themselves and of their friends than of their employers. The subject is one of considerable interest, and if you like to furnish me with any explanation of the points to which I have alluded, I shall be quite ready to give publicity to it. I do not question the desire of your council to protect the public. What I deny is, that they succeed in doing so.

Yours obediently,

THE EDITOR OF "TRUTH."

### ENGINEERING PROGRESS.

AT the opening meeting for the session of the Institution of Civil Engineers of Ireland, an address was delivered by Mr. Wm. H. Mills, president, in the course of which he said, there are so many large and important works recently finished, as well as others now in course of construction or approaching completion, that it would be next to impossible to follow up the history and particulars of each. In the Forth Viaduct, East River Bridge, New York, and Kinzua Viaduct on the Erie Railway, we have three enormous works, each one of a totally different character. The Forth Viaduct presents us with a striking departure from the previous recognised arrangement for long-span bridges. The hitherto unattempted great span of 1,700 feet has led to the adoption of the system of cantilevers and central girder, and in the working out and completion of this great work we shall obtain valuable practical information of a system of which our experience has hitherto been limited to theory or experiment. Steel will play an important part in the construction, as the use of this material, with its increased strength per square inch as compared with wrought iron, will result in the saving of a large amount of dead weight. In point of magnitude this viaduct will be unrivalled. Its length will be over a mile, divided into two spans of 1,700 feet, two of 675 feet, fourteen of 168 feet, and six of 50 feet. The East River Bridge, to connect New York and Brooklyn, is an example of the suspension principle on its grandest scale. The total length of the bridge is 5,989 feet, of which the length of the main span is 1,595 feet 6 inches, and of each of the side or land spans 930 feet. The height from lower floorway of centre of main span to water

level is 135 feet 6 inches, and from roadway at piers to water level 119 feet. Height of arch of towers of piers above roadway 117 feet, and total height of towers above roadway 159 feet. The size of the towers at high water level is 140 feet by 59 feet, and at the top of roadway level 136 feet by 53 feet. The width of opening through the towers is 33 feet 9 inches. The full width of the floorway is 85 feet, carried by four steel wire cables, each 15 $\frac{3}{4}$  inches diameter. These cables are so arranged as to provide for a raised platform or promenade, about 15 feet wide, for pedestrians along the centre of the bridge. On each side of this promenade there is a line of rails for railway carriages and waggons, and outside of these are the roadways 18 feet 6 inches wide, one on each side of the bridge—to carry the ordinary carriage, cart, and tramway traffic. Each cable is 3,578 feet long, and contains 5,434 wires. The Kinzua Viaduct, on a branch of the Erie Railway, in the State of Pennsylvania, is remarkable for its great height and the lightness and peculiar arrangement of the iron piers or towers. Situated at a high level, on a spur of the Alleghany Mountains, the roadway of the viaduct is 2,065 feet above sea level. It may be interesting to note that this spur forms part of a water shed whose waters flow north into the Gulf of St. Lawrence, east into Chesapeake Bay, and south into the Gulf of Mexico. Designed to save about eight miles of a detour, and to avoid long lengths of heavy gradients, this viaduct has been completed in a very short time, and at a very moderate cost. The total length is 2,051 feet, the greatest height 301 feet from rail level to bed of stream. It consists of twenty-one spans of 61 feet, carried on abutments of masonry and intermediate piers of light ironwork. The proportion of span to height differs so much in this viaduct to what has hitherto been adopted in several works of a similar nature as to form a study for engineers. The Giant's Causeway, Portrush and Bush Valley Tramway, six miles in length, recently constructed in the north of Ireland, to be worked by electricity, affords a striking example of how the natural resources of a locality may be made available for generating the motive power. The promoters of this line have erected powerful turbines near the large fall in the river about a mile above Bushmills, and by thus utilising the passing or waste water to drive the dynamo machinery, are enabled to obtain their electrical power at the lowest possible cost. Several special difficulties were encountered in the making and equipment of this line, and its working will be watched with interest by all engineers. Although so wonderful and almost magical in its effect, the working of the telephone is so simple, and possesses such advantages for business purposes, as to have led to its adoption as a distinct branch of telegraphy. Especially have its benefits been felt in the far East—in countries such as China and Japan—where our ordinary complete letter-code systems were utterly unable to represent the strange consonants and sounds which form the alphabets of those distant lands. Whatever may be the views and experience obtained as to the comparative cost and utility of the electric light, there is but one universal opinion as to the beauty and brilliancy of the light itself. Far more powerful than any other known means of illumination, electricity undoubtedly stands in the first rank for lighthouses, or for important works of construction which must be carried on during the night, or for other purposes requiring an intense, penetrating light. For such duty the question of cost may be a matter of secondary consideration, the chief object being to obtain the most powerful light which can be procured. During the past year—1882—which was one of remarkable activity in railway construction, 10,918 miles were constructed in the United States, and that country has now 1 mile of line to every 500 inhabitants. This shows a striking proportion to even the richest of European nations, where Great Britain has for every mile of line 1,939 inhabitants; France, 2,170; Germany, 2,154; Belgium, 2,203; Austria, 3,200; and Russia, 5,576. The use of steel rails has resulted in greatly increased durability of our permanent way, and the moderate price at which they can now be manufactured has put iron rails comparatively out of the market. It is satisfactory to know that this branch of our national industry is largely on the increase. In 1882 the total manufacture of steel rails in the United Kingdom was 1,293,785 tons, which was an increase of 212,045 tons on the production of 1881. Of this amount by far the larger proportion, or 733,919 tons, was for export, the remainder, or 559,866 tons, being for home consumption. The supply of sleepers must, sooner or later, become a very important question for consideration on our railways. There is no doubt creosoting and other wood-preserving processes have done much to prolong the life of sleepers, but the rapidly increasing extent of mileage throughout the world, together with the enormous number of sleepers now required annually for renewals, must before very long severely tax the present powers of supply. In the great timber producing territories the axe is often heard, but the planter is rarely seen; vast forests are cleared away, and their sites transformed into busy towns and manufacturing districts, these new places in their turn creating a demand for timber which their own districts can no longer supply. Unless some great change take place, and planting be carried out on a grand scale, we must look to some material for this important item of our permanent way. Appearances would indicate that at no very distant date we shall have to rely on iron or steel for our

future sleepers. Ingenious minds have already been at work devising different forms in cast and wrought iron, and several descriptions have been tried with various degrees of success. In dealing with a hard, unyielding material like iron it is difficult to produce the soft, elastic, vibration stopping effect of timber, and most of the proposed systems of iron sleepers have failed to become popular on account of the noise and vibration when trains pass over them. Another objection to many of the schemes has been the great multiplicity of parts, and the constant and severe strain produced on the fastenings by the passing of every wheel. The bolts may be made tight at first, but the incessant shaking works them loose, the threads become stripped, and the rails cease to be held securely in position. To be of any use for heavy and fast traffic iron sleepers must be simple in construction and of few parts, and the fastenings must be of such form as to be the least affected by the continual jarring of a passing train. Tramways, the latest offspring of the railway system, are now so thoroughly appreciated, that their introduction is becoming every year more and more extended; and whether in the accommodation of a large passenger traffic in the immediate suburbs of busy cities and towns, or in mixed passenger and goods traffic in very thinly populated districts, there is no doubt that, in many cases, tramways supply special conveniences and facilities, which the ordinary type of railway cannot always be expected to confer.

### OLD EDINBURGH.

ONE of the wooden-fronted houses in the Lawn Market, Edinburgh, is being taken down, and a correspondent of the *Scotsman* says that it affords evidence of the correctness of Dr. Robert Chambers' theory that the wooden fronts were not an afterthought, but formed part of the original plan. A popular tradition is that, to clear the Borough Muir of wood, the citizens were allowed timber free to form *elks* to their houses, and hence the wooden fronts. Dr. Chambers, after careful examination, pointed out that this was not so, but that the fronts were originally open verandahs (one for each flat), and that they were, in more recent times, plastered up. Confirmation of this is seen at the present stage of demolition, for, now that the lathing is removed, the original front railings may be observed.

Messrs. Kinnear & Peddie, architects, say that they cannot agree that what can now be seen of the wooden construction corroborates Dr. Chambers' theory that the fronts of these houses were open verandahs. In the first place, the timber framework as it is now seen differs widely from that of the original structure, and to draw inferences from its present appearance would scarcely be safe. As a matter of fact, however, there is strong internal evidence to show that this building at least had, in all probability, not a verandah. It has been said that the railing of the verandah is now visible, but Messrs. Kinnear & Peddie are inclined to think that what he supposes to be the railing is only a portion of the vertical weather boarding with which the whole front was covered. They have, however, no hesitation in saying that the wooden structure is not an addition, but an integral part of the original building.

Messrs. Kinnear & Peddie are preparing minute drawings of all the details of the structure, and when they have recorded all the facts regarding its construction which the opportunity of the demolition affords, a paper on the subject will be communicated to the Royal Society of Antiquaries.

### THE WEDGWOOD INSTITUTE.

THE following valuable books have been presented to the Wedgwood Institute by the Mayor of Burslem, in commemoration of his mayoralty: Gruner's specimens of ornaments selected from Raphael, &c., 80 plates, atlas folio, the greater part in gold and colours, mounted on cloth and enclosed in portfolio case, bound in half Russia, with cloth sides and flaps, also explanatory note-book; Audsley's "Ornamental Arts of Japan," 2 vols., folio, 90 plates, 74 being in colours and gold; Shaw's "Illuminated Ornaments of the Middle Ages," with 59 plates in gold and colours, folio, half calf, 1883; Flaxman's classical compositions, illustrating Homer's Iliad and Odyssey, Æschylus and Hesiod, 146 outline plates, by Piroli, Moses, and Blake, 4 vols., oblong, folio, boards, 1805 to 1831; Wyatt's "Industrial Arts of the 19th Century," 158 plates, printed in colours and gold, royal folio, half morocco, 1851; Wyatt's "Ornamental Metal Work," 50 plates, in colours and gold, royal folio, half morocco, 1852; Stuart and Revitt's "Antiquities of Athens," with nearly 250 plates, 3 vols., atlas folio, half calf, 1762 to 1794; Moses's collection of antique vases, 170 plates, quarto, half morocco, 1811; Harding's "Elementary Art," 28 plates, cloth, imperial quarto; Harding's "Lessons on Art," imperial quarto; Harding's "Guide and Companion to the Lessons on Art," octavo, cloth; Hulme's "Suggestions in Floral Design," 52 coloured plates, folio, cloth;

Hulme's "Plants: their natural growth and ornamental treatment," 44 plates in gold and colours, folio, cloth; Hope's "Costumes of the Ancients," 321 plates, 2 vols., cloth, 1841; Flaxman's "Acts of Mercy," 8 compositions in the manner of ancient sculpture, oblong, folio, half bound; Cundall's "Examples of Ornament in every style," folio, with plates; Shaw's "Handbook of the Art of Illumination," with illustrations in colours and gold; Harding's "Lessons on Trees," four parts, in folio; and Waring's "Art Treasures of the United Kingdom," 100 plates, mostly in gold and colours, folio, full morocco, gilt and tooled.

## BRADFORD SOCIETY OF ARCHITECTS.

AN exhibition of architectural drawings has been held in the Art Gallery of the Bradford Free Library. The drawings were furnished by arted pupils in the offices of the surveyors and architects of the town. Some months ago the council of the Bradford Society of Architects and Surveyors, with a view to promote increased study and interest in their profession on the part of the pupils, invited a competition, by offering prizes and certificates of success to the authors of the best drawings of certain specified subjects. In response to their invitation thirteen sets of designs have been received, numbering altogether about fifty drawings, and, after careful consideration, the prizes have been awarded as follows: Architectural subjects—First prize, Mr. A. A. France, pupil with Messrs. Milnes & France; second prize, Mr. Louis Ambler, pupil with Messrs. W. & R. Mawson; third prize, Mr. W. Broderick Clarkson, pupil with Messrs. T. H. & F. Healey. Surveying subjects—First prize, Mr. Thomas H. Smith, pupil with Messrs. Smith, Gotthardt & Co.; second prize, Mr. W. H. S. Dawson, pupil with Mr. Joseph Cowgill. The drawings are necessarily of a somewhat technical character, but the subject that best lends itself to picturesque treatment (a bit from Kirkstall Abbey) has been rendered, in several instances, in a highly artistic manner. Bearing in mind the fact that all the competitors are under twenty-two years of age, the drawings may be regarded as very satisfactory and as evincing much promise of future distinction; and the society is to be congratulated on the success of its laudable attempt to promote a healthy rivalry among the junior members of the two professions.

On the 8th inst. a meeting of the society was held, when the competitors, together with Mr. W. T. McGowen (town clerk) and Mr. J. H. Cox (borough surveyor), were invited to meet the members at the Alexandra Hotel. Mr. C. H. Hargreaves, the secretary, read the report and award of the judges, and each of the successful competitors received from the president (Mr. T. H. Healey) a certificate and cheque for the amount of his prize. Mr. McGowen delivered an interesting address to the students, and other gentlemen having proposed votes of thanks to the president and judges, the remainder of the evening was spent in a social manner.

### Plain Speaking.

SIR,—Straightforward "plain speakers" will agree that no man can fairly lay claim to that title who is afraid or ashamed to complete the outspoken character of his utterances by giving his name.

An anonymous letter-writer, like a cur barking behind the railings, secures his safety at the expense of placing himself altogether beneath serious notice.

Faithfully yours,

ARTHUR W. BLOMFIELD.

6 Montagu Place, Montagu Square,  
London, W.: Nov. 14, 1883.

### Historical Chairs.

SIR,—Will you kindly enable me to ask, through the columns of your journal, for descriptive particulars, with engravings, drawings, or photographs of celebrated chairs in family residences of the nobility and gentry; with information, also, of notable chairs in cathedrals, churches, colleges, clubs, town-halls, and public institutions at home and abroad. I am preparing a collected account of historical chairs from available literary sources, but knowing that there are many interesting ones which have escaped my search, as well as some others in private possession but little known, and wishing to make the proposed illustrated work as copious as possible, I thus beg your assistance.

Yours obediently,

C. B. STRUTT.

34 East Street, Red Lion Square, W.C.

### Page Memorial.

SIR,—May I ask you to be so kind as to find room for the enclosed circular, which is about to be sent to members of the Architectural Association and others? The committee will esteem it a favour.

Yours, &c.

ARTHUR E. NORTHCOTE.

Hon. Secretary.

Nov. 14, 1883.

120 Belgrave Road, S.W., November 1883.

DEAR SIR,—A committee has been formed, of which the president of the Architectural Association is chairman, to raise a fund for a memorial to the late Richard C. Page, who for so many years was an active and energetic member of the Architectural Association, and for four years one of the hon. secretaries, and last session a vice-president. The committee desires to give all those who knew and respected him an opportunity of subscribing to it. It is proposed to publish twenty-five photo-lithograph copies of his Pugin drawings, the originals of which were exhibited at the last conversation. They will be printed on stout paper, interleaved, with a photograph portrait of Mr. Page, preface, index, and list of original subscribers; the book will be handsomely bound in cloth, with gilt lettering and edges.

Subscribers of 12s. 6d. and upwards will receive gratis a copy of this memorial work; and the surplus funds, after defraying expenses of publication, advertising, postage, &c., will be devoted to raising a permanent memorial, the nature of which must depend upon the amount collected.

If I may add your name to the list of subscribers, perhaps you will be good enough to fill in the form attached, and return it to me at your earliest convenience.

I am, dear sir, yours very truly,

ARTHUR NORTHCOTE, Hon. Sec.

## CHURCH BUILDING AND RESTORATION.

**Atherington.**—The church of St. Mary, Atherington, North Devon, has been reopened after restoration. A fragment of a rood-screen delicately carved, and an unusually fine specimen of the Devonshire screen encloses the north chancel or Umberleigh aisle. There is also an interesting old carved chancel screen. The work has been carried out by Mr. Dart, builder, of Crediton, from the designs of Mr. J. L. Pearson, R.A.

**Pangbourne.**—The new church of St. John the Baptist, at Whitchurch, has been opened. The building has been erected from the designs of Mr. Francis Bacon, architect, of Parkhurst, near Newbury, in Early English style. The walls are principally of flint, with facings of the same material, weather-stained as picked from the fields. The dressings are of Bath stone, and the linings internally of red brick, banded with basket colour, no plaster being used except between the roof timbers. The roof covering is of tile. The builders were Messrs. Wheeler Bros., of Reading.

**Shipton.**—The old church at Shipton Thorpe, near Market Weighton, has been restored and reopened. The work has been carried out by Messrs. Morgan, contractors, under the direction of Mr. Demaine, architect, York. During the work a number of antique carved heads and other remains of early work were discovered, and have been as far as possible replaced. An interesting Norman porch was also brought to light, and it has been re-inserted in the new entrance.

**Stourport.**—A Baptist chapel has been opened. The building has been erected by Mr. Smallwood, builder, of Henley-in-Arden, Messrs. Ingall & Hughes, of Birmingham, being the architects. The cost has been about 1,350*l*.

**Ramsgate.**—Plans for sundry alterations to the parish church have been prepared by Mr. William White, F.S.A., who has also submitted a report on the state of the lantern tower, the window mouldings, &c., and on the expenditure required for the repairs.

**Widnes.**—The memorial-stone of the new church of St. Paul has been laid. The building is cruciform in shape, and in the Early English style of architecture. The church is to accommodate about 750 people. Mr. Shelmerdine, of Dale Street, Liverpool, is the architect.

## NEW BUILDINGS.

**Warrington Art School.**—This building was opened on the 8th inst. The site is close to the Art Gallery and Museum. The accommodation on the ground-floor is the attendant's house, with bedroom, living-room, and scullery; committee-room and library, attendant's rooms, entrance hall, 32 feet by 15 feet; modelling room, 24 feet by 16 feet; class-room, 24 feet by 16 feet; elementary room, 32 feet by 24 feet; and cloak-rooms, lavatories, &c., for the male students. On the half landing of stair is the entrance to the cloak-room and lavatories for the female students. On the first floor there is a painting room, 32 feet by 24 feet, and a gallery for drawing from the antique, 32 feet by 24 feet, both of

which are lighted from the north, and have also shuttered windows in the south for occasional use. On this floor is the private room of the art master, 15 feet by 14 feet; and in the basement are the cellars for the heating apparatus and for spare packing-cases. The building is heated throughout with hot water. The architect from whose plans the building has been carried out is Mr. William Owen, A.R.I.B.A. The cost will be about 4,000*l.*, exclusive of site.

**South Shields.**—The new county court offices at South Shields were recently opened, and have been erected in Queen Street, at the rear of the site in King Street intended to be occupied by the new premises for the National Provincial Bank of England Company, and offices for Messrs. Mabane & Graham, solicitors, the owners. The large county court office has a frontage of 24 feet, and is entered through a glazed lobby; measures 24 feet by 22 feet, and is 18 feet high. Directly communicating is the private office for the use of the registrar and treasurer; also a private passage, which will give access to the offices in King Street when completed. The building is faced with red pressed bricks, with stone freely used as dressings, and is designed in the Queen Anne style. The works have been carried out by Mr. Alexander Thompson, contractor, Gateshead, under the supervision of Mr. Henry Grieves, the architect.

**Congregational Hall, Hornsey.**—This building was lately opened. The hall accommodates 350 adults, and, as it has seven class-rooms communicating with it, there are seats for 450. In addition, the infant room has seats for 150, and the mothers' meeting-room for 100. The exterior is of red brick, and the interior has been made of pleasing appearance. The builders were Messrs. Mattock Brothers, and the architects Messrs. Lander & Bedells, of 6 John Street, Bedford Row.

## SCHOOL BUILDINGS.

**Elton, Bury.**—An infant school and class-rooms, to accommodate over 400 scholars, are about to be built in connection with the day and Sunday-schools of the Methodist Free Church. The plans have been prepared by Messrs. Maxwell, Tuke & Hurst, architects, Southport, and the works will be carried out under their supervision.

**Southport.**—Extensive alterations and additions have just been completed in connection with the Wesleyan school-chapel, Southbank Road. The additions comprise two large band-rooms, two class-rooms, an infant school, library, tea-room, corridors, &c. The architects are Messrs. Maxwell, Tuke & Hurst, of Southport, and the works have been carried out in a satisfactory manner by Messrs. Whitehead & Foster, builders, Southport.

## LEGAL.

### Court of Common Pleas, Dublin.

CALLAN *v.* SEGRAVE.

A BUILDER'S CLAIM.

This was an action on foot of a builder's contract to recover a sum of 4,200*l.*, claim for work and labour done, materials supplied by the plaintiff as contractor and builder, and for trespass and trover, conversion of the plaintiff's goods, and for alleged breach of contract. The plaintiff, who is a builder in Dublin, entered into a contract with the defendant, a parish priest, to build a church at Termonfeckin, county Louth, for 3,000*l.* According to plaintiff's statement he erected the greater portion of the edifice in strict accordance with the plans and specifications, and received 2,100*l.* in part payment. When the chancel was erected, with two side chapels and the sacristy, he required a certificate from the architect, Mr. Hague, to enable him to receive a further instalment, but was refused. He alleged that the defendant fraudulently induced Mr. Hague to refuse the certificate on the ground that the work had been executed in an unskilful and unworkmanlike manner. The plaintiff swore that this was not true, and that he had carried out the work strictly according to contract. The defendant, after the certificate was refused, took possession of the works, scaffolding, materials, &c., and, as the plaintiff alleged, illegally detained them. The defence was that the material used was bad, that the work was unskilfully performed and not in accordance with the contract, and that the plaintiff misconducted himself and used not to be in a condition properly to superintend the erection of the building. Defendant further alleged that under the terms of the contract he was at liberty to take possession of the premises and plant when the plaintiff failed to fulfil his contract.

The hearing of the case occupied a couple of days, and the Lord Chief Justice directed a verdict for the defendant.

## GENERAL.

**Mr. Charles Waldstein, M.A.**, has been appointed Director of the Fitzwilliam Museum, Cambridge, in the place of Professor Colvin, resigned. The value of the appointment is 300*l.* a year. Mr. Waldstein is Reader in Classical Archæology.

**Mr. John Rhind**, architect, has been elected Dean of Guild for Inverness, in succession to Mr. A. Mackenzie.

**The Glasgow Art Club** has elected the following new members: Mr. Francis Powell, president of the Scottish Society of Water-Colour Painters; Mr. James G. Laing, and Mr. James M. Nairn. Sir Frederick Leighton and Sir Fettes Douglas, who recently accepted the hon. membership of this club, have intimated their intention to contribute to the forthcoming annual exhibition of paintings.

**Mr. T. Stopher**, architect, has been elected mayor of Winchester, the coming year being the seven hundredth anniversary of Henry II.'s charter and grant of the mayoral dignity.

**Mr. G. D. Leslie** is engaged on a picture of a young girl and a sleeping cat lying in a window seat overlooking the Thames; and a second picture, a ferry scene on the middle Thames in Oxfordshire.

**Mr. William Morris** gave a lecture at Oxford on Wednesday on "Art under a Plutocracy." He referred to the degradation of the beauty of Oxford, the most beautiful of all towns, and which should have been treated as the jewel of the country, as compared with what he knew of the city thirty years ago.

**The Paintings and Models** for the Royal Academy medals were sent in on Saturday. In figure-painting the subject is *St. Peter Denying Christ*. For landscape the subject has been taken from "In Memoriam." The Creswick medal is to be won by the best representation of a *Country Inn*. For sculpture the subject is *Socrates Teaching in the Agora*.

**Herr Oscar Begas**, the historical painter, died in Berlin on Saturday last. Among the more notable of his monumental works may be mentioned the *Battle of Arminius*, in the Teutoburg Forest; *Reception of the Salzburg Protestants*, in Potsdam; the masterly *Frederick the Great after the Seven Years' War*, in the chapel of Charlottenburg Castle; the compositions founded on the mythical legend of Amor and Psyche, and the paintings in the Festal Saloon of the Berlin town hall and in the Imperial Saloon in the *Passage* at Berlin.

**Mr. J. O. Scott** gave a lecture at Lichfield on Monday upon the restoration of the cathedral.

**A Technical School** is to be established in Coventry. The cost of the buildings and workshops is estimated at 7,000*l.*

**Messrs. Bellamy & Hardy, of Lincoln**, have been awarded the first premium for designs for laying out the proposed new cemetery, and building chapel, mortuary, and lodge, for the Frodingham and Brunsby Burial Board. Mr. Robert Clamp, A.R.I.B.A., of Hull, obtained the second premium.

**General Pitt-Rivers** has been for some days engaged at Penselwood, the site of the ancient British city, "Caer Pensanelwit," which was besieged by Vespasian A.D. 47.

**The Marquis of Bath** has been chosen a trustee of the British Museum in place of the late Earl Somers.

**The Carlisle School Board** have awarded the first premium, and adopted the designs of Mr. Geo. Dale Oliver, of Carlisle and Workington, for the new schools in Lowther Street. The second premium has been awarded to Mr. T. T. Scott, of Carlisle.

**The Autumn Congress and Sanitary Exhibition** of the Sanitary Institute will be held in Dublin in the year 1884.

**The Guarantee Fund** of the International Forestry Exhibition, which is to be held in Edinburgh, now amounts to 5,000*l.*

**Mr. R. Tangye** has notified to the Smethwick Local Board that if public baths are provided for the town he will contribute 1,000*l.* towards the cost. The board has accepted the offer, and the necessary plans are to be obtained.

**Messrs. J. Edmundson & Co.**, of Dublin, and Westminster, have obtained the contract for supplying and fitting up the appliances for the electric light in the saloons and cabins of the City of Dublin Company's mail steamers.

**Public Buildings in Sydney.**—Returns recently printed for the New South Wales Parliament show that the total amount expended on public buildings, fortifications, furniture, &c., completed and in progress, under the supervision of the colonial architect, between 1862 and 1880 inclusive, amounted to 3,598,568*l.* In 1871 the amount expended through the colonial architect's department was 67,651*l.*, whilst in the year 1880 it amounted to 633,274*l.*, or an increase of over half a million of money. During the year 1881 the works entrusted to the same officer amounted in value to nearly a million of money.

**Manchester Society of Architects.**—The remarks in the report of the society, published last week, referred to the Gaiety Theatre, Manchester.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, NOVEMBER 17, 1883.

### EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

### TO AMERICAN SUBSCRIBERS.

*All subscriptions are payable one year in advance, and may commence at any date.*

*The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.*

*Post Office Orders should be made payable at Lombard Street Post Office, London, but should be addressed to GILBERT WOOD, 175 Strand, W.C., London, England.*

*In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—*

*To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order.*

### COMPETITIONS OPEN.

**ABERDEEN.**—July 1, 1884.—The Testamentary Trustees of the late Mr. John Steill, of Edinburgh, hereby notify that they will receive Models for a Colossal Statue of Wallace, in Bronze, with Basement of Granite Blocks, to be placed on the Mound in the North-West part of the Duthie Public Park, near the City of Aberdeen, in conformity with Instructions left by Mr. Steill, at a cost not exceeding £3,000. Intending Competitors, on Application, accompanied with a Remittance of 10s. 6d. to Mr. John Otto Macqueen, 19 Bridge Street, Aberdeen, will be supplied with Copies of Mr. Steill's Instructions, Conditions of the Competition, and Lithograph Plan of the Duthie Park, showing Sections of the Mound. The Author of the Accepted Model will be employed to Execute the Work; and the Author of that next in order of merit will receive a Premium of £50.

**BIRENHEAD.**—Dec. 1.—Plans are required for Laying-out Bidston Hill for Building Purposes. Premiums of

100 guineas and 50 guineas, and four of 15 guineas each. Messrs. Davies & Stephen, Estate Agents, Mollington, Chester.

**BRIDGEND.**—Nov. 20.—Plans are required for Disposal of Sewage by Filtration in the most economical and beneficial manner. Mr. T. Stockwood, jun., Clerk to the Local Board, Bridgend.

# The Architect.

## THE BUILDING PRESSURE ON THE LONDON POOR.

OW to lodge the lowest classes of the population in London has long been one of the pressing problems of the age; and within the last few weeks it has acquired, almost accidentally, an exceptional interest, in which it is desirable that the readers of such a journal as *The Architect* should fully participate. Perhaps we may add that a scientific understanding

of the whole problem depends a good deal more upon professional builders, if they would but set their minds to it, than upon philanthropists, for instance, or even legislators.

It will be remembered that Sir RICHARD CROSS, when in office a few years ago as Home Secretary, carried through Parliament a measure from the operation of which much was expected by some and little by others:—in few words, the municipal authorities were authorised to effect a compulsory purchase of the worst house property they could find, and forthwith to pull down the houses and sell the land for the erection of “artisans’ dwellings,” at whatever the financial loss might be. This loss was very soon found to be in its degree ruinous; an experienced public body like the Metropolitan Board of Works dared not to face it; when the principle of the scheme was translated from the enthusiastic rhetoric of beneficence into the plain language of a commercial balance-sheet, it simply signified that the “rookeries” were to be bought up “at any price” by the ratepayers, and sold “at any price” in a very different sense to certain Associations which make it their business to house people of the working class upon what must necessarily be exceedingly cheap land. The property, therefore, which must be bought prodigiously dear, must be sold prodigiously cheap, and the difference, as we have said, is ruinous. It is virtually the failure of Sir RICHARD CROSS’s Act that has brought about the present agitation.

Without touching upon the domain of party politics, we may observe that it was the Conservatives who in this enterprise had assumed the attitude of the poor man’s friends, and that it was the Liberals upon whom there seemed to be thrown the necessity of favouring a less generous policy. Such an incident, however, is easily accounted for. Apart from everything like that competition for popularity between rival parliamentary parties, which is an essential element in our constitutional system, it is obviously natural for the more aristocratic party in the State to regard it as their duty to provide for the poor, while it is equally natural for the more commercial party to leave “the labour market” undisturbed by those protective influences of State intervention which political economy generally objects to authorise. The Conservatives, consequently, were undoubtedly the right party to devise a scheme for housing the poor at the public expense, and, if they saw their way at the same time to make political capital out of the movement, no politician surely could blame them. But it would obviously be somebody’s duty to prove the scheme to be commercially impracticable, as even Conservatives by this time must see that it is; and we may probably say that the Liberal party has ever since that time been consequently placed in a position of political danger upon this question, and (as politics go) quite legitimately so.

When, therefore, Lord SALISBURY published the other day a magazine article on the subject, this may be regarded as the right step for the Conservative leader in Opposition to take in the circumstances; and there is no necessity for considering such a step to have been prompted otherwise than by the combined motive of a desire to induce the State to help the poor and an equally strong desire to compel the Government to take up an embarrassing question.

The noble Marquis’s dissertation was of course duly criticised by the literary and philanthropic world, simply because it was the noble Marquis’s; but, equally of course in the circumstances, nothing came of that except words. Then the *gravamen* of the complaint was dutifully taken in hand by an assembly of Nonconformist divines, which happened to be

then in session in London for the periodical direction of denominational affairs. Kindhearted Churchmen promptly followed, under the same sense of duty; for there is no other class of men in London, not even the medical profession, who have to witness so closely and so continuously as the clergy do the miseries of the poor. Then there was suddenly sown broadcast over the town a fervid appeal in the form of a pamphlet called “The Bitter Cry of Outcast London;” and from hundreds of pulpits, and in almost hundreds of newspapers, the echo of this bitter cry has been persistently assailing the public ear. In one of our morning journals more particularly, a dexterous dramatic writer has been engaged to magnify to the uttermost the intensity of the appeal, in a series of descriptive articles under the uncompromising vernacular heading of “Horrible London.” But, what is much more to the point practically, Sir CHARLES DILKE, as the representative of the Cabinet, is exploring the slums—as Sir RICHARD CROSS did before him—manifestly and properly for the political purpose of meeting Lord SALISBURY’s challenge. Whether anything of real avail will come out of it all is, however, as problematical at this moment as it can well be. For it is useless to deny the overwhelming difficulty of the problem, both morally and materially; and, indeed, if anyone could be supposed to have thrown down the gauntlet to the Government upon this question of the Poor of London for some such clever purpose as to preoccupy the hands which had undertaken to tackle the Municipality of London, it might be (as politics go) precisely the most judicious move on the board. And, what is more, if Lord Mayors, Aldermen, Common Councils, Livery Companies, and Vestries are to retain their places as tenants at will until the poor are all comfortably housed, they may safely regard themselves as tenants for ever. Possibly (as politics go) the next judicious move may be to pronounce the reform of the City a necessary preliminary to the reform of the Slums; we cannot say. At all events, for our own part, speaking professionally as we are alone entitled to do, we certainly should like to see, by whatever means may be possible, some reform of the slums at least attempted. But then, inasmuch as it is a universal rule in these scientific days that no reform can be attempted with a chance of success unless it be founded first upon a clear understanding of the facts that render it necessary, we must take leave to express the hope that public opinion may have its attention fixed as soon as possible upon the root of the matter, which we take to be simply this—the inevitable and inflexible pressure of London building for London business.

Denunciation is always adopted as the first mode of operation in cases of this kind. At present, therefore, we have denunciation of the Metropolitan Board—which we may at once say is absurd; denunciation of the local vestries—which we admit may be a much more reasonable thing; denunciation of the selfish and shabby class of house-farming vestrymen—in which, we need only say, *The Architect* has dutifully taken its part for some time back, and scarcely need further follow now; denunciation of all-abounding Taverndom—although it is affirmed by many that this is the effect, and not the cause, of “horrible” homes; and various other denunciations of a more general and less practical kind, which frequently only complicate the question. But angry denunciation must cease before calm inquiry can begin, and if it succeeds in stimulating earnestness, we may be content to let it have its say.

The nature of the building pressure in London is aptly illustrated by the case of New York, which we took occasion to describe some months ago. The result in New York is that the houses are being, so to speak, squeezed up to a height of 100 feet, 150 feet, in some instances even 180 feet! It is of no use to wonder, and perhaps laugh, at this. The cause is the simple circumstance that the business quarter of that most “go-ahead” of all earthly paradises is, like the “City” and some other business quarters of London, coming to be so tightly crammed and over-crammed with counting-houses, offices, shops, warehouses, and manufactories (and we must not omit the necessary widening of the streets), that every foot of ground has been rising in value year after year to a marvellous extent, merely by the competition of those who *must be in the midst*. In New York the very peculiar position of the great commercial nucleus—it is surrounded by water on three sides—prevents it from expanding laterally; and it is expanding vertically, therefore, in the alarming way we have stated. In London, where, as it happens, there are several

such nuclei, and where all of these are more or less able to accomplish lateral enlargement, the force of expansion is as yet only pushing out the poor. The process was aptly described—and unconsciously—by a small maker of mops at the meeting of the people of the Mint held one day this week. Many years ago he had two rooms to live in, for which he paid a certain weekly rent. The time came when his rent was raised; he could not see why this was, but he managed to pay the increase. Then it was raised again, and he could no longer manage to pay; he gave up one of the rooms. Now the time has come when even this one room cannot be left to him, nor anything in the shape of a room of any sort; a "clearance" is to take place, and the ground must be otherwise occupied. In fact, he has been gradually squeezed out. Speaking more scientifically, the struggle that is still going on amongst men of business for more elbow-room has advanced the value of the ground by degrees till it is too dear for poor men's dwellings to keep their hold upon it anyhow or anywhere. When in such circumstances the well-meant scheme of Sir RICHARD CROSS is attempted to be put in operation, the effect, sad to say, is only to tighten the pressure. The little maker of mops will not even be allowed to enter the "PEABODY buildings;" they won't take in such as he; away he goes into the abyss more irretrievably than ever, and the squeeze still goes on!

### HETH AND MOAB.\*

IN the early days of railway schemes a good deal of strategy was needed in order to take a section or make a survey of a line. The possibility of obtaining a sum of money for land that was far in excess of the value was then unknown to the landlords, and accordingly they opposed the surveyors, with the aid of tenants and other retainers. GEORGE STEPHENSON was at one time very nearly finding himself in a pond, and on another occasion he was threatened with the lock-up. He was watched by night as well as by day, and guns were constantly fired to deter him and his staff. But all the feats of danger which were accomplished in Lancashire or Yorkshire were tame affairs, if compared with what was lately accomplished by Captain CONDER in Egypt. It was not an irascible, good-hearted proprietor that opposed him, but the Turkish Government, and yet in the sight of the army of officials he surveyed about five hundred miles of country. The history of his raid on Moab is not, however, the principal subject in Captain CONDER's book, nor does he aim at self-glorification. Having had the opportunity of examining a most interesting part of Palestine, and of living in the tents of tribes that are supposed to be outside the pale of civilisation, he has in a frank, manly way described what he saw. His book on Heth and Moab has, indeed, much that will interest archæologists, politicians, and anthropologists, as well as biblical students.

At the end of March 1881, Captain CONDER and his coadjutor, Lieutenant MANTELL, arrived at Beyrout, having a commission from the Palestine Exploration Fund to undertake the survey of the region lying on the east side of the Jordan, the plans of the western side having been already completed. As it was necessary to wait for assistants and stores from England, Captain CONDER resolved to employ the time in seeking for the site of the Hittite capital. The route lay through Baalbek, and there he heard that all surveys were prohibited, unless there was authority for them from the Sultan who now reigns. However, he was permitted to travel, and continued his journey northwards. A ruin called Kades, on the south slope of Tell Neby Mendeh, was identified by Captain CONDER as the site of Kadesh, a Hittite city which is represented in the great Egyptian battle-pieces at Thebes and Abu Simmel; and he gives an animated description of the contest:—

Standing on the acropolis of the sacred Hittite fortress of Kadesh, we could, in imagination, see enacted at our feet all the episodes of that battle famous more than thirty-two centuries ago. We might picture the serried ranks of the Egyptian infantry advancing northwards, with the light chariots yoked each to its pair of horses, and hung with quiver and shield. We could see the

adventurous Rameses, with his scanty following, coming down from the rougher land into the open plain, north-west of the city, and the host of the Turanian warriors concealed beyond the river and by the great Tell itself. We might almost hear the cries of the wild Hittites dashing over the bridges in their chariots to intercept the incautious monarch; their long pigtails floating behind them as these red-booted and mustachioed princes, with their cloaks swelling in the wind, urged on their steeds. The dark beards and eagle noses of the Semitic allies, with their shawl-heads, so like that of the modern Arab, contrast with the Tartar-like mien of their Turanian masters, and with the slimmness of the Egyptians. The clash of the opposing chariots is hidden by clouds of dust from the corn-lands. The first brigade of Ra, the God of Light, gives way before the Hittite charge; but Rameses, calling aloud to his father, Ammon, to help him, rallies his hosts, and the panicstricken Syrians flee.

The next point in Captain CONDER's journey was the lake of Koteineh, where there is a remarkable dam about half a mile in length, and V-shaped, like a cutwater. Afterwards, the city of Homs, the ancient Hemesa, was visited. Here basalt is the principal building material, and the place is full of fragments of Greek and Arab inscriptions, coins and gems. The "Mosque of Light" is an ancient basilica of three aisles, with Early Byzantine capitals to the columns. The travellers afterwards turned southwards in the direction of Tripoli, and on their way they examined the Crusaders' castle of el Hosen, or Crac. It is well preserved, the gates of oak studded with iron still remain, and the delicate tracery of the windows in the beautiful chapel. Captain CONDER was able to closely examine the masonry, and the following observations on the Crusaders' work in Palestine will be read with interest:—

The masonry of the Crusaders is here, as everywhere else, drafted with a boss, which is left rustic in exterior walls, but finely finished in the interior. It is a very common mistake to suppose that such masonry was found and reared by the mediæval architects, but we have now good evidence to show that it was actually cut by the Gothic masons, as in Cyprus also and elsewhere. Indeed, so far from drafted masonry indicating Jewish or Phœnician builders, we have no evidence whatever that these nations ever used it, though we know that Greeks, Romans, Byzantines, Crusaders, and Arabs all drafted their stones. The Jerusalem temple walls and those at Hebron give no contradiction of the supposition, for they are, in all probability, Herodian imitations of Greek or Roman work. Here at Crac we find masonry drafted, yet dressed with the peculiar Gothic diagonal dressing, and, moreover, marked with masons' marks. We find pointed arches with the keystone cut out to form the point, and yet drafted, as are the remaining voussoirs.

The masons' marks are of considerable interest, and the subject has now been carefully studied in all parts of Syria. They are distinctive of the Crusading work of the twelfth and thirteenth centuries, and are found on all the best-finished stones on the walls of such buildings, but especially on interior walls. The same mark is found in places separated by hundreds of miles, and in English cathedrals and Persian palaces no less than in Crusading castles or churches. The same work is used in buildings which differ in date by more than the lifetime of a single man; and I have found all the letters of the alphabet save *Q*, which seems to indicate that the masons were French or Italian. *X* is doubtfully found, and so, curiously enough, is *D*; but the marks are not merely letters, for many very interesting signs also occur. Among these more suggestive marks may be noted the "Solomon's Seal" or five-pointed star, "David's Shield" or the double triangle giving six points, the lituus or crozier, the fish, the cross, the trident, the arrow, the *fleur-de-lis*, the hammer, and other well-known emblems of good luck. The two first are Indian caste marks, as is also the trident; the letters of the Slav alphabet, dating earlier than the ninth century, are also in many cases exactly like the Norman masons' marks; and several of the masons' marks, found by Ouseley on the old palace of Saaditalat, near Ispahan, are the same as those copied in Syria, including the cross, the arrow, the hour-glass, the trident, and the square.

No doubt in some cases a letter was put on the stone by way of claiming its workmanship, as, for instance, at Rosslyn, where such a mark is found on the famous "prentice's pillar," no doubt cut by that proud mason to mark his own work; and this perhaps accounts for the marks being always on the finest stones. There is evidently no indication intended of the position for which the stone was destined; but in many cases it seems pretty clear that the signs were intended as charms to secure good fortune to the building, just as the hand or the "Shield of David" is now painted in red on doors and walls by the Moslem masons in Syria.

Crac was one of the principal European strongholds in Syria, and it would long have remained one if the Frank possessors had not degenerated. Its history should be a warning to those who are compelled to rule a far larger territory in India. From Tripoli, where he saw a strange Dervish

\* *Heth and Moab: Explorations in Syria in 1881 and 1882.* By Claude Reignier Conder, R.E. Published for the Committee of the Palestine Exploration Fund, by Richard Bentley & Son.

dance of a kind that is seldom witnessed by unbelievers, Captain CONDER returned to Beyrout. What he saw in his journey through the Land of Purple recalled the Phœnicians, about whose influence he is sceptical. "At one time," says Captain CONDER, "they were credited with almost every antiquity which could not otherwise be accounted for. All drafted stones, whether of Greeks, Romans, Crusaders, or Saracens, were pointed out as having 'the Phœnician bevel,' though there is nothing to show that the Phœnicians either bevelled or drafted their masonry." At Tyre Captain CONDER tested M. RENAN's theories, and found them to be unsafe. His "immense hypogees" are in some cases only disused quarry pits, and other remarkable statements are also derived from the French scholar's imagination. But archæological exploration was of secondary importance to Captain CONDER. The time had arrived for him to attempt the survey of the land of Moab. It was necessary to obtain a new firman, and he was aware of the delays and difficulties of the Turkish Circumlocution Office. Accordingly, while he appeared to be waiting for official authority in his tent, he one day crossed the Jordan and began laying down his base lines. The country was in an unsettled state, and, although Captain CONDER has little fear if opposed to ten or a dozen Arabs, still there was danger to his small party if they were attacked by a horde. Accordingly the aid of a chief called GOBLÂN was purchased, and it would be hard to find a character better adapted for a melodrama or a picture :—

A tall, gaunt man with a gray bronzed face, half hidden by his shawl, one eye red and sightless from the sword cut, which has furrowed all one cheek, and of which he is much ashamed, because it was a blow from an injured relative, and not a wound received in fair fight. His hair (as I saw accidentally one night) is long and silvery, and his beard quite white. His age is probably about seventy, though he either does not know or else conceals it, for he told us that he believed himself to be about forty. He wore a double kufeyeh, the inner shawl black, the outer one black with gold embroidery. His shirt was white and clean, with a kumbaz or long gown fastened by a belt with yellow and purple vertical stripes.

It is a pity that the portrait of so picturesque a fellow was not sketched. For half a century he was pursued by a tribe of enemies who wished to kill him on account of a blood feud; the Government were eager to capture him, but he contrived to baffle all his foes. His attention to Captain CONDER was remarkable. The country which was to be surveyed is less visited by Europeans than that on the western side of the river. It is full of wild gorges and desolate wildernesses, and the descriptions suggest the impression that scenes of the kind were likely to make on the minds of primitive worshippers. The principal city is 'Ammân, where there is now a colony of Circassian exiles. There are two interesting works in 'Ammân, viz., a Moslem building on the citadel hill, and another discovered in 1882. They both—according to Captain CONDER—belong to the tenth century, although by other authorities they are ascribed to an earlier period.

Moab contains many monoliths and other primitive stone monuments, and their existence is a testimony to the genuineness of some of the statements in the Old Testament. In one place, where there are seven remarkable stones, Captain CONDER supposes that they are the altars which BALAK raised. Pisgah was visited, but the view from it differs from that described in the Bible. There are a great many of those scenes which might have been illustrated with advantage; and, in fact, the absence of plates is the only drawback to the full enjoyment of a book which will add to the reputation of the author of "Tent Work in Palestine."

#### PARIS NOTES.

AT the very last moment the closing of the Triennial Salon which was to have taken place on the 15th inst., was postponed until the end of the month. This fresh prolongation has been made at the request of the Director of Fine Arts, in the hope that the extra fortnight will raise the total receipts to a sum sufficient to pay the expenses. Up to Wednesday, the 14th inst., the takings had amounted to 75,000 frs., the daily receipts for admission having averaged about 1,100 frs.; and as the exhibition will have twelve more paying days to account for, the total result of the returns for admission to the end of the month should reach

90,000 frs., a sum that it is estimated will cover all outgoings. The State, it must not be overlooked, has also allowed the sum of 100,000 frs. towards the organisation of the Salon. This subsidy will, therefore, remain intact, and will be carried to the credit of the Fine Arts Department. Unforeseen expenses will be further met by the sums tendered for the monopoly of the catalogue, and the maintenance of the refreshment-rooms established in the precincts of the exhibition.

The Association of French Artists will hold a general meeting in the St.-Jean Hall of the Hôtel de Ville on the 29th inst. to hear the report of the managing committee on the financial position and work of the society during the past twelve months. On this occasion an important discussion on the question of an artist's property in his creations is likely to arise. A few days ago the Société des Artistes Libres submitted the following motion for consideration by the committee of the elder association: "That it is the duty of the Association des Artistes Français to make common cause—morally and even pecuniarily—with M. Karl Daubigny in his defence of the principle of artistic property; and that the action brought by that gentleman against the forgers of co-called paintings by his father ought, therefore, to be supported by his *confrères* as a body." It is understood that this proposition, which was presented to the committee by M. Tony Robert-Fleury, met with a general approval at the hands of that body, and, under its auspices, will be brought before the general meeting next Thursday.

Several small exhibitions are being organised for December. The friends of André Gill, the caricaturist, who is happily now almost restored to health, are arranging for an exhibition of his works between December 15 and January 15, in the Galerie Vivienne. It will comprise not only paintings, drawings, and studies by the popular artist, but also numerous original sketches executed for his caricatures. The proceeds of the exhibition will be devoted to providing for the needs of the artist during the period of convalescence.

The Minister of Fine Arts has decided that the exhibition of the late M. Manet's works shall be opened at the School of Fine Arts on January 2. About 150 works by the leader of the realist school of painting will be on view.

Another exhibition announced is that of the works of the late painter Sellier, which will be held in the great hall of the Fine Arts School, placed at the disposal of the artist's widow for this purpose, throughout the whole of next month.

A new gallery has been opened at the Louvre, containing sculptures from Chaldea, Assyria, Phœnicia, Judæa, and Cyprus. It is entitled the Salle des Antiquités Orientales. The evacuation of the Salle des Etats by the Municipal Council, who for several years has held its meetings there, places a large additional space at the disposal of the museum authorities. This vast hall, which had been divided by wooden partitions, galleries, &c., to provide for the various services of the Council, has now been restored to its original state and handed over to the Fine Arts Administration. It is intended to fit it up to receive pictures.

M. Cormon has just terminated for the ceiling of one of the rooms of the St.-Germain National Museum a large decorative painting, representing *The Iron Age*. It will be exhibited in the next Salon.

M. du Locle has been sent on a mission to Italy, charged with the execution, on behalf of the French Government, of water-colour reproductions of the frescoes in the House of the Drunken Fawn at Pompeii. These paintings, which are unfortunately very nearly effaced, represent a series of burlesque scenes that throw much light upon the theatrical arrangements and *mise en scène* of the ancients.

The Government has undertaken the maintenance of the School of Ceramics, founded by M. Dubouchet at Limoges, and has recognised it as an establishment of public utility.

The Exhibition of Incoherent Art, lately held in the Vivienne Gallery, resulted well for the poor of Paris, M. Jules Lévy, the president of the society, having handed over to the Director of the Assistance Publique a sum of 6,700 frs. as the net profits of this eccentric show.

A prize of 2,000 frs. was recently offered by the State manufactory of Beauvais for the best design for a sofa to be executed in tapestry. The award has been made during the past week, the successful competitor being M. Couty, professor at the Nice School of Decorative Art, and a pupil of M. Galland.

M. Reinach, a member of the French School at Athens, and M. Babelin, of the National Library, are about to start for Tunis with the intention of undertaking extensive excavations on the site of ancient Carthage, and of collecting everything that will throw light upon Phœnician civilisation. The Government vessels on the station have been directed to lend every assistance to the explorers.

A set of chimney ornaments, consisting of a clock and two candelabra in Louis XVI. style, which formed part of the furniture of the Palais Royal previous to the Revolution, has just been purchased, it is said, for the sum of 100,000 frs. by a well-known member of Paris society, who desires to present them to the Princess Amélie d'Orleans as a *souvenir de famille*.

## EXHIBITION OF FRENCH ART IN GLASGOW.

IN continuation of the series of exhibitions of works of decorative art which have been held yearly during the past few seasons, the committee of the town council some time ago resolved that the exhibition during this winter should be specially devoted to the illustration of French art manufactures. The *Glasgow Herald* says: Considerable progress has now been made in the acquisition of loans of French art objects, and the preliminary preparations for the exhibition are in so advanced a condition that it is expected to be opened about December 17. The most remarkable features of the exhibition will probably be the display of French furniture of the eighteenth century, which is expected to include examples of the famous inlaid work of Charles Andre Boulle, commonly known as buhl work, and of the productions of the numerous workers in marquetry and chiselled brass of that period. Loans of several very beautiful collections of Sevres porcelain have also been promised, which will be sufficient fully to illustrate that most important department of French decorative work, and valuable contributions of fine ancient velvets and other artistic textiles, tapestries, and laces have been secured. The rare and costly enamels of Limoges, miniatures, jewellery, artistic snuff-boxes, and magnificent-painted fans will also form features in the collection, which will certainly be at once interesting and valuable to the ordinary visitor, and to the student of decorative art and professional designer. As usual, the nucleus of the collection will be supplied by the Science and Art Department, but around that there will be contributions of great importance from several of the leading noblemen and collectors both in England and Scotland. Among the principal leaders are His Grace the Duke of Hamilton, the Marquis of Bute, the Earl of Wemyss, the Earl of Glasgow, Lord Balfour of Burleigh, the Hon. W. F. B. Massey Mainwaring, and Miss Nisbet-Hamilton, and it is expected that His Grace the Duke of Buccleuch will, as in former years, give generous support to the undertaking by lending examples of the buhl furniture in Dalkeith Palace—the finest in existence—and other specimens of great value and importance.

## MR. RUSKIN ON "SINCERITY" IN LANDSCAPE ART.

IN his last lecture at Oxford, Mr. Ruskin spoke of the works of Wilson, De Wint, and other landscape painters of their period. The very lowliness of subject and simplicity, he said, make the work of Wilson, and Stanfield, and De Wint, of Robson and of Fielding, all the more valuable for the average student; and the small rooms of the Old Water-colour Society, which were covered by their drawings, presented an aggregate of unaffected pleasure of which those can have no idea who only know the enormities of luscious and luxurious art which flaunt and glare on the miles of exhibition walls in modern galleries. "The great secret of these men's success was the rare sincerity of their pleasure in their subjects—a pleasure as simple and romantic as a young girl, in sympathy with which (added Mr. Ruskin) I have said and done all that in my words or works may have been of any value." "Romantic" he used in opposition not to "classic," but to "prosaic"—with all the selfishness and stupidity that belong to prosaic people. The best types he could give of non-romantic persons, with no interfering element of vulgarity, were Henry VIII. and Charles II.—"the destroyers, according to their power, the one of English religion, the other of English morals—and culminating types, both of them, of all that seeks to rob God of His honour." And in painting, the best type of the non-romantic work against which the pre-Raphaelites revolted was Vandyck's *Miraculous Draught of Fishes*. Near this picture in the National Gallery hangs a Teniers, *The Château of Teniers at Perck*, which is a perfect type of all that was assailed by our landscape school. It represents "some ordinary Dutch trees, some ordinary Dutch clowns, and an ordinary Dutch duck-pond—unless the concession

to the grand style in the size of the pond requires one to call it rather a goose-pond. The colour is all grey or brown, and the atmosphere suggests the idea, not merely that the sun has disappeared for the day, but that it has gone for ever, leaving a stable lantern in its place. The general effect of the picture being far from exhilarating, it is relieved by three figures—two gentlemen and one lady—all of them standing perfectly upright, with expansive boots and tall hats; while a rustic fisherman presents to them, as a tribute to their interest in natural history, a fish which has been elicited from the pond by six other fishermen wading in the pond up to their calves. This work is, of course, hung on the line, while Tintoret's and Gainsborough's are skied; but in this instance any student may feel grateful to the authorities in our National Gallery for giving him so good an opportunity of seeing a picture which exhibits the utmost stoop possible to manual dexterity. It is exactly typical of the spirit of avaricious trade and unrestricted luxury, bent only on pleasure and gain, which has ostracised the spiritual sun, and which lives only by the snuff of the wick of its own mental stable lantern." It was long before art freed itself from this "stupor of the Stygian pool brooded over by Batavian boors." Rubens saw nothing in mythology but corpulence; Gainsborough knew no other goddess than Mrs. Graham; and Reynolds sought in vain to find the "Age of Innocence." But at last a school arose in England which sought and found in the solitary places of the earth a beauty and a pleasure which consisted neither in pride nor in sensuality. To Richard Wilson Mr. Ruskin ascribed the credit of beginning the sincere art of landscape. But the first impulse was given by the poetry of Scott and Byron; the love of mountains which is so conspicuous and so sincere in both these poets forced their illustrators to learn the beauty that is among the hills, and especially the charm of wreathing mists and wandering clouds. "Well, do I remember," said Mr. Ruskin, "the day, fifty years ago, when a little drawing by Copley Fielding was brought home in triumph to Herne Hill, to form the foundation of that collection of landscape art some portion of which, at Cambridge and here, it has been allowed me to make permanently national. The picture which filled our back parlour with proud surprise and gratulation was only of a gleam of sunshine on a bull and a couple of drivers, with some distant hills seen through a soft curtain of driving rain. An undergraduate friend, fresh from Eastern travel, was staying with us, and came into the room to see the cause of our ravishment. He looked at the cheerless scene and remarked, 'But, Ruskin, what is the use of painting such very bad weather?' To which question I could only make the reply that there was no such thing as bad weather, but only different kinds of pleasant weather—some demanding, indeed, courage and patience for their enjoyment, but all of them fittest in their seasons—best for the hills, for the cattle, the drovers, my master and me! The weather might be bad for Greek or Saracen, but for us these simple pictures of mountain mist were more precious than Titian's blue skies or Angelico's gold rings of Paradise." It is, indeed, characteristic of the English landscape painters that they show no thought or invention; they are themselves only "a kind of contemplative cattle, who like being out of doors." Do not, however, suppose, Mr. Ruskin added, that fresh air is easy to paint. "A modern French sensational landscape could, indeed, well be painted in ten minutes. A liberal expenditure of gas tar, with some oil to make it stick, will do it for you in no time. You must, however, remember the claims of 'solemn symmetry,' and the necessity of making your picture look exactly the same upside down; and thus, if you have six or seven streaks for clouds above, you must have six or seven below for a pool. Then add some black bushes and a log-like dead body, and your picture will be the talk of the season. Far other is the discipline required of the least disciple of the English water-colour school. The amateur brush flops over every outline, and speckles its colours so that the work is never finished till it is half washed out; but there is no greater marvel in art than the absolute precision with which the masters of this school lay on their smooth tints."

## ART AND DEMOCRACY.

THE lecture which was delivered lately in Oxford has inspired several letters against Mr. Morris's propositions, viz.: 1. That the present prospects of art, and especially of what may be called industrial art, in this country are such as to induce a feeling of despair. 2. That the best remedy for this condition of things—the true source from which we may hope to regenerate our national taste—is Socialism. Mr. C. L. Eastlake writes:

It will be strange if the accuracy of these opinions remains long unchallenged. For my own part, having watched with keen interest the progress of British art for the last twenty-five years, and after making due allowance for that love of novelty which has in all ages influenced and always will influence the taste of the public, I do not remember any time within the period I have mentioned when the higher arts, especially architecture and painting, in this country were distinguished among educated experts by more refinement and originality of treatment than at present. In the minor arts a still greater advance has been made. There is

scarcely a branch of national handicraft into which the element of taste enters, whether cabinet work, textile fabrics, metal work, paper-hangings, or glass manufacture, that does not indicate a marked improvement in design, and consequently a higher and more delicate appreciation of art among the public. Indeed, I should not be surprised if among Mr. Morris's own customers there were found many of that unhappy class whom he describes as "living in swinish comfort," so widely have his efforts to invest our homes with an artistic character been recognised and esteemed. Of what, then, does Mr. Morris complain? That machinery has taken the place of hand labour? As well might one lament that railroads have superseded the mail coach, that cheap postage and telegrams have lessened the literary value of correspondence, or that photography is interfering with the engraver's vocation. The nature and aspect of art have ever varied and always will vary with the external conditions of life by which it is surrounded, and we can no more conduct our manufactures on mediæval principles than we can adopt the language of Chaucer or arm our regiments with crossbows. Life in the nineteenth century has lost many characteristic features which lent romance to the Middle Ages; but the truest artist is surely he who, accepting the altered condition of society as inevitable, so shapes his art that it fulfils an honest unaffected aim in his own epoch. The aspect of physical nature, the emotions of the human heart, are much the same now as in the golden days of the early Renaissance, and afford now as then an endless source of inspiration to the painter and the poet.

Into Mr. Morris's scheme of social and political reform, so far as it is expressed or suggested by his lecture, I do not propose to enter; but, apart from abstract questions of morality and justice, I have much mistaken the disposition of the British workman, and greatly misinterpreted the lessons of past history, if the spread of Socialistic doctrines would tend to improve the dwellings of the poor or advance the cause of art; and I venture to add my conviction that the ultimate effects of Democracy, if ever it should be established in this island, would be to render it, even in Mr. Morris's eyes, anything but an "earthly paradise" for the artist or the workman.

### ILLICIT COMMISSIONS.

THE following letter has been addressed to the editor of *Truth* by Mr. C. Harston, architect:—

Sir,—The secretaries of the Royal Institute of British Architects might with propriety have included in their defence the whole profession, and not only the members of their body.

You ask (1) "Why this extraordinary trade custom prevails?"—the custom in question being that of allowing large discounts on the list prices of articles used in the building trades—and I will endeavour to give you a satisfactory reply. This custom, then, prevails at wholesale houses in all trades, partly for the purpose of keeping the retail buyers in ignorance of the actual profit of the retailer, and partly for the facilities which it offers for the adjustment of prices. You quote the discounts on certain articles in the building trade, but much higher discounts are customary on other articles. Take, for instance, screws, with a discount of about 90 per cent.; wrought-iron pipes, 40 to 70 per cent.; and drain-pipes, 20 to 50 per cent. In all these cases the list price is permanent, and by means of the discount it is made to apply to the various qualities of the same article, and adjusted to the fluctuations of the markets.

You ask (2) "Whether the members of your Institute are in blissful ignorance of it?"—i.e., the discount custom. Manufacturers and builders will, if possible, keep architects in ignorance of these matters, but they succeed only in the case of the very inexperienced men.

(3) "Whether they, or some of them, do not certify to the correctness of a builder's account when it contains items on which these discounts are allowed, without their being deducted?" With the exception of the very "green" ones before mentioned, certainly not.

(4) "Whether architects do not invariably insert the names of houses where these discounts are allowed in their specifications, and insist upon the builders dealing with these houses, and whether in these cases the builder does not receive from such houses a smaller discount?" This is a misleading question, to which it is difficult to give a short and plain answer. Seeing that discounts are customary at all wholesale houses, it resolves itself into this: "Do architects specify certain houses for certain goods?" They do, and, further than this, they often include a lump sum on the specification for certain goods, and reserve to themselves the right to select the goods at any warehouse they deem fit. Take the cases of stoves, mantelpieces, locks, gasfittings, paperhangings, &c. If you can show architects how these can be otherwise provided for, you will do them a service for which they will thank you.

You ask, "Does the builder in these cases receive a smaller discount?" That depends upon the nature of the contract. If it is stipulated that the goods shall be allowed for at the gross prices, then the builder receives the discount and considers that fact when

making his estimate. If the contract states that the builder's profit on provisional sums is to be, say, 10 per cent., the item would figure in the account thus:—

Paid for stoves gross	£150 0 0
Deduct 25 per cent. discount	37 10 0
Nett payment	112 10 0
Ten per cent. profit	11 5 0
	123 15 0
Deduct provisional sum	120 0 0
	3 15 0

If by special arrangement with the manufacturer a nett quotation is given, the builder should receive from the manufacturer no discount, but his profit is added thus:—

Paid for locks nett	£112 10 0
Ten per cent. profit	11 5 0
	123 15 0
Deduct provisional sum	120 0 0
	3 15 0

In these two last instances the builder very properly *does* receive less than the trade discount, and the client gets the benefit of the balance.

I have not read the original article which gave rise to this correspondence, but you appear to have stated that "almost invariably the architect is paid a second commission by those whom he employs," and "whenever an architect particularly recommends mantel-pieces or grates, or any other such articles, which are made by some particular firm, it is about fifty to one in favour of his having a personal reason for the suggestion," and you put the questions which I have replied to in support of these assertions, adding, "so long as the trade custom prevails, so long as architects insert in their specifications the names of particular houses, instead of allowing builders to deal in the open market, I for one shall continue to believe that many architects take more care of themselves and their friends than of their employers."

If this be so, it is clear I shall never be able to inspire you with sufficient faith in the profession. But I do not despair. You have a reputation for common sense, and, with the explanations given, you cannot fail to see the want of connection between your facts and inferences. As well say, "so long as newspapers are issued from Fleet Street, I for one shall continue to believe most editors are rogues," or "so long as barristers wear wigs, I for one shall continue to believe most solicitors are in the habit of committing bigamy!"

To say that in a body of men numbering thousands there are none dishonest would be manifestly absurd, whether with reference to architects, lawyers, editors, clergy, or men of any other calling; but I venture to assert that, considering the temptation to which they are exposed, architects are, as a body, as upright and honourable as the men composing any other profession or trade whatsoever.

Your obedient servant,  
C. H.

### MR. BROWNING'S "APOLLO AND DRYOPE."

A CORRESPONDENT of the *Manchester Guardian* says that Mr. Robert Browning, son of the poet, has just finished at his studio, No. 117 Rue Notre Dame des Champs, a considerable work in sculpture. Mr. Browning has hitherto been chiefly known as a painter; but, like other modern artists of this kind, reviving the practice of an earlier date, he has now attempted a considerable work in clay. The subject is *Apollo, in the form of a Serpent, courting the Nymph Dryope*. The story, according to the classical dictionary, if one may dare to avow that authority, is that the nymph, although the daughter of a king, was in the habit of tending her father's flocks, and that the god could find no easier means of approaching her than by assuming the form of the tempter of Eve. As Mr. Browning has realised it, we have before us a vigorous naturalistic study, more than life size, which is in the same spirit of conception and treatment as the *Diana* of Falguière. It is primarily a young girl of the fields absolutely non-classical, with all the splendid beauty of the human form developed by labour and exercise. The non-classical treatment extends particularly to the features, which are full of expression of a kind of wondering scorn. The serpent hangs from the uplifted arm, with its face near the face of the girl, which is thrown back with a movement of repulsion and curiosity combined. The serpent is just as carefully studied from nature as the figure, and it is a very successful treatment of an animal but rarely introduced in sculpture except in a purely conventional way. The great weight of it is somehow suggested by the heavy drooping coils, and there is an attempt to render even the colourations of the skin by light relief in the modelling. The work is to be cast in bronze, but all its essential merits are of course to be seen in the plaster. It is a work of great power, full of feeling for nature, and of a very

refined and true sense of beauty, absolutely unconventional and belonging distinctly to the new school in art. It will remain on view for a short time at Mr. Browning's studio.

### THE ROYAL SCOTTISH ACADEMY.

THE annual meeting of the Royal Scottish Academy was held on the 14th inst., when the office bearers for the ensuing year were elected. Messrs. T. S. Burnett, P. W. Adam, and G. W. Johnstone, were elected associates. The annual report stated that the exhibition of 1883 (the fifty-seventh) was opened on Saturday, February 17, and closed on Saturday, May 12. The number of works exhibited was 1,118—viz. 1,084 paintings in oil and water-colour, and thirty-four works in sculpture, selected out of a total of 2,268 sent for exhibition. The exhibition was composed, with comparatively few exceptions, of the productions of Scottish artists, and its attractiveness was enhanced by a more than usual number of contributions from honorary members. The attendance of visitors was unprecedentedly large.

There has been an average attendance of the members in the library during the past session. The librarian has been engaged during the year carrying on the arrangement and classification of the large and valuable collection of drawings bequeathed to the academy by the late David Laing, LL.D., Honorary Professor of Ancient History to the Royal Scottish Academy, and it is expected that this duty will be accomplished, in terms of Dr. Laing's report, before the issue of next annual report. The books, prints, &c., in the library are in good condition, and catalogued up to date. A number of new works have during the year been added to the library.

The visitors to the Life School report that the session of 1882-83 commenced on November 6, 1882, and ended on July 2, 1883, and included 122 evening and 119 morning meetings. The aggregate evening attendance was 1,841, or an average of fifteen per night, and 1,663 was the aggregate morning attendance, being an average of fourteen per morning. Testimony is borne to the assiduity and the diligent and orderly conduct of the students during the session. It is gratifying to the council to be able to commend the generally high quality of the students' work, which indicates that the school is progressing favourably. After a long and careful scrutiny of the studies and of the works sent in competition for the Stuart prize—the students' work in this year's exhibition having been previously examined with a view to deciding the Keith prize—the prizes were awarded as follows:—

For painting from the life (the Chalmers prize), T. Alison and C. K. Robertson—equal; for the best drawing from the life, C. A. Sellar; for the second best, W. G. Boss; Keith prize, for the best work of a student in this year's exhibition, R. Paton Reid; MacLame Watters medal, C. K. Robertson; Stuart prize, R. Paton Reid; Basso-relievo, from life, J. S. Rhind. Several studies from the life executed in water-colour by T. Scott deserve honourable mention.

The council have again the pleasure of adverting to the kindness of Mr. John Leng, of Kinbrae, who has completed the terms of his engagement to bestow for three years an annual sum as a prize to a student of the life school to enable him to extend his art education by travelling on the Continent. The student selected this year as recipient of Mr. Leng's prize is Mr. J. Michael Brown. Cordial acknowledgments and thanks are due to Mr. Leng for the warm interest and liberality he has thus displayed towards the students of the Academy. During the past year the following, among other additions, have been made to the Academy's collection of works of art, &c., viz.:—

1. *Caleb Balderston's Ruse*. Diploma work of George Hay, Esq., R.S.A. 2. *Far from the Busy World*. Diploma work of John Smart, Esq., R.S.A. 3. *The Cid and the Five Moorish Kings*. Diploma work of W. E. Lockhart, Esq., R.S.A. 4. *Turnip Singlers*. Diploma work of W. D. McKay, Esq., R.S.A. 5. *Portrait of Sir William Fettes Douglas, P.R.S.A.* By George Reid, Esq., R.S.A. Presented by George Reid, Esq., R.S.A. 6. *Ripon Cathedral*—water-colour drawing. By Thomas Girtin. Engraved in "The Rivers of England." Presented by James G. Orchar, Esq., Dundee.

It is with much regret that the council record the death of one of the oldest associates of the Academy, Mungo Burton, which occurred on December 1, 1882. Born at Colinton in 1799, he early displayed a taste for art, his first professional efforts being likenesses in water-colour. His principal works in portraiture, however, were in oil, whilst occasionally he produced figure pictures of Scottish homely life. His amiability and kindness secured for him the general esteem of his professional brethren. The Academy have also within the year suffered a loss of no little import in the demise, on January 12, of George Monro, advocate, Sheriff of Linlithgowshire, who for many years was consulted by the Academy when legal questions arose. His intimate knowledge of the Academy's career, and the warm interest he manifested in its welfare and prosperity, are amply testified in his work, "Scottish Art and National Encouragement." The council have also to report that a blank has been made in the rank of Academi-

cians by the death of Robert Gavin. He was born in Leith in 1827, and at an early age manifested a taste for art. Under Thomas Duncan on the board's school of design he studied assiduously, producing numerous pictures, mainly compositions of landscape and children. In 1868 he went to America, turning his visit to account by delineating several characteristic phases of negro life. After his return to this country—where his stay was but short—he took a journey to the Continent, which resulted in a residence of some years at Tangier, where he evidently found what was congenial to his taste in subject and material. A series of Moorish pictures, many of them of importance, emanated from his pencil at this time, and from his final return in 1880 he continued to paint this class of subject. Mr. Gavin was elected an associate of the Academy in 1855, and attained the rank of Academician in 1879. It was stated in last year's report that a printed catalogue of all the works in art in the possession of the Academy was in preparation, and would shortly be placed in the hands of the members. The council have the pleasure of reporting that this has now been done, and, as anticipated, it has been cordially received.

### THE ROMAN CAMP AT BOROUGHBIDGE.

FOR more than a century the tenth Iter of Antoninus, having regard to his stations, has been a puzzle to archæologists. The identity of the places named in it has never been clearly defined. That Manchester is Mancunium is the one thing certain. As to Glanaventa, Galava, Alone, Galacum, Brematonacum, Coccium, Condate, and Mediolanum there is still scope for investigation. The identification of these stations is now being worked out by some of the learned societies in the North. The identity of Alone, if Alone it be, with Boroughbridge, in Westmoreland, will throw a flood of light on Roman history in Britain. Convinced of its importance, the council of the Cumberland and Westmoreland Antiquarian and Archæological Society voted a substantial sum to enable excavations to be made. This has been done and with what result will presently be shown. The committee which has superintended in a most practical manner these workings consists of the Mayor of Carlisle (Mr. Ferguson), Canons Simpson, Weston, and Ware, and Messrs. Nanson and Titus Wilson. The site of the camp is eminently characteristic of the Romans. It is situated just at the confluence of the Lune and its tributary the Borrow. Its form is that of a parallelogram, the wall from north to south extending 420 feet, and that from east to west 300 feet. Here, as in most cases, the length exceeds the breadth by about one-third. The walls consist of the Silurian stone of the district, together with sand and freestone from Shap Fells and Orion Low Moor. Even with the aid of Roman wagons the labour entailed in the conveyance of these must have been great. From the camp the distance to the first-named spot is five miles, to the second six. Beyond the outer wall traces of ditch and mound, fossa and vallum, may still be seen. The latter, without the western wall, is constructed of earth faced with rubble stone. The original depth of the ditch was 3 feet, the width 5 feet, the vallum being not less than 6 feet high and 8 feet broad. The accumulations have been removed from the tops of the walls, and these in many places have been approached laterally. Upon each of the four sides the foundations of the walls are laid in clay, this also having been brought from a distance. The masonry is still intact, many of the stones being worked in characteristic Roman fashion and inlaid in mortar. The normal thickness of the walls is 7 feet 6 inches. The sites of three of the gateways have already been unearthed, and near two of these have been discovered large stones containing sockets in which the pivots of the gates have turned. The gateways are 6 feet 3 inches across—just sufficiently wide to admit a Roman chariot, and narrow enough to be easily defended. In every Roman encampment are four gateways. Each *porta* was defended by an outwork of earth and stone. Remains of these are here abundant. Vandalism is abroad in Westmoreland, and the posts of one of the gateways have been put into the foundation of a chimney in one of the neighbouring farmhouses. Two others found in the vicinity have been removed to the exact spots where they originally stood. In excavating, quantities of pottery, some exceedingly fine, have been found, and the other day a large piece having an inscription upon it was picked up. This was taken to Carlisle for examination, and may afford some important clue. Inside the camp, and under the surface of the soil, are flues radiating in every direction, and containing large quantities of charcoal. These may either be the remains of ovens or have served the double purpose of heating the baths and warming the tents of the soldiers. Fragments of hypocausts have been dug up, as well as several querns or grinding-mills. A few pieces of money stamped on leather, "sacrificial relics," and a silver coin, supposed to be of Vespasian, have also been found. Outside the camp and beneath the soil of the garden attached to the little inn, the workmen have come upon what appears to be the floor of a beautiful bath, but this discovery will have to be followed up. Tesselated pavements also occur, and these, together with the bath outside the camp, would seem to point to a Roman villa. There can now be no

doubt that Alone belonged to the class of camps known as *castra stativa*. These camps were designed for permanent occupation. According to the Notitia here was stationed a cohort of Nervians. "Tribunus cohortis tertie Nerviorum Alionae manebat." Looking from the north gate of the camp is a low alluvial tract of ground bounded by the Lune and its tributary stream the Borrow. Here probably the Roman soldiers were drilled. The generals standing on the *fossa* could superintend and command the whole situation. The general plan of the camp must have been as follows: There were four gates—Porta Pretoria, Porta Decumana, Porta Dextra, and Porta Sinistra. Facing the first-named gate stood the Pretorium, where resided the general and his staff. This would be fitted out according to the rank of its occupants, and here various traces of luxury usually occur. Opposite to this, and on the north side of the camp, is Porta Decumana. Two streets ran through the camp at right angles, connecting its gates. Via Principalis joined the east and west gates, and was used as a promenade by those in command. Porta Decumana was the street which in this case stood nearest the river and furthest from the enemy. Through it were brought the cattle and the whole of the provisions for the garrison. The intersecting streets naturally divided the camp into four quarters, in which in *strigæ* or rows stood the tents of the soldiers. These were arranged in parallel lines, and between them were stores for arms, baggage, horses, and waggons. Although we have only mention of one cohort being established at Alone, yet Mr. Nicholson infers that at Boroughbridge there was accommodation for six legionary cohorts of 480 men, or a total of 2,800 soldiers. This is supposing the garrison to be wholly composed of infantry, and the camp closely packed with common soldiers. But some space must be allowed for horses, some extra for superior officers, and the number of men must be proportionately reduced. As the excavations proceed it is more than probable that some relic may yet be exhumed which will prove beyond anything that has yet been adduced that the Roman station here is Alone. This is to be hoped, as by it a long-vexed question will be definitely settled.

### THE ANGLO-SAXON SWORD.

TWO lectures have been delivered at the British Museum by Professor Hodgetts, late of Moscow, upon the swords among the Anglo-Saxon antiquities. It was said that the Anglo-Saxon sword was purely Scandinavian in form and general appearance, and he contrasted the weapon with the *gladius*, showing them, however, both to be referable to leaves of plants, the English word blade being cognate with the German *blatt* and Icelandic *blath*. The names of the chief parts of the sword—blade, grip, hilt, tang, ball, edge, and even guard (ward)—were all Scandinavian, like the weapon itself. Having in a very interesting manner traced the history of the sword, pointed out its modification in different ages and by different nations, and related some of the ancient customs in connection with it, he said that the sword was in the Scandinavian system as much a gift of God as letters were, it having been forged by Völundr in Valhalla for Odin. This Völundr or Wayland had come down to them in the Wayland Smith of Scott's "Kenilworth," and the Scandinavian sword of Völundr was repeated in Anglo-Saxon manuscripts, enabling us thereby to identify the older northern weapon with those in the cases at the British Museum. The smaller seax having been referred to at considerable length and shown to have been the prototype of the English dagger of later times, the lecturer next spoke of the adornments of the sword, and the philology of the word "sword." He then alluded to the use of the sword in poetry, mythology, art, and history. Passages from Beowulf were adduced to show how dear the sword was to our ancestors, and that the swords of the various gods of Valhalla were in exact keeping with the mythical value of each divinity, and that the weapons borne by those whose names guard the days of our week were strictly in harmony with the function of each of the patron deities, as representing a phase of human life from the birth of the sun-child on Sunday to the destruction of all things by the advent of Surtur or Satur in devouring flames with a sword of fire at the last day. Having spoken of the sword-belt, Mr. Hodgetts concluded by calling attention to the great debt of gratitude due to the officers of the British Museum for the zeal and judgment with which the national collection had been made and was kept up, and suggested that a hearty vote of thanks should be awarded to them for giving facilities to study those precious relics in so convenient a way. Mr. Ruskin, who was present, observed that Mr. Hodgetts had overthrown some of his most dearly-cherished ideas, but had at the same time opened a new world of light and poetry, from which he hoped to derive much benefit and pleasure. He had conversed on two or three occasions with Mr. Hodgetts on the Odinic world, in which he seemed to be so at home, and he had begun to see that there was much of the glory of poetry in our Saxon myths which we had much neglected and ought to know. He spoke in complimentary terms of the lecture, and of the manner in which the lecturer had dealt with his subject, and warmly approved the vote of thanks to the Museum authorities.

### MR. RUSKIN ON "ASHESTIEL."

IT was lately stated by Lord Reay, when delivering an address at Hawick, that Mr. Ruskin had been on a visit to his lordship. A description of some of the scenes in the neighbourhood of Lord Reay's house appears in the last number of *Fors Clavigera*, a series of letters which has been recommended by Mr. Ruskin. It is satisfactory to find that there is no trace in them of that "decline in the energy of advancing age" or "disabling illness" which Mr. Ruskin accepts as inevitable. In none of the books of his early days are there more exquisite examples of what words can do towards enabling a reader to imagine the appearance of a scene than are found in this small pamphlet. Mr. Ruskin says that he went into the Border Country chiefly to see Ashestiel in Ettrick Forest, which was the house of Walter Scott before he removed to Abbotsford. The following is Mr. Ruskin's description:—

The house of Ashestiel itself is only three or four miles above the junction of Tweed and Ettrick. It has been sorrowfully changed since Sir Walter's death, but the essential make and set of the former building can still be traced. There is more excuse for Scott's flitting to Abbotsford than I had guessed, for *this* house stands, conscious of the river rather than commanding it, on a brow of meadowy bank, falling so steeply to the water that nothing can be seen of it from the windows. Beyond, the pasture land rises steep three or four hundred feet against the northern sky; while behind the house, south and east, the moorlands lift themselves in gradual distance to still greater height, so that virtually neither sunrise nor sunset can be seen from the deep-nested dwelling. A trickle of stream wavers to and fro down to it from the moor through a grove of entirely natural wood—oak, birch, and ash, fantastic and bewildering, but nowhere gloomy or decayed, and carpeted with anemone. Between this wild avenue and the house, the old garden remains as it used to be—large, gracious, and tranquil; its high walls swept round it in a curving line, like a war rampart, following the ground; the fruit trees trained a century since, now with grey trunks a foot wide, flattened to the wall like sheets of crag; the strong bars of their living trellis charged, when I saw them, with clusters of greengage, soft-bloomed into gold and blue; and of orange-pink magnum bonum, and crowds of ponderous pear, countless as leaves. Some open space of grass and path, now all re-designed for modern needs, must always have divided the garden from what was properly the front of the house, where the main entrance is now, between advanced wings, of which only the westward one is of Sir Walter's time; its ground floor being the drawing-room, with his own bedroom, of equal size, above, cheerful and luminous both, enfiling the house-front with their large side windows, which commanded the sweep of Tweed down the valley, and some high masses of Ettrick Forest beyond, this view being now mostly shut off by the opposite wing, added for symmetry! But Sir Walter saw it fair through the morning clouds when he rose, holding himself, nevertheless, altogether regardless of it when once at work. At Ashestiel and Abbotsford alike his work-room is strictly a writing office, what windows they have being designed to admit the needful light, with an extremely narrow vista of the external world. Courtyard at Abbotsford, and bank of young wood beyond; nothing at Ashestiel but the green turf of the opposite fells with the sun on it, if sun there were, and silvery specks of passing sheep. The room itself, Scott's true "memorial" if the Scotch people had heart enough to know him, or remember, is a small parlour on the ground floor of the north side of the house, some twelve feet deep by eleven wide; the single window little more than four feet square, or rather four feet *cube*, above the desk, which is set in the recess of the mossy wall, the light thus entering in front of the writer, and reflected a little from each side. This window is set to the left in the end wall, leaving a breadth of some five feet or a little more on the fireplace side, where now, brought here from Abbotsford, stands the garden chair of the last days. Contentedly, in such space and splendour of domicile, the three great poems were written, "Waverley" begun, and all the make and tenure of his mind confirmed, as it was to remain, or revive, through after time of vanity, trouble, and decay. A small chamber, with a fair world outside: such are the conditions, as far as I know or can gather, of all greatest and best mental work. At heart the monastery cell always; changed sometimes, for special need, into the present cell. But, as I meditate more and more closely what reply I may safely make to the now eagerly-pressed questioning of my faithful scholars, what books I would have them read, I find the first broadly-swept definition may be—books written in the country. None worth spending time on, and few that are quite safe to touch, have been written in towns.

Mr. Ruskin says that Scott was beyond comparison "the greatest intellectual force manifested in Europe since Shakespere," and in his life the lesson is given, with a clearness as sharp as the incision on a Greek vase, that error of intellect and hardening of heart may be measured by denial of spiritual power. Nearly all the grotesque sculpture of the great ages, beginning with the Greek Chimæra, has a nascent form of faith for its impulse. In Giotto and Dante art is always subjected to the true vision.

## NOTES AND COMMENTS.

WE have received several letters inquiring for the answers to the questions in the examination papers which we published last week. It is not, we believe, the practice of the authorities to print answers in technical subjects, and it would need a small volume to work out the papers that were set in this case. But there need be no difficulty should a student wish to ascertain if he has arrived at correct answers. Architects would willingly aid their pupils, and there are books and papers available which will give the information. It will be the student's best plan to work out the questions unassisted. If the answers were printed they would serve as a key, and students would be crammed. The papers are comprehensive, and anyone who has mastered them need not fear the practical part of the Institute examination.

As we anticipated, the uncertainty which accompanied the conditions for the Dublin museum competition has had the effect of diminishing the number of competitors. Only thirty-three designs have been sent in. Although professional work is not at present in a flourishing state, yet the chances of success and fair play were so slight it is not surprising that so few have ventured. In the first competition there were eighty-seven competitors. The diminished number will, of course, make the duties of the assessors far easier, and it is to be hoped that the designs will be thoroughly investigated, and that the decision, if reasonable, will be upheld.

PUBLISHERS find it harder every year to obtain novelties for their Christmas cards. The public demand is for a class of work that is not to be obtained unless from artists who have gained a position, and who, of course, require high prices for sketches. Last year Messrs. RAPHAEL TUCK & SONS commissioned some of the Academicians to prepare designs, and in consequence many other artists have been stimulated to rival them. In the collection of three hundred and fifty cards which Messrs. TUCK have ready there are designs which, if painted on a larger scale, would grace a gallery of pictures, and some of the cheapest cards are gems of art. They are arranged to suit all classes of purchasers, from critics to children, and they are well worthy of preservation.

THE conservatories at the Jardin des Plantes, which received much damage during the bombardment in the Franco-German war, have since been repaired and enlarged by the erection of two new greenhouses, each about 150 feet long, and four smaller glass-houses for raising plants intended for the decoration of the national palaces and public buildings. A large winter garden has also been erected for the display of the most curious specimens of exotic vegetation. All these buildings will be shortly inaugurated, and in connection with the opening a marble slab, bearing the following curious inscription, is to be placed on the façade: "The Garden of Medicinal Plants, founded in Paris by an edict of King LOUIS XIII. on January 3, 1386, and which became the Museum of Natural History on May 23, 1794, was bombarded under the reign of WILLIAM I., King of Prussia, Count VON BISMARCK being Chancellor, by the Prussian army during the night of January 8, 1871. Until then it had been respected by all parties and all powers, national and foreign."

THE railway communication between the different parts of London would have been improved long ago if the parks did not stand in the way. Schemes have been proposed of junction lines running east and west, forming, as it were, a diameter to the Inner Circle, and thus making Oxford Street and the streets north and south more accessible than they are at present. But as a line was not allowed to pass through the park, the schemes were always found to be impracticable. Mr. LEFEVRE has, however, recognised the fact that communication in the metropolis is too important to be impeded by antiquated theories about royal property. He has approved of a project for a line between the Praed Street Station and Westminster, which will run under Hyde Park, the Green Park, and St. James's Park, the terminus being opposite the India Office. It is guaranteed by the company that the surface of the parks will be preserved from injury, that no ventilators will be visible, and that the station buildings will be according to an approved design. But if a line be permissible that shall run north and south through Hyde Park, there is no reason why one should

not run east and west, so as to connect Oxford Street and Piccadilly with lines from the remaining parts of London.

SIR WILLIAM SIEMENS, who died on Monday night, was one of those foreigners who are always welcome in England. He came to this country in 1843 to explain an improved process of electro-plating. Like many other strangers, he expected to find London paved with gold, and, knowing but little of the language, he entered the shop of an undertaker in Finsbury Pavement in search of an agent or promoter. In time he gained an introduction to the late Mr. ELKINGTON, and then found that he had been anticipated in his discoveries. By the kindness of Sir JOSIAH MASON he was enabled to experiment, and succeeded in depositing a certain quantity of silver on a dish-cover, the difficulty being to overcome the crystalline texture of the deposit, and to retain a smooth surface. Afterwards he did much to revolutionise glass and ironworks by the introduction of his regenerative gas furnaces, and his direct process of making cast steel on an open hearth is second only to the Bessemer process. The subject of electric lighting latterly engaged some of his attention, and his system is in use in the British Museum. Sir WILLIAM SIEMENS had received all the honours that are available for a man of science in this country. He was a naturalised subject since 1859.

A MEETING has been held at Chester, under the presidency of the Duke of WESTMINSTER, to take steps to provide a museum in the city for Cheshire and North Wales. The Duke of WESTMINSTER announced on the occasion his intention of presenting the greater part of the site, and His Grace promised also to contribute a sum of 4,000*l.* towards the funds for the erection of a suitable building. It was decided at the meeting that the Chester School of Art should be housed in the building, as also two societies, namely, the Chester Archaeological Society and the Chester Natural Science Society.

SIR G. B. AIRY, the late Astronomer-Royal, has again called attention to the danger arising through the buckling and springing of metal columns, especially those in railway structures. He finds one remarkable example in the Chepstow Bridge, which was designed by BRUNEL on a novel principle, and was also supposed to be an enduring work. One of the columns is now seen to be split with several longitudinal fissures; and in order to avoid an accident it is hooped in a strong but unsightly way. That column may be safe, but Sir G. B. AIRY has doubts about the strength of the remainder. The failure of one column, he considers, is enough to show that, after all, our knowledge of the strength of materials is insufficient. HODGKINSON'S experiments were on a small scale, and we are without experiment on springing and buckling, and especially on bursting—a phenomenon that appears to have been exhibited for the first time at Chepstow.

At Sevres there is an office for the testing of weights and measures, in which the most accurate results can be attained. With the means there provided it is possible, for instance, to ascertain a difference between two kilogram weights so small as 0.00000003 kilogram, or less than  $\frac{1}{300,000,000}$ th part of the whole weight. In the comparison of two mètres, a difference so small as 0.1 micron (0.0001 millimètre, or 0.0000039 inch) could be determined. At the Standards Office in London, which is perhaps as well equipped as the best offices of other Governments, it is at present not possible, with the microscopic apparatus alone, to ascertain differences in kilogram weights smaller than 0.00000005 kilogram, or  $\frac{1}{20,000,000}$ th of the whole quantity weighed; or the difference between two measures of length to less than 0.0000005 inch. The high accuracy obtained at the Sevres Bureau may be partly traced to the mode of construction and arrangement of the comparing rooms. The rooms are lined at the top, bottom, and sides with zinc, the light being admitted through overhead double windows placed at an angle of about 60 degs. There is a space of about two feet between the inner and outer walls, and the rooms have double doors. The inner wall of the rooms is also hollow, so that the rooms may be surrounded by water at a given temperature. The house, which is situated on the north-west slope of the hills of St. Cloud, is entirely built of stone and iron on deep concrete foundations, and is provided with a special double roof. An uniform temperature is maintained in the rooms all the year round.

NO. 4 FENCHURCH AVENUE.

THIS building now in progress is the most recent of four large blocks of offices erected by Messrs. COLLS & SON in Fenchurch Avenue. It stands on land leased from the Carpenters' Company, and was the last vacant site forming part of a comprehensive scheme of improvements projected jointly some few years ago by several of the City companies, for altering and almost entirely rebuilding "The Avenue" and its surroundings, and is a remarkable example of rapid and successful development. The front facing Fenchurch Avenue is executed in Portland stone, with Peterhead granite columns and pilasters, &c., to doorway. (The other elevation which faces the churchyard is executed in white Suffolk bricks, with Portland stone dressings and granite jambs to doorway.)

The interior consists of five storeys in all, and is admirably lighted, a handsome and convenient staircase and hydraulic lift giving access to each floor. The various suites of offices will be arranged and finished in a superior manner according to the requirements of tenants, part of the basement being designed for strong rooms and part for offices. The main corridors and staircases will have Formosa marble dados and marble mosaic floors. The architect is Mr. ALFRED HOWARD, of 6 Martin's Lane, Cannon Street, E.C.

HOUSES AT BEDFORD PARK, CHISWICK.

THE house in The Orchard, here illustrated by an interior and exterior view, contains three sitting-rooms, inner and outer halls, housemaid's pantry, &c., and eight bedrooms, dressing-room, and a bath-room. Local red bricks and Box ground stone have been used externally; and the building was most admirably carried out by Messrs. T. H. ADAMSON & SON, of Turnham Green, for 1,650*l.* The other house was built about three years ago. Mr. E. J. MAY, of 21 Hart Street, Bloomsbury Square, London, was the architect for both houses.

THE KING'S SCHOOL, PETERBOROUGH.

THIS illustration has been reproduced from a water-colour drawing submitted by Mr. E. W. FAREBROTHER, A.R.I.B.A. (of the firm of FAREBROTHER & ROBERTSON, architects, Great Grimsby), in a competition by invitation of the Dean and Chapter of Peterborough.

Accommodation is provided for 140 boys, including 40 boarders, the buildings all being grouped to be capable of extension hereafter, if required. The schools, corridors, and class-rooms are heated by means of GRAHAM & FLEMMING's hot-water system, and the ventilation is of the most improved system. The estimated cost of the entire buildings, including head-master's house and boundary walls, is 7,000*l.*; to be carried out in white Whittlesey bricks, with Ancaster stone dressings, covered in with Westmoreland slates, and COOPER's tile roofing.

BOLLING OLD HALL, NEAR BRADFORD.

WE publish this week a view of the south front of the fine old hall of the TEMPESTS, from a drawing by Mr. WALTER HANSTOCK, A.R.I.B.A., of Batley. The following description of the building is taken from "The History of Bradford," by JOHN JAMES, F.S.A. :—

Bolling Hall is still a stately pile. Its site is very elevated overlooking an extensive tract of country. It has two fronts. The south, and principal one (shown in the illustration), is flanked at each end by a square tower or wing, of much more ancient erection than the rest of the building, and are undoubtedly remains of the ancient residence of the Bollings. The western tower is again of a more remote period than the other, bearing all the marks of having been reared in the days of the earliest Bollings. It is far from being an outrageous conjecture in stating that most likely for the space of five hundred years the town of Bradford has been overlooked by this tower. Its apartments are, notwithstanding the lapse of time, fit for a genteel family, and it may be safely asserted that it is, as a habitable structure, one of the oldest in Yorkshire. That part of the hall on the southern front which is bounded by the tower, seems, from its large embayed windows and the general style of its architecture, to have been a work of the earlier Tempests. Anciently Bolling Hall was surrounded by an extensive park, stocked with deer. From Saxton's Map of Yorkshire, published in 1577, there appears at that time to have been only three parks in the neighbourhood paled round, viz., Bolling and Denholme, and one at Calverley. When Bolling Park was parcelled

out and enclosed, I am unable to state; it was after the manor left the Tempests. Bolling Hall has, to a sensitive and reflecting mind, connected with it many interesting associations. Its history conjures up recollections "rich with the spoils of time," contemplated either in the days of feudalism, when its lords, surrounded by their armed vassals, marshalled on the flat roof of the embattled western tower, watched the approach of a hostile force; or when the entrance-hall (now remaining, with its balcony), in the days of the Tempests was the scene of joyous festivity on the safe return of the heroes of Flodden Field and Jedburgh, and their chieftains.

OAK FIREPLACE, ETC., IN OLD HOUSE, NEWCASTLE-ON-TYNE.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE second ordinary meeting of the Institute was held on Monday evening, Mr. Ewan Christian, vice-president, in the chair. A paper was read by Mr. E. C. ROBINS, F.S.A., entitled

## Fittings of Buildings for Applied Science Instruction.

Mr. ROBINS began by remarking that he looked on the present paper as supplementary to that read by him last session on the buildings themselves, but by no means secondary in importance. In an economic view of the question it was necessary that the architect should possess from the very outset a clear perception of the structural provisions involved in the adoption of any particular system of permanent fittings. Mr. Robins said that there was a work of research to be done by the science professors before the constructive faculties of the architect could be properly brought into play; and moreover that a sound economy demanded that the very best method of doing anything from the very beginning should be the rule of those who desired the best results at the least expense. The paper was not intended to include any description of movable apparatus, which did not immediately concern the architect except so far as the position of necessary articles of furniture in a house always affected its planning; thus the position of steam, gas, electric and other machines, shafting, &c., must be prearranged. The paper was intended to take the professor's place, and be an *aide m  moire* to the architect for some of the chief permanent fittings required in chemical, physical and mechanical laboratories; but more especially chemical laboratories. Mr. Robins then went on to describe the more important fittings of physical laboratories, as illustrated by those of the Technical College of Japan, and the Finsbury College, both of which were designed by Professor Ayrton. The solid tables and working benches chiefly required in these laboratories were illustrated; also the glazed enclosures to the same, where the operator stands on a floor in no way connected with that which forms the foundation of the table at which he works, and which he can close and lock up in his absence. In respect to chemical laboratories, he chiefly, with the assistance of Dr. Armstrong, had prepared an elaborate comparative analysis of the fittings of some two dozen chemical laboratories at home and abroad, which were taken in the following order: 1. The working benches and their fittings, illustrated by a comparative table of the different laboratories and a series of large drawings. These fittings were described under the following heads: (a) dimensions and distance apart of benches and students; (b) drawers and cupboards, their shelves and locks; (c) materials used in their construction; (d) upper works, reagent shelves, &c. 2. Draught closets for general use: (a) their position in the laboratories; (b) their dimensions, area, and height; (c) the arrangement of the closing sashes; (d) the material used in their construction; (e) the extraction flues provided; (f) Dr. Armstrong's hood arrangement. 3. Draught closets for special purposes: (a) sulphuretted hydrogen closets; (b) evaporation closets. 4. Demonstration table and fittings. 5. Lecture-room fittings. 6. Preparation-room fittings. 7. Store-room fittings. 8. Classroom fittings. 9. Balance-room and library fittings. 10. Assistant's room. 11. Fittings for rooms for various special purposes: (a) gas analysis room; (b) spectroscopy and polariscope room; (c) photometric room; (d) combustion room; (e) explosion room. 12. Metallurgical laboratory. 13. Special operations room. Mr. Robins gave an exhaustive description of the reasons for and against the various representative examples, which he illustrated with numerous large diagrams drawn to a scale of a quarter full size. The paper concluded with remarks on the fittings required for mechanical laboratories with illustrations, the result of consultation with Professor Perry and others, these fittings being described under the following heads: 1. Lecture-room fittings. 2. Laboratory fittings. 3. Engine-room. 4. Workshops. 5. Melting-room and smithy. 6. Drawing office. 7. Museum. 8. Testing-room. In an appendix to the paper would appear detailed descriptions of the systems of heating and ventilation appropriate to science laboratories, exemplified by those adopted at the following institutions, viz., Finsbury College, Central Institution, Yorkshire College, Merchant Venturers' School, University College

(Dundee), and the Institution of Civil Engineers. In compiling the tables Mr. Robins was indebted to the professors and architects of the various buildings referred to for the information given, and to whom his thanks for the same were due, and, though some of the tables were not yet complete, they would be made so before the paper was issued.

Mr. WATERHOUSE, A.R.A., proposed a vote of thanks to Mr. Robins for his paper, in which, he said, an extraordinary amount of information had been collected for future use. His own name had been mentioned more than once in the course of the paper, so that he was glad to have the opportunity of correcting the impression that he had done anything in the way of designing such fittings, for he had simply followed the clear and explicit directions furnished to him; and in particular, he mentioned, by Dr. Roscoe and Dr. Thorpe. When doctors differed, difficulties increased, so that it was of great importance to know whom they had to serve before beginning the work. At times it would happen that it was impossible to know who was going to be the master before the plans were drawn up, and therefore he thought Mr. Robins's paper an important one, as it got over this difficulty. Mr. Waterhouse then observed that among the important questions to be considered, one of the most important was that of light, and instanced the arrangement at the Manchester College, where the light was so arranged that it came down between the students' tables, so that none of the students could stand in their own light. It was, however, often difficult to arrange matters, as the professor would not unfrequently insist on having things arranged in his own way. What was considered rather a feature at the Manchester College was the extra depth in the recess for the toes in the students' tables. Professor Armstrong's arrangement of the draught-places was novel, and if it proved a success would be a great step in the right direction.

Professor CAREY FOSTER said that the requirements of physical laboratories were more difficult to treat than those of chemical laboratories, as the operations were of so much more varied a character. The routine in the students' laboratory was chiefly confined to analytical operations, which did not require a large amount of space, and the apparatus required was much the same for all students. But in physical laboratories light, electricity, heat, and sound were all different subjects that required special arrangements, in order that the operations might be carried out to the best advantage; and very often elementary operations, such as might be put into the hands of a beginner, would require a great deal of room. One essential requirement was to insure such steadiness of support as would be independent of any shaking due to passage outside the building or walking inside the building itself. He was interested in knowing how this steadiness could be obtained when the ground was in tremor. The idea had occurred to him whether the system of floating support would answer, and he had thought of making the experiment. Mr. Foster concluded by a reference to the Birkbeck laboratory, the earliest student laboratory in the country, built, he believed, in 1845 or thereabouts, and which he considered had certainly been a good attempt.

Dr. THORP, of the Yorkshire College, Leeds, said he regretted the paper had not been in existence some eighteen months earlier, as it would have saved them much trouble in carrying out the college building. Comparative steadiness, he said, had been secured in buildings not originally erected for laboratory purposes by introducing heavy wood beams under the floors to bear the apparatus. One such method had been brought to his notice by Professor Andrews, of Queen's College, Belfast. Here the operator when walking over the floor only gave rise to the smallest possible tremor in the apparatus placed above the beams. His experience was that far less sink accommodation sufficed than was usually provided. It was a waste of space to furnish a sink for every table, and he considered a tolerably large rectangular sink would suffice for four persons. In most of the large towns the water pressure was pretty high, and in some laboratories care was taken to reduce the pressure, but disadvantages attended this. In Munich the difficulty was got over in an ingenious way without reducing the pressure. The sinks were shaped obliquely, so that when the water was projected into the sink it met the oblique side, and no water was spilt or splashed over the place. It might be thought that they were inclined to be faddy in many small matters; but they found from experience that if the air was kept sweet it conduced greatly to the amount of work they could turn out. The number of hours they could work in such a laboratory as at Bonn was greater than here, where numberless impurities and fumes, emitted in quantities that were trivial, at the end of the day rendered the laboratory unbearable owing to the noisome vapours. The system of draught-niches in the buttresses of the Yorkshire College had, he said, been devised after considerable thought and consultation with chemists.

Mr. SLATER seconded the vote of thanks, and spoke of the gratification it was to find such subjects brought before the Institute. Physical science was, he said, becoming more and more part of everyday life. They might not all be called on to design chemical or physical laboratories, but it was now found that in many industries it was necessary to have skilled assistants, and many firms had on their staff a skilled chemist, &c., and a proper place on the premises for laboratory operations, such as fifty years ago would have had to be done outside. On the subject of vibra-

tion, Mr. Slater said that in addition to earth tremors from railways, &c., if electric light was as it was said about to come into general use in the near future, the vibration caused by a number of stations for dynamo machines would have to be considered, and to prevent causing a nuisance to the neighbours the vibration would have to be confined within the four walls of the buildings that held the machines. Speaking of the use of fans to exhaust air, he remarked on the tendency of the edges of the blades to get worn and lose their efficiency, and this was a serious consideration where deleterious gases had to be exhausted. He strongly recommended an inspection of an apparatus he had seen in the Midland counties, an American invention he believed, called the Baker patent rotary pressure blower. It was not a fan, but consisted mainly of a series of disks revolving one upon another, and the amount of air passed could be raised from some hundreds of cubic feet to many thousand a minute, and where gas had to be exhausted it could be done without passing through the machine at all.

Professor ARMSTRONG said that looking at the immense number of buildings now erected, he considered we were remarkably ignorant in the matter of laboratory ventilation. He thought it would be of great advantage if some one would follow Mr. Robins with a description of school laboratories, the examples brought forward by Mr. Robins being all high-class ones.

The vote of thanks was then passed to Mr. Robins, and the discussion was adjourned to December 3.

## NORMAN BUILDINGS IN APULIA.

IN the *Guardian* of this week there is another article by Dr. Freeman, which contains the following description of some Norman buildings in Italy: The attractions of Trani are irresistible; a bell-tower rising as proudly over the waves as that of Spalato itself would force us to halt even if we knew nothing before of what church and city has to show us. The metropolitan church of Trani is certainly one of the very noblest examples of that singular mixture of Norman and more strictly Italian forms—not without a touch both of the Greek and the Saracen—which is the characteristic style of this region, the natural result of its political history. Strange, but striking in the extreme, is the effect of the east end of this church rising close above the sea; far more truly admirable is the effect of the inside, where the coupled columns of the Saracen have been boldly taught to act as the piers of the great arcades, and to bear up above them a massive triforium which by itself would make us think ourselves in Normandy or England. All the churches of this district have a good deal of their strength underground, and the under church of Trani is worthy of the building which it supports. The smaller church, All Saints, a charming little basilica with a portico of singular grace, as also several good pieces of domestic architecture, and the general effect of the tower, skirted with its dark arcades, all join to make Trani a place which cannot be passed by, though no august form calls on us, as at Barletta, to tarry to pay Cæsar his due homage. But Trani has found something to be said for itself both by pen and by pencil in quite other company. An accident of later times gave it a right to rank, like Brindisi itself, among the Subject and Neighbour Lands of Venice. And Trani has peculiarities of its own. The main features of the style may be studied elsewhere. We long to see Barletta, to tarry to pay Cæsar his due. We long to stop at Bisceglia and Molfetta, of which we read attractive notices; but again we must pick and choose, and Bitonto is the only place on which we can qualify ourselves to speak at all at large, till we come to the head of the whole region at Bari.

Bitonto shares a station with San Spirito, but it lies further away from the railway, and that on the inland side, than most of the towns along this line. Its main interest is found in its cathedral church, which in some points prepares us for the buildings of Bari. First of all in point of wonder, though latest in point of date, is the treatment which it has undergone at the hands of modern improvers. A dim remembrance comes to us that we saw something of the same kind in the Dominican church at Perugia; otherwise we ask in amazement why any man should think it an improvement to cut off the whole upper part of a church as seen inside by thrusting in a roof a great deal lower than the original one, and thereby leaving the upper stages outside to stand up in the air, serving no kind of purpose. Yet this has been done both at Bitonto and at Bari. Yet perchance the improvers of modern times might retort on the original architects, and ask why, when they had made three apses at the east end, they presently built up a wall to hide them. This is the arrangement both at Bitonto and in the two great churches of Bari. The notion of Normans working in Italy would almost seem to have been to make an Italian front at one end, and something approaching to a Norman front at the other end. Thus the church of Bitonto has an excellent west front of Italian outline, with details more Italian than Norman, and with the characteristic round window evidently designed from the beginning, though the one which is actually there must be of later date. And there either has been or has

been meant to be a portico over the lower stage of the west front—a thoroughly Italian notion. But the east end takes almost the form of a Norman west front; a Norman founder, it would seem, was not happy unless he could somewhere or other get two towers with an ornamented wall between them. To this end the apses are sacrificed. Instead of the three curved projections which form the main features of so many Italian, German, and indeed Norman east ends, the whole east end is flat. The side apses are disguised by towers, one only of which is carried up to any height, while the great apse is hidden by the wall between the towers. Herein is the difference between Bitonto and Trani. At Trani there are no eastern towers, and the apses, though of amazing external height, and no less amazing slightness of projection, are still real apses with a real curve. At Bitonto no one could know from the outside that there were any apses at all. As the ordinary ranges of arcades and windows are thus made impossible, the architect, like an English architect some generations later, threw his strength into a single east window, and certainly made one as large and as rich as was possible before the invention of tracery. An elaborate round-headed opening is covered with rich devices, and has wonderful monsters to bear up its side-shafts. This, too, is to be seen at Trani, and we shall come again to other examples at Bari. There is something very strange in these attempts to reconcile the ideas of Normandy and of Italy in one building. But in these flat east ends the result is that we get something which is certainly neither Italian nor Norman, and which can hardly be approved according to any law of either reality or beauty.

The same spirit of compromise goes on in other parts. The endless columns of the under church supply a rich study of capitals, largely of the grotesque kind. Men, monkeys, the original ram's horn, leaves, the Imperial eagle—better suited for the purpose than anything else—all do duty as volutes. The columns in the upper church, too, give another rich collection of various kinds of human, animal, and vegetable forms. But here a soberer spirit reigns; though perhaps no one capital is strictly classical, yet the grotesque does not reign as it does below. Three arches from columns, a solid block, three more arches from columns, make up the nave. Over these Italian elements Norman taste set a triforium; modern taste has hidden the clerestory. Outside the Italian has his way in the rich, open arcades of the parapets and in the windows of various forms, filled, some of them, with that kind of pierced tracery which is neither Italian nor Norman, but distinctively Oriental, and which look as if they had come—as they possibly may have come—from a mosque.

Altogether, there is something singularly interesting in this mixture of styles—more strictly, this mixture of two varieties of the same style, for Italian and Norman Romanesque are, after all, members of one great artistic family. Nothing of the kind happened in Sicily, where the Norman kings simply set native craftsmen, Greek and Saracen, to build for them after their several native fashions. Here, in a land where Greek and Latin elements were striving for mastery, where the Saracen was a mere occasional visitor, the Norman brought in the ideas of his own land to make a new element. But, if nothing like this happened in Sicily, something a little like it did happen in England. There is no doubt that Norman architecture was influenced, though very slightly, by the earlier native style of England, a rude imitation of Italian models. That Norman architecture in Apulia should be far more deeply influenced by the Italian models themselves was but carrying out the same general process, as was only natural, in a far greater degree.

#### EDINBURGH ARCHITECTURAL ASSOCIATION.

THE usual fortnightly meeting of this Association was held on the 14th inst., the president, Mr. David MacGibbon, in the chair. Before commencing the business of the evening, the president alluded to the great loss the association had sustained in the recent death of Mr. Lessels, one of the oldest and most esteemed of its members. Although Mr. Lessels had not been very long an enrolled member, he had for years taken a great interest in the proceedings of the Association, and they would all recollect the cordial and enthusiastic manner in which he promoted the architectural exhibition of last winter, and how greatly his exertions tended to its success. He not only contributed many beautiful works from his own hands and from his own collection, but also most successfully exerted his influence amongst his friends in securing many important contributions. They were also greatly indebted to him for much valuable advice, which his long experience enabled him to give them. Mr. Lessels' death would create a blank not only in the Association, but also in the architectural profession and in the city, for he was most cordially esteemed by all who knew him, not only as an eminent architect, but as a true and upright citizen. During the long period of about forty years in which he had practised in Edinburgh, his ability, together with his perfect honesty and fearless impartiality, had gradually raised him, in spite of many adverse circumstances, to a high position amongst his fellow citizens. This was not the time to

allude to Mr. Lessels' many important professional and artistic works, but he trusted an opportunity would be given to the public of seeing these as a whole. He was satisfied that, much as Mr. Lessels was esteemed, his modesty prevented his great merits as an architect and as an artist from being fully recognised and appreciated. He believed that an exhibition of all his works would be very satisfactory both to the profession and the public, and would have the effect of still further raising his memory in the estimation of his fellow-citizens. He now proposed that they record in their minutes their deep regret at the loss of so valued and respected a member, and that it be remitted to the council to communicate with Mr. Lessels' family to ascertain whether an exhibition of his architectural and artistic works would meet with their approval; and, if so, offer the assistance of the Association in considering what steps should be taken in the matter. Professor Baldwin Brown then proceeded to deliver his lecture on "The Basilica and Domed Church of the Fourth to the Ninth Centuries." He began by describing the various constructive forms, such as the arch, the vault, and the cupola, which were in use in the Roman world at the time of the rise of Christian architecture. Remarking that the development of the rectangular stone vault belonged rather to the Romanesque than to early Christian times, he traced the steps by which the architects of the early centuries perfected the construction of the cupola, and combined it with other features to suit the exigencies of Christian worship. Examples of the two great classes of early Christian buildings, the basilicas and the domed churches, were then reviewed, and their main characteristics explained by the aid of photographs and drawings. A brief sketch of the history of Byzantine architecture, and of its influence in the west, concluded the lecture.

#### THE VIKING'S TOMB.

AN account has been given by Mr. James Rutland (the secretary of the Berks Archæological Society) of the results of the excavation of the tumulus in Taplow churchyard.

After four days' work the first indication of an interment was the finding, at a depth of 20 feet from the top of the mound, a quantity of gold fringe,  $\frac{3}{8}$  inch and  $\frac{1}{4}$  inch wide, lying in an oblique direction across the grave. The fringe was about 2 yards in length, and doubtless formed the embroidery to a cloak or mantle which was fastened at the shoulder by a large gold fibula or buckle, of exquisite design and workmanship, and jewelled with garnets, which lay close to the fringe. It is in the most perfect state of preservation, measures 4 inches by 2, and weighs 4 ounces. This brooch-buckle is of the cross or Tau-shaped form, and Mr. Wright in his "Celt, Roman, and Saxon," considers the round buckle as peculiar to the Jutes, and the cross-shaped to the Engle. About 20 inches from it were two smaller gold buckles, measuring  $4\frac{3}{4}$  inches by  $1\frac{1}{2}$  inch, and of similar workmanship. Towards the centre of the grave, the dimensions of which were 12 feet by 8 feet, were an iron double-edged sword, 30 inches long and  $2\frac{1}{2}$  inches wide, in a wooden scabbard; two iron spears, one 26 inches in length, including its socket, and another about 10 inches long; two knives (sceax) in wooden sheaths; and an iron ring  $4\frac{1}{2}$  inches in diameter. In the north-east corner were two iron umbos or bosses of war shields, each 5 inches wide and  $3\frac{1}{2}$  inches high. On the south side of the fibula was a magnificent bronze vessel or vase, 12 inches in height and 16 inches in diameter, the dish of which is twelve-sided, with knobs at the angles, and with a massive drop-handle of Roman design, and probably of Roman workmanship, on either side; the stand which formed its base contained a quantity of carbonate of lead, probably to give it solidity. Underneath it was a small drinking-horn, with silver-gilt terminals and bands. Near it lay the fragments of a glass vase; and also a bucket 12 inches in diameter, with iron frames and ash-staves, strengthened on the outside by bronze bands, with horse-shoe ornamentation and radiating points stamped upon it.

In the centre were the crushed remains of a large bucket or tub, 24 inches in diameter, with iron frame, but covered with plain bronze. When first it was uncovered, its circular form led to the impression that it was a bronze shield, but on more careful examination of the fragments the true character of the vessel became apparent. It contained the fragments of two glass drinking-cups, each 11 inches high and 4 inches wide at the mouth, and with ten pear-shaped drop ornaments in alternative lines round the body of the cup. The glass is thin and of a greenish tint, and is ornamented round its upper part with fine parallel lines. In it were also two large drinking-horns, with massive silver-gilt terminals and bands; two silver bands, richly embossed, which may have been ornaments to the horns or lips of drinking-vessels, as they seem to have been lined with thin wood of a very peculiar cork-like texture; and two large silver-gilt rings,  $4\frac{1}{2}$  inches in diameter and 3 inches wide, with deeply radiated edges of twelve points. These latter might be, if not armlets, either the rims of the drinking-horns or those of wooden beer-cups. On the north of this mass was another bucket of similar dimensions and character to that on the south side of the fibula.

To the west of the large vessels—that is, at the foot of the

grave—were the fragments of another glass drinking-cup and of a small drinking-horn, similar to those already described; a silver gilt ornament of crescent shape, about 6 inches long; and, lastly, about thirty circular hollow rings of ivory, about one inch high, the ends of which were closed by ivory discs united by a silver pin. These may have been draughtsmen or counters for a game. There were very few fragments of bone, but on a line about north-west and south-east, and therefore parallel to the sword, were fragments of vetebræ, much broken and decayed. Throughout the body of the mound were numerous well-wrought flakes, scrapers, hammer-stones, and cores of flint, and fragments of pottery of possibly Celtic and certainly Roman, Romano-British, and Saxon character. The hill-top must have been an ancient occupation site far back into prehistoric time. It is gratifying to know that Mr. A. W. Franks, F.R.S., F.S.A., Keeper of Antiquities at the British Museum, who has inspected the relics, holds a very high opinion as to their archæological value; and that, at his suggestion, and with the concurrence of the local authorities, they are shortly to be added to the national collection.

### GLASGOW PHILOSOPHICAL SOCIETY.

THE opening meeting of the Architectural Section of the Philosophical Society of Glasgow was held on Monday, Mr. James Sellars, the president, in the chair.

Mr. Sellars, in opening the proceedings, congratulated the section on the auspicious opening, and the fact that they were likely to have an interesting and instructive year. The paper to be read at next meeting by Mr. Honeyman on better dwellings for the working classes was one that at present was agitating the whole country, the highest in the land taking an interest in it. Mr. Honeyman's paper was to deal with free spaces in densely populated districts, a subject which had a direct bearing on the important question of such dwellings as he had referred to. At the conclusion of his address last year the speaker referred to that subject, and it was his intention, unless it was whipped dry by that time, to return to it and endeavour to put it in some practical shape, and offer some suggestions with regard to it. Another matter to which he alluded at the close of last year was the Police Bill, when he advocated its division into two parts, or rather the withdrawal from it of all building regulations. While he was of opinion that the building regulations would be better if separated from a Police Bill and made the subject of a special Act, it did not appear to him that that would involve any material alteration in the constitution of the Dean of Guild Court. That body would have plenty of work in seeing that the provisions of the Act were properly carried out. They would practically be in the position of the Metropolitan Board of Works, who, with the assistance of an advising surveyor, assisted by district surveyors, see to the provisions of the London Building Act being properly attended to. He had noticed that the late Lord-Provost, who had taken a deep interest in the Bill from the beginning, had, if he was not mistaken, come to be in favour of the separation. In these circumstances he hoped that the idea would be carried out. The Glasgow Institute of Architects were endeavouring to frame a rough draft of such a Bill, which was intended to be laid before the Lord-Advocate, and there was a likelihood that to some extent their views would have full consideration.

Mr. John Hay read a paper on "The Application and Comparative Value of the different kinds of Air-warming Apparatus." In the course of his paper he pointed out that to insure more genuine interest in air-warming, increased attention should be given to certain laws as the basis of all legitimate improvement—chiefly that as to the distinction between radiated heat and heated air; that the warm air in any building if in sufficient quantity and quality would naturally absorb the full quantity of moisture it could hold in solution without the need of special evaporation; that the atmosphere was heated only by contact with a warm substance; that iron was generally the material used when artificial heat was wanted, and that iron was a slow conductor of heat; that upon the distinct recognition of that fact lay the whole question of the value of the different methods of air-warming; that the quality of the atmosphere heated by the best gill-stove was equal to that from the best hot-water apparatus.

Mr. Douglas agreed with Mr. Hay as to the great value of the gill-stove, and in his opinion it was most unfortunate that it had gone out of fashion, and that there was a great running after hot-water pipes. He considered that the gill-stove acted most admirably in many of the lofty cathedrals in England, just from the principle of the diffusion of gases—the air being warmed rose up and caused the cold air to come down. In cases where hot-water pipes were used failure had often occurred through trusting to radiation, for unless means were taken to get the air to pass over the pipes, they would be almost useless.

Mr. Walter Macfarlane said that it was almost impossible to get a uniform temperature in a large building, because heat could not be bottled up but must travel. Wherever there was a heating apparatus, there ought to be a chamber in the roof of every build-

ing where the foul air was drawn out, and at the same time a certain amount of fresh air let in.

After some further discussion,

Mr. Hay replied and combated the statement of Mr. Macfarlane. He said he had had to do with between 300 and 400 churches, and with the exception of one at an odd time, he had always given his written guarantee that he would give 55 degrees, diffused alike over all parts, and that, too, obtainable in the coldest weather. As an instance he mentioned Montrose parish church, where the heat at the close of the forenoon service was found to be 60 degrees in the body of the church, as well as in the highest part.

On the motion of the chairman, a hearty vote of thanks was awarded to Mr. Hay for his paper.

### PROPOSED WORKS IN LONDON.

THE Metropolitan Board of Works have given notice of their intention to apply in the ensuing session of Parliament for an Act for further amending or repealing the Metropolitan District Railway Act, 1881, and to compel the railway company or authorise the board to close the following openings made by the company under the authority of section 12 of the Act mentioned: In Victoria Street, near the company's Victoria Station; on the roadway of the Victoria Embankment, opposite Montague House; in the gardens of the Victoria Embankment—1, near the east end of Whitehall Place; 2, between Charing Cross and Waterloo Bridges; 3, near and to the west of the Temple Station; and 4, between the Temple Station and the Temple Gardens. The Act will make provision for the payment by the board or the company of the expenses incurred in the making and closing of the openings, and the removal of all buildings or erections connected with them.

By another Bill the board will ask for powers to enable them to provide a new means of communication across the Thames. The works comprise a road commencing on the northern side of the river at a point in the road known as Upper East Smithfield, near the gateway forming the entrance to the London Docks, continuing thence partly on and partly near the side of Nightingale Lane, passing under the river by a tunnel (below mentioned) and terminating in Bermondsey at or near the intersection of Abbey Street and Dockhead; a road commencing by a junction with the last-mentioned road, in Dockhead, and terminating near the Dockhead Distillery by a junction with Tanner, near its junction with New Street; the widening of this street to its junction with Fair Street; a tunnel for carriage and general traffic, by means of which the first-mentioned road will be carried across the river, commencing at the junction of Burr Street with Nightingale Lane, and terminating in Dockhead; a tunnel for foot traffic in connection with that just described; a roadway ("C") on the northern side of the river, commencing in Lower East Smithfield, at its junction with Nightingale Lane, continuing thence to and over the tunnel first described at its commencement, and thence to and terminating in Upper East Smithfield at or near its junction with Dock Street; a roadway commencing by a junction with the road "C," at or near the northern corner of the Red Lion Brewery, and terminating by a junction with Upper East Smithfield, at or near the entrance to the London Docks. Powers are asked to enable the board to construct and maintain all necessary and convenient lifts, machinery and incidental works, "and to provide by means of horses, mechanical, or other power, aids for traffic on the inclines of the said roads, tunnels, or subways." By the same Bill the board will ask for authority to enable them to maintain and work a ferry across the river at Woolwich, and a ferry between the Isle of Dogs and Greenwich; to widen Nile Street, Woolwich, from its junction with High Street to the river; to alter the situation of the new Battersea Bridge; to widen Battersea Bridge Road; to remove the old Battersea Bridge for the purpose of constructing the new bridge; to enable the board, for the purposes of any of the works authorised by the Act, to alter and interfere with the bed and foreshore of the Thames, &c.; and to purchase, by compulsion or agreement, any property required.

In a third notice the board intimate their intention of applying for leave to introduce a Bill to extend the powers of section 144 of the Metropolis Management Act, 1855, and to authorise the board "to promote or oppose in Parliament any Bill or Bills relating to the supply of water in or near the metropolis, or relating to any company having powers of such supply, or to all or any part of the undertakings of any such company, and to prosecute or defend any legal proceedings which the board may deem necessary or proper for the public benefit of the inhabitants of the metropolis having reference to the supply of water or to any such company."

Authority will be asked by another Bill to alter so much of the Metropolitan Fire Brigade Act, 1865, as relates to the contributions towards the expense of carrying the Act into effect, which are to be paid by insurance companies insuring from fire property in the metropolis, and to fix the companies' contributions on a new basis. Powers are also sought to alter the provisions of section 22 of the Board's Loans Act, 1869, which prohibits them from estimating

as required for the general purposes of the Fire Brigade Act, 1865, any larger sum than would be produced by a rate of  $\frac{1}{4}$ d. in the pound on the gross value of the property assessed to the Metropolitan Consolidated Rate.

The board further intend in another application to ask for authority enabling them to extend their powers under the Metropolitan Street Improvements Act, 1877, for the compulsory purchase of lands for improvements authorised by this Act, but not completed; to enable the board to make new streets from Kentish Town Road to Great College Street, St. Pancras; connecting Cotton Street with Preston's Road, All Saints, Poplar; and an extension of Great Guildford Street to Bankside, Southwark; to purchase Sot's Hole, Plumstead, and two fir plantations on Hampstead Heath; to confer further powers on the board as to Hackney Commons, and to vest them absolutely in the board; to alter section 33 of the Metropolitan Street Improvements Act, 1877, so far as relates to the new street (authorised by this Act) from Southwark Bridge Road across Queen Street and Duke Street, to Mint Street and Blackman Street; and to repeal or modify section 9 of the South-Eastern Railway (New Lines and Widening) Act, 1882, and to define and fix the respective positions of railways Nos. 1 and 2 authorised by that Act, or to require the railway company to define the position of their intended railway so far as it will affect the street referred to.

### ARTISANS' DWELLINGS.

A PARLIAMENTARY paper has been issued, giving a return from the London Commissioners of Sewers, from the Metropolitan Board of Works, and from such urban sanitary authorities as have received official representations under the Artisans' Dwellings Act, of the number of official representations made to them of the number, size, and locality of the areas to which they relate, &c., and similar returns from Ireland and Scotland. The Commissioners of Sewers of the City of London report twenty-two areas as having been either dealt with, or as being dealt with; while the Metropolitan Board of Works give full details regarding thirty-three areas, with the addendum that "the moneys borrowed for the purpose of the Act amount in the aggregate to 1,360,500*l.*" Birmingham, with a population of 400,774, is entered as having had two official representations made to the Urban Sanitary Authority under the Act—one on October 1, 1875, in regard to an area of 43½ acres in the Market Hall Ward; and another on November 9, 1875, in regard to 49½ acres in St. Mary's and St. Stephen's Ward. The improvement scheme affecting these two areas was adopted on November 10, 1875, and the confirming Act having been since passed, the scheme is now being carried out. The amount of money borrowed was 1,500,000*l.*, and the estimated cost is 1,344,000*l.*, with a net amount of 550,000*l.* Walsall, with a population of 58,795, has made one official representation on September 5, 1876, in respect of 2½ acres in Townsend Bank and neighbourhood. A scheme was adopted on October 30, 1876, and the local authority have now purchased the whole of the property comprised within the area of the scheme, and have demolished all the whole buildings, and have resold or leased the greater portion of the land available for resale. The amount borrowed under the Act is 15,000*l.*, the estimated cost 17,000*l.*, and the net estimated cost 10,510*l.* Wolverhampton, with a population of 75,766, has made one official representation on February 29, 1876, in respect of 11½ acres near the centre of the town. Two schemes were adopted—on July 4, 1876, and August 7, 1876—and the whole of the property referred to in the scheme has been purchased, and some part of it resold. Several new streets have been made, and others improved. The amount borrowed under the Act was 207,350*l.*, and the estimated total cost of the work is 162,307*l.*, and the net cost 45,307*l.* At Derby the estimated cost is 37,774*l.*; at Devonport, 3,500*l.*; at Liverpool, 62,254*l.*; at Newcastle-on-Tyne, 18,300*l.*; at Norwich, 20,800*l.*; at Nottingham, 35,500*l.*; and at Swansea, 11,044*l.* The Act is under consideration at Brighton, Dover, Exeter, Hastings, Nottingham, and Sheffield; while at Jarrow-over-Darwen and Whitehaven the Act has been made applicable by local Acts. In Ireland the Act has been applied to Belfast, Dublin, and Cork, but not to Limerick or Londonderry. The part of the paper referring to Scotland notes the fact that the Scottish Act applies only to such Royal and Parliamentary burghs as had a population of 25,000 or upwards at last census. The town clerk of Edinburgh states that "he has no return to make," the city having an Act of its own. In Glasgow, also, it is stated, the Act has not been put in operation, the Corporation having obtained a Local Improvement Act in 1866, "under which large areas occupied by the artisan and labouring population have been entirely reconstructed and improved." The local authority of Dundee "has received no official representations under the Act." The Police Commissioners obtained a special Improvement Act of their own, now consolidated with other Acts, and entitled the "Dundee Police and Improvement Consolidation Act, 1882," and they have already demolished portions of the most densely-populated districts in the ancient burgh of Dundee, and reconstructed them." Aberdeen

reports—"No official representation under the Act;" Paisley, that "the Act has not been put in force; there is a Local Improvement Act, which was passed in 1877;" and Perth, that "no official representations under the Act have been received, and the Act has not been adopted." From Greenock and Leith only there are returns. In the case of the former, official representation was made on March 20, 1876, and related to a total area of about 2½ acres in the low-lying and central part of the town, between the Vennel on the west and the East Quay Lane on the east. The area as to which resolutions have been passed or for which improvement schemes made extends to 3½ acres, and includes the district already mentioned, a little enlarged to afford proper accesses to the unhealthy areas. The local rate is 3*d.* per 1*l.*, and the whole of the loan applied for from the Public Works Loan Commissioners, amounting to 115,000*l.*, has been duly received and applied for carrying out the purposes of the Act. "All the unhealthy and insanitary properties scheduled under the Greenock Improvement Provisional Order Confirmation Act, 1877, have been acquired, the titles completed, and the prices paid or consigned in bank. The old buildings have in most cases been cleared away, and the street improvements effected. New dwelling-houses for the artisan classes, with proper sanitary arrangements, have been erected, and are fully let. On account of a depression in the property market a number of building sites remain vacant, and the Local Authority are endeavouring to have them disposed of." In Leith, the two areas respecting which official representations have been made extend respectively to nine and eight acres, the first being bounded by Yardheads, Giles Street, and King Street; and the second by Giles Street, Kirkgate, St. Andrew Street, and Sheriff Brae, including Coal Hill. The Local Authority, on April 27, 1883, state: "The Local Authority will be in possession of the whole properties at Whitsunday 1883, the arbitrator having issued his provisional award, and the final award is expected soon. One of the areas into which the scheme has been divided will soon be exposed to feu. A loan of 70,000*l.* has already been received from the Public Works Loan Board, and other 30,000*l.* is being applied for, the estimated recoupment not yet being available."

### ENGLISH MEASURES OF LENGTH.

THE present standard of linear measure appears to have been re-established in 1324 by a Statute of Edward II., which ordained 3 barleycorns, round and dry, make an inch, 12 inches a foot, 3 feet a yard, or *ulnam*. By other statutes and decrees, particularly the Statute 31 Edward III., st. 1 ("Tractatus de Ponderibus et Mensuris"), provision had been made for maintaining uniformity of measure. The Statute of 1324 appears, however, to be the first in which the unit of linear measure was more accurately determined. In the reign of Henry VII. several Statutes were passed relating to uniformity of measure, under which new standards were made, and copies sent to the different county towns throughout England. The standard yard of Henry VIII., 1496, still exists, and is probably of the same length as the old Saxon yard. This ancient standard is a bronze rod, the length of the yard being the distance between the ends of the rod, and it was in constant use for the verification of other yards until the reign of Queen Elizabeth. After allowing for the estimated wear of the standard, it is found to be of the same length as the present standard yard. In 1601, in consequence of a Royal Roll addressed by Queen Elizabeth to the Barons of the Exchequer, new standard measures were made, including a yard (36 inches), and an ell (45 inches), subdivided into inches, twelve of which made a foot. There is no record of the mode in which these standard measures were constructed, but as Queen Elizabeth's measures of length have always been found to agree nearly with those of Henry VII., it is supposed that they were copies of the more ancient standards.

The standard yard of Queen Elizabeth remained the only legal standard yard until the passing of the Act 5 George IV., c. 74, 1824. The committee of weights and measures of 1750-60, of which Lord Carysfort was chairman, reported, however, that Queen Elizabeth's standards were very coarsely made, the divisions on them not being exact, the rods being bent, and, therefore, very bad standards. The committee being informed that in 1742 the Royal Society had with great pains taken an exact measure of these standards, caused new standards to be made, which were compared with the Royal Society's standard. One of the new standards thus made was sealed up by the committee and delivered into the custody of the Clerk of the House of Commons; another of the standards being kept at the Exchequer office for common use in sizing legal yards.

Although the standard of 1758-60 was not referred to for general use, there is no doubt it was for many years regarded as the scientific representative of the standard yard, and in 1824 an Act was passed declaring that after May 1, 1825, the straight brass rod in the custody of the Clerk of the House of Commons, whereon the words and figures "Standard Yard, 1760," were engraved, should, at the temperature of 60° Fahr., be the original and genuine standard of that measure of length or lineal standard called a yard, and that one-third of such yard should be a foot

The standard yard (1760) deposited in the House of Commons then continued to be a legal standard until the burning of the House in 1834. In 1838 the Chancellor of the Exchequer appointed a committee to replace the standard destroyed, and in 1855 the Act 18 & 19 Vict., c. 72, was passed, declaring that the straight line or distance between the centres of the two gold plugs in the bronze bar deposited at the Exchequer should be the genuine standard of length. By the Weights, Measures, and Coinage Act, 1866, the standard yard was transferred from the Exchequer to the custody of the Board of Trade. In 1878, by the Consolidating Act 41 & 42 Vict., c. 49, the bronze bar (1855) deposited with the Board of Trade was continued as the Imperial Standard Yard, and it is still the standard for determining the yard measures of this country. The standard of Henry VII. has thus been continued down to the present time without legal or practical interruption.

### THE LANCASHIRE ROMAN ROAD.

A SPECIAL meeting of the Lancashire and Cheshire Antiquarian Society was held on Tuesday, for the purpose of discussing the subject of the Roman road over Blackstone Edge.

Dr. Colley-March said he held that the road was Roman in all its physical characteristics. Its size, strength, and solidity indicated that it was designed for a very considerable traffic, while a structure so massive and costly could hardly have been made by other than a wealthy and imperial power. The manner in which it was made appeared to be Roman. The foundation was of sand and rubble, and in this the stones of the causeway were bedded. The pavement was convexly arched from side to side, and its centre was formed by a line of large blocks of millstone grit to where the ordinary setts were built up, while these were supported on the outside by buttressed curbstones. The mode of foundation drainage was also Roman, and was that of a bilateral foss, a ditch on either hand. It was the filling up of these dykes by rain wash that had caused so much of the road, especially on the eastern side, to be covered by bog and peat. The route or direction, too, was Roman. It ascended the steepest slope not only without winding, but in a line at right angles to the crest of the hill; and he was not aware of any pack-horse track in the kingdom of which this could be stated. Besides the evidence of antiquity furnished by those portions of the road that were left, there was that which was afforded by all the important parts that were gone. In the neighbourhood of Blackstone Edge were places where the road must have crossed a stream, and where there was now no trace of a bridge. English roadmakers had usually built bridges of stone, and if the causeway under discussion was constructed or even used in anything like modern times such a total evanishment of all corresponding positive remains would appear well-nigh inexplicable. On the other hand if the road was Roman they might suppose either that its bridges having been of wood had disappeared by natural decay, or that the present streams having cut their course since Roman times no bridging was then required. Not the least striking evidence of antiquity was the fact that on the eastern portion of the road, and at a spot from which all wrought stones had disappeared, was "The Devil's Pavement." A name of that sort might be taken to indicate that the paved road once passed in that direction, but that its structure was so different from the familiar pack-horse tracks of the district that it could have been the work only of malignant powers. The western portion of the road was the most interesting from its containing a line of trough stones which occupied the centre of a causeway 16 feet across, or, measured within the curbstones, a compact paved roadway 15 feet wide. The gradient was about 1 in 5. Dr. March discussed two theories with regard to the trough stones, the pedal or foot furrow theory, and the skidding theory. A pack-horse track of a highway was, he observed, called a "pack and prime way." Such roads were made of a series of thick transverse blocks of millstone grit, on which horses walked, and which they often wore into deep furrows. There was a side pavement for foot passengers, and no provision for wheeled vehicles. It was difficult to conceive that a driver could compel his galloways, or that they would themselves prefer to toil up a gradient of 1 in 5 in a mathematically straight line and on a perfectly smooth surface—because if the furrow was made by horses' feet the stones must have been once entirely without a groove—where they could wind to and fro on a spacious and even road whose pavement afforded ample foothold. Something had been said about a "straddle mark" at the bottom of a pack-horse furrow. There was sometimes the faintest possible indication that the furrow had been made by two feet. He had made many examinations but he had never seen a stone, much less a line of stones, in a pack-horse furrow with a genuine convex bottom. Its usual shape was a true and even concavity. In the western slope of the Blackstone Edge he doubted if there was one stone which presented an even concavity. The wheel ruts, he maintained, though variable in appearance, were constant in position. The size of the ruts, taking the narrowest as a guide, showed that the wheels that wore them were 2 inches broad. A Roman chariot wheel with the woodwork petrified had been found at Portici.

The tire was of iron and measured 48 inches in diameter, 1 in thickness and 2 in breadth. Dr. March pointed out in detail the position of the wheel-ruts with regard to the furrow as supporting the skidding theory. That the skidding theory should be true it was necessary that the gradient should be sufficient to make the brake power desirable; that the trough should present a planed appearance rather than, or, if they pleased, as well as a trodden one, that the wheel-rut on the road should correspond with it, and that it should be absent or bear different characteristics on the summit of the hill. On the summit of the hill there were no trough stones at all. In some parts it seemed occupied with disturbed setts, in another part was a causeway 12½ feet broad, with a central line of stones, but smaller than the troughed ones, and either not grooved at all or very slightly worn indeed. It was here, according to one writer, that pack-horses, overcome by fatigue, lay down to rest. Happily, the skidding theory was not exclusive. Everything should be admitted. In this trough might have revolved the wheels of waggons that had to be kept by such means from quitting the road in the frosts of winter or the obscurity of the night. In this trough the rains that it received might have trickled down in such wise that though it could not have drained the road, at any rate it drained itself. In this trough in Indian file might have marched many legions of Latin soldiers leaving behind them not so much "footprints on the sands of time" as impressions on the millstone grit of a swaggering imperial straddle. In this trough might have toiled the patient pack-horses of the country, millions of them, with acquired tastes for inherited tendencies. In this trough might have shuffled the sandals of eminent Roman guides whose midnight mission it was to lead over a mountain pass, under cover of darkness, the conquerors of the world who dared not cross by day. All he contended for was that in this trough, and on this gradient, not only skidding was practised, but that it must have been and that it was.

Mr. Blomfield, Scott, and Street.

SIR,—Mr. Blomfield is very indignant that anyone should write anonymously to find fault with any works of Scott or Street. Let me quote a few instances *within my own knowledge* of their failings, and ask Mr. Blomfield if he can palliate them. Scott destroyed all the historical value of the choir of Ripon Minster, by moving the fourteenth century sedilia out of their place, and setting the altar against the east wall. At Edwin-Loach he built a bit of Chartres cathedral within a few yards of the Early Norman church, which wanted no more than a new roof. I myself found and put together the bowl of the Norman font; the vicar assured me that Sir G. Scott never once came near the place. As to Mr. Street, does Mr. Blomfield know what he did about Christ Church Cathedral, Dublin, or about Sir Tatton Sykes' churches, in both which cases he had no limit as to cost? In the former case the drains in the crypt were made without any outlet, although it stands on the side of a hill; and the crypt used to fill with water until another architect had to be employed to rectify his blunder—for Street vouchsafed no reply to about fifty letters sent him on the subject. On Sir T. Sykes' property, West Heslerton church (new) has no provision for an organ; and in the vicarage, the rain poured through the roof, and neither windows nor doors were windproof. At Weaverthorpe snow came through the roof, because no felt was laid under the lead. At Luttons, a belfry staircase was forgotten, the bell-ropes could not be mended, and a brass screen, designed by Street, and costing Sir T. Sykes 500*l.*, was *painted* over, because it did not harmonise with his reredos. At another church, near Driffield, a Norman font was buried, to make way for a new alabaster one. The same sort of thing happened at St. John's, Torquay, where the interior was flooded through not using cement for the exposed walls. Your readers will remember that the chief opponents of the high-pitched roof at St. Albans were Messrs. Street and Christian—the very people who copied it at Southwell, making, however, the only mistake possible in a lead roof, viz., putting a straight roll along the ridge.

Let me also ask Mr. Blomfield himself if he remembers a church tower at East Sheen which fell down? And if he is the architect of a tower now being built near Worcester—to contain a peal of bells, the tenor of which is to be 3 tons—with walls 3 feet thick and the tower only 14 feet square?

Very different was the way in which another architect, systematically snubbed by the Royal Academy—Mr. Burges—carried out his works. Every stone of Cork Cathedral and his churches near Ripon bear witness to his thought and care.

Allusion was made in your columns to a reredos in a Hertfordshire private chapel—that of Mrs. Gerard Leigh, at Luton Hoo. In that case Street allowed the sculptor (Woolner) to make his bill

and his reredos so big that the lady carted it away, and it is now at Manchester.

The addition of my name to this would convey nothing to Mr. Blomfield. You, sir, can assure him that I am not Sir E. Beckett, and

NOT AN ARCHITECT.

November 17, 1883.

#### Plain Speaking.

SIR,—According to Mr. Blomfield's letter in your current number, everybody who expresses in print an opinion under a *nom de plume* does a dastardly act. He is, it seems, to be regarded as a cur dog, who barks behind railings in safety, and should be passed by in silent contempt. All this, forsooth! because some one happens anonymously to differ from Mr. Blomfield on a professional question, in which there is nothing personal between them. Your correspondent, in withholding his name, has done precisely that which, under like conditions, is, by universal rule, conceded as fair and at the writer's option. It is true that a man may conceal his name under motives of malice, but it is equally true that he may do so under a laudable avoidance of self-assertion. *Per contra*, he may publish it worthily or in contemptible quest of publicity under motives of vanity.

Your obedient servant,

November 20, 1883.

NEMO.

SIR,—I was afraid that Mr. Blomfield would have attacked me in the vein of Hercules or Ancient Pistol, and then of course there was an end to the "Plain Speaker" and his heresy. But I felt more at ease when I saw that he appeared in the rôle of a philosopher who was created in order to make people smile. Everyone who has seen the "School for Scandal" must have recognised at once the source of the pair of sentences with which I was chastised last week, and many were probably amused to find that the moralities of Joseph Surface supply the place of a "Ready Letter Writer" in giving inspiration to Mr. Blomfield. There is an unmistakable likeness between the sayings of the man of sentiment and that aphorism about the canine character of every writer who does not care to advertise himself by means of signed letters. The philosopher would be proud of a disciple who could formulate that wonderful sentence and its companion about the "no man" who does something or other. In both we have not only lofty ideas, but the well-chosen words abounding in r's and s's, by means of which Virtue, when aided by good emphasis, becomes triumphant on the stage. Sir Peter Teazle, who, like myself, was once an admirer of wisdom of this kind, says that there is nothing in the world so noble as a man of sentiment; and who, with Mr. Blomfield's epistle before them, could be of a different opinion? although he evades the difficulty of writing a reply by the easy plan of objecting to unsigned letters. But nobility is not to supersede truth and common sense.

I take the liberty of maintaining against Mr. Blomfield that one may withhold one's name from a letter in a newspaper without being afraid or ashamed. Letters of the kind might be said to be an English institution, for they are as old as the newspapers. They are found in the *Spectator* in the early part of the eighteenth century, and in the *Times* of the end of the nineteenth century. Some of the greatest and most honourable men and women have written in that form, and, knowing this, a plain man like myself may not think it to be a crime to follow their example. I grant that there is a limit. If a man, for example, wrote that he had seen Mr. Blomfield copy some of Mr. Street's details and apply them, he ought to give his name and the fullest particulars of time and place; but if he said that Mr. Blomfield's defence of Mr. Street was not convincing, he would be merely expressing a common opinion, and anonymity is then allowable. Things that are within everybody's knowledge do not need the support of personal authority, as if they were libellous allegations. Of course there are letters that for other reasons would not gain admission into a newspaper unless names were attached. I cannot help thinking that Mr. Blomfield's is one of them. It is now manifest that, even with the attraction of his name, the *Times* was compelled, out of pity for its readers, to keep clear of Mr. Blomfield and his serious straightforwardness.

Yours obediently,

A PLAIN SPEAKER.

#### LEGAL.

Exchequer Division, Dublin.

(Before Mr. Justice ANDREWS.)

MOONEY v. WEST AND ANOTHER.

THE ACCIDENT AT ST. PATRICK'S CATHEDRAL.

Application was made in this case on behalf of plaintiff for liberty to administer interrogatories to the defendants. The action was brought by an infant under the age of twenty-one years, who sued by his father to recover damages from the defendants, the Dean and Chapter of St. Patrick's Cathedral, for injuries sustained through the falling of one of the buttresses of the cathedral in September 1882, whereby portion of the *débris* fell

upon the plaintiff and inflicted upon him serious personal injury of a permanent character. The accident took place on September 14, 1882, and the nurse in whose arms the plaintiff was at the time was killed by the falling *débris*. Counsel stated that a motion had some time ago been instituted to compel the defendants and also Mr. James P. Pile, the architect in charge of the works at the cathedral as contractor or otherwise, to make a discovery of documents, but the defendants replied they had no documents in their possession having reference to the cause of action. The interrogatories which counsel now asked leave to deliver were, firstly, whether the Dean and Chapter of the cathedral had employed any person or persons to do the work which was being carried on at the time the buttress fell; and secondly, whether there was any written or verbal contract in existence as to the doing of the work. The allegation of the plaintiff was that the accident was the result of negligence on the part of some of the persons employed at the works. Counsel submitted that the interrogatories were reasonable and fair, and that he was entitled to the order. Counsel for the defendants argued that the motion was late, and that the interrogatories were of a fishing nature, and were with the object of discovering whether the plaintiff had a cause of action against the Dean and Chapter, and if not, whether he could proceed against the contractor.

Mr. Justice Andrews held that the interrogatories were reasonable, proper, and necessary, having regard to the nature of the action, and to the fact that he had brought forward a motion for discovery of documents while the pleadings were still open; and the defendants' answer to the application having been unsatisfactory, he held the plaintiff entitled to put the interrogatories, to enable his counsel to determine whether they should proceed further with the action against the Dean and Chapter of the cathedral or against the contractor, or whether he should institute new proceedings against any other person. He therefore granted the motion.

#### CHURCH BUILDING AND RESTORATION.

**Adlington.**—The memorial-stone of a church in the village of Adlington has been laid. The building—which has been designed by Messrs. D. Barry & Son, architects, of Liverpool—when completed will consist of chancel, nave, north and south aisles, and north and south transepts, and there will also be an organ-chamber and clergy and choir vestries. A tower will surmount the principal entrance, which will be in the second bay of the south aisle. The interior of the nave will contain an arcade of five pointed arches, supported with moulded pillars with caps and bases. The aisles will be lighted with cusped lancets, the west window being of five lights, and with enriched tracery. The roof will be open-timbered, and the benches will be of pitch pine. The floors will be of wood blocks. The work is being executed by Mr. Winward, contractor of Wigan.

**Catherington.**—On Wednesday the parish church of St. Catherine's, Catherington, Hants, was reopened, after extensive reparation and additions. During the works some very interesting discoveries were made—e.g., two original thirteenth-century tempora paintings in a fair state of preservation, the head of the old churchyard cross, and some early sepulchral slabs. The church is an interesting specimen of the Transitional Norman period. The gentry of the parish and neighbourhood have been liberal with their contributions, and the poorer parishioners, so that all has been done in a most substantial way. The work has been under the direction of the architect, Mr. Edmund Ferrey.

**Cheriton Fitzpaine.**—The parish church, a fine fifteenth-century church, has recently undergone some external restoration. It is planned with a nave and chancel, north and south aisles, western tower, and south porch with parvise over. The work has been done under the supervision of Mr. James Crocker, of Exeter. It is intended to shortly continue the restoration in the way of reseating the whole of the church, laying tile floors, restoring the windows, &c.

**Pocklington.**—The restoration of Millington church, Pocklington, has been successfully completed from designs by Mr. T. L. Moore, architect, of Hampstead, N.W. The church has been reseated with open stalls, painted dark green; and the old high-backed pews have been partially used as a dado for the walls. The roof of the nave has been recased, and also decorated with distemper colour. A new vestry has been added at the west end of the church, and a substantial oak pulpit takes the place of the old one in the north-east corner. The chancel has been filled with carved oak seats for the clergy and choir. The work of restoration has been carried out by Mr. Elwell, of Beverley.

**Dallington.**—The parish church was restored some years since. The church has now been restored from designs and under the superintendence of Mr. Edmund Law, architect, Northampton, who has successfully completed the work begun by his late father, who restored the church. The work has necessitated the rebuilding of a large portion of the chancel. The east end, which was of very modern date, has been taken down, and the chancel

extended some 5 feet eastwards on ancient foundations, which were discovered at the time the church was restored, and a beautiful east window inserted in the place of the debased piece of work which before existed. The floor of the sanctuary is executed in marble mosaic, by Mr. Ebner, of Clerkenwell Road, London, and Maw's tiles in the chancel floor. The work has been carried out by Messrs. Edmund Roberts & Sons, of Weedon, who executed the works in the restoration of the church. The carving was executed by Mr. Charles Phillips, of Northampton.

**Romford.**—The Congregational church, South Street, Romford, which was destroyed by fire, has been reconstructed and reopened. Plans for the restoration of the building were prepared by Mr. E. C. Allam, architect, of Romford, and were entrusted for execution to Messrs. Staines Bros., who built the church originally. The slated spire has been replaced by a stone spire, 4 feet higher than the original one. The total cost of the reconstruction has been about 2,800*l*.

**Broughton, Manchester.**—The new Baptist chapel consists of entrance lobbies, 6 feet wide, leading to the school-room, 33 feet by 50 feet long and 28 feet high, with an open-timbered roof. The room will seat on open pitch-pine benches 280 persons, and there is a class-room on either side of lobbies having glazed sliding screen opening into the main room. A platform is placed at the opposite end, with a covered baptistery in front of it. On one side behind platform is a vestry, 11 feet by 12 feet 9 inches, and on the other a church parlour, 21 feet 6 inches by 12 feet 9 inches, with open fires. Kitchen and heating chamber under same in cellar. At opposite end to platform, there is a gallery for 84. The total accommodation is for 404 adults. There is also an infants' room for 60 children. The building is in the Early English style, the walls are of red stocks and stone dressings, and has been carried out from the designs of Mr. George Baines, Accrington. The total cost will be about 2,000*l*.

### SCHOOL BUILDINGS.

**Yeadon.**—A Board school, which has been designed by Mr. W. T. Morley, of Bradford, is now complete. Accommodation is provided for 1,070 children, the schools being divided into three departments. Those for the boys and girls are placed at either end, while provision is made for the infants in the centre. The department for boys consists of two large rooms, 53 feet and 75 feet long respectively, with a width of 20 feet in each. That portion of the building devoted to the girls is similarly arranged. The infants' school consists of a large room 60 feet by 32 feet by 22 feet high, and is provided with a similar number of class rooms to the other departments. Separate entrances have been provided for each department, and in addition doorways have been fitted up at the back which give access to the playgrounds, of which there is one for each department. Covered grounds have been laid out for the girls and infants, the latter having a covered approach leading to theirs from the school. At either end of the building are turrets of dissimilar design, and these form the chief entrances to the boys' and girls' sections of the school. The total cost is about 5,000*l*.

### NEW BUILDINGS.

**Enlargement of Elswick.**—Plans have been prepared for one of the most extensive building operations contemplated in Newcastle for many years, namely, the laying out for building sites of a very large portion of the late Mr. Buddle Atkinson's estate, the trustees of which are Sir W. G. Armstrong and Mr. Benjamin Chapman Browne. The estate begins exactly at the western boundary of the borough, and extends westward over 800 yards, and northward to Benwell 820 yards, the total area of the estate being 473,000 superficial yards. The portion at present put into the market has an area of 140,000 superficial yards. It was originally intended to give the streets a width of 40 feet, but to meet the requirement of the Benwell Local Board they were reduced to 36, to make the back streets 24 feet in width instead of 20, as originally laid out, and the streets will contain on an average twenty-eight houses, with an eastern and western aspect. The approximate area in superficial yards of the various sites will be as follows: For houses in Atkinson Street, 153; Wallend Street, 146; Woolley Street, 140; Aline Street, 122; Violet Street, 122; School Street, 146; Clara Street, 180; Hugh Street, 140; Frank Street, 146; Maughan Street, 140; and Buddle Road, 250. The western portion of the works of Messrs. Sir W. G. Armstrong, Mitchell & Co. will be exactly at the south-east of the estate. The plans for the laying-out of the whole estate have been prepared by Mr. William Glover, architect, 16 Market Street, Newcastle.

**St. Mary Church.**—The town hall at St. Mary Church has lately been completed. The architect was Mr. G. S. Bridgman, of Torquay. The erection of the building has cost 2,718*l*. 2*s*. 6*d*.; furniture, &c., 373*l*. 17*s*.; architect's fees, 154*l*. 12*s*. Mr. Harris was the builder.

**Chelmsford.**—The new Infirmary and Dispensary Buildings at Chelmsford have been erected from the designs of Mr. Fred. Chancellor and Mr. C. Pertwee. The buildings throughout are supplied with hot and cold water, gas is laid on to all wards, corridors, and rooms, and special attention has been devoted to the ventilating and sanitary arrangements.

### GENERAL.

**Mr. J. Volum**, of Geelong, Australia, has intimated his intention of presenting to his native town, Peterhead, N.B., a picture, *The Pool of Bethesda*, to be placed in the Arbuthnot Museum. The picture formed part of the collection of the late Mr. Giles.

**Mr. W. J. Palmer**, of Reading, has made a further contribution of 15,500*l*. towards the cost of the town hall and municipal buildings at Reading.

**Diggle Hall**, Hindley Green, Lancashire, which has just been elaborately decorated for a wealthy colliery proprietor, was on Wednesday partially destroyed by fire.

**The Incorporated Society of British Architects**, on Wednesday, elected Mr. W. P. Burton, Mr. Alfred East, Mr. W. Ayerst Ingram, Mr. J. Macculloch, and Mr. Thos. Pyne as members.

**A Bronze Statue of the Earl of Beaconsfield** was placed upon the pedestal erected for it in front of St. George's Hall, Liverpool, on Tuesday.

**The City Church and Churchyard Protection Society**, at a meeting held on Wednesday, adopted the following resolution: "That this meeting views with deep regret the proposal to pull down, desecrate, and disendow the churches of St. Olave's Jewry, St. Catherine Coleman, and St. Thomas in the Liberty of the Rolls, as causing scandal and disturbance of the remains of the dead, besides being an injustice to the resident parishioners."

**The "Allgemeine Zeitung"** states that in the forests of Sonora, a province of Western Mexico, near Magdalena, a pyramid has been found measuring 4,350 feet at its base, and rising to the height of 750 feet! A carriage road winds about this enormous structure from base to summit. The face consists of granite blocks carefully cut and perfectly fitted together.

**The Electric Lighting Committee** appointed by the Leeds Town Council, on Wednesday decided that an installation for lighting the new municipal buildings be proceeded with without delay; and a sub-committee has been appointed to report upon the merits of the incandescent and arc lighting for indoor purposes, and also as to utilising gas engines for the necessary power.

**Birmingham Architectural Association.**—The first ordinary meeting of the session was held on Tuesday evening at Queen's College, under the presidency of Mr. W. H. Kendrick. There was a good attendance. One new member was proposed, and, after the preliminary business, a paper on "The True Functions of Art, and the Practicability and Necessity for its Culture in our Town" was read by Mr. Norman Gething. At the close a vote of thanks, proposed by Mr. McConnal, seconded by Mr. V. Scruton, and supported by Messrs. Newton & Stanbury, was accorded to the reader of the paper.

**The Directors of the Dundee Royal Lunatic Asylum** have prepared plans for laying out the old asylum grounds for building purposes. The streets on the plan are 50 feet in width, and are arranged in the way considered best suited for properties consisting of tenements of dwelling-houses and shops. The old asylum buildings will probably be utilised in some way.

**Mr. Walter Scott**, contractor, of Newcastle-on-Tyne, has received the contract for carrying out the drainage and formation of roads on the South Benwell estate.

**Mr. William Simpson**, builder and contractor, Roman Road, Victoria Park, recovered 2,000*l*. from the North London Railway Company on Tuesday, for injuries sustained by him in a collision last November.

**A Builder** has been fined 5*l*. with costs at Woodford for commencing the erection of certain houses without intimating his intention to the urban authority, or submitting plans and sections of the work, as required by the by-laws.

**The Master Joiners' Association of Edinburgh** at a meeting held last week, decided that the rate of wages to competent workmen should be reduced to 6½*d*. per hour on and after to-day (Saturday). At the end of April, in consequence of a strike, the employers had conceded the men an advance of ½*d*. per hour, raising the wages from 6½*d*. to 7*d*.

**Kershaw's Patent Pneumatic Ventilators** have been recently supplied to buildings at Overstone Park, the seat of the late Lord Overstone, and also to new stoves recently erected at Messrs. Jacobi's lace factory, Nottingham, and have been selected for Mr. Player's large new tobacco factory. They are being supplied for the board-room of the waterworks department, Portsmouth. They have been adopted at the Royal Morningside Asylum, Edinburgh; County Lunatic Asylum, Lancaster; Ulverstone Workhouse, Ulverstone Court-house, Rothbury Court-house, Wooler Police-station; Palatine Hall, Lancaster; St. Paul's Church, Grange-over-Sands; Locher parish church, near Dundee; Congregational Church, Sunderland; Newsham Park Chapel, Liverpool; National Schools, Carnforth; National Schools, Burneston; and St. Paul's Schools, Stayley.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, NOVEMBER 24, 1883.

### TENDERS, ETC.

\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

\* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—  
"Contract Supplement to THE ARCHITECT."

### TO AMERICAN SUBSCRIBERS.

All subscriptions are payable one year in advance, and may commence at any date.

The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.

Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED to GILBERT WOOD, 175 Strand, W.C., London, England.

In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—

To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order

### ADVERTISEMENT SCALE.

For Two Lines and under	£0 2 6
For every Additional Line	0 0 6
For Quarter Page	2 10 0
For Half Page	4 10 0

Public Companies' Advertisements, 12l. 12s. per page; 1s. per line.

Special arrangement may be made for a series of insertions on application at the Office, 175 Strand, London, W.C.

### EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

### COMPETITIONS OPEN.

ABERDEEN.—July 1, 1884.—The Testamentary Trustees of the late Mr. John Steill, of Edinburgh, hereby notify that they will Receive Models for a Colossal Statue of Wallace, in Bronze, with Basement of Granite Blocks, to be placed on the Mound in the North-West part of the Duthie Public Park, near the City of Aberdeen, in conformity with Instructions left by Mr. Steill, at a cost not exceeding £3,000. Intending Competitors, on Application, accompanied with a Remittance of 10s. 6d. to Mr. John Otto Macqueen, 10 Bridge Street, Aberdeen, will be supplied with Copies of Mr. Steill's Instructions, Conditions of the Competition, and Lithograph Plan of the Duthie Park, showing Sections of the Mound. The Author of the Accepted Model will be employed to Execute the Work; and the Author of that next in order of merit will Receive a Premium of £50.

BIRKENHEAD.—Dec. 1.—Plans are required for Laying-out Bidston Hill for Building Purposes. Premiums of 160 guineas and 50 guineas, and four of 15 guineas each. Messrs. Davies & Stephen, Estate Agents, Mollington, Chester.

BRISBANE.—Nov. 30.—Plans are invited for the Erection of a Town Hall. Messrs. Gordon & Gotch, 15 St. Bride Street, E.C.

CAPE TOWN.—Jan. 30.—The Town Council of the City of Cape Town invite Plans and Specifications, accompanied with approximate estimate of cost, of a System of Drainage. Selected Plans and Specifications to become the absolute property of the Corporation. All others will be returned free of expense. Premium of 250l. A plan of the City, with levels, may be seen, and further information may be obtained, on application to the South African Loan, Mortgage, and Mercantile Agency, 9 King William Street, London, E.C.

LONDON.—March 1, 1884.—The Commissioners of H.M. Works and Public Buildings are prepared to receive Designs for New Buildings proposed to be erected in Whitehall for the Admiralty and War Office. Mr. A. B. Mitford, Secretary, H. M. Office of Works, 12 Whitehall Place, London.

NORTHAMPTON.—Dec. 1.—Designs are invited for the Erection of a Board School, with Class-rooms and Out Offices, to Accommodate 1,150 Children. Mr. John B. Hensman, Clerk to the School Board, 4 St. Giles's Street Northampton.

Kingdom to choose from.

**ECONOMY IN FUEL.  
ECONOMY IN FUEL.**

**PERFECT COMBUSTION**

Can only be obtained by means of a  
shallow fire, constantly fed as the fuel  
is consumed. THE ONLY STOVE that  
fulfils the above conditions is WALKER  
& SON'S PATENT SELF-FEEDING  
STOVE, which is the most admirable  
and efficient means of warming build-  
ings of all sizes, from the smallest  
room to the largest Cathedral.

All stoves made by T. WALKER & SON have  
an external casing of SHEET IRON.

Extract from a letter from the Astronomer Royal:—

"Walker's Patent Self-Feeding Stove effects its purpose  
exceedingly well, at no great expense, and with very little  
trouble; it is by far the most efficient and convenient Stove  
for maintaining a continued uniform heat that I have seen."

"G. B. AIRY, Royal Observatory, Greenwich."

WALKER'S GAS STOVES require no Chimney.  
Price from 15s.

WALKER'S Flat-topped COAL STOVES will  
burn any kind of Fuel. Price from 16s.

Prospectuses and Testimonials may be obtained from all  
respectable Ironmongers.

MANUFACTORY:—58 OXFORD STREET, BIRMINGHAM.

**FOX & BARRETT'S SYSTEM OF  
FIRE-PROOF CONSTRUCTION.  
MR. BARRETT, { 13 York Buildings, Adelphi,  
London, W.C.**

# LINDSAY'S IMPROVED PATENT REVERSIBLE TREADS & LANDINGS FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

In Hospitals, or places where it is desirable to be free from dust, the blocks can be placed close together, not leaving any cracks, so that the treads or landings can be swept or washed quite clean; also, if it be necessary to get light under a Staircase or Landing, rough glass blocks can be fitted in the Iron frames, side by side with the wood, and a subdued light thus obtained.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be re-filled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works,

13, 14, & 15 SOUTH WHARF, PADDINGTON, LONDON, W.

# The Architect.

## THE BUILDING PRESSURE ON THE LONDON POOR.—II.

NE thing that would contribute greatly to promote an understanding of the problem how to lodge the London poor is a statistical classification of some sort—even if it were no more than a hasty approximation, provided it were an intelligent one—whereby to show who, and what, and how many these poor really are, where they

live, how they live, what rents they pay and for what accommodation, what occupations they follow, who are their landlords, and perhaps a good deal more, with sufficient comprehensiveness, precision, and minuteness to enable the news-reading public, who read as they run, to discern the common sense of the matter. The classes of poor people with which we ourselves are concerned for the moment, comprise of course only those persons who, living in average honesty one way or another by their skilled or unskilled labour, are, according to their own account, "obliged to live near their work." But, if we mistake not, such statistics would prove that it is the people of these classes alone who, in the first instance, are worthy of public consideration; and indeed it is not improbable that if all such comparatively respectable, if frequently unfortunate, people could by the waving of a wand be at once decently lodged, the remainder would be found to be much fewer in number than some of our philanthropic writers and speakers seem to suppose. In other words, how to reform the dens of the criminal classes, the debauched, the degraded, and the irreclaimably forlorn, is not the real question which now presses for public attention, either in London or anywhere else in the world. It is easy to assert that, if reprobates could be comfortably lodged, their mode of living would improve. No doubt it would. Perhaps the improvement might even to a considerable extent be permanent, for a cleanly home must tend so far to encourage a cleanly life. But there are so many thousands in the heart of London who appeal to us on the much higher ground—leading a decent life already, and only asking for a decent lodging to be in accord therewith, which the pressure of the crowd denies them—that calm men of business may surely be content to consider first how to deal with these, if even thus much be not impossible, and leave to enthusiasts for a time the vastly more difficult question how to deal with the others. The "bitter cry," we are prepared to maintain, is the cry of the very poor working men and women of central London, and not of the habitual drunkards and thieves; and their demand is simply to have wholesome shelter in return for an equitable rent.

If, then, we separate the London poor into the two primary classes of the poor workers and the poor idlers, it is the more easy to perceive how existing legislation affects them practically. By means of TORRENS'S Act, the local Boards of Health—the Vestries doing such duty in central London—are enabled to take summary proceedings against the very worst kind of house property, in order to compel the owners to do such cleaning and repairs, and to make such other amendments as shall render it habitable. If these powers were put in force as they ought to be, the "rookeries," and a good many other lanes and alleys, and even streets, which are not much better constituted, might easily be cleansed and put in order, provided with sufficient sanitary appliances, and occasionally pulled down and rebuilt, so as to be at any rate sufficiently wholesome for very humble tenants; and we make bold to say that it is the fault of the municipal bodies, distinctly and solely, that the worst of the slums are not so far thoroughly rehabilitated every now and then throughout the whole of the metropolis, and this without any expense at all to the public, or any oppressive expense to the owners. There are many experienced persons who hold that TORRENS'S Act is, in fact, all that London really requires in order to relieve it

entirely from the disgrace attaching to house property of the worst description.

The operation of the Artisans' Dwellings Act of Sir RICHARD CROSS may be best regarded in conjunction with the transactions of the PEABODY Trust and other benevolent societies of the same kind. The ground is cleared of unwholesome houses by the process of "compensation," and "Model Lodging-houses" are built in their stead at a certain loss to the public purse. The direct effect of this, as regards tenancy, is to dislodge the disreputable idlers and provide for the workers; but it is everywhere complained that the very poor workers, dislodged with the rest at the beginning, are expressly excluded at the end, and indeed that certain other classes of workers, not poor at all, are brought in to take the place of these humbler people, who are thus driven forth into other slums.

It seems not unlikely that, when Parliament meets, the Conservative party may advocate chiefly the policy of Sir RICHARD CROSS'S Act, and the Liberals that of Mr. TORRENS'S Act. Lord SALISBURY'S dissertation has been replied to by Mr. CHAMBERLAIN in a spirit which indicates this already; and, without in any way desiring to disparage the principle of Sir RICHARD CROSS, or to weaken the effect of Mr. CHAMBERLAIN'S admission that it might have worked sufficiently well but for the professional chicanery of clever compensation surveyors, we cannot help thinking that a persistent system of "pegging away" in detail at the whole mass of rotten house property throughout London under TORRENS'S Act will be accepted by political economists before long as the only effectual means whereby, without loss of time, to put at least a different face upon the existing accommodation of the very poor.

But the pressure of building must still go on ruthlessly; and those poor workers who "are obliged to live near their work" must still be ruthlessly squeezed, and squeezed at last out and away. Here we obviously have to deal with a mechanical and not a sentimental question—a building question in fact—and on that account one which can be fairly taken in hand because it can be scientifically understood. It is, however, even mechanically, a very large question. It is how to provide what may be called new dwellings for hundreds of thousands of deserving working-people—and now we must obviously include a considerable proportion of those who are not of the very poor—to whom it is supposed to be essential that they shall live near their work. It must be borne in mind that London is a "manufacturing centre" of the most busy and complicated character in the world, besides being a "commercial centre" equally complex. The consequence is that hundreds of classes of business, from the leather-market of Bermondsey to the cattle-market of Islington, and from the sugar refiners of Whitechapel to the upholsterers of Bond Street, have distributed themselves in so many separate quarters of the immense town, each settlement regarding its own convenience alone, and demanding elbow-room for its own workers in the form of a sufficient circular space around its own central point. Each of these circles, moreover, is continually expanding. Debateable land between the circles, that is to say, is constantly being annexed. In some instances the enlarging circles have come to press against each other, no one of them inclined to give way to its neighbour. But in all cases it is manifest that the old occupiers of the debateable land, those whose occupation was general and not special, must be undergoing compression to such a degree that they are being squeezed out and away altogether, and that even the special workers within their own circles are being equally compressed, and indeed are only able to retain their ground at the expense of constantly increasing discomfort and deprivation. These are the people—the workers and those who wait upon the workers—who, because as they say they must be near their work, have to complain so bitterly of decreasing accommodation, increasing rent, increasing insalubrity and increasing indecency.

The only scientific remedy seems to be an acceptance as soon as possible of the eventually inevitable principle of the workers working elsewhere. The time must come when the central quarters of London will be, generally speaking, occupied by business exclusively. Each kind of trade or manufacture will then no doubt have drifted into a system of its own, whereby to accomplish the requisite communication with its own retainers at a distance. The telegraph, the telephone, and the pneumatic tube for parcels, will probably figure conspicuously in the arrangement. The additional cost, if any,

must simply be added to the prices of production, and the inconvenience will soon be forgotten. Nothing, it will then be frankly said, could be more absurd than the superstition that a Bond Street tailor or bootmaker could only have his work done in dirty back streets about Golden Square; or a housebuilder by the Strand have his bricklayers and labourers housed of necessity about Clare Market and Drury Lane. The change will of course involve a struggle, but we can only say that the sooner some of the specialist commonwealths begin the struggle the sooner it will be over.

There are some neighbourhoods, although not generally the most central, where the simple expedient may be resorted to of adding another storey to the houses; but of this nothing further need be said, except that what we should like to see in such a case is a diminution of pressure, whereas an increase of numbers would be equally likely to result.

But, first and foremost, we hope the Government, and if necessary the Legislature, will lose no time in forcing upon the lazy local authorities of London a prompt and drastic application of the provisions of TORRENS'S Act.

#### DR. SCHLIEMANN'S TROJA.\*

WHEN we reviewed Dr. SCHLIEMANN'S "Troy and its Remains," in 1875, we declined to join in the almost universal acceptance of his theory. While admitting the remarkable character of his discoveries, it was suggested that much had to be done before Hissarlik could be identified with Troy. Dr. SCHLIEMANN, it was said, entered upon the work with a notion that PRIAM'S city was to be found under the fourth stratum on the hill, and in consequence an insufficient value was set upon the remains in the fourth and superincumbent strata. It was shown that the area of his Troy was inadequate for a large town unless the people were packed in very high houses. "Strange as it may sound," we wrote, "PRIAM'S many-gated city would occupy no more ground than the buildings of the British Museum, and it might readily be enclosed within the railings of either Grosvenor or Belgrave Square." The objections we raised against Dr. SCHLIEMANN'S conclusions could, in fact, be ranged under three heads: First, the difficulty of proving that HOMER'S Troy was a real city, and that it was situated at Hissarlik; secondly, the unscientific character of the excavations, through which the value of objects found in the upper strata was not recognised; and lastly, the smallness of the site. In the eight years which have elapsed, Dr. SCHLIEMANN has worked at Hissarlik on a more methodical plan; he has accepted the advice of a good many English and German scholars, he has from time to time sought the criticism of archaeologists, and he has to some extent modified his theories. What, then, has been the issue of his labours, and is there a nearer approach to unanimity among scholars about Dr. SCHLIEMANN'S identifications than existed a few years ago, when the excitement of his first discoveries had subsided? A study of the new book will enable a reader to answer those questions for himself.

It is to the credit of Dr. SCHLIEMANN that in some matters he has become less convinced than he was formerly of his own omniscience and infallibility. This is evident from his engagement of two architects, Dr. DÖRPFELD, who managed the technical part of the German excavations at Olympia, and M. HOFER, in order, as he says, "to secure for science any light which might be obtained from ancient architectural remains." The former was paid 35*l.*, and the latter 15*l.*, with travelling expenses. Some of the Olympian overseers were likewise employed. We may be pardoned for drawing attention to the fact that one of the first results of the assistance of those experts was to demonstrate that we were right when we condemned Dr. SCHLIEMANN'S treatment of the strata which were not supposed to be Trojan, comparing him to a geologist, who, from having an imperfect knowledge of fossils, threw aside many relics which were of scientific importance. Here is the Doctor's confession:—

My architects have proved to me that, together with M. Burnouf, my collaborator in 1879, I had not rightly distinguished and separated the ruins of the two following settlements, namely, the second and third; that we had rightly considered as foundations belonging to the city the walls of large blocks 2.50 mètres deep, but that we had been mistaken in not connecting it with the layer

of calcined ruins which lies immediately upon these walls, and belongs to the second city, and in attributing this burnt stratum to the third settlement with which it has nothing to do. We had been led into this error by the colossal masses of *débris* of baked, or, more rightly, of burnt bricks of the second city, which in a very great many places had not been removed by the then settlers, and were lying on a level with their house foundations, and often very much higher.

In another place Dr. SCHLIEMANN says that his architects ascertained with certainty the direction of the acropolis wall of the second city. When the exploration was commenced the substructure existed, and was on the north side of blocks which were a *mètre* in length and breadth. "But I had to destroy it," he says, "on this side in 1872 in excavating my great northern trench." It would appear too that the positions of the towers or buttresses could then be ascertained. One of Dr. SCHLIEMANN'S theories was that some great conflagration occurred by which the bricks of the houses of the third city were calcined; but here again professional knowledge has prevailed, as is frankly stated:—

My architects ascertained beyond all doubt that the third settlement never perished in a catastrophe, for the remains of its house walls still stood from 2 to 3 *mètres* high, and its walls of fortification were more or less well preserved. The fourth settlers built their houses on the gradually accumulated ground of the hill, and on the ruined house walls of their predecessors. My architects further found that the fourth settlers used the brick walls of the third settlement, after having repaired them, and perhaps having built them somewhat higher, in proportion to the increased height of the ground.

But the most important result of the improved system of investigation is the abandonment of the theory that Troy was an irregular polygon, of which the longest side was less than 200 feet. In 1875 Dr. SCHLIEMANN said, "I assert most positively that Troy was limited to the small surface of this hill, and that the city had no acropolis." Contrast this positive assertion with the statement in his latest volume: "This second settlement on the hill of Hissarlik constituted only the acropolis, to which a lower city was attached on the east, south, and south-west sides. . . . We cannot determine now with certainty how far the lower city extended." Common sense might have inspired Dr. SCHLIEMANN at an earlier date with the belief that the Trojans were hardly competent to build houses on Mr. HANKEY'S principle, and that, unless they possessed mansions of that kind, they could not live on the top of Hissarlik. The disproportion must have dawned upon the Doctor's mind, for his wish was "to be able to make the plan a thousand times larger;" but his confidence in himself overcame everything, including the laws of arithmetic. It will be remembered that Dr. SCHLIEMANN brought to England some objects in gold and silver, which he maintained were PRIAM'S treasures, and which gave rise to much controversy. He still believes in their value, but there is an important modification in regard to the place where they were found.

It is even possible, he says, that the brick *débris* in which the great treasure was found was the real brick wall. I call particular attention to the fact that for a layman it is next to impossible to distinguish what is Trojan brick *débris* and what Trojan brick masonry; and thus it may be that what I called "red and calcined ruins" was really a brick wall. Nay, it is even in the highest degree probable that the whole space between the western city wall and the large house on the third settlement (which, on account of the wealth found near it, I used to ascribe to the town chief or king) had remained filled with brick *débris* of the second city wall, which had not been removed by the "third settlers."

From this paragraph it may be surmised that Dr. SCHLIEMANN is no longer so sure of the connection between the treasure and King PRIAM. Professor SAYCE, who has written a preface for the new volume, in an ingenious way tries to throw a glamour over the discovery in order that the reader may believe in what was imagined by Dr. SCHLIEMANN in 1872. He asks, "Can we venture to call him?" (*i.e.*, the unknown owner of the trinkets) "the King of Ilion?" Then, in a characteristic way, he begs his own question, saying that "the ruler of the city was a powerful prince who must have had at his disposal the neighbouring gold-mines of Astyra." If we once admit "must be's" and "must have had's," there is no knowing where we may be landed, and they have brought Professor SAYCE very quickly to old Troy. "Hissarlik, then, or Ilion, as we will henceforth call it, must be a city whose siege and conquest became the subject-matter of Greek epic

\* *Troja: Results of the Latest Researches and Discoveries on the Site of Homer's Troy.* By Dr. Henry Schliemann. John Murray.

song." But, for the determination of the age of the treasure, we should attach more importance to a statement by Dr. SCHLIEMANN's architects upon the character of the place where the objects were discovered. It is now plain that the strata were not accurately discriminated in the first exploration, and it would be satisfactory to be assured, on the authority of men who were competent to know a brick wall from brick *débris*, whether the palace of PRIAM, or whatever may be its name, was so situated that relics of a later age could not find their way to it.

With archæologists of the classical kind a few facts go a long way towards building up a theory. Professor VIRCHOW, who had had an opportunity of looking down into the big pit on Hissarlik, described what was below as "a city of gold," on the strength of the "Treasure." In the same spirit the remains of walls and houses are supposed to exemplify a very massive class of building, and, with the help of imagination, they become a part of a city, which, according to HOMER, was "well builded." But what is the true character of the work? So far as we can discover in "Troja," there is not one piece of good masonry or brickwork to be found in that part of the hill which represents Troy. The most remarkable specimen is a substructure wall shown in an engraving, and, according to the description, "it consists of quarry stones, on the average 0.45 mètres long by 25 mètres broad, which are somewhat irregularly joined in easily recognisable horizontal courses, without any binding material." The brick walls are supposed to have been baked or dried after they were constructed, by lighting a fire in the trench at the base; but, according to Dr. SCHLIEMANN, "they must have had a very imposing aspect." Troy was supposed to have been built by NEPTUNE and APOLLO, who were masons rather than bricklayers; but, owing to Dr. SCHLIEMANN's revelations concerning the class of work found at Hissarlik, a theory has been set up by Mr. GLADSTONE and others, by which the gods are interpreted to denote Phœnician builders. In this way the character gained NEPTUNE and APOLLO for good workmanship is preserved.

(To be continued.)

### CURIOSITIES OF THE CENSUS.

ACCORDING to the latest census, the population of England and Wales was 25,974,439. The number of architects, including pupils and assistants, was 6,898. There is consequently, taking the average of the country, one architect, or member of his staff, to 3,765 inhabitants. As there were 7,124 civil engineers, the relative proportion to the population of the members of the two divisions of constructive science is nearly alike. If architects are compared with other artists, there are somewhat fewer painters, the number being 6,082 (including 1,880 females); there are 816 sculptors (16 being females), and 2,201 engravers (64 being females). It is remarkable that the number of architects nearly corresponds with the number of people who have adopted literature or science as a profession—viz., 6,830. But if compared with the members of what are called the learned professions, architects are in a minority. England and Wales possesses 33,486 clergymen, priests, and ministers, 17,386 barristers and solicitors, and 15,091 physicians, surgeons, and general practitioners. The difference is more remarkable, for students are included among architects, and come under a separate category in the other professions. Whether it is an advantage for a State to have so few architects we do not presume to determine; but if men were perfect they could dispense with clergy, lawyers, and doctors; while, unless the climate were transformed, they must have houses, and therefore architects. The number of pupils may be inferred from a consideration of the ages of architects. There are 23 who are put down as being five years old but less than fifteen, 847 are under twenty years, 1,378 are under twenty-five years, 3,187 range between twenty-five and forty-five, 1,251 between forty-five and sixty-five, and 212 architects are described as being sixty-five and upwards. Probably about 4,000 have a claim to be recognised as architects. It is gratifying to know that among the blind there are only two architects, and but one architect among the dumb.

The foreigners, who are included with English and Welsh architects, are not numerous. We have one Dane, one Swede, three Swiss, four Germans, and four Frenchmen. The painters

have not only a greater number of those nationalities, but there are also artists from Norway, Russia, Poland, Austria, Hungary, Holland, Belgium, Portugal, Spain, Italy, Greece, and even from Turkey. Europe is thus well represented in England, for, as DRYDEN says, "the pencil speaks the tongue of every land."

If we inquire in what proportion architects, assistants and pupils are distributed over the country, we find that nearly one-third—that is, 2,067—are to be found in the metropolis; the south-eastern counties (Surrey and Kent [extra metropolitan], Sussex, Hampshire, and Berkshire) have 834; the south midland counties (Middlesex [extra metropolitan], Hertfordshire, Buckinghamshire, Oxfordshire, Northamptonshire, Huntingdonshire, Bedfordshire, Cambridgeshire), 404; the eastern division (Essex, Suffolk, Norfolk), 198; the south-western counties (Wiltshire, Dorsetshire, Devonshire, Cornwall, and Somersetshire), 254; the west midland counties (Gloucestershire, Herefordshire, Shropshire, Staffordshire, Worcestershire, Warwickshire), 555; the north midland counties (Leicestershire, Rutlandshire, Lincolnshire, Nottinghamshire, and Derbyshire), 346; the north-western counties (Cheshire and Lancashire), 1,039; Yorkshire, 696; the northern counties (Durham, Northumberland, Cumberland, and Westmoreland), 336; finally, Monmouthshire and Wales have 169. It will be evident that the divisions which contain manufacturing towns have more architects than those which are mainly agricultural. The following figures will suggest the relative importance of provincial towns—from an architectural point of view: Liverpool, 103; Manchester, 99; Leeds, 94; Birmingham, 75; Nottingham, 72; Newcastle-on-Tyne, 68; Bristol, 65; Sheffield, 63; Bradford, 57; Leicester, 55; Birkenhead, 48; Salford, 47; Derby, 44.

If we assume that there are 6,898 persons who are practising as architects and architects' assistants, and that they were given an equal share in superintending builders, it would follow that every one of them must direct about one hundred workpeople. The number of persons who are engaged in working at houses, furniture, and decoration is 786,660, but 101,066 are assigned to furniture, and 18,856 to decorations, thus leaving 666,738 for houses. The building trade (including furniture and decoration), if judged by the census only, thus holds an important position among the occupations of the English people. It is, in fact, the sixth. The ratio between it and the entire population is as one is to thirty-three, or in other words, out of every hundred people in England and Wales at least three will have something to do with the building, furnishing, or adornment of houses. The industries which are represented by larger numbers are those relating to domestic service, minerals, agriculture, textile fabrics, and dress. The position of the trade is a comment on what has been said by QUETELET, that "the classification of professions indicates the means by which a people provides for its subsistence and augments its prosperity." The numbers engaged in the building trades are as follows:—

Total for England and Wales.		Total for England and Wales.	
Builders . . .	30,564	Plasterers, white-washers . . .	28,800
Carpenters, joiners . . .	235,017	Paperhangers . . .	4,177
Bricklayers . . .	125,055	Plumbers . . .	37,160
Masons . . .	97,432	Painters, glaziers . . .	99,676
Slaters, tilers . . .	7,469		

We have not included the females who are set down as being engaged in these trades. They amount in England and Wales to 1,388. The conditions of building vary so much in different towns, it is impossible to fix a normal proportion between the trades. This will be plain from a comparison of the statistics from London, Liverpool, and Birmingham:—

	London.	Liverpool.	Birmingham.
Builders . . . . .	7,319	403	553
Carpenters, joiners . . . . .	38,102	5,597	2,881
Bricklayers . . . . .	23,222	1,915	2,829
Masons . . . . .	7,502	1,501	476
Slaters, tilers . . . . .	754	282	227
Plasterers, whitewashers . . . . .	6,699	1,294	462
Paperhangers . . . . .	1,797	368	96
Plumbers . . . . .	7,477	1,616	406
Painters, glaziers . . . . .	28,084	3,130	1,976

Birmingham has nearly as many bricklayers as carpenters and joiners. There are 50 per cent. more bricklayers than in

Liverpool, with about one-half the number of carpenters. Neither town corresponds with London. Taking the entire country, the carpenters are numerically the most important branch of the building trade; but in some towns, such as Brighton, Ipswich, Norwich, Plymouth, Bath, Wolverhampton, the equality between the numbers of carpenters and bricklayers or masons corresponds with that of Birmingham.

### PARIS NOTES.

THE city architects, MM. Ballu and Deperthes, have laid before the Municipal Council a project for completing the decoration of the Place de l'Hôtel de Ville, which consists mainly in carrying into definitive execution the plan of temporary decoration adopted last year on the occasion of the opening of the new Town Hall. The chief features of this, it may be remembered, were two fountains on the open square and a monumental balustrade in the form of a hemicycle, bearing numerous statues, and surrounding the approach to the central door leading into the Cour Louis XIV. In the scheme now under consideration the fountains will be of imposing size, each surmounted by an allegorical group, and the basins ornamented with figures of children, garlands, sculptured heads, &c. Round the approach will be erected a number of *rostra*, surmounted by lamps, and on each side two large seated figures to represent *Commerce* and *Industry*. The total cost is estimated at 735,000 frs. This money will almost certainly be voted, for the Paris Municipality appears to stick at no expense in the embellishment of its own abode and surroundings. In the Hôtel de Ville, the Salle Saint-Jean, one of the finest rooms of the new building, has within the past few days been entirely cleared of working paraphernalia, so that its noble proportions and artistic decoration may be clearly seen.

The lower or subterranean portion of the great Eglise du Sacré-Cœur, now rapidly rising on the heights of Montmartre, is almost entirely finished. The centre of this underground cathedral is occupied by the Chapelle des Morts, which was opened with great ceremony on November 1, All Saints Day. In the centre of this chapel, directly under the future site of the high altar in the upper church, the venerable Cardinal Archbishop of Paris, the originator of this monument to the memory of his martyred predecessor, has expressed a fervent desire to be interred. The gallery surrounding the chapel is occupied by six oratories, erected solely by donations from the towns of Nancy, Rodez, Nevers, Saint-Claude, Orleans, and Toulouse. Exactly at the central point of the underground apsis is a grand altar dedicated to St. Peter, around which are arranged seven other chapels, completed as far as the construction is concerned, but not yet decorated. Work on the upper church is being pushed on with the utmost activity; and by the end of the year the side walls and pillars will be finished up to the capitals. Thirteen million francs have already been expended, and it is estimated that at least another ten will be required for its completion.

The Trouillebert-Corot and Daubigny picture frauds have had one good result. Many influential artists and amateurs are engaged in founding an association which will furnish information and certificates respecting the value and authenticity of the works of contemporary French artists. Pictures will be sent in to the society, and after a careful examination by the first experts of the day, a stamp will be affixed to the canvas, and the work will be registered under a number in the books.

The Société Libre des Artistes Français have decided to propose to the managing committee of the Society of French Artists that for the future (1) the voting papers in the election of medallists shall be signed; (2) that the Grand Medal of Honour shall be voted by all the exhibitors; and (3) that the number of medals shall be unlimited. M. de Gatines, the secretary of the younger body, has been charged to communicate on the subject with M. Bailly, the president of the Société des Artistes Français.

The Tribunal de Commerce, at the corner of the Boulevard du Palais, facing the river, possesses one of the most spacious and magnificently decorated chambers of audience in the world. Two large panels on the walls contain historical paintings representing, one, *Napoleon I. giving the order to promulgate the Commercial Code in 1807*; the other, *Napoleon III. and the Empress attending the Inauguration of the Tribunal of Commerce*. The pictures are quite appropriate to the place, and as they refer to historical

events, one would have thought it impossible that they should offend the susceptibilities of anyone. A majority of the Municipal Council have, however, voted the removal of these pictures, and charged one of the standing committees with the choice of the subjects to be substituted for them. It must be said, however, that many even staunch Republican members of the body both protested and voted against this piece of vandalism.

At the last sitting of the Commission of Historic Monuments, held under the presidency of M. Antonin Proust, the Hôtel de Ville of Saint-Armand (Nord), of sixteenth-century architecture, and the church of Ecrouves (Meurthe-et-Moselle), dating from the end of the twelfth century, were classed among the protected buildings. Various credits were also voted for repairs to the churches of Helment (Puy-de-Dôme); Celles (Deux-Sèvres); Marennes (Charente-Inférieure); Saint-Jacques de Dieppe (Seine-Inférieure); Villeteire (Oise); and Saint-Restitut (Drôme).

The annual exhibition of the Union of Lady Painters and Sculptors is announced to be held from February 15 to March 15 of next year, at the Palais de l'Industrie, in the same rooms as were occupied last spring.

The committee of the Taylor Society has adopted a proposal of M. Roger Ballu to organise an exhibition of "Sketches by Modern Masters," to be opened at the Ecole des Beaux-Arts on February 1 next, immediately after the Manet exhibition. No effort will be spared to make the collection as universal as possible. Among other great artists, David, Géricault, Delacroix, Ingres, Millet, and Rousseau will be particularly well represented.

A conflict has arisen between the Chapter of the Saint-Denis Cathedral and the Commission of Historic Monuments. The latter demands the suppression of the charge of one franc made for the admission to visit the interior of the building, on the ground that as the church was restored at the cost of the State it should rank as a national museum from the artistic riches it contains, and so be open free. The Chapter, however, refuses to abandon the charge unless the State indemnifies it for the loss of the 2,500 frs. a year at present realised therefrom. The question will be brought before the Chambers, and the Minister of Public Worship will be asked to exercise his authority to put an end to this ecclesiastical pretension.

Aimé Napoléon Perrey, a well-known sculptor, has just died at Pont-de-Roide (Doubs). Among other works executed by him are the sculptures in the church of Belleville, three statues on the portico of Sainte-Clotilde, those of *St. Martha* at Saint-Augustine's, *St. Paul* at the Sainte-Chapelle, &c.

### THE BUILDING TRADES EXHIBITION AT BRISTOL.

THE above exhibition was opened at the Rifle Drill Hall, Queen's Road, Bristol, on Monday last, much interest being shown in the enterprise, as it is the first occasion on which an exhibition under this title has been held so far west. The space available has been found inadequate to meet the demands of many intending exhibitors.

Messrs. ASHTON & GREEN, Temple Gate, Bristol, have a very attractive display of chimney-pieces of the purest statuary and other marbles, which are fine specimens of skilled workmanship and artistic design. This firm also show a bath fitted with a marble casing of elaborate design.

Messrs. CASHMORE & CO., Victoria Street, Bristol, contribute several good samples of cut glass, some of which are on order for the Rajah of Bhawalpoor, a large number of plates having already been shipped there. They have also manufactured cut plate for the corridor leading to the throne-room at Buckingham Palace.

Messrs. ALFRED GARDINER & SONS, of Nelson Street, Bristol, display is a capitally-arranged one in eight divisions, representing various departments of their business. One section contains some very elaborate examples of wrought ironwork of their manufacture, also some fine hammered leaf-work and flowers. Our attention was, however, more particularly directed to a selection of their wrought-iron mitre-joint sashes and casements, made so as to form combined sashes and guard-bars, being specially suited for lunatic asylums, reformatories, and all buildings where security is desired with the least possible obstruction to light.

Messrs. ARTHUR LEE & BROS., of Canons Marsh, Bristol, have some good specimens of carving in monumental crosses made of Sicilian marble. In one a wreath of roses is twined round the cross; the carving is in bold relief, and has been delicately manipulated. One of their chimney-pieces is of statuary marble, with *St. Sylvester* panels. But the great feature of their show is

the novel and successful manner in which they have treated enamelled slate, specially prepared, which they term "Anti-Lignum," and this is displayed in two chimney-pieces made of the material, in the manufacture of which all idea of imitating marble is abandoned. The contrast between the appearance of slate so treated and of wood chimney-pieces is marked. Mr. W. E. Jones, F.R.I.B.A., of Bristol, supplied the designs from which the work has been carried out.

Mr. J. C. STOCK, 8 Victoria Street, Bristol, shows some artistic wall papers, including a new Teele paper and Wistaria decoration. The latter is in two shades, and is suitable for drawing-rooms, and a peacock-blue is more adapted for a dining-room. There are also some choice patterns of Japanese leather paper. In the cheaper kind of paper-hangings the new sanitary washable papers are sure to find favour and to be in great demand.

The Willesden patent metalline waterproof paper and canvas is shown by Messrs. MARDON, SON & HALL, of Milk Street, the agents, and appears to give unqualified satisfaction. It can be applied to many uses, and it is likely to rival more expensive fabrics.

Messrs. H. W. COOPER & Co., Limited, 28A Upper George Street, Edgware Road, exhibit their well-known glass revolving circular and sliding ventilator, and their improved glass Louvre and Venetian ventilators. Good specimens of a new patent are also shown, by which any design of lacework, flowers, &c., can be reproduced on glass.

The Patent Asphyxiator, for applying the smoke test to defective drains, soil-pipes, &c., for fumigating greenhouses and disinfecting rooms, bedding, &c., is shown by Messrs. JOHN WATTS & Co., Broad Weir Works, Bristol, the patentees and sole manufacturers. It is a very simple and portable invention, and has been adopted by many of the sanitary authorities and medical officers of health in the kingdom. Orders on a very liberal scale are being received from New York and other Continental places, and architects should recognise the importance of specifying the testing of drains by this process.

Messrs. SMITH, POWERS & Co., Priory Varnish Works, Coventry, besides showing their principal varnishes largely used by builders, house and church decorators, draw particular attention to their "Terebine," a liquid dryer for varnishes, paints, &c.

Marble mosaic flooring in various designs is shown by Messrs. DIESPEKER & Co., 40 Holborn Viaduct, to whom were awarded the gold medal at the late International Exhibition at Amsterdam.

Joinery is well represented by the stand of a local firm, Messrs. BROCK & BRUCE, the excellence of whose productions are known in many distant parts of the world. We understand this firm were entrusted with the contract for supplying the carving and putting up of all the woodwork used in the restoration of Bath Abbey some time back.

The exhibits of Messrs. JOSEPH BELL & SON, College Green, include designs of stained glass windows executed at Bristol Cathedral, Bath Abbey, Clifton parish church, Stoke Bishop church, and other places; and also for screens, doors, &c.

Captain PAPIER, 34 Church Road, Islington, is again to the fore with his "Zenith" Patent Air or Steam-screw Ventilator, the principle of which our readers are doubtless well acquainted with, as we have on other occasions described it. We are pleased to hear that it is getting into favour with architects, builders, and others.

THE ANTI-LITHON COMPOSITION COMPANY, No. 11 Lawrence Hill, Bristol, exhibit their speciality under this name for owners and users of steam power, claiming for it a pre-eminence on account of its being a pure vegetable extract not containing soda, muriate of ammonia, alkali, or any kind of mineral acid. It is stated that its action in the boiling water is different from any other article yet invented, as a portion of the ingredients having a great affinity for iron and all kinds of metals, it fixes itself to the plates and tubes, and thereby forms a fine, soft film or glassy surface, which preserves the skin of the iron.

THE BOWER-BARFF RUSTLESS IRON COMPANY, 23 Queen Victoria Street, London, E.C., have a numerous collection of general builders and sanitary castings, such as rain-water pipes, gutters, heads, shoes, &c., treated by this process.

Mr. ALEXANDER DICK, 110 Cannon Street, London, E.C., has on view many finished articles in his new Delta metal. This remarkable material is an improved brass, but is much superior to it. It can be made as tough as wrought iron, and as strong and hard as mild steel. It can be forged, stamped, or rolled hot, and will stand being worked and drawn into wire when cold. Its colour resembles that of gold alloyed with silver; it takes a high polish, and when exposed to the atmosphere will tarnish much less than brass. The price of Delta metal is but little more than that of best brass. Its great strength, durability, and hardness recommend it for all kinds of engineering work, whilst its fine, rich colour has already secured for it a market in cabinet work, harness and carriage fittings, &c., &c. We confidently anticipate for the invention an almost illimitable field of usefulness, seeing that there is hardly any metallic article which may not be advantageously made from Delta metal.

In gas-engines there is a 1 horse-power "Turner," working one of Baxter's 12 inch by 8 inch patent knapping motion stone-breaker

on wheels; a "Universal"  $\frac{1}{2}$  horse-power, by Messrs. T. B. BARKER & Co., Birmingham, driving a boot manufacturer's one-man eccentric sole-cutting press, 25 inches by 26 inches bed; a "White's" 1 horse-power, driving a dynamo electric machine for 10 Swan lights.

Mr. GEORGE JENNINGS, Palace Wharf, Stangate, S.E., has by far the most complete show of sanitary appliances, including his well-known valve-closets, urinals, lavatory basins, &c., &c.

Messrs. HODKINSON & CLARKE, Canada Works, Small Heath, Birmingham, have their usual extensive collection of Continental window-blinds, Venetian blinds, stained and painted glass for all purposes, fireproof screens for theatres, &c., &c., much interest being shown in their revolving partition as applied to school-rooms, for the division of the large rooms into class-rooms, for cupboards, cabinets, libraries, &c. Particular attention is given by this firm to school furniture, and it is pleasing to know with very marked success.

Mr. P. PFLEIDERER, 86 Upper Ground Street, is here demonstrating the advantages of his "Universal" kneading and mixing machine. The principle of the machine is one of revolving discs, so ingeniously contrived that in action they effectually traverse the whole area within, and thus subject the substances placed there to a thorough blending and kneading unattainable by any other means. The working of this machine is most simple. For bread-making alone it has gained a notoriety for excellence by many well-known firms. It is equally adapted for builders, engineers, paint and putty makers, and many others. We can strongly recommend architects and others to become fully acquainted with the many advantages of this machine. Stauffer's patent lubricators are also shown at the stand. These are extremely simple, and consist of two parts—a lower part, which is screwed on to the bearing of the pulley, &c., and an upper part, forming a cap, which is filled with a suitable lubricant. The advantages claimed are—a saving of about 90 per cent., perfect cleanliness, reduced wear of bearings, saving in time, &c. We certainly think it a good article.

Messrs. JOSIAH WEDGWOOD & SONS, Stoke-on-Trent, through their agent, Mr. J. O. Bessele, 12 Bridge Street, Bristol, exhibit some patent impressed pattern tiles, enamelled decorated tiles, printed tiles, &c., suitable for wall decoration, dados, friezes, fire-places, stoves, &c. The impressed pattern tiles are produced by an improved method, which obviates the necessity of the use of expensive moulds and dies. The chief character of this decoration is that at a small cost and saving of time, the architect's own drawing can be reproduced with the most minute exactitude both in design and colour.

At the stand of Messrs. PRICE, SONS & Co., of the Old Stoneware Potteries, Bristol (established so far back as 1740), is to be seen a potter's wheel at work, a source of much interest to the visitors. Apart from this the firm are noted for their stoneware goods.

THE FISHPONDS AND BEDMINSTER BRICK AND TILE COMPANY, who have offices at Albion Chambers, Bristol, display some durable facing bricks in several colours, also culvert, fire, and stable bricks. Roofing tiles and common bricks are well represented in large variety and number. From the weekly increasing output by this firm they should have but little cause to complain.

THE CATTYBROOK BRICK COMPANY, LIMITED, have a large collection, which includes red and white pressed fancy bricks, red wire cut fancy bricks, common stock bricks, blue bricks, pitching bricks, vitrified stable bricks, &c., &c. As a proof of the durability and appearance of the Cattybrook bricks, they have been very largely used in churches, chapels, schools, almshouses, factories, and warehouses built in Bristol and neighbourhood.

Another very attractive display is that of Messrs. CORFIELD & MORGAN, Enamelled Slate, Marble, and Monumental Works, Cardiff. Included in their exhibits we notice a very finely-carved statuary marble chimney-piece; also one with inlaid painted panels, representing pastoral scenes; an enamelled slate chimney-piece, in imitation of Morris's green, with griotte inlays and black mouldings, all of which are fitted with grates, tile hearths, and fenders to match. This firm is evidently able to hold its own in the question of low prices.

Messrs. KING & Co., of the Western Electrical Works, Bristol, have a very varied collection of apparatus, manufactured and used by them. At one point a Wimshurst influence machine is shown; also electric bells of every size and description. At present this firm cannot execute their orders fast enough, a very good sign of the quality of their manufactures.

We should not omit to mention that Messrs. CLARK, BUNNETT & Co., of Rathbone Place, London, exhibit ornamental iron stair-cases, lifts, and revolving shutters of well-known excellence.

We may add that the exhibition is likely to prove a success. It closes on the 8th inst.

The Royal Opera House in Stuttgart has been entirely rebuilt, provided with iron drop screen, electric light, steam-heating apparatus, and reopened. The total cost of the new building will be about 35,000*l.* sterling.

## THE CALCUTTA EXHIBITION.

THE Art Work Association at Kandy, in Ceylon, have raised a voluntary loan in order to secure the proper representation of Kandyan art at Calcutta, and the following brief sketch from the Ceylon papers of the articles which have been already sent with this object may not be without interest. The principal objects are those in the pottery known as "Embekke ware." There will be a considerable collection of the already well-known shapes and patterns, such as the large and small chatties and bowls, the plates, and the goglets. Besides these, there will be two series of large tiles of considerable curiosity. One consists of twenty scenes from the great annual perahera, as it is carried on at the present day. Every detail of the procession is accurately depicted: the costumes, flags, censers, elephant trappings, and musical instruments are "from the life;" even the omnipresent policeman is not omitted, and many of the headmen are very passable portraits. This is the first time that this remarkable ceremony has been illustrated in detail. The second series represents a story of very great antiquity, preserved in the Pali language, known as the "Dharma Sonda Vathu," or the tale of "the king who was intoxicated with the law." It consists of eleven pictures in all, and depicts, by means of an allegory, the severe struggle between early Buddhism and triumphant Brahminism. Every detail of the figures, scenery, and incidents is in strict accordance with the directions contained in a curious old Sanskrit "ola," in the possession of the Embekke family of painters. A third series of smaller tiles represents what are known as the "Nawa Nari Kunjari" designs, in which the figures of from four to nine men or women are ingeniously worked into the shape of a horse, an elephant, a bandy, a flower vase, &c. There will be a good selection of brass work, Kandyan swords and knives, Dumbaramats, lacquer work, and ivory carving; but, next to the pottery, the silver work will be the most important exhibit. The five best workmen are each making a large silver "heppuwa" of 20 rupees weight, the design being left to their own choice. There will also be a pair of handsome silver card trays and patens, and a good show of "heppuwas," chunam boxes, and "Ratemahatmaya" spoons.

## "THE HOUSE BEAUTIFUL."

A LECTURE entitled "The House Beautiful" was delivered last week in Dublin, by Mr. Oscar Wilde. The lecturer said he did not desire, even if he were able, to give any abstract definition of the word beauty. They could get on without philosophy of that kind if they only surrounded themselves with beautiful things. When he said that everything in the house should be beautiful he was not preaching any mere poetic dream. There had been many times and many countries when everything made by the hand of man was beautiful, from the stately palace with its gorgeous tapestry and splendid carving, down to the simple house of the honest yeoman, that had at least outside its plain or decorated plaster between broad oak beams to uphold the roof, and within its bright and pretty painted oak. Then our beautiful remains of Celtic art, including both carved work and illumination, were essentially decorative, because they dealt entirely with form and colour without any imitation. Surely the spirit should not be in the slightest degree dead amongst them, although it may have been repressed; for, suffering as their country had, a very Niobe amongst nations, all her artistic power had gone almost entirely into poetry. The question was, was it possible again to elevate handicrafts so that every one of them would become an art? Until people recognised that to make the smallest bit of ornament that ran round a room or formed the design of a carpet the greatest delicacy of hand and the greatest refinement of imagination were required—until people recognised that there was no nobler profession for young men or women than any one of those simple decorative arts, they might have art as a mere fashion amongst them, but never as really strong and natural born, as they desired it to be. They should not imagine that he was about to prescribe any particular form of decoration. They must recognise how absolutely various all taste was. But it was not sufficient for people to say that they knew what they liked. It was far more important to know what to like, and the desire for beauty being, he could not but think, natural to every one of them, all he could hope to do was to lay down a few general principles which lay at the base of all art in order to enable them to have something better in the shape of decorative art than a nineteenth-century house. Mr. William Morris, whose name as a poet and a handicraftsman was familiar to many of them, had been in the habit of laying down some very sensible rules to people about to furnish houses. One was—have nothing in your house that you do not either know to be useful or think to be beautiful. If that rule were followed out, what a lot would be got rid of. The wax peach would no longer repose under the glass shade, and endless macassars, reminding one of an eternal washing-day, would disappear even though nothing absolutely artistic took their places. Mr. Morris's second rule was—have nothing in your house that you do not feel must have been a joy to the man who made it, and

that you do not know is a joy to you who use it. That second rule struck at the root of all that was beautiful in art. The whole meaning of ornament was that some noble-minded man or woman, having felt the beauty of the world about us, must needs convey to others in the work of his hands the joy and delight that that beauty had given him. Mr. Morris's third rule was—not to imitate one texture by another; for example, not to paper a hall to make it look like Sienna marble. Mr. Ruskin laid great stress on the ethical side of art, declared that it was extremely immoral for people to have anything of the kind—that it really put the master of the house in the position of telling a falsehood to everyone who came to see him. He (Mr. Wilde) was not sure that he took exactly such an ethical view. The morality of art was merely beauty—its immorality, ugliness.

As regarded the style of architecture for private houses the Gothic was the most beautiful and best, because it allowed the most freedom. The Classical condemned them to square windows, whereas in the Gothic they could have square, round, pointed, or all three. They could have also a little turret without any necessity for monotonous symmetry interfering. If they worked in red brick it afforded more opportunities for pleasant decoration than almost any other material. Broad lines of colour were effective. The Venetians in their palaces used broad bands of colour with large shields of marble let in between them: but of course they did not want marble—brick would give them as much colour as they wanted. Beautiful colours and beautiful proportions were what they wanted. Absolute ornament was secondary, and should follow afterwards. If their house were beautiful in its scheme of colour and graceful in its proportions, it would surely be a pleasant house to live in. As to the hall-door, a polished brass knocker was better than a blackleaded iron monstrosity. The door itself should not be painted to imitate any other wood, grained like oak or walnut, but treated in colours. He should not paper the hall, but should rather wainscot it or use matting. The hall was not the place for pictures. A good picture should hang only where people had quiet and time to enjoy it, whereas people were always rushing into halls with umbrellas, and out of it to catch trains. As regards rooms, assuming that they had the modern whitewashed square box that was so often left in their hands by the builder, and that they had to decorate it, what was the first thing to think about? The colour scheme according to which they proposed to decorate it. Don't ask him, as many people did, "What was the artistic colour?" There was no such thing as an artistic colour; all colours were equally beautiful. Colours lay before the decorative artist exactly as the keys of a piano before a musician. One note was not lovelier than another, but certain combinations of notes and certain harmonies were beautiful; and so it was with colours. But it was to be remembered that the most valued colours in decorative art were the gradated colours—those that were just passing from one primary colour into another. An artistically decorated room was not a gloomy room done in sage-green, which, he was sorry to say, was the idea many people had. Nothing of the kind. The decorations should be as bright and joyous as colour and texture could possibly make them. But how were they to get that bright effect? If they looked at the old stained-glass window of some great cathedral, or at a Persian carpet, they would see that the effects were produced not by using the primary colours to excess, but by the proper use of neutrals, such as white, black, and grey, which, properly blended with the primaries, produced effects as wonderful as those in a peacock's tail. The bright colours should be set like gems through the others. Such combinations produced the splendour they had in the workmanship of the East, while Europe only gave them glare. Gold was often used as a colour, whereas it should only be employed as a neutral. The most beautiful room was, he thought, the low room. If the walls were too high, their height could be apparently diminished by broad horizontal lines, of course not dividing the wall into two equal halves. There might be a frieze above and a dado below, but not all three unless the wall were very high. The dado was of practical use to preserve the wall from being injured by the furniture, and therefore he thought the best dados were of wood rather than paper. Remember that in most cases the wall was a background. The paper should be of a very low note of colour—dull greens, with a little red, and so on. Their highest notes of colour should be reserved for their more delicate textures. If they made their wall very brilliant, they would have struck their finest note at once, and the wall would have ceased to be a background, and become a decorated foreground. The highest colours should be reserved for their beautiful porcelains and delicate embroideries. As regarded the wall surface and the choice of paper or distemper, he did not speak against paper. Many good artists now designed beautiful wall-paper. But it was not the only method of covering a wall. Provided they kept the colours right, the room would look well, no matter if the material were only deal or plaster. He could hardly conceive a room too low to be beautiful; but if they thought it was, the way to get height was to have decorated vertical panels in the walls. As to the texture of the panels nothing could be more beautiful than many of the very lovely poplins that he was glad to say they were still making in Ireland. The old poplin of fifteen years ago was a little too thick and coarse

n texture to fall well in folds. That was entirely changed now. They had a beautiful texture, while the mixture of wool with silk gave durability, which was desirable, as the panels could not be changed every day. As to the frieze, they should never have it of paper; gold-stamped leather would always look better. With respect to the ceiling, what a problem came before them! What were they to do with the glaring white plaster? What was wanted in a ceiling was a raised surface, which would break up the light. Many old houses in Dublin had beautiful ceilings; some, he believed, from designs of Angelica Kauffman. Such designs were a beautiful art which we seemed to have forgotten.

As regarded windows, a good many architects seemed to treat a house as if the rooms were not intended for reading, quiet, or conversation, but for conservatories. There were such enormous windows with plate glass panes, as if the people in the street had nothing to do but look into the house, and the people in the house had nothing to do but look into the street—both being, of course, extremely bad habits. Such windows let in a glare that had the same relation to light as noise had to music. To stop this glare the upholsterer was applied to, and he came and erected across the top of the window a pole as big as a ship's mast. At each end of the pole he put a sort of gilt pineapple, and from heavy gold rings hung down curtains so low that they had to be looped up. That was an error. They should not touch the ground. Again, any decorations on the curtains should be horizontal or transverse, in order that the folds might form graceful curves. The panes of glass might be of any form, but they should be small; stained glass should be more frequently used than it was. He did not mean those dreadful, transparent, lithographic pictures that came from Germany, and particularly Munich. A stained glass window had nothing to do with being a picture. It should be a coloured design. There was no necessity for the large curtain pole; a mere rod would suffice. Then, what were they to do with the dreary, white marble chimney-pieces with machine-made curves? It would be clearly immoral to sell them, for they should never ask money for what was ugly. It would be equally immoral to give them away, for they should not wish any of their friends to possess what was ugly. If they could not get rid of such a chimney-piece, they might paint it, or adopt the Italian method of incised lines with coloured cement between the interstices. As regarded the fireplace, one could take many a pleasant lesson from the farmhouse, where one often saw, instead of the ugly black-leaded cast iron or polished steel fender, a nice brass one. The more brass and copper one got near the fire the better, because it reflected every flicker of the burning embers. They did not want "Tintern Abbey by moonlight" upon the front of their coal-scuttles. A plain brass scuttle was sufficiently beautiful. He should never have elaborate designs in any tiling near the fire, because one should never put design, particularly figured design, where it was liable to be spoiled. For the back of the grate he should not have tiles—the heat was too great—but good cast-iron. They should not be alarmed by all that Mr. Ruskin had eloquently said against cast-iron ornament. It really was not ugly when used properly. Many beautiful objects ornamented in very low relief were fashioned from it. From Japan, for example, came pretty little kettles, with the most delicate and fantastic designs. In Japan, too, with splendid recklessness, the moment they had cast one design they broke the mould, and thus prevented that indefinite repetition by machinery, which was one of the sad things of modern times. As regarded the mantelpiece itself, he thought it had better always be carried up to the ceiling, with little shelves of wood on each side (the panels being filled in with decoration), to store Venetian glass and delicate ornaments. It was good always to carry at least one thing in a room up to the ceiling. In the centre of the mantelpiece they could have a pretty circular mirror, or an oblong, or square one, with bevelled edges. Do not have that huge, plate-glass mirror, with its very grave, gold ornamentation. Artistically it was bad, because it reflected the ugliest part of the room—the ceiling; a fantastic glare was created: your lines were spoiled and your colours tarnished. Then, of course, it was extremely bad for people's vanity to be always looking at themselves in these gigantic looking-glasses.

Then, as regarded furniture, they had a choice. He would not limit them to any era or age. The Gothic was beautifully made and solid, and a great deal of it was finely carved in its own day; and in a large and stately house it was always in place. But in the houses of simple, refined people very often it looked heavy. A great deal of it seemed to belong to a very warlike age, when people felt it was an advantage to have furniture that might be used as weapons of defence. What they wanted was furniture made by refined people for refined people, furniture which would not weary them with ornamentation out of place, but which would grow more beautiful the longer they had it. How sad it was that decorative art should have fallen into such disgrace; that a new word had to be invented—"secondhand"—which meant that the moment you bought a thing it began to decrease in value, until after eighteen months it was worthless. If beautifully made, the thing ought to increase in value and beauty the more one used it. When you got a modern imitation of the work of Louis Quatorze there was very little beauty about it. He did not think gold furniture, in its texture and exaggerated curves, was suited to use; and

the fault of Louis Quatorze's furniture was that its curves were always exaggerated. In a beautiful curve one hardly perceived beginning or end; it was the course of an ellipse rather than of a circle. Furniture having exaggerated curves could not last long, because the curves were made by cutting against the grain, which weakened the wood. The furniture of the First Empire in France and some in Holland were made by refined people for refined people; it did not weary with ornamentation. Ornamentation should be kept for sideboards, bookcases, and state pieces.

They would be quite right to subdue their decoration to their pictures, if they had good ones. Mediocre pictures were worse than bad ones, and, without any intention of speaking against pictures, he urged that beautiful embroidery, lovely porcelain, delicate metal-work, ivory, Venetian glass, were far more decorative than mediocre pictures, and did not cost one-fiftieth as much. In hanging a picture do not be led astray by the subject, but consider, "Is this picture beautiful in line and colour—is it a lovely decorative?" If so it would look well. The first thing a picture had to do was to be decorative, and to affect one by colour and form. Engravings were decorative, but never have a white ground to them. Etchings were extremely decorative. Photographs of natural scenery he certainly thought were really decorative and very fine in a portfolio, but he should not hang them on walls. If anything could prevent one going to Switzerland it would be the photographs of the valley of Chamouni one sometimes saw. But there were artists who photographed well; and he had seen hanging on walls good photographs of pictures by Velasquez. As to photographs of one's relations, of course if one's relations were decorative, there was every reason for hanging them on the wall. But suppose you had to make a stoical and Roman choice between relations and decorative art, he hoped decorative art would be given first place. It was sad to think how the piano, which should be the centre of culture in every house, was, as a rule, the ugliest thing there. It was possible to hide the ugly parts of the huge rosewood grand with embroidery, but that dulled the tone. Better far take a hint from the pretty little harpsichords and spinets of the last century, with their beautiful carved wood cases and decorative work. If a school of art would set itself to produce a piano and decorate it well, that would be really an era of art.

The whole basis of art lay entirely on the honour and value they gave to handicraft. He could not but think that, in the comparative neglect of handicraft, there had been a great mistake made as regarded popular education. A great deal was to be learned by watching a man doing something useful, as a smith working at his anvil or a carpenter in his shop; and if, instead of teaching little boys and girls the latitude and longitude of countries that nobody wanted to go to—which was called geography—and all that criminal calendar of Europe, which was termed history—if, instead of wearying children with these two so-called sciences, we were to teach them simple decorative arts, how much better we would make them, and what a source of knowledge and delight in afterlife we would be giving to them. Let them be sure, before they directly appealed to the mind or soul by printed books, that there was a mind to appeal to; and how could they better create a mind than by teaching a child to design? This meant, in the first place, opening the child's eyes to the wonders and beauty of the world around it, so that there would be nothing—the pageant of the clouds in the morning and in the evening, the flight of birds, the moon, the sea, the waving grass—which would not have its little message of beauty to the child. Then, when his eyes were suddenly opened to these beauties, show him how there was no mechanical instrument in the world which, for delicacy and exquisiteness and power, could match the human hand, by which he could transmit to others the sense of beauty and reverence which he had in things around them. So he should like to see in every school, for rich and poor alike, a pleasant workshop. He did not say banish books entirely; but he did say teach also carpentry, carving in wood, working with the potter's wheel, working in metal, and at *repousse* brasswork—the beating out of brass and silver being so simple—working in leather, and designing in various other materials. Let this be to the child an art, not merely a trade. Mr. William Morris said once, talking of his own workmen, "I have tried to make the artisan an artist, and when I say an artist I mean a man." What nobler definition of an artist could one get? He could not but feel that a great deal of our over-seriousness in decorative art came from people taking to art merely when they grew up, and not having been brought up to it from their childhood. Look at Japanese art. It seemed to be the art a lively child would paint if it meant to amuse others. Look at Gothic art and all the fun that went on around those beautifully carved Gothic pillars. He could not but think there was not enough of play in our art. If artistic education began at the earliest time how changed all this would be! How wrong they were to let children live in a sordid atmosphere. Their school should be the most beautiful place in every town or village—not whitewashed walls with everything around dull. It should be so beautiful that the greatest punishment for a little boy would be not allowing him to go to school next day. It was so in Japan, where the decoration of the school was changed every week. How little that was really beneficial did

children know. Perhaps they knew the population of Madagascar—how many blacks and whites were there—as if that made the slightest difference, or of what colour they chose to be. Perhaps they knew also the names of the kings in the Saxon Heptarchy, as if that could be a source of any delight in after life. But perhaps they would not know how anything useful around them was made. He did not think children would ever be cruel to animals if they were taught designing, because they would then learn to admire all the bright-eyed furred things that lived in woods and fields. Teach a child to love what is good and beautiful, and to hate what is ugly and evil. Every great artist, it seemed to him, had taken a certain degree of delight in working at simple things. Raphael designed furniture for the Vatican. Titian painted many a lovely chest in which a Venetian girl could keep her marriage dresses. The real ruin came to art when artists separated themselves from handicraft. This was the hour to weld again into one the artists' and handicrafts' art. The mission of art was very simple. It had no very elaborate philosophy about it. It merely claimed to bring into the life of every one of us a little joy, to touch the fleeting hours of day and make them gracious. If asked what great things art would teach us, he knew no better answer than the language of Keats, "I have not got the slightest reverence for anything in existence except for the Eternal Being, the memory of great men, and the principle of beauty."

### LABOURERS AND ARTISANS' DWELLINGS.

THE following is the concluding portion of an article by Mr. Chamberlain which appears in the *Fortnightly Review* for December:—

After defending the Birmingham Corporation from the criticisms of Lord Salisbury, and declaring that the cost of improvements is an insuperable obstacle at present to a bold and comprehensive dealing with the subject, by reason of "the exorbitant valuations of arbitrators and juries, and the extravagant expenses allowed in connection with them," Mr. Chamberlain proceeds:—

Here, then, we arrive at the conclusion of the whole matter. It is simply a question between the rights of property and the rights of the community, and as long as we are willing to treat as one of the incidents of private ownership the power of exacting extortionate terms of compensation whenever the necessities of the public call for expropriations, we may write as many articles and make as many speeches as we please about artisans' dwellings, but we shall not advance one single step in the direction of their improvement.

Is there reason to hope that public opinion has advanced to a proper appreciation of the situation? Is Parliament prepared to recognise the obligations as well as the privileges of ownership, and to insist that this traffic in misery and vice shall no longer be a source of profit and advantage to those who wink at its existence, or actually assist in promoting it?

It is to be feared that Lord Salisbury, at any rate, has not arrived at a clear conception of the duty of the State in this matter. He is in favour of everybody doing something except the persons who are the authors of the mischief. He appeals to private charity, and recommends the extension of the useful and benevolent work associated with the name of Miss Octavia Hill; he urges employers of labour to undertake the business of housing their work-people; he calls on the State to lead the way in this socialistic movement; and he contemplates a large extension of the system of public loans, which he would advance on insufficient security and at unremunerative rates to private bodies, like the Peabody trustees.

These proposals all have a fatal tendency—even if they are not dictated by the wish—to shift the burden from the right shoulders, and to load the public with a responsibility which properly belongs to the owners of the land.

They are, besides, ill-considered and ineffectual for their purpose. What can be more unpractical, for instance, than the demand that the State shall provide house room for all its servants? Consider the difficulties raised by such a scheme. Is the accommodation to be provided free, and in addition to present salaries and wages, or is it to be charged at a fair market rate? If the former, then the proposition amounts to a grant of one-sixth increased remuneration, over and above the ordinary rate of wages, to all persons at present in the employ of the Government, and at the expense of course of all persons who are not officials. A sum which must be counted in millions will be added at once to the taxation of the country; but this is by no means the only objection. The grant of house accommodation must be proportioned to the size of the family—otherwise the State would become *particeps criminis* in overcrowding—and the postman with a large family of eight or ten children will receive benefits double or treble the value of what will fall to his comrades who have remained single. Again, is the accommodation offered to bear any relation to the position of the official, or is a coal porter to have the same apartments as a confidential clerk or private secretary? If, however, the accommodation provided by the State is to be rented at a fair value to its servants, we are landed in another set of difficulties. Are all the officials to be required to avail themselves of the house

room offered them, and at the rents fixed by the Treasury? If so, there will be something like a general strike, and not half of the existing officials will surrender their independence and right to choose their own residence for their appointed share in the great Government barracks which Lord Salisbury would erect for them. If acceptance is voluntary, what is to be done with the rooms and houses which will be vacant and unoccupied by officials? Is the State to become general landlord and lodging-house keeper? *À la bonne heure!* but this is nationalisation of the land with a vengeance, and will lead us much further than Lord Salisbury appears to imagine.

Lastly, who is to insure that the evils of overcrowding and of insanitary conditions do not grow up even in the Government buildings? Are we to have a new department charged with the inspection of the private life of all the members of the Civil Service, a new *police des mœurs* created for the express benefit of Government officials?

Lord Salisbury's proposal as to loans of public money is as vague and unsatisfactory as his scheme for State almshouses. He throws over Sir Stafford Northcote, who, as Chancellor of the Exchequer in 1879, forced a Bill through the House of Commons which raised the rate of interest on all loans granted by the Public Works Commissioners. The present writer, with Mr. Shaw-Lefevre, and a few others, opposed this legislation. We warned Sir Stafford Northcote that by increasing the cost he was rendering impossible any future operations under the Artisans' Dwellings Act, the Harbours Acts, and other measures, an essential feature of which was the provision of capital on favourable terms under the guarantee of the State. The opposition was of no avail, and only earned for those who took part in it a charge of obstruction, which has been often repeated in subsequent years. It is some satisfaction to find that events have justified our criticisms, and that, in the dual leadership of the Conservative party, one voice is raised to condemn the policy which was initiated by the other.

But while admitting the principle of State loans for such purposes as that under discussion, we may be permitted to point out that nothing is to be hoped from the particular proposal of Lord Salisbury. To lend money at 3 per cent. to non-representative bodies, who are largely irresponsible in their actions, is a very doubtful policy. What security is to be taken for payment of the interest and for the ultimate reimbursement of the loan? It is not so much capital that is wanting in the case of the Peabody Trust and similar undertakings, as the opportunity of expending it with any chance of a reasonable return. The difficulty is to get sites for building at a cost which will allow of even 3 per cent. upon the outlay. Lord Salisbury's own article shows that in the most recent case this object has been attained by a sacrifice of property belonging to the ratepayers equal to half a million of money.

Passing over, then, these halting suggestions, let us go to the root of the matter and state the principle on which alone a radical reform is possible. The expense of making towns habitable for the toilers who dwell in them must be thrown on the land which their toil makes valuable, and without any effort on the part of its owners.

When these owners, not satisfied with the unearned increment which the general prosperity of the country has created, obtain exorbitant returns from their investment by permitting arrangements which make their property a public nuisance and a public danger, the State is entitled to step in and to deprive them of the rights which they have abused, paying only such compensation as will fairly represent the worth of their property fairly used.

1. The law should make it an offence, punishable by heavy fine, to own property in a state unfit for human habitation. The law already punishes the retail tradesman who exposes diseased meat for sale, and it is a much more serious offence to make a profit out of conditions which are absolutely incompatible with health and morality.

2. In every case in which the local authority acquires property under these conditions, the arbitrator should be empowered to deduct from the ascertained value such sum as he thinks fit by way of fine for the misuse of the property and the offence committed in allowing it to be the cause of disease and crime.

3. Local authorities should have power, subject only to appeal to the High Court, to close such property, or to make at the expense of the owner such alterations or repairs as may be ordered by the sanitary officer, without being compelled to acquire it.

4. Local authorities should be further empowered to acquire any lands and buildings for the purpose of a scheme under the Artisans' Dwellings Acts, at the fair market value of the same, to be settled by an arbitrator appointed for the purpose, and instructed to give in every case the value which a willing seller would obtain in the open market from a private purchaser, with no allowance for prospective value or compulsory sale.

5. The valuation should be made in every case by an official arbitrator, and no appeal should be allowed from his decision.

6. The scheme of improvement should include any surrounding property which will be benefited by the reconstruction of the unhealthy area, and the confirming order should authorise a rate to be levied on the owners of such adjacent property, fairly representing the appreciation of their holdings by the proposed improve-

ment. The principle of this proposal has always been adopted in the case of town improvements in the United States, and it has even found its way into English legislation. The Artisans' Dwellings Act, 1882, provides that when in the opinion of the arbitrator the demolition of the property dealt with adds to the value of other property belonging to the same owner, the amount of such increased value may be apportioned and levied as an improvement rate on lands, &c., affected; and a similar provision has been inserted in a Provisional Order, 1879, obtained by the Corporation of Liverpool. All that is now required is to extend this principle to all lands benefited, whether belonging to the same owner or not.

7. The cost of any scheme for the reconstruction of an unhealthy area should be levied on all owners of property, including long leaseholders, within a certain district to be determined by the scheme. The promoters would, in fact, in every case specify a contributory district, and the official sent to conduct an inquiry into the scheme would decide whether or not it had been rightly defined. The contributory district might be, in London, the whole metropolis, or, in the provinces, the whole borough; but if the improvement were essentially local in its character, and likely to be to the immediate advantage of a more limited district, the cost might be thrown entirely on the owners within such district.

The effect of these or similar provisions would be simply that improvements on a large scale, and in every large town, could be undertaken by the local authority without fear of excessive cost or additional burden on the rated occupiers. This is the age of municipal activity and enterprise, and there is not the slightest doubt that local authorities would under those conditions joyfully embrace the opportunity afforded to them, and that they would quickly put an end to the scandal and disgrace which has at last forced itself on public attention, and alarmed and shocked the public conscience.

It remains to be seen whether practical effect can at present be given to the only measures which afford hope of permanent relief, or whether we shall be condemned to witness yet another tinkering of the machinery which has entirely broken down.

In this case it will be our duty to point out to the people at large that what they want done they must secure for themselves. Political power is only the means to an end—the extension of the suffrage and redistribution of seats would, indeed, be as worthless as the vacation essays of great landowners if they did not lead directly to the practical solution of some of those social questions which intimately concern the welfare of the masses of the people, and in the settlement of which they have a just right to make their voices heard.

### THE NATIONAL PORTRAIT GALLERY.

SEVERAL pictures of long established popularity have been added to the National Portrait Gallery under the new Act of Parliament, which enables the trustees of the National Gallery to lend to other institutions. The large "high room" of the Portrait Gallery has been re-arranged, and was open to the public on Monday. The well-known full-length picture of John Philip Kemble as Hamlet holding the skull of Yorick, painted in 1801 by Sir Thomas Lawrence, has, after falling into an almost hopeless condition of obscurity from exposure to gas and heated air in the South Kensington Museum, been successfully cleaned by Messrs. Haines & Son, and occupies an important position on the side wall. The majestic full length of Mrs. Siddons reciting from "Paradise Lost," also by Lawrence, and given to the nation by her friend Mrs. Fitz Hugh, is another instance of satisfactory restoration. Theatrical portraits of Fawcett, "Gentleman" Smith, Morton the dramatist, and Miss Stephens, afterwards Countess of Essex, will be found in the same room. Several choice portraits by Gilbert Stuart, painter of the *Skating Man*, which excited so much interest at the Burlington House Exhibition in the winter of 1878, representing Mr. W. Grant of Congalton have also been transferred to this collection. They were never so well seen in Trafalgar Square. The portraits are Benjamin West, P.R.A., William Woollett, the engraver, and John Hall, who succeeded him as historical engraver to the king. John Smith, the mezzotint engraver, who chiefly devoted himself to the works of Sir Godfrey Kneller, by whom the portrait was painted, blends appropriately with this interesting group. It had been presented by Mr. William Smith to the National Gallery before a distinct collection devoted to portraiture was established. *Sir John Soane*, the architect, is a highly favourable specimen of Jackson's breadth of treatment and power of seizing character. *Sir David Brewster*, painted by Sir John Watson Gordon, with solid heavy colours, although fully conveying the look and character of the individual, is a singular contrast, on technical grounds, with the preceding. A portrait of *William Pitt*, one of the numerous repetitions by Hoppner to be found in great houses and public institutions, and by no means one of the best, represents the statesman in a white cravat and plain black suit, resting the fingers of his right hand on the embroidered robe of the Chancellor of the Exchequer laid on a chair beside him.

At the entrance of the gallery, forming one of a group of eminent English women, is an effective portrait of *Mrs. Mary*

*Somerville*, drawn by James Swinton, and bequeathed by her daughter, Miss Martha Charters Somerville. It is encumbered with an elaborately-ornamented wooden frame carved by herself. The marble bust of *Mrs. Jameson*, the gifted writer on art and matters connected with social improvement, by John Gibson, her friend and admirer, has been transferred to this collection from the South Kensington Museum, where it had been deposited before the establishment of the National Portrait Gallery in a place suited to receive it. The National Gallery has also transferred from Trafalgar Square a so-called portrait of *John Milton*, by Van der Plaas, with a pilgrim's staff and gourd beside him, and a small figure of the Redeemer issuing from the tomb in the upper right-hand corner. A curious water-colour drawing of *General Wolfe*, showing his pointed nose and receding forehead and chin in profile, turned to the left, is attributed to the pencil of the Duke of Devonshire. It formerly belonged successively to two Duchesses of Devonshire, Lady Georgiana Spencer, and Lady Elizabeth Foster. It has the appearance of having been drawn by an amateur from the life, and is presented by Lord Ronald Gower. A bust of *Porson*, electrotyped on a mould taken from his face by Ganganelli, has been bequeathed by his niece, the late Mrs. Chuter; and a terra-cotta bust of *David Garrick*, full of animation, comes from Sir Theodore Martin, who had previously given the attractive portraits of *Margaret Woffington*, *Flaxman*, and *Hayley*.

On the walls of the outer room, among the very earliest portraits, have been placed some outlines facsimiled from tracings taken from the original wall-paintings in St. Stephen's Chapel, Westminster, depicting King Edward III., the Black Prince, and other members of the royal family, by a skilful contemporaneous artist. These tracings have become the more valuable as the originals perished in the great fire which destroyed the Houses of Parliament in 1834. The facsimiles were made and presented by Mr. George Scharf, the director of the gallery. A large number of autograph letters and documents have recently been added. For these no money is appropriated in the annual grant by Government, and they are exclusively donations. Among them are many letters of considerable historical interest presented by Earl Stanhope from among his literary treasures at Chevening.

### THE FORTH BRIDGE.

ONE of the four caissons which will form the foundation of the large span on the South Queensferry side of the Forth, has just been completed by Messrs. Arrol Brothers, of Glasgow. All the caissons will be of similar construction, though slightly varying in height to suit the inequalities of the surface on which they will rest. Each of them will be 70 feet in diameter, varying from 46 to 64 feet in height, with an inclination of 1 in 46. The one which is just completed, and of which the others will be *fac-similes*, is built up in plates, and is constructed in the most substantial manner. It consists of two skins, an outer and an inner, and these, which are placed 7 feet apart, are made of iron varying from three-eighths to five-sixteenths of an inch in thickness. Seven feet from the bottom the inner skin is made to slope outwards at an angle of about 45 degrees, and, joining the outer skin at the point, forms what is known as the shoe, which is entirely composed of Hallside steel. The cutting edge of it is formed of two 6-inch angle-irons, three-quarters of an inch thick, placed back to back. To these the junction of the outer and inner shells is rivetted, the whole of this cutting edge being bound on the inside by a half-inch plate, and on the outside by an inch plate 18 inches deep. Between the outer and inner skins there are heavy diagonal angle-iron bracings, placed horizontally and vertically, and the whole plates are to be caulked so as to make them thoroughly watertight. Between the skins there are bulkheads, in order to divide the space into ten compartments, the object being to facilitate the sinking of the huge piece of metal. In the inside four main girders are carried across the floor of the caisson at equal distances from each other, and these are taken right through to the outer skin, so as to give more strength, and prevent any chance of collapse by the pressure of the water on the outer shell. Just at the point where the inner shell turns towards the angle to form the shoe, a floor or roof of  $\frac{3}{8}$ -inch iron plating is laid across, and is also made watertight. It is carried by means of four strong latticed girders, 18 feet deep, and to these are attached a sufficient number of cross-girders, to make the floor perfectly rigid. These main and cross-girders are so placed that the floor will resist an air pressure of 30 lbs. to the square inch. It is intended that while the operation of sinking the caisson is being performed the men will work in the seven-feet space underneath the floor, access to which will be had by three tubes reaching to above the level of the water, and all fitted with the necessary air-locking doors. It is estimated that there will be about 400 tons of iron in each caisson.

Messrs. John R. Clayton and Alfred Bell have received a warrant from the Lord Chamberlain appointing them "Glass Painters to the Queen."

## NOTES AND COMMENTS.

It is not surprising, when the state of the building trade in general is considered, that for the past seven years the North Wales slate trade has been depressed and unsatisfactory to the quarry owners. It was also inevitable that there should be a competition that was not conducted on sound principles. Some of the principal owners of quarries now see that there must be united action if the trade is to be again successful, and a meeting was lately held in London to consider the subject. The main question discussed was whether the prices in 1884 were to be raised or reduced. On one side it was urged that at present prices are too low, and that it would be politic to increase them. But the majority were of opinion that as the stocks at the wharves were increasing in quantity, any addition to price would be likely to promote the trade in foreign slates. It was finally decided to reduce the prices of large-sized slates, and in a few instances to slightly raise the prices of small slates. The reduction will not be made uniformly nor by means of a percentage, but each size has been discussed separately, and reductions made in accordance with the requirements of the trade.

THE committee who were entrusted with the examination of the designs for the National Museum and Library in Dublin have not taken much time to arrive at a decision. The members, with one exception, were Irishmen. Lord POWERSCOURT, Sir ROBERT KANE, and Mr. JOHN McCURDY were on the former committee, and the remaining members were Mr. DAWSON, Lord Mayor of Dublin; Sir WILLIAM GREGORY, formerly Governor of Ceylon, whose exertions for the preservation of Arab art are well known; Colonel NOLAN, R.A.; and Lieutenant-Colonel FESTING, of the Science and Art Department. In this trial the Irish architects have been fortunate. Out of the five designs selected, three have been prepared by architects who are resident in Dublin—viz. (1) Messrs. THOMAS N. DEANE & SON, (2) Mr. THOMAS DREW and Mr. W. M. MITCHELL, (3) Messrs. MILLER & SYMES. The remaining designs selected are by Mr. OWEN WILLIAMS, of Bangor, and Mr. FRANK HOLME, of Liverpool. But we give the names with some reserve, for their accuracy has been doubted, and as yet there has been no official announcement of the results of the first stage in the competition.

So many dangers are supposed to arise from living in ordinary dwelling-houses, we are not to be surprised if a sanitarian suddenly advocates that we should go back several stages in civilisation and dwell in tents. It was lately ascertained in Berlin, by Herr PETENKOFER, that the minute pores in bricks serve for ventilators, but a San Francisco naturalist has discovered that "each pore in a brick is inhabited by a peculiar rod-like animalcule of the genus *bacili*." The bacili are most interesting beings. "Their motions when they were agitated by blows were as the links of a chain, reminding one of a system of joints to be extended and contracted. They were semi-transparent, with a light, scintillating column nearly two-thirds their length, extending from near their head to their pointed tails, probably their spinal column." They are too, if we are to believe our Californian observer, identical with the animalculi that are observed to be connected with some of the most grievous forms of human suffering. The only way to escape from them it appears, is to build houses of stone or terra-cotta, and we may shortly expect to learn that the San Francisco philosopher has a financial interest in a quarry and a pottery which hitherto have not been successful.

It is proposed to publish reproductions of ninety-nine drawings by ALBERT DURER, from those which are in the Royal Print Room, Berlin, and in the collections of Mr. MALCOLM, of Poltalloch, Mr. WILLIAM MITCHELL, and Mr. FREDERICK LOCKER. They will be edited by Dr. F. LIPPMANN. DURER's style of drawing would seem to have been designed for such a purpose, and the publishers announce that they have been able to produce a collection of facsimiles which will afford enjoyment to the public, and instruction to students in art. Several processes have been employed, such as phototype, heliogravure, woodcuts, photo, and chromo-lithography, as well as combinations of those processes, so as to produce faithful facsimiles and efficient substitutes of the originals, the method selected being determined by the peculiar characteristics of each individual drawing. If the first series of reproductions be successful, a second series will follow without delay.

SOME of the gentlemen in the office of Mr. PEARSON, assisted by Mr. EVANS, the surveyor, and his staff, have subscribed the cost of the enrichment of the largest bay of the choir groining of Truro Cathedral—viz., that at the intersection of the choir and eastern transepts. It is desirable that an effort should be made to continue the enrichment throughout the choir; as if it is not done now that the scaffolding is up it will be impossible, or at any rate very difficult, to do it afterwards, not to mention the enormous difference in cost it would make. If done now the cost of the other bays would be about 160 each. There are six bays in the choir and two in the eastern transepts, making eight bays in all; that is, about 1300 are required to finish the whole complete. Mr. SWAN, the clerk of works, anticipates that there will be little difficulty in raising that sum.

WE have often recommended that local archæology should become a feature in provincial museums. Anything, in fact, would be preferable to the carved paddles by South Sea islanders and the Egyptian mummies which meet the tourist throughout England and Scotland. In Glasgow the Corporation have agreed to co-operate with the local Archæological Society in securing local antiquities. The members of the society will endeavour to collect objects, and the Corporation will undertake to provide cases and other requisites for their preservation. As soon as there is a sufficient collection, the Corporation will provide a room or rooms where it can be seen by the public. This willingness on the part of the Corporation is likely to attract donations.

ELECTRIC lighting has been adopted at the works of the Forth Bridge. The workshops at South Queensferry are lighted by 16 arc lights, supplemented by a certain number of movable small incandescent lights. Outside 12 large arc lights serve to illuminate the various lines of rails and the approaches to the workshops. The offices, canteen, and other buildings are lighted throughout with Swan incandescent lights of 20 candle power, over 200 being there alone required for the purpose. The staging, which, beginning near the Howe's Pier, extends for nearly half a mile into the Firth, has, with its approaches, 12 large lights devoted to its illumination. On the island of Inch Garvie in mid-channel, four large arc lights are in use outside, and small incandescent lights in the offices and workshops, in the old castle, and in the neighbouring buildings. At North Queensferry six large arc lights serve for the outside illumination, and a number of incandescent lights for that of the interior of the offices and workshops. The lighting has been carried out under the direction of Mr. JAMES N. SHOOLBRED.

GLASGOW has reason to be grateful to the firm of Messrs. JOHN ELDER & CO. A week or two ago Mrs. ELDER contributed a sum that will be sufficient to endow a chair of Naval Architecture in the University. Mr. WILLIAM PEARCE, who now represents the firm, has undertaken to pay the cost of removing the old gateway of the former buildings of the University in High Street, and re-erecting it with a lodge near the new University. It has often been regretted that so little is left of the old University buildings, which were not only surrounded by historic associations, but were excellent examples of Scottish architecture. The buildings have had to succumb under railway works and city improvements, the gateway alone survived, and through Mr. PEARCE's munificence it will continue to be a memorial of a famous school.

A DECISION which was given in the Edinburgh Sheriff Court a few days ago is of importance to architects. In June a clerk of works was engaged by Messrs. ANDERSON & BROWNE to superintend the drainage works at Fettes College. In less than a fortnight he was dismissed, on the grounds that he did not keep a correct account of the workmen's time, and that his levels were incorrect. He claimed damages, and the Sheriff Substitute has upheld his claim. Mrs. ANDERSON had lost confidence in the clerk of works, but, according to the Sheriff, an employer is not justified in dismissing his servant unless a serious case of incompetence, neglect, or disobedience is established. But what is a "serious case," according to the Sheriff's notion, was not defined. Surely incorrect levels in drainage works are serious, and so are incorrect time-sheets. If an action had been taken against the architects on account of the defects in the drainage, or irregular expenses, would the Sheriff hold them to be exempt?

DESIGN FOR ROOF OVER QUADRANGLE, ROYAL EXCHANGE.

By GEO. AITCHISON, A.R.A.

## ILLUSTRATIONS.

DESIGN FOR ROOFING QUADRANGLE, ROYAL EXCHANGE, LONDON

OUR view this week is of the proposed roofing of the Royal Exchange by Mr. G. AITCHISON, A.R.A., one of the unsuccessful competitors, but as the designs were not publicly exhibited, no notion can be given of their relative merits. The paltry sum of 10,000*l.* was utterly inadequate for roofing the Exchange of the greatest mercantile city of the world, and is probably less than would have been expended by a second-rate town in Belgium or Switzerland.

Looking at the fact that the sum to be expended was only sufficient for the material covering of the quadrangle, the scheme appears to be sensible, practical, and not devoid of grace. The flat roof or platform, formed of HYATT'S lights, was relieved from monotony by having its borders and centres in slightly tinted glass; and it had these merits, that it would not be damaged by hail, could be readily cleared from snow, and could at all times be washed with a hose. There seems, too, to be ample means of ventilation both by the large circular sashes in the clear storey, and by raised lanterns in three places on the roof.

OFFICES OF "DUNDEE ADVERTISER," ETC., BANK STREET, DUNDEE. NEW BUILDINGS.

THERE are few, if any, newspaper offices to which the auctioneer's term "commodious" can be more aptly applied than to the extensive block of buildings from which the *Dundee Advertiser*, the *Evening Telegraph*, the *People's Friend*, and the *People's Journal* are issued. As a rule, printing-offices are not attractive to the eye, although some men say whenever they enter one their ambition is excited in some mysterious way. There must be, even in the humblest office, as much system as can be found in a man-of-war, but the outward signs of it are seldom apparent. The rooms are generally overcrowded, everything has a dingy workworn look, and too often the heat and absence of ventilation are inconvenient to a stranger. In Mr. LENG'S premises in Dundee the defects of ordinary printing-offices are absent; the rooms are lofty and well lighted, the walls are bright with colour, and the compositors and readers have room to move, instead of being packed like sheep in a pen. The remaining offices have been also arranged so as to afford as much comfort as possible to the employés. But the different departments of the establishment are so well planned by the architects that the large area of floor surface does not add to the difficulties of superintendence. In addition to the production of daily and weekly publications, miscellaneous printing is undertaken; but with all this variety of work there is no appearance of hurry or confusion. There is a place for everything, from the bales of paper in the vaults to the encyclopædias and blue-books in the reference library for the journalists. In one room a man can be seen employed on the cheapest kind of handbills, and in another an artist is at work preparing illustrations for an article which is being written in a third room, and which will in a few hours take the form of a stereotype plate. Here there are bookbinders, and elsewhere lithographers busily engaged.

A visit to Mr. LENG'S establishment at once suggests the causes of his success. His skill in organisation, his enterprise and sagacity, his liberality and consideration for his staff, have enabled him to produce newspapers and periodicals in a Scottish provincial town that can hold their own with those published in London. About twenty years ago the *Dundee Advertiser* was printed at a hand-press in a tumbledown house in Argyll Close, and if it now requires a palatial building and the most productive machinery that can be devised, the transformation is due to a wise management, which has not failed to recognise the ability and zeal of assistants. Great are machines and buildings, but without a staff that is loyal they will no more make a newspaper than class-rooms and apparatus can make a college.

The frontage of the offices of the *Dundee Advertiser* to Bank Street, as shown by the illustration, extends to 215 feet, and the block to the left forms the latest addition, having been completed in May last. This part has been designed to harmonise with the older parts, and at the same time to group with the adjoining buildings to form a symmetrical elevation to the north side of Bank Street. The frontage of this addition is 61 feet; the height from the street is 60 feet; and from the basement floor to the ridge of the roof is 77 feet. The masonry is polished ashlar, the stone being from the Leoch and Fallaws

Quarries. The foundations are of solid ashlar blocks in piers set on inverted arches, and built in cement. Care was needed in underpinning the gable at the west end of the old part of the office—which was founded at the street level—while the new work is 12 feet lower. The ground floor is used for publishing offices for the various papers; the wide doorway serves as a cart entrance for paper waggons, and a strong hydraulic lift is placed near it for raising or lowering the bales. The printing machinery is placed in the basement, and the newspapers are carried up by means of a continuous band with catches, which is kept in motion while the machinery is in action. The remaining floors are used for compositors' rooms, machines for commercial printing, bookbinders' rooms, stores, &c. The newspaper section of the establishment is in communication with the editor's room by means of electric bells, and manuscripts are conveyed to the printers by small patent lifts.

All the floors are carried on heavy rolled iron joists spanning from front to back without columns, their average span in the clear being 28 feet. There is no wooden joisting in the building, the flooring boards being 2½ inches thick, and resting directly on the rolled beams. The boarding is coated with fireproof asbestos paint, and by this construction—fire not being able to fasten upon the flat surface of the floor or ceiling in the way it does upon the usual system of joisting—a practically fireproof and, at the same time, a light floor has been obtained. The flooring is beaded on the joists for the sake of appearance in the ceilings of the rooms underneath. For extra security, and to insure that no accident in the floors above could affect the printing machines and engine in the basement, the floor at the street level has been entirely constructed of heavy rolled iron beams, with iron joists resting on and rivetted to them. These joists are embedded in concrete to prevent fire getting at them and softening them, and over the concrete the thick flooring is laid as on the other floors. The staircase is enclosed in fireproof partitions with iron standards and wire netting, instead of lath for the plastering. No wood has been used where incombustible material could serve the purpose as well, and all woodwork is coated with five coats of asbestos fireproof paint. The roof couples and purlins are of iron, and the sarking is covered with a layer of asbestos felt under the slates, to protect the room from extremes of heat and cold.

A hydraulic lift, capable of raising half a ton at a speed of 40 feet per minute, has been erected for raising the rolls of paper to the paper stores. The whole of the lift is cased from bottom to top with sheet iron to prevent it being the means of carrying fire from one flat to another. All doors in the building are lined on both sides with sheet iron, and having cast-iron frames fixed to the stonework. The doors are ornamented with iron mouldings screwed to the sheet iron.

The building is heated by small-bore malleable iron pipes, by Mr. CHARLES RITCHIE, of Edinburgh. Ventilation tubes about 6 feet high are placed in the corners of the rooms, and in each tube there is a coil of pipe which heats the cold air coming into the tube from the outside before it enters the room, thus preventing cold down draughts. Outlet ventilators with mica flaps are placed in the walls near the ceilings. All the walls are finished in cement for 4 feet in height, and the rest in plaster.

The following contractors were employed on the new buildings: Mason work, Councillor GENTLE; joiner work, Mr. J. W. LYON; slater work, Mr. MARTIN; plumber work, Mr. FARQUHARSON; plaster and concrete work, Mr. M'RITCHIE; iron roof and floors, Messrs. LEE, CROLL & Co.; fireproof doors, Mr. D. KEAY; iron beams, Messrs. MEASURES BROS., London, and McLELLAN, Glasgow; hydraulic lift, Messrs. WHYTE & COOPER; glaziers, Messrs. LINDSAY & SCOTT; wire work, Mr. DICKIE; painting, Mr. NORWELL; heating, Mr. CHAS. RITCHIE, Edinburgh; iron stairs, Lion Foundry Company, Kirkintilloch; stone-carving, Mr. NEILSON, Edinburgh; street gratings, Messrs. M'CULLOCH, Glasgow. Mr. DAVID GEMMEL acted as clerk of works. The whole of the works have been carried out from the designs and under the superintendence of Messrs. C. & L. OWER, architects, Dundee.

## CONTINENTAL SKETCHES.

THIS illustration is a reproduction of some pen-and-pencil sketches by Mr. A. BERESFORD PITE. As they relate mainly to Germany, the Dureresque style in which they have been drawn is allowable.

## THE ARCHITECTURAL ASSOCIATION.

THE second ordinary meeting of the Association was held on Friday evening, the 26th inst., Mr. Cole A. Adams, president, in the chair. After the election of a large number of new members, a lecture was delivered by Professor Kerr, which may be summarised as follows:—

## The Law Business of Architects.

Professor KERR began by observing that in choosing for his discourse that evening the subject of the law business of architects, he was quite aware he was dealing with a subject so large that it would be impossible to give more than something like a syllabus of what the treatment should be, or an index to the various questions that would be treated of in a book. But as those engaged in the practical work of architects knew their success to a great extent unquestionably depended on a knowledge of that administration of affairs which had to do with litigation, he could not too much impress on young men who were preparing for active work as architects to try and acquire this knowledge. This was a commercial country, and whatever honour might be paid to artistic merit, the people at large required the expert administration of affairs, and as building affairs were unfortunately much mixed up with litigation the young architect could not acquire this knowledge too early. Litigation might be defined in a few words as the process which the State provided for the settlement of the disputes of the people. Disputes to settle there always must be; and the perfection of litigation, if it could be conceived of, must be some system of adjudication perfectly simple, inexpensive, and satisfactory to the majority of litigants. That language he was sorry to say could not be applied to the English system of litigation. It was highly artificial, and it was complained of on all sides. The judges themselves would always advise us to avoid the courts of law; and, without any strong language, it might be said that litigation, as administered in England, was not satisfactory. Nor did they require a judge to tell them that when building affairs, with which they in that room had to do, were in question, litigation was most unsatisfactory. The substitute for litigation was arbitration. When an adjudication had to be arrived at, which would carry with it an authority equal to that of law, it must be by arbitration. It was the only way to arrive at justice where delicate and difficult technicalities were involved, which those who were not acquainted with the *arcana* of building affairs could not understand. It had always seemed to him that there was something in the training of the legal mind that prevented lawyers from condescending to those minutiae which building disputes involved. Some years ago an assessorship on expert business was established by statute for all courts of law, but the principle had not been carried into effect, or some such thing would be seen as an eminent assessor-surveyor assisting the judge on the bench.

The architect, when brought forward as an administrator of law business, had for his object justice and fair play. Not that this was not the purpose of law, but the law arrived at it in a different way. The architect was brought in to apply common sense and first principles. In building disputes the arbitrators commonly employed were surveyors, and not architects, and this, too, in matters more strictly concerned with architecture than surveying. The reason was that the business of surveyors consisted in controversy, where the architect dealt with office work. The surveyor by nature of his profession was always engaged in the settlement of doubts, and, in consequence, became better trained for the work; and so it was that when even architects were appointed as arbitrators, they were generally men known rather as surveyors than as architects. Out of the system of arbitration there arose the practice of "splitting the difference." This mode of deciding the dispute was the result, so to speak, of a natural law. When two parties to a controversy were brought face to face before an adjudicator, human nature prompted each to exaggerate his case, and, by what was so far a natural law, each party would probably exaggerate his case equally, justice according to the proverb lying midway between extremes. Hence arose the practice of "splitting the difference;" but sometimes the gentlemen employed as arbitrators were found systematically to split the difference, if not so as to please both parties, at any rate so as to displease each party equally—a practice which could not be justified. An architect should apply his whole mind to the merits of the dispute so as to arrive at the justice of the case, and then give his decision fearlessly and faithfully. An architect, as they all knew, was supposed to be a sort of arbitrator between client and builder; but that was not the principle of law, which considered the architect as the agent of the person who paid him. An architect was not entitled to demand so much confidence from the builder as from the client, yet the profession was so honourably practised that the architect was, in fact if not in law, an arbitrator between the two; and no one would wish this to be disturbed. But, as it was not a legal position, another idea had of late been brought forward and put in practice, by the introduction of an arbitration clause in the contract, providing for the appointment of an impartial person as arbitrator. The fair play of the principle was perfectly manifest; the only difficulty was the appointment

of the arbitrator. In the choice of an arbitrator it was not enough to select a man who was honest; what was wanted was a man acquainted with the business in hand, and possessed of specialist skill and a judicial mind.

An architect when brought into litigation or arbitration acted in one of three capacities, either as adviser, advocate, or arbitrator. In the capacity of an adviser an architect, to assume the position of an expert in building matters, must possess special knowledge. It was not enough for a man to say, "I am an architect, and therefore a safe adviser on all architectural matters." Certain architects were exceedingly bad advisers. They did not know the particular subject which they, nevertheless, took in hand. They forgot the responsibility they incurred in undertaking to advise in what they did not understand, and they incurred the danger of being defeated by a man who did understand it, and doing great injury to the client's interest. Therefore, in order to entitle any one of them to assume the position of adviser in building matters, it was necessary that he should conscientiously feel that he understood the matter, whether it were a question of party walls, dilapidations, ancient lights, or whatever else it might be; unless he conscientiously felt that he understood what was necessary to be done, it was not fair to undertake to advise a client. In respect of advocacy, partisanship was a trap that architects—especially young architects—were apt to fall into. When a barrister was employed in a case it made no matter to him on which side he was retained. His function was to take care that everything that could be said on his client's side should be said, and when he had said all that could be said he had done his duty, and the judge and jury must do the rest. Such a position would be mistaken ground for an architect to take up, and it often led architects to unpleasantness and cause for regret. To assume the position of advocate an architect must not only be conscientious, but he must be more than sure that he understands the business—he must understand how to secure justice in spite of opposition, whether it be technical or mere quibbling. Now, a practice prevailed in the profession against which he entered his protest—the delivering of one-sided reports. A gentleman, for instance, finds himself involved in a dispute with a builder, or a district surveyor, or whoever it may be, and he is recommended to go to Brown the surveyor. Brown says he will make a survey and deliver a report, and he does so. Now, he only hears one side of the question; he does not want to hear the other side. His business is to make an *ex parte* survey without possessing himself of a knowledge of the facts on the other side. But Brown goes further still. He says, "I have delivered my report, and I mean to stand by it," and he does. Whatever may turn up he adheres to the report through thick and thin in the witness-box. Let him deliver his judgment in writing by all means, but let him inquire into the facts before delivering his report. Affidavits, again, were often called for. An affidavit was a statement of facts within one's knowledge, and a statement of opinion on those facts, given in writing, and sworn to, to be handed into a court of law as evidence. He need not say how solemn a matter it was, and that the person making oath in this way should have absolute certainty of the correctness of his statement. Without casting any reflection on the profession, he was perfectly open to acknowledge that they sometimes were in the wrong. Lawyers said of architects, "We can go into the streets of London and get half a dozen architects, each of whom will make an affidavit to any statement we like; and you can do the same. Our men will swear white is black, and yours will swear black is white, and that is the value of expert evidence." He was sorry to say that judges said nearly the same thing; not in such forcible language, but in language even more vexing. It was a pity, for it could all be prevented and the evil cured if an architect, when called on to make an affidavit, would remember that no man had a right to make it unless he were wholly and conscientiously sure he understood everything, and that every word was absolutely and completely true.

Mr. Kerr said he proposed now to take cases of dispute and classify them in reference to architectural, or more properly building matters, in which they might be called on to act in one of the three capacities of adviser, advocate, or adjudicator. To take the valuation of property first. It was perfectly plain this was a surveyor's question, and not an architect's, and therefore when they were called in as advisers on valuation of property they must remember that, however expert they might be, it was an auctioneer's business, who alone knew at any particular moment what was the value of property. Many might, however, have noticed that an architect, when he understood the matter, was invariably deferred to. The valuation of property, however, was a specialist business, which there was no need to go particularly into. If a client, came to them and insisted on having their opinion, the proper course was to possess themselves of the principles on which property is valued, and then, in giving their opinion, to confess that their knowledge was only so and so, and explain on what grounds they based their valuation. If they went further, and came to be advocates, they could not dispense with being well up in these matters. Special skill was indispensable, and cross-examination was so ably conducted that it was hopeless that any one of them would be able to go into the witness-box if not possessed of this

specialist knowledge. A surveyor told him once: "I remember being called on to give evidence for that house. I gave my report in my client's interest, and I was prepared to do my best for him; but I happened to look into my papers, and I found that some years ago I had been engaged the other way for the house next door. So I went to my client and told him, and of course he did not put me into the witness-box." As an arbitrator in this kind of business, a man must be chosen who has a thorough knowledge of the subject; a man who is a really good, sound, scientific authority, or he will be of no use. Next came dilapidations and fixtures. These disputes though taken up by auctioneers were really an architect's work, the work of a practical architect thoroughly acquainted with building subjects. The law of dilapidations was that a tenant occupying a house as leaseholder entered into an obligation to keep the house in repair, and leave it at the end of his term in a substantial condition. The law of fixtures, on the other hand, was that anything the tenant added to the house, which could not be removed without damage to the house, must be considered to belong to the owner of the house, and must be handed over with the house itself, and that all the tenant added must be kept in repair. It seemed clear that no one but an architect, who understood the designing and the building of the house to completion, could properly understand the dilapidations on a building. It was astonishing to architects to see how lawyers reduced everything here to a mere jingle of words. As a rule, judge, counsel, and solicitors spoke of matters of this kind in a way which could be only described as dealing with phrases and not things. Such a dictum as this had been used to any extent, viz., that what was fixed to the wall with a screw belonged to the tenant, and if fixed with a nail it belonged to the landlord. It was merely a play upon the word "fix." Trivialities of this kind seemed to be binding in the case of the law of fixtures, and it might be taken for granted that the law of dilapidations was just as bad. When called on to advise, if they could obtain for their client mere justice, their course was clear, but if litigation had to be gone into they must read up the law, and possess themselves of the necessary knowledge before they could undertake to advise. Landlords, it might be admitted, were grasping. If engaged on the landlord's side, he would only remind them that honesty was the best policy. If they were advising the tenant, they might be sure he was more likely to go to the wall than to come out victorious; so if the tenant were about to go to law, they must make themselves thoroughly acquainted with the law, and try their best to do their client justice. For an arbitrator they must choose a man of experience and of elastic mind—one who would, if necessary, revert to first principles, and so get over technicalities. The law of ancient lights was this, that if your window had been in existence for more than twenty years, and had possessed light over a certain area of sky, that area of sky, as a lighting power over your neighbour's property, belonged to you for ever. A person who encroached on this sky area was entitled to encroach so long as the damage to your light was not material. The whole point turned on whether the damage was material or not. If the damage were material, the question would be asked in court whether the building should be taken down to where immateriality ceased, or compensation be paid. Now, what was an architect to do? Any architect who took on himself to advise a client, whether plaintiff or defendant, ought to know well what he was about, and must be able to judge of the materiality of the obscuration of light. If the architect were incompetent to do this, he had better leave the case alone altogether. If called on to act as advocate, all that he had just said was still more necessary. If, not being thoroughly competent, he were placed in the witness-box, and cross-examined by a barrister who understood his business, the state in which he would leave the box might be imagined. And, then, what damage he has done his client! They should never go into the witness-box unless they knew thoroughly what they were going to say, and the influence their words would have, and unless they knew the questions that would be put to them and the answers they would have to make. In an arbitrator the important thing required was a principle of elastic equity, that elasticity which arose out of acquaintance with things instead of words.

The Building Act Regulations were a set of rules whose object was twofold; in the first place to compel builders of houses to attain a certain minimum of substantiality—it was a miserable substantiality, after all—which should prevent a building falling about people's ears; and, secondly, to prevent the spread of fire. It was not difficult to acquire a sufficient knowledge of the Building Act Regulations to be able to advise a client to a certain extent; but unless they were district surveyors, they must exercise a certain amount of modesty, and what they did not know themselves they could always get from some one else. District surveyors he had always found willing to afford help in this respect. As an advocate in a dispute, the architect had to go to the police-court and do his best to persuade the magistrate that the district surveyor was in the wrong, one function of the magistrate being to see that the district surveyor was not straining the law. Police-courts were exceedingly unsatisfactory in building matters. They did not like building disputes, nor did they wish to have anything to do with them, and yet it was not easy

to see where else they could be taken. Still, if they treated the court with respect, the court would do them justice to the best of its power. If they went to arbitration, they would not think of appointing a man as arbitrator unless he were a district surveyor. As a body, the district surveyors always tried to prevent disputes. They had an organisation for the settlement of them, and were always found ready to set matters right. Another way of conducting an appeal was to go to the officers of the Metropolitan Board of Works, who would always decide fairly.

The next question he came to was that of party walls. The object of the Building Act was to keep lawyers out of disputes. The ownership of a party wall was a partnership affair between two unwilling members, and as it was a fact that could not be got over that the wall belonged to both, it followed as a principle that each possessed an undivided moiety of the whole. The ownership extended over the whole wall in an undivided way, so that each man owned the whole of any single brick, and an owner dare not touch a brick on his side of the wall without giving his neighbour three months' notice. Three months' notice was given in order that you might let your neighbour have time to turn round. In giving notice, it must be specified what was going to be done to the wall, and the best way was to take the list of everything that could be done, and say, "I intend to do all this." Then the neighbour must be told that this is a matter of form, and that it has been done because things might arise which were not foreseen at the first. After referring to the subsequent proceedings, as laid down in the Building Act, Professor Kerr remarked that it was an exceedingly common sense way of doing what might otherwise involve two unwilling partners in an interminable law suit.

In London the Metropolitan Board had charge of the law in respect of dangerous structures. It was quite enough if the Board received an anonymous letter from a passer-by saying that a house, No. So-and-so, in such a street, was in a dangerous condition. Notice was then entered in the books to that effect, and the responsibility rested with the Board. The Board sent orders to the district surveyor, and the responsibility then rested on the surveyor. His object was to get rid of the responsibility as soon as possible; he therefore made a report, and, if he erred on the safe side, how could he be blamed? He made his report so as to insure that the building should be made quite safe; and it must be agreed, hearing what they had heard of late, that it was right that good building should be enforced in London, *coûte que coûte*. The surveyor stated in his report what had to be taken down of the structure, and notice to take down was given to the owner. If the owner refused to take down he was summoned before the magistrate, who then decided what was to be done. Mr. Kerr said he recommended them not to encounter the district surveyor too rashly with opposition, because the surveyor had shifted the responsibility on the owner, and if they advised the owner to resist, the responsibility was shifted on to the adviser, and if the house fell down he might have to go to the Old Bailey. In regard of advocacy, a certain hardship existed. Dangerous houses were often, or very generally, houses existing at the fag-end of a long lease, and the leaseholder held the position of owner as regarded the liability for the state of the structure. The lease had perhaps a couple of years to run, and the leaseholder had to pull down a wall and rebuild it, or whatever it might be that had to be done. It was hard on tenants in general to have to do the repairs under such circumstances, for, do what we would, the expense could not be thrown on those who ought to bear it, and the district surveyor had, metaphorically speaking, to listen to the most heartrending appeals. It was quite right to represent all this to the magistrate, but the magistrate would say, "I cannot take the responsibility on my shoulders; if the Metropolitan Board won't, and the district surveyor won't," &c.

After the consideration of questions of structural disputes the next point dealt with was the performance of contracts, and the arbitration clause. It was intended by this that the builder should have an appeal to an independent architect. Contractors were often placed in a position of great hardship. An unfortunate phrase, "the best quality," was introduced into specifications which had no meaning at all, but which could be made to mean anything one liked. If the lowest possible tender were taken, how could the builder be blamed if he did all he could to avoid losing by the contract? There was scarcely a builder, he heard, but was losing by contract business. There was also such a thing as an exacting architect, who made very fine drawings and details, and often made the details while the building was going on. It was only in the usual course of things that the architect should like to improve his work, and it was only too likely that the improvement added a little more to the expense. Architects should be more generous with builders; and when it was said that builders were losing by building contracts rather than making money, architects should be more than ever disposed to look at both sides of the contract. The contract was a contract, but in the eye of the architect the specification had no hard-and-fast meaning. He remembered a report which he had once given, which was to this effect: "The work is very badly done, but it is done well enough for the money." As arbitrator it was not enough to appoint a nice man, but a man whose name and repute would justify one in

thinking he would administrate with elasticity. On the question of extras, Mr. Kerr observed that they would find they could make their bread much more easily by making out a bill of quantities than by making a pretty drawing.

The next point was *quasi* legal rather than strictly legal, viz., adjudication on designs. The adjudicator in a competition of architects ought to remember that he was assuming a position in which he took upon himself a responsibility which he ought to consider in accordance with the strict principles of equity as laid down by law. There was no contract between the competitors and the promoters of the competition, and that was the unfair part of competitions, so that one could not sue the promoters for the multitude of iniquities they committed. The professional adjudicator ought, in the first place, to insist on perfectly equitable conditions in the conduct of the competition, or else refuse to have anything to do with it.

In the matter of architect's charges, when an architect's bill was laid before them for an expression of their opinion, they should be cautious before they pronounced any opinion on it whatever. They should not go behind the back of the architect, but they should go to him and get his story. The etiquette of fraternity was not practised among architects. They did not hang together as the members in other professions did. They should always remember this as a principle—that whenever they had anything to do with the charges of a brother architect, they must make it a rule to go to him and hear his story. Then as to the architect's duties, Mr. Kerr remarked that he had often said that no architect's employer, if he were so minded, need pay him a single shilling, and this on the plea of negligence. In all questions of this kind, whether as to charges or as to conduct, ten to one the architect was in the right. Lawyers wanted to get a verdict, but if an architect acted as an advocate against an architect he was doing what was called "cannibalism."

Professional etiquette would be the last subject. Architects in practical business were associated with men of every class and description, with men in different departments of business, with professional men—some of high, some of low standing—with men who were great artists, men possessed of high sentimental feelings and the very reverse, with tradesmen, working people, &c. According to the individuality of a man's mind, so was there a tendency to imitate the manners and customs of those with whom he associated. They should be careful to imitate the manners of the best classes, but above all do not let them imitate the manners and the customs of the worst. There was this great distinction between trades and professions. In trade there was competition for business, which allowed one tradesman to canvass against another, but in a profession of any standing the idea of one man canvassing against another was utterly out of the question. There were certain trades in which it was competent for one tradesman to vilify another in order to succeed in business. In professions that was not allowed, and amongst architects it ought not to be. No one, though he had at times said many severe things, had ever heard him say anything to the disparagement of a brother architect. He had seen a good deal of the estimation in which architects were held in England. He would put it to them in this way: Whenever any of them were called to be the architects of a gentleman's house they would find they were made more of than almost any other professional men, and they would be set down to dinner, for instance, where they would not meet the doctor or the lawyer. He wished to impress on them that they belonged to a profession which was learned and which was illustrious. The amount of learning they had to accumulate was great. We heard of learned divines, of men learned in the law, but what complex matters architects had to learn did not seem to be known. Old Vitruvius, 1,900 years ago, said plainly that in his day the architect ought to possess universal knowledge, and it was pretty much the same in the present day. They, as architects, were a learned profession; they were treated as men who belonged to a profession of high degree. They belonged to a profession which was especially honoured in England; a profession of illustrious, historical repute. When it came to a dispute were they then to act as tradesmen? As rivals treating each other with mutual scorn? Was that the way to act up to the traditions of the profession they belonged to? Coming in contact with such high surroundings their conduct ought to be signally magnanimous. He could tell them, too, that self-sacrifice would be found to pay and shabbiness would not. One final remark he would make, and it was that they should never on any consideration take up a case in an unfriendly spirit against a brother architect.

Mr. H. TRUBSHAW proposed a vote of thanks to Professor Kerr for his address. It was very desirable, he thought, that young men should be encouraged to stand up for the honour of their profession. He always considered the line in specifications that "all materials were to be the 'best' of their kind" an unfair one where builders were invited to tender for the work, and so to undersell one another. As to party-walls, he should be glad to know if Professor Kerr could say if a decision had been given (he fancied in a provincial case) to the effect that where one of two adjoining houses was considerably higher than the other, the wall actually separating the houses was a party-wall above the roof of the lower

house, or whether it was simply the external of the higher house. He believed such a decision had been given, and should like to know if it was founded on a special or the general law relating to party-walls.

Mr. APPLETON seconded the vote of thanks. He judged that Professor Kerr's remarks, like the celebrated advice in *Punch* to those about to marry, was in most cases simply "Don't." It would be desirable if we could have specialists in some difficult cases arising out of building matters to whom we could submit the problems.

Mr. SEAGARS referred to New Zealand practice, where it was customary to keep all the builders in ignorance of the amount of the tender until one had been accepted. He did not think this fair, and proposed in practising in London to send all tenders he received for works executed from his plans to the professional newspapers.

The vote of thanks was put by the President, and carried by acclamation.

Professor KERR, after acknowledging the compliment, said, in response to a question that had been put, there was not work, as far as he was aware, in which all legal questions relating to building matters could be studied, at least no one book of recent date. There were many specialist books on most of the subjects he had referred to, which could be found in the Institute or Association libraries. The question as to what was the character of the upper part of a party wall where one house overtopped the other occasioned a curious decision given some years ago in a case from Bristol, and which had never been upset. The magistrate, in his wisdom, decided in a case of this kind that the wall below the roofs was of a party character, but above the lower building it became simply an external one. The effect of this decision was that in the numerous cases where adjoining houses differed in height the owner of the loftier one could pierce his blank wall with as many windows as he chose, and where, then, was the protection against the spread of fire? The decision was supported on appeal. As to the naming of an arbitrator in a clause of the building contract, his advice would be not to select an arbitrator until the nature of the case likely to be brought forward was known. He thought the New Zealand practice of keeping builders in ignorance of each other's tenders was unjust. In England, as most gentlemen knew, the tenders were usually opened in the presence of representatives of the builders who had tendered, and these representatives made a note of the prices, and sometimes sent them to the newspapers, although some architects disapproved of the practice.

#### MR. HERKOMER'S ART SCHOOL.

ON Saturday last Mr. Herkomer's school at Bushey was opened, and after a short address, a programme of the work to be undertaken every week was given. On Mondays, at 9.30 A.M., the model will be posed by one of the students (they will be taken in alphabetical rotation) in the presence of all the other students of the class, and the pose will have to be altered until a show of hands declares the satisfaction of the students. By three in the afternoon each student must have laid in the whole figure in colour, or those who have not yet painted must have drawn it in. This it is expected will prevent niggling, effeminate work. On Tuesdays the first hour and a half is to be devoted to sketching in chalk the same figure in the same view on a smaller scale. At eleven, having revived the power of the hand to that of the day before, the painting commenced the day before will be proceeded with. The whole of Wednesdays and Thursdays, till ten o'clock, will be occupied in the same way, but on Thursday afternoons the whole of the studies will be laid aside, the model re-posed with drapery by the same student, who is the poser for the week, four times successively, and sketches of a quarter of an hour's duration made therefrom. Friday will see the studies commenced on Monday finished, and a fresh model will sit the following week, except in cases where the president wishes one or more students to paint life size studies, when the model will stay a fortnight. On Saturday all the students, male and female, will work together, the study being a head painted in a sitting of three hours from the pose of the male student officiating that week. Within each week, therefore, there is the possibility of each student finishing a study, sketching in black and white from a draped figure, and painting a head quickly. Rapid realisation must in this way be acquired. From seven to nine each evening students will attend, but painting is strictly forbidden. From Monday to Thursday a drawing is to be made from one pose, and on Friday evening three fresh poses are to be sketched. The same poser who officiates in the morning does duty of an evening, so that each student in turn will be considerably taxed in this direction. Mr. Herkomer then gave an outline of his own intentions, saying that all his criticisms would be made before all, that he should not come to the school at any fixed time, but would attend as often as his engagements permitted or the welfare of the students demanded; that as the school was not the main object of his life, but merely an additional interest, he should go away sometimes; but that if he went landscape painting, he should be only too glad to tell them all about it.

on his return. He then urged upon all the duty of making the most of their faculties and gifts, not for themselves alone, but for others; advised them all to make no excuses to themselves for what they could not do, but to appeal to their own inner tribunals and see what was wanting, and when they had found their difficulty they could come to their president and he would do his utmost to help them. The faculty for prolonged concentration to finish a work was above all necessary in art, with portrait painting especially so, and therefore he wanted them all to make themselves work and not to wait for the mood and dawdle lazily along. The method of work he would not restrict, they might be eccentric at first if they liked, but they must produce artistic work. All the students had been asked beforehand to write down their chief difficulties in art, or two questions upon those difficulties. One of them Mr. Herkomer selected and answered, saying he would answer them all from time to time, and it was with great interest that the students followed him in his explanation of what should be uppermost in the mind in painting from nature, the technique or handling or the drawing, concluding by saying that nothing should be uppermost but the desire to represent what is actually seen. With a few final words, impressing the necessity for industry and zeal upon all, Mr. Herkomer finished his address, and the students and friends moved off to inspect the other studios, and to witness the ceremony of laying the corner-stones of the entrance cloisters. Thirty-four students have now gone into residence in the neighbourhood, nineteen ladies and fifteen gentlemen. The majority of them have been Slade School students, four come from Birmingham, and two from America.

### THE USES OF SCULPTURE.

AT the Birmingham and Midland Institute, on Monday, Professor Gosse lectured on "The Public and Private Uses of Sculpture." The lecturer said the subject of his discourse was one which, he ventured to believe, would within the next ten years occupy a great deal more of public attention than it had hitherto done. In the one art of sculpture France was so far ahead of any other country that it was hardly worth while to consider any other in our day. The sculpture of France was as healthy as the painting was morbid. Sculpture had been fostered in some degree in France by the Roman Catholic religion, and was now encouraged by the Democratic feeling, in the best sense of the term, which pervaded to so great an extent the middle classes of France, and which, teaching a man the real relation that he, as a citizen, bore to the State in material things, made him take a pride in the beauty of its streets and public buildings. By a stroke of intelligent Liberalism, then, we in England must realise that we were part and parcel of the grace and dignity of the cities we inhabited. The present system of public patronage was, he believed, altogether unwholesome to English art, and distressing to the sculptors—he meant the system of public competitions. Whenever the profession found an occasion to speak, it bewailed its fate on this question, and many sculptors talked of forming a sort of trades union to put the system down altogether. He was not opposed to it in theory, but he agreed with its fiercest opponents in what they said about it in practice. In the first place, the constitution of the juries was so careless and irrational that no artist of position liked to submit his work to judges so thoroughly unprofessional. But the strongest objection which sculptors had to the system was that it involved a great waste of time and money. The lecturer described what he regarded as an ideal jury with an ideal procedure, urging that the judgment of professional men should be taken. As to the patronage of local men, it was very hard in a provincial town to say that civic commissions should not be given to the artists that were born and bred and that lived there. But was not a local artist an artist who had never enjoyed the training of the great schools, who had remained local simply because his genius was insufficient to call him up to the metropolis? Why should a competition be needed at all? The names of the eminent sculptors were well known, as the names of the eminent painters were; yet if a competition were proposed to artists they would laugh in our faces. Considering what forms works of sculpture should take, Professor Gosse observed that in these days it took but one form, and that the worst possible. The persons to whom statues were erected in England belonged at present to a very limited class. They were mainly politicians and philanthropists, and politicians and philanthropists were rarely what he might call picturesque persons. He believed this was at the bottom of the lack of interest taken in sculpture in England. If we could once get over the notion of representing cloth coats and trousers he believed we should start on an entirely new basis. A man of intellect worked with his head. His arms and trunk, and least of all his legs, had no meaning or importance. The true work of the sculptor was to memorialise—in colossal form, if they pleased—those sublime heads from which intelligence, benevolence, and greatness of soul shone forth like a light. It had sometimes struck him, too, that the memory of actions rather than of faces ought to be perpetuated; nor did he see why monuments should be reserved for eminent persons, for his belief was that sculpture in

England had been bound up far too largely in two conventional classes—the portrait statue and the classic subject. The Greek sculptor merely noted what he saw every day of his life. It seemed to him that it would be a very interesting and graceful thing if Birmingham's reliance on the hardware manufacture for much of her prosperity could be indicated to future generations by sculpture. He would like to see somewhere in the centre of the town a bronze statue, executed by the very best artist, of a welder with a gun-barrel in his hands; or of a caster in the brassfoundry, ready to pour the metal into the mould—a true Warwickshire man, in his shirt-sleeves and apron. In speaking of private sculpture, the lecturer observed that a great deal of what was most refined and beautiful was only fitted for the inner room. The prose of the art stayed out of doors, and we kept the poetry in our churches and our houses. He pointed out that in the church there was a wonderful field for sculpture, and in reference to its use in the adornment of houses he offered some valuable suggestions.

### LICHFIELD CATHEDRAL.

A LECTURE on the "Architecture of Lichfield Cathedral" was lately delivered in the Lichfield School of Art by Mr. J. O. Scott.

The Dean of Lichfield presided, and expressed the pleasure he had in introducing the lecturer. They all of them would know Sir Gilbert Scott by fame, and it was his (the Dean's) great pleasure to reckon him as one of his very best friends. Some few days after the Queen did him the honour to appoint him Dean of Lichfield, he met Sir Gilbert Scott in London, who congratulated him very warmly on his appointment, and said in a half-humorous way, "The whole of your west front is faced." He replied that he had been acquainted with the melancholy fact for the last fifteen years, and Sir Gilbert remarked, "Then it will soon be stone." Looking back, however, on what had certainly been a labour of love, he little thought when he announced his intention of trying, with the assistance of the chapter, to restore the west front that, in the course of six years it would be so near completion as he now found it. During the first two years of that work he received great help from Sir Gilbert Scott, and when that celebrated architect died he was succeeded by his excellent son, in whom he (the Dean) thought he saw a remarkable resemblance to his father.

Mr. Scott then delivered his lecture, and in the course of his observations referred to the restoration of the west front. He opposed the idea that the design of the west front had been obtained from France. Although here and there there might be features which some might attribute to French influence, yet he was satisfied that there were no grounds whatever for bestowing on any country but our own the glory of having produced this remarkable and beautiful design. He went on to say: The restoration of this part of the cathedral is a right noble work, of which the diocese, the chapter, and more especially the Dean, may be justly proud. It is more than sixty years since the lamentable decay of the stonework led to its being encased with Roman cement, in which material every detail, as far as it could be ascertained, was reproduced. When this was done, it was a very clever work, on which infinite pains must have been expended; but, in spite of this, the result was utterly unsatisfactory, false, and lifeless. So it remained till the important undertaking of recovering its ancient design and restoring it in its original materials was commenced about six years ago. Although so much had been hidden by the coating of cement, yet, happily, traces of all the mouldings were found when it was removed. Nevertheless, the process of investigating these minute evidences, extending over so great an area, and relating to a design so full of variety and elaborate detail, has of necessity been most laborious. I should be guilty of great injustice if I did not take this opportunity of stating that the work could not have been carried out with such marked success but for the incessant care, the skill, and archaeological knowledge which has been devoted unsparingly to the task by the clerk of the works. The restoration has been truly conservative, and the beautiful result we now see is not due to any cleverness or originality on the part of the architects entrusted with its superintendence, but to its being a faithful and exact reproduction of the original design. Referring to the present condition of the edifice and its past misfortunes, he said that these latter consisted mainly of three: (1) the attacks of the Puritans, (2) the attacks of time, and (3) the attacks of Wyatt. "Of the last, I will only say that every vestige has now disappeared: his glazed screen, his blocked arches, his false mouldings, and his wonderful rearrangement of the choir and all matters of a benighted past. The injuries due to time would not be so serious had the cathedral been originally built in a more enduring stone. All those cathedrals which were built in red sandstone have suffered alike, Chester, perhaps, worst of all, but the decay which has taken place at Lichfield is most lamentable; some parts of the exterior have now been repaired in a better stone, but much still remains to be done; the evil goes on continually, and some parts are in a most serious condition. The Lady Chapel is especially in need of repair, as well as the unrestored parts of the central tower." The Rev. Prebendary Andrew, of Tideswell, moved a

vote of thanks to Mr. Scott for his admirable lecture. The Rev. Canon Lonsdale seconded the motion, observing that, with the exception of Mr. Gresley, he was the only one that remained of those who were engaged in the work of restoring the interior of the cathedral to which Mr. Scott had referred. They heard now much of the restoration of the west front, and very properly so, too, but, as compared with that work, the internal restoration of the cathedral was far more interesting. The excavations brought new things to light hour by hour, and it was difficult to withdraw, even for a short time, from within the precincts of the place. The Canon proceeded to give some interesting reminiscences of the restoration, mentioning amongst other things, that the busts of Johnson and Garrick blocked up two windows, and that their removal called forth loud protests from a relative of Garrick's. The resolution was unanimously agreed to, and Mr. Scott briefly acknowledged the compliment. The Rev. John Graham moved a vote of thanks to the Dean for taking the chair, and the resolution was seconded by the Rev. Melville H. Scott, who expressed his gratification at seeing the workmen from the cathedral present at the lecture. The rev. gentleman also complimented the workmen upon the ability they had displayed in the work of restoring the west front, and congratulated them upon their excellent conduct whilst engaged upon it. The resolution was carried with acclamation, and the Dean, in responding, likewise referred in eulogistic terms to the ability and conduct of the workmen engaged in restoring the west front. The very rev. gentleman also said that because the west front was nearly complete it must not be supposed that there was nothing more to do. Had he 50,000*l.*, he could easily spend it on Lichfield Cathedral. The transepts and the Lady Chapel were crying out for restoration, and it would be absolutely necessary to repair the mischief wrought by natural decay.

#### GLASGOW ARCHÆOLOGICAL SOCIETY.

THE annual meeting of the Glasgow Archæological Society was held on November 22; Professor Young presided. The annual report was read by Mr. W. G. Black, and it stated that the society had been prosperous during the year.

Dr. Young said that the society had urged the citizens to preserve the front of the old college buildings in High Street, and he was glad to say they were successful. They should endeavour to conserve the few objects of interest that now remained in the city and neighbourhood, and especially the line of the Roman wall.

Professor Veitch, the newly-elected president, then delivered an address. After referring to the early interest taken by Sir Walter Scott in antiquarian matters, as illustrated by his first meeting with James Hogg, and his description of Monkbarns, in "The Antiquary," he said that in the novel Scott himself was laughing somewhat at the tastes and pursuits of his own life. He was pausing somewhat to consider whether the whole business was not a huge joke and illusion, and whether he might not turn to something other and better. It was fortunate that he did not abandon this line of interest. Not that Scott ever turned to the scientific side of archæology, but true to the instincts of his genius he kept to the suggestions of the past, and we could now live and rejoice in the universal and everlasting truth of his ideal creations. The truth was that in the days of "The Antiquary" there was a feeling of the need of reason for ancient things, but this was a feeling of impatience, because in those times the explanation of a flint arrowhead or a celt was not forthcoming. At length, however, the scientific method forced itself into archæological study, and then it began its progress. That method was to note, observe, analyse the facts, group together the similar ones, note the points of difference and resemblance, and therein, at least for the archæologist, they would find their purpose and their use, that which was in the thoughts of the men who lived in those days, and whose needs were the same as our own—needs of shelter, clothing, food, needs of defence, and even needs of moral obligation and faith in the unseen. For what archæology teaches, leads to, in its last and highest lesson, is the link of human brotherhood between those whom he (the lecturer) now addressed and the earliest specimen of man whom the rudest implement declares. Having referred to the progress of antiquarian research as to method during the past century, Professor Veitch said the grand principles of that research were these: (1) An exhaustive collection, as far as this was possible, of the objects of the same class; (2) comparison of these, so as to get at the essential points of resemblance, the varying points of difference; (3) comparison of them with the remains—similar remains—in other countries, especially the line of country from Central India across Northern and Central Europe, in particular the whole district of Scandinavia. In this lay the value of great public collections, and he was glad to observe that their secretary, Mr. Black, and the council of the society, had taken steps to obtain accommodation in the buildings under the municipality for objects of antiquarian interest connected with Glasgow and its neighbourhood. This had only been too long delayed. These principles of archæological method seemed to have a very special application to a department of antiquities which had not

been at all adequately investigated—he referred to the hill-forts of stone and earth, the cairns and cromlechs, stone circles on the moorlands, the single standing stones, and not less to those long lines of fosse and mound that were still visible on our hills, over large tracts of country, especially in the Lowlands of Scotland, and in the northern counties of England. The speaker then referred in detail to some of the fosses in the south of Scotland and the north of England, which seemed to be lines of defence. He contended that objects of antiquarian interest were of the highest utility, because they showed the feelings, the hopes, and the aspirations of the people who once used them, and were the link that connected us with the past life of our kind. They threw light on the home life, the manners, the faith, the art of the people of the past—in a word, they showed the progress of civilisation. He thought there was need for the preservation of these old objects. And had this remark no application to our own locality? Were we in the neighbourhood of Glasgow as careful of old remains as we might be, ought to be? Was it not the case that within half a dozen years one of the most interesting portions of the Roman Wall had been cut across, dug, and effaced that two or three commonplace villas might be put up for the sake of their accompanying feu-duties? This society owed it as a duty to itself and the public to make a strenuous effort to preserve all that was left us of national relics and national monuments. It was within the memory of some present when the Edinburgh and Glasgow Railway smashed through the Roman Station at Castle-cary, and had not now left even the fragment of a wall. This, of course, was said to be done in the interest of public utility, but he did not see it in that light. They should object to this wanton destruction of relics of the past unless the sacrifice was required in the highest interests of the nation. In concluding, Professor Veitch said that besides the destruction of annihilation there was the destruction of "restoration." Restoration meant generally annihilation.

On the motion of Mr. John Honeyman, vice-president, seconded by Mr. C. D. Donald, jun., a vote of thanks was awarded Professor Veitch for his address.

Mr. John Coubrough then exhibited a collection of objects from the Tharsis Mines, Spain, and two ancient swords found in Strath-blane.

#### UNIVERSITY COLLEGE, BRISTOL.

THE necessity of a thorough and systematic training for those who intend following the profession of architecture has been felt for many years. The absence of it has been deplored by all interested, especially the leading practitioners in the country, having, as a rule, many pupils and assistants in their offices, who, for lack of early training, are obliged to grope through their work, following their master as best they can, without any clear or definite idea of their art. Precious years are wasted, and what should be precious work is entirely spoilt. It is not, perhaps, until the hard-working assistant gets into the thick of his work, and commences practising on his own account, that he finds how little he really knows of the "art of architecture." But work presses; there is not time to begin again, so he makes the best of it by most industriously working the "business of architecture" instead of "practising the art."

In London we have the University College, the Royal Academy, the Institute, and Association, and other institutions where pupils and assistants may pursue their studies. But what seems to be most urgently required is a course of instruction for those intending to enter architects' offices. A pupil well prepared entering an office would be invaluable to an architect in full practice. Such work as is now being done by the University College is, we are pleased to find, being most thoroughly carried out at the Bristol University College. Bristol is not generally credited with being the fastest place in the world, but in this work it is certainly coming to the front. For some years there has been a steadily increasing civil engineering and surveying class, doing excellent work under Professor Shaw, and this year architecture has been added to the list of subjects taught at the University. Mr. W. Edward Jones, F.R.I.B.A., has been appointed lecturer. The syllabus includes the history of architecture, building construction, the ornamental treatment of material, architectural drawing, &c., and, combined with the civil engineering class, forms the best possible training for those intending to become architects. We notice also a course of lectures now being delivered by Professor Fanshaw on "Greek Sculpture." We must congratulate Bristol on its enterprise, and wish it all success.

Mr. F. H. Fowler has now prepared the seat plans and elevation of the new National Opera House, which Mr. J. H. Mapleson hopes to build on the Victoria Embankment. According to these plans, there will be 460 orchestral and 440 balcony stalls, 90 private boxes on three tiers, 500 amphitheatre stalls, and 860 amphitheatre seats. Bouquet and music counters are provided on the stall level, and on the first tier there will be a spacious foyer, the royal apartments, a ladies' boudoir, and a smoking-room.

Mr. Blomfield, Scott, and Street.

SIR,—Allow me to correct an implied error in my letter of the 17th inst., which you have so kindly inserted in *The Architect*. I have just ascertained that Mr. Blomfield is *not* the architect of the small tower with the heavy peal of bells near Worcester.

Let me mention another amusing blunder of Mr. Street's at Dublin Cathedral. He constructed a strong-room, with thick granite walls and a formidable Chubb door and lock, and then covered it with a lath-and-plaster roof!

Yours obediently,

November 25, 1883.

NOT AN ARCHITECT.

SIR,—I have never been guilty of the manifest absurdity of feeling or expressing indignation at fair criticism, whether anonymous or not. What I have complained, and still complain, of is reckless misrepresentation, and the distortion and even invention of facts in support of disparaging statements and opinions. My protest against a flagrant example of this kind of writing appears to have excited the spleen of certain anonymous scribes who, it may fairly be inferred, see no harm in such tactics. Their effusions might well be passed over in silence, but the letter of "Not an Architect" in your last number is so characteristic an example of the discreditable practice to which I object, that I am tempted to notice it.

In the first place, the writer begins by misrepresenting me in imputing to me a sentiment which I have never expressed or felt. Next, in order to have a fling at Sir Gilbert Scott, he drags his name in by representing me as his champion, the fact being that I have never even alluded in the most distant manner to Sir Gilbert or his works. Thirdly, he asks me two questions, the only apparent object of which is to try to do me an injury by throwing doubt on my professional skill and knowledge.

To the first I reply that after the lapse of twenty years I probably remember more of the occurrence to which he refers than anyone else, and that I am ready to give anyone interested in the matter a full and properly substantiated account of the whole facts of the case.

The second question is clearly intended to lead your readers to believe that I am now making serious mistakes in building some tower near Worcester. The whole thing is pure invention. I have no work of any kind going on near Worcester; nor am I anywhere building such a tower as he describes.

I must leave to those personally interested the task (if they think it worth while) of sifting, and where necessary, contradicting, the other stories which he has been at the pains to scrape together.

Permit me before concluding to say a few words about anonymous letter-writing. It appears to me that ordinary anonymous criticism and correspondence (to which no one of course can reasonably object) is one thing, but that it is quite another to cut into a correspondence hitherto signed on both sides, and to take up the running in a very personal style under cover of a pseudonym. The writers of such letters may protest as much as they like; the natural conclusion will still be that they are either afraid or ashamed to publish their names. The only other possible motive for such reticence—viz., a modest shrinking from publicity—will scarcely, I think, meet with general acceptance. If, however, it be the genuine one, such a rare and laudable feeling certainly deserves encouragement, and I can only say that it will afford me the greatest pleasure to help these gentlemen to avoid all further publicity by having a personal interview (strictly private) with any one or all of them if they will kindly give me the opportunity. Five minutes' quiet talk will often do more to clear up differences than hours wasted in correspondence.

Yours, &c.,

November 27, 1883.

ARTHUR W. BLOMFIELD.

SIR,—Your correspondent "Not an Architect" makes statements as to the work of Sir Gilbert Scott and Mr. Street, to which, as I am unacquainted with the facts, I must leave others to reply; but if they are not more truthful than what he says as to mine at Southwell Minster, they are certainly not to be relied on. As regards that work, first, the roof, which he says was "copied" from St. Albans, was designed, and estimated, and reported to the Ecclesiastical Commissioners in July 1875. The question as to the roof of St. Albans was raised in November 1878. Secondly, "the only mistake possible in a lead roof, viz., putting a straight roll along the ridge," was *not* perpetrated, inasmuch as the sheets are laid, as they ought to be, overlapping the ridge on the two sides alternately; and there is no longitudinal lead ridge, because none was required. As regards the roof of St. Albans Abbey, I would refer you to the concluding paragraphs of a letter of mine which appeared in your paper of January 18, 1879, which are, I think, a sufficient reply to what he says as to my opposition to a roof of high pitch.

Yours faithfully,

November 26, 1883.

EWAN CHRISTIAN.

SIR,—The correspondence about Messrs. Street and Blomfield and Sir G. G. Scott is interesting to hundreds of architects, and may be instructive likewise. No doubt many persons (like your correspondent of the 17th inst.) could name scores of defects and blunders in works built under the name of these and other very eminent architects. But, after all, this does not really detract from their eminence. Three more hardworking men in any profession could not be found. Mr. Street's days of nineteen hours are no secret; and the selection by him of Mr. Blomfield as the architect in whom he believed and trusted, has, we can all understand, greatly added to the number of that gentleman's already—may I say?—too numerous engagements.

But, as to the faults in their work? Is it not the fact that these and other eminent men have allowed themselves to undertake much more work than any architect can see to, in the way that an architect should see to his work? Are there not many men whose work is every way far better than that of, say, Scott's *deputies*, and who *do* see to their work in every department thereof, as it is an architect's duty to see to it? The public do not know (*before-hand*) how very little personal attention they will get from the great architect. It would be more honest if such men would at the outset tell their would-be clients plainly that they could not *duly* attend to the work. If after this it was pressed on them, it would be the client's responsibility. It would be far better for architecture, far better for the building public, far better for the profession (as a profession) if work was more divided between a far greater number of men. Such men as those alluded to, in the crush and press of business, *cannot* give their mind to the thousand and one details, each of which, in its turn, requires their whole mind and thought. So, sad mistakes occur—e.g., new and costly churches let in the wet, because the lead flashings have been omitted, or the slates have had too little lap. On the roof of one such new church 400*l.* or more has just been expended since the death of its truly eminent architect. He *was* eminent, but he had no time to *see* to details. Another very fine new church in the suburbs of London I am watching with interest, as the roof timbers are of pitch pine, and every one really practically acquainted with timber knows that in such constructional woodwork, if pitch pine be used, decay is certain to appear before very long. At another very fine and very costly church, also by a very eminent architect, some of the timbers began to decay before he was well off the ground, and this through what many a man of inferior position would call culpable negligence or ignorance. But it may be rather that the architect "had not time" to see and know that the timber was of prime quality, and that it was duly ventilated.

These instances and illustrations may be multiplied *ad infinitum*. The point of it all is—How may the public be best enlightened as to what they get for their money? and how may the consciences of our most eminent men be awakened to the duty they owe to their clients and to their profession, not to undertake more work than they can give *proper* attention to? Professional jealousy would, I fear, prevent one solution of the problem. But as now, in almost every town of any importance in the kingdom, there are really able and accomplished architects, why should not those men whose headquarters are in London, and to whom are entrusted works in the provinces, seek the assistance of provincial men less encumbered with work, it may be, and on whom reliance may be placed to *see* to the work in progress with the eye of an architect? A clerk of works is all very well in his way; but, with rare exceptions, he is not an architect, and cannot give an architect's supervision. It is the cormorant-like spirit on the part of many of our great architects that has done, and is doing, much to degrade architecture (or at least the work of architects) in the eyes of the public.

I wish I could provoke some of our greater men to take up the pen, and say their say in reply to my presumptuous suggestions.

Yours obediently,

November 26, 1883.

A PROVINCIAL ARCHITECT.

P.S. Your correspondent of 17th inst. refers to Wm. Burges, who too was a very great man; but even as to the Ripon churches, does not your correspondent know the trouble in which he involved himself and his employer? I have lately had before me the drawings by Mr. Burges of a little village church, the orders being to spend 10,000*l.* in *all*. The lowest tender was 18,000*l.*, and this without fittings. An architect, if he deserves the name, should consider the care of his client's purse as one of his important duties.

## CHURCH BUILDING AND RESTORATION.

**Darlington.**—The church of Holy Trinity, Darlington, was reopened by the Lord Bishop of Durham, on the 22nd ult., after being reseated, ventilated, and lighted. The designs were by Mr. G. G. Hoskins, F.R.I.B.A.

**Hunslet.**—The foundation-stone of the church of St. Cuthbert, Hunslet, Leeds, was laid on Saturday last. The materials being used are pressed brick facings and stone dressings inside and out. The architects are Messrs. Perkin & Bulmer, of Leeds, and the contractors Messrs. Longley Bros., of Hunslet.

**Newhall, Burton-on-Trent.**—On Tuesday last the church was reopened by the Bishop of Lichfield, after being enlarged. Formerly it was a plain brick building, consisting of nave and tower only. A chancel, organ chamber, and vestry have been added, and the nave reseated with open seats. The additions are built of pressed bricks, with tracery and dressings of Bath stone; and are in the Perpendicular style. The whole has been done under the superintendence of the architect, Mr. E. Isle Hubbard, of Rotherham. The contractor was Mr. John Slater, of Woodville; the joiner's work being executed by Mr. Samuel Fish, of Hartshorne; and the stonework and carving by Mr. R. Kershaw, of Burton-on-Trent.

### SCHOOL BUILDINGS.

**Baptist Chapel and School, Colne, Lancashire.**—These buildings have recently been opened for public worship. The chapel contains 760 sittings, the seats on the ground-floor being arranged semicircularly, all facing the pulpit, which is of light and dark oak; with choir-gallery and organ-chamber behind pulpit, and gallery all round the chapel. The school contains ten classrooms, and lecture-room for 150; and on upper floor a school assembly-room, 66 feet by 33 feet, with open pitch-pine timbered roof, varnished, and end gallery. There are three vestries to the chapel in addition. The buildings are partly connected, and are faced externally with ashlar stone from Wynewall, and are in the Romanesque style, with a lofty stone pinnacle in front of chapel, and have been carried out from the designs and under the superintendence of Mr. George Baines, architect, Post Office Chambers, Accrington, whose plans were selected in a limited competition. The cost of the works has been about 8,000*l*.

**Pole Street Schools, Preston.**—New Baptist schools are being erected at a probable cost of 1,500*l*., from the designs of Mr. George Baines, architect, Accrington, whose plans were selected in open competition.

**Bury.**—A school-chapel has just been opened at Parkhills, in connection with the Bury Circuit of the United Methodist Free Churches. It is a Gothic building, and is intended to be used as a day and Sunday-school for 350 scholars, and will also be used temporarily as a chapel. The works have been carried out in an excellent manner by Mr. John Inman, builder, Fishpool, Bury, from the plans and under the supervision of Messrs. Maxwell, Tuke & Hurst, architects, Southport. The same firm of architects has also prepared plans for a chapel to seat 800 persons, which is intended to be built on a large plot of land adjacent to the before-mentioned schools.

### NEW BUILDINGS.

**Auction Mart Restaurant, London.**—A new City restaurant has been built by Messrs. Spiers & Pond under the Auction Mart in Tokenhouse Yard. The whole establishment embraces a floor area of 11,800 square feet. The extreme length from the new entrance to the end of the extension under King's Arms Yard is 130 feet. There is ample room to seat 350 guests in the large restaurant, while the buffet and smoking-room will accommodate about 150 more. The alterations to the new and old buildings and the decorations and fittings have been carried out by Mr. Bassett Keeling, the architect of Tokenhouse Buildings. The walls of the restaurant are decorated in "Burmantofts faience," inlaid with Venetian mirrors in gun-metal frames. The ceilings, which are by Messrs. W. B. Simpson & Son, are richly panelled in enamelled iron, with the ribs, moulding, and cornices decorated in leaf and bronze gilding of various tones. The gas-fittings and brasswork are by Messrs. Edgar Keeling & Co.

### LEGAL.

#### County Court, Stonehouse.

(Before Mr. GIFFARD, Judge.)

SNELL *v.* CARNELL.

In this case, Mr. H. J. Snell, architect, Plymouth, sued Mr. James Carnell to recover 12*l.* 2*s.* 9*d.*, balance of money alleged to be due for professional services. Mr. Shelley appeared on behalf of plaintiff, and Mr. Curteis for the defendant. In the beginning of 1881 Mr. Snell was employed by the defendant to prepare plans for the erection of a dwelling-house at Yelverton. This he did, but the railway being about to be made through the property, Mr. Carnell received notice to treat with the company. A price for the land was not agreed upon, and the matter was ultimately referred to arbitration. In anticipation of this Mr. Snell prepared plans showing how the estate might be laid out for building purposes; he visited the property on several occasions, made tracings, held consultations, and so forth. He drew up his evidence, and attended two days at the hearing of the case. The result of the arbitration was that a sum of 502*l.* was awarded to Mr. Carnell,

the railway company having offered 280*l.*, and Mr. Snell's valuation having been 659*l.* The award being above the sum offered, Mr. Carnell was entitled to costs, and Mr. Snell sent in his charges. These charges were taxed in the ordinary way, and nine guineas was allowed instead of 22*l.* 1*s.* 9*d.*, which his client's bill amounted to. The taxation was, of course, as between party and party, but the defendant had refused to pay Mr. Snell the balance which was owing to him.

Mr. Snell, plaintiff, said he had been engaged in arbitrations many times, and about the beginning of 1881 he was employed by Mr. Carnell for the purpose of erecting a house at Yelverton. On July 12, 1881, he saw Mr. Carnell, who said that the railway was coming through his land, and asked him to draw the plans just as if the land had not been cut by the line. He did so, and was afterwards asked to give what was called "local evidence" in connection with the arbitration which ensued out of a dispute between Mr. Carnell and the railway company. He paid several visits to the estate in consequence, drew up his report, and attended two days before the arbitrators. He valued the land which the railway wished to acquire at 659*l.*; the railway company offered 280*l.*, and the award of the arbitrators was 502*l.* His charges for all this were fair and proper, and as low as any charges he had made for similar work in previous cases. His whole bill amounted to 22*l.* 1*s.* 9*d.*, and the sum allowed was 9 guineas. Mr. Snell was cross-examined upon the items as set down in his diary. The witness denied that the time employed as set out in his memorandum represented the whole of his labour in connection with the matter.

Mr. Keats, architect, stated he had looked over the particulars of Mr. Snell's charges. They were very reasonable, and he had been paid similar charges again and again, and sometimes heavier charges. His costs in arbitration were always taxed, but never in one case had he been offered only his charges as taxed.—Mr. J. Foster, architect, gave similar evidence. His charges varied from a guinea to four or five guineas a day, according to the work done.

Mr. Curteis said his client was fighting this purely as a matter of principle; and the action came in bad grace from Mr. Snell, who had already been paid a large amount in connection with work upon this land. Mr. Curteis then called attention to the various items which Mr. Snell had charged for, and compared them with the charges of accountants and solicitors.

His Honour: In Mr. Snell's diary you do not see the process of his work, but only the result. The allowance as taxed is not a stopper against any claim as between solicitor and client Mr. Snell might have.—Mr. Curteis: According to Mr. Snell's books, he was engaged only twenty-two hours and his clerk eight hours, and, taking the ordinary scale for professional men—

His Honour: I never heard of an architect being allowed so much per hour.—Mr. Curteis: Yes, sir; I, as a solicitor, am allowed 6*s.* 8*d.* per hour.—The Registrar: If you didn't get more than that, Mr. Curteis, you couldn't live.

His Honour said something must be paid for a man's experience, knowledge, and the intelligence which he brought to bear in his work. He did not see anything unreasonable in the plaintiff's charges, and he did not agree that the amount allowed on taxation was any criterion at all as to what was justly due.—Mr. Curteis said his client thought he was justified in fighting this as a matter of principle, and making it a test case.

His Honour: I think he ought to have brought some evidence to show these charges were excessive.—Mr. Curteis: Well, sir, "birds of a feather flock together," and it is difficult to get one architect to say another architect's charges are too high.

His Honour gave a verdict for the amount claimed, with costs on the higher scale.

### GENERAL.

**The Royal Scottish Academy**, on Monday, elected as honorary members of the academy Mr. J. W. Oakes, A.R.A., and Mr. Thomas Graham.

**Mr. John Slagg, M.P.**, has presented to the Manchester Art Gallery the picture of *Eve Tempted*, by Mr. R. Spencer Stanhope, which gained the Heywood gold medal at Manchester in 1877.

**Mr. J. S. Crowther**, architect, of Manchester, has prepared plans for the enlargement of the Manchester Cathedral mission church, St. Saviour's, Cheetham.

**The "Gazette"** announces a dissolution of partnership between Messrs. Wilson & Wilcox, architects, of Bath.

**An Art School for Putney** is proposed to be established, and a committee is to be formed for the purpose.

**The Dunfermline Fine Art Association** will open their first annual exhibition to-day (Saturday). Nearly 800 paintings in oil and water-colour, besides sculpture, have been brought together. Among the water-colours are some works of Mr. R. Phene Spiers.

**A Committee of the Liverpool Town Council** have made a recommendation that the sum of 200,000*l.* should be borrowed to deal with the insanitary buildings of Liverpool.

MESSRS C & L OWER ARCHITECTS.

# SUPPLEMENT

TO THE

# ARCHITECT

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, DECEMBER 1, 1883.

### TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*\*\* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Supplement to THE ARCHITECT."*

### TO AMERICAN SUBSCRIBERS.

All subscriptions are payable one year in advance, and may commence at any date.

The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.

Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED TO GILBERT WOOD, 175 Strand, W.C., London, England.

In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—

To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order.

### ADVERTISEMENT SCALE.

For Two Lines and under	£0 2 6
For every Additional Line	0 0 6
For Quarter Page	2 10 0
For Half Page	4 10 0
For a Page	8 8 0

On pages preceding and following matter, special rates.

Public Companies' Advertisements, 12l. 12s. per page; 1s. per line.

Special arrangement may be made for a series of insertions on application at the Office, 175 Strand, London, W.C.

### EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

### NOTICE TO THE PUBLIC.

By the Post Office arrangements THE ARCHITECT can now be sent to any part of the United Kingdom by an affixed Halfpenny stamp; hitherto the postage has very frequently been twopence per copy. The Publisher will be happy to forward, for 20s. per annum, post paid, THE ARCHITECT, to residents in towns and neighbourhoods to which there is no easy access by railway. Terms for the half-year, 10s.

Our readers are invited to address us on subjects of interest to themselves or the public. We shall be always ready to insert letters asking for a solution of any suitable questions of a professional or practical nature, and to receive replies to such inquiries.

### COMPETITIONS OPEN.

ABERDEEN.—July 1, 1884.—The Testamentary Trustees of the late Mr. John Steill, of Edinburgh, hereby notify that they will Receive Models for a Colossal Statue of Wallace, in Bronze, with Basement of Granite Blocks, to be placed on the Mound in the North-West part of the Duthie Public Park, near the City of Aberdeen, in conformity with Instructions left by Mr. Steill, at a cost not exceeding £3,000. Intending Competitors, on Application, accompanied with a Remittance of 10s. 6d. to Mr. John Otto Macqueen, 19 Bridge Street, Aberdeen, will be supplied with Copies of Mr. Steill's Instructions, Conditions of the Competition, and Lithograph Plan of the Duthie Park, showing Sections of the Mound. The Author of the Accepted Model will be employed to Execute the Work; and the Author of that next in order of merit will Receive a Premium of £50.

BIRKENHEAD.—Dec. 1.—Plans are required for Laying-out Bidston Hill for Building Purposes. Premiums of 100 guineas and 50 guineas, and four of 15 guineas each. Messrs. Davies & Stephen, Estate Agents, Mollington, Chester.

CAPE TOWN.—Jan. 30.—The Town Council of the City of Cape Town invite Plans and Specifications, accompanied with approximate estimate of cost, of a System of Drainage. Selected Plans and Specifications to become the absolute property of the Corporation. All others will be returned free of expense. Premium of 250l. A plan of

the City, with levels, may be seen, and further information may be obtained, on application to the South African Loan, Mortgage, and Mercantile Agency, 9 King William Street, London, E.C.

LONDON.—March 1, 1884.—The Commissioners of H.M. Works and Public Buildings are prepared to receive Designs for New Buildings proposed to be erected in Whitehall for the Admiralty and War Office. Mr. A. B. Mitford, Secretary, H. M. Office of Works, 12 Whitehall Place, London.

NORTHAMPTON.—Dec. 1.—Designs are invited for the Erection of a Board School, with Class-rooms and Out Offices, to Accommodate 1,150 Children. Mr. John B. Hensman, Clerk to the School Board, 4 St. Giles's Street, Northampton.

WIDNES.—Dec. 3.—Designs are invited for the Erection of Public Offices. The Surveyor, Public Offices, Widnes.

### CONTRACTS OPEN.

ABERDEEN.—Dec. 1.—For Enlargement of Public School. Mr. Thomas Hector, 81 King Street, Aberdeen.

BALLINDINE.—Dec. 5.—For Building Dispensary and Medical Officer's Residence. Mr. Glover, County Surveyor, Claremorris.

BECCLES.—Dec. 7.—For Building Temporary Bridge Removing old and Building new Bridge. Mr. F. S. Rix, Clerk to the Beccles Navigation Commissioners, Beccles.

BECKENHAM.—Dec. 3.—For Additions and Alterations to Stables and Buildings at the Old Manor House, and Formation of Engine Station and additional Stabling, Cart Sheds, Boundary Walls, &c. Mr. F. Stevens, Clerk to the Local Board, Beckenham.

BELPER.—Dec. 8.—For Alterations and Additions to the Workhouse. Mr. George Eyre, Architect, Codnor, Derby.

BIRMINGHAM.—Dec. 8.—For Supplying and Fixing Speaking Tubes and Electrical Communication, Lift, and Fireproof Doors; also Clock for Tower, Parish Offices, Edmund Street. Mr. W. H. Ward, Architect, Paradise Street, Birmingham.

BIRMINGHAM.—For Alterations to Legge Street Chapel. Mr. E. J. Sherwood, Architect, 101 Queen Victoria Street, E.C.

BLACKBURN.—Dec. 4.—For Extension of Goods Warehouse and other Works. Plans at the Engineer's Office, Hunt's Bank, Manchester.

BOGNOR.—Dec. 7.—For Extension of Groynes. Mr. H. L. Staffurth, Clerk to the Local Board, High Street, Bognor.

BOURNEMOUTH.—Dec. 3.—For Converting Montrose Villa into Coffee Tavern. Mr. C. T. Miles, Observer Chambers, Bournemouth.

BRANCEPETH.—Dec. 5.—For Building Passenger Station. Mr. William Bell, Architect, Newcastle-on-Tyne.

## MACHINE-MADE ART.

N the interesting process of artistic development which is so satisfactorily going on amongst us as regards the industrial work of everyday artisan-ship, there is one element which seems to exercise the minds of well-meaning theorists not a little. This is the production of art-work by mechanical repetition; and the latest doctrine with reference to it is that

it must necessarily be fatal to the principle of true art when artificial mechanism takes the place of the natural hand. At the same time the common sense upon which the new criticism professes so much to rely, is forced to acknowledge that mechanism is one of the special powers or forces of the age which it would be idle to resist or even to discourage. The conclusion arrived at for the present is therefore something like this—that machine-made art is a necessary evil for the many, and artistic handiwork a special delight for the few, the progress of culture consisting in the gradual conversion of the majority of vulgarity to the faith of the minority of grace.

Now there are manifestly several important points for consideration here. What is the function of the mechanical in modern art? We might almost say—What was the function of the non-mechanical in ancient art? Indeed, wherein lies the essential distinction between the old non-mechanical and the new mechanical? What constitutes the superiority, positive or negative, of the non-mechanical? Is the inferiority of the mechanical positive or negative?

One of the best illustrations of the case is furnished by ordinary Mediæval church work of any ornamental kind. Take a piece of oak tracery; let us say that the architect has designed certain new cusped panelling to be executed in exact conformity with certain authentic old panelling of which it is to be an extension. There are three ways of doing the work. First, as all the world knows, there are carving establishments where machinery, acting by means of revolving tools directed with accuracy, whisks away the superfluous wood with a precision which is the wonder of all beholders, leaving your cusping at the end so neatly turned out that little more than glass-paper is requisite to make the finish complete. This, we shall say, our architect rejects with scorn, feeling the rather inclined to lead forth on some dark night a band of æsthetic patriots to deal with such pestilent inventions very much as the threshing-machines and turnpike-gates used to be dealt with in good old times that are gone. Secondly, there is the alternative process of working out the cusping by hand. Here the skilful workman takes his pencil and indiarubber, his dividers and compasses, and delineates his subject upon the expectant oak with all the painstaking of an architect's office; then with chisel and gouge, not forgetting the centre-bit, he pursues with delight the shaping of the art-work with a precision, if it comes to that, which no machinery can surpass; until at last, when glass-paper has put on its final polish, the delicacy of the workmanship is exquisite. This process the architect probably approves and accepts with enthusiasm. But there is a third mode of dealing with the subject. For if we examine the old work which is to be imitated, we find that it has been executed not only without machinery, but without even being set out on the wood with drawing instruments. The old-world workman, in a blunder-headed way which is philosophically distressing when tested by modern rule and square, had evidently been in the habit of "making a dash" at his work, and "cutting away at it" with his rude tools so entirely "by the eye," and with a free-and-easy licentiousness so reckless of consequences, that one can only say such a fellow would not be kept an hour nowadays in any well-regulated shop; he would spoil more stuff than he was worth. Looking at the moulding and geometrical carving of "revived" Gothic, as compared with the same work of antiquity, no one who will be candid enough to recognise it can help perceiving the characteristic natural ruggedness of the old and the equally characteristic mechanical smoothness of the new. Indeed, if we may venture the remark without waiting a few years longer, we

would suggest that true Gothic is rugged art or nothing; and if so, the question which we have before us becomes all the more interesting, as to whether it is not in great part a Gothic question.

For, historically speaking, it is only in such art as Gothic—which therefore would be rude if not crude art—that free and easy workmanship has been in any way the rule. The very name *Gothic*, which we are accustomed to be told was conferred upon the remains of Mediæval architecture as "a term of reproach," was obviously so conferred in the interest more immediately of a certain pedantic conventionalised refinement of handiwork which called itself *Classic* because of its admiration for the characteristics of Greek and Roman art, amongst which nothing like the free and easy was ever admissible. Everybody has heard of the curvature of architectural straight lines, practised by the Greeks; and when we are informed that the curves so adopted turn out to be the parabola and hyperbola, we are expected to understand that the ancient artificers not only possessed the means of striking these curves on any requisite scale, large or small, with infinite delicacy, but had previously arrived by the subtlest mathematical calculations at their identity with the precise optical corrections required in all kinds of circumstances. But why should this be so? Suppose we affirm that all Greek curves whatever, whether for moulding-profiles, for entasis, for volutes, or for level lines, were in reality only drawn by the eye? That all such curves would turn out to be conic sections is not at all surprising; indeed it would be surprising if they were not to do so. If, therefore, we say that the Gothic mason did his setting out by the eye, and that the Greek mason did his setting out also by the eye, what then?

In the Greek work every touch of the tool was intended to be absolutely geometrical. When instruments of precision are applied to the finished execution, there is no deviation discoverable from the most uncompromising hard metallic certitude. The capitals of the Erechtheum might just as well have been so many castings from one iron mould. The running ornament in all cases might just as well have been so much of the same kind of casting cast by the yard. The whole production of exquisite marble might just as well have been in crystal or in steel. The Romans followed the same principle; and it was only when barbarism began to creep over the Roman world that coarse workmanship came to be tolerated, "then pitied, then embraced." In the rude Middle Ages it was delighted in, and, in accordance with a strange law of development, instead of a blemish it became at last an essential grace. Connoisseurs—indeed, we are all connoisseurs so far in these days—discover in work that is very much more free and easy than the Gothic ever was—quite Antipodean work—that it is the freedom from restraint that is the beauty. And yet, in the wildest times of the Gothic revival, no man in his senses, perhaps no one out of them, was ever heard to say that Greek architecture was obnoxious because of its perfect refinement of geometrical manipulation.

What, then, would the Greeks have done if they had possessed our machinery for artistic manufactures? It would be a bold man that would say they would not have used it, and indeed used it to the utmost advantage. Even in the thirteenth century, we will venture to suggest, there was no academical rule of æsthetic effect which would have called for the rejection of mechanical aids. But what would have been the destiny of Gothic development if the machinery of that age, instead of being so primitive as it was, had been as complex as our own, might be an interesting question for speculation.

At all events, in these days of ours the assistance offered by machinery and mechanical processes for the production of beautiful things it would be more than preposterous to reject. No doubt there is in non-mechanical products a charm which is distinctly recognisable by the expert, and which he is fully entitled to magnify. When it has no other value, it indicates at least the intelligence and patience of human hands and eyes, as distinguished from the clatter of a spinning-jenny or the thump of a steam hammer. But who is so bold out of Bedlam as to tell, for example, a sober-minded Englishwoman to forswear figured silks and laces and revert to the mere "spade labour" of embroidery by needlework as her only wear in honesty? An Oriental carpet, with its quaint crudeness, and indeed blundering unshapeliness, all over, speaks of manual dexterity, no doubt, even if it be sometimes not above a very low level of both brains and breeding; but surely we

are not, for the sake of such handicraft as that, to repudiate the claims of European manufacture, in which far higher mental forces multiply their power indefinitely by the aid of the most exquisite instruments! Are not these very instruments the wonderful work of man?

The interests of art manufacture in England demand something quite different from a sweeping discouragement of all mechanical apparatus. It is palpably foolish criticism that merely rails at machinery and puts its faith in antediluvian spade labour. In a little time all this fanaticism will have volatilised into the empyrean of ridiculous opinions, and the true intelligence of the country will look forward to a greater and greater expansion of the happy influence of the beautiful by the increasing refinement of a thousand marvellous appliances of art.

#### THE WATER-COLOUR SOCIETY.

THE winter exhibition of the Royal Society of Water-colour Painters presents some novelties. In the first place a happy change is made in the disposition of the room as regards the screens, which are now limited to two, placed in the middle of the gallery, towards the centre, and hung on both sides with drawings. This arrangement is a great improvement; it leaves the corners of the room free and well lit, and makes circulation on crowded days far easier. The seats are now only the large settees and chairs, but this really is ample for a gallery of the size. Then, as to the drawings, the members seem to have availed themselves more widely than heretofore of the variety of method permitted in the sketch and study exhibition. Mr. POYNTER, R.A., sends two pleasing heads in red chalk; Mr. DU MAURIER shows black-and-white illustrations for *Punch*; Professor RUSKIN, hon. member, contributes pencil studies of objects in the British Museum, a *Twelfth Century Capital* from Avallon, a sketch of the *Bay of Naples*, with a touch of colour on the mountains, and so forth; and Mr. ANDREWS hangs a large and ambitious study in monochrome, of two men-of-war *Fighting at Sea Long Ago*. More work in black-and-white and sepia, careful pencil and point drawings and studies in chalk would be a welcome and instructive variety in this winter exhibition, and we hope to see an increase in the direction of such student drawings which, though not so popular with "the general," would always command their value from the discriminating dilettante.

Not by way of disparagement, but rather of welcome, we may say that there is nothing fresh to comment upon a large quantity of the drawings, simply because the subject-matter and the style of the artists is, however pleasant, so well known that, if blindfolded, one could, at mention of a name, describe pretty accurately a number of the studies exhibited. Thus with the veteran Mr. F. TAYLOR, with Mr. THOS. DANBY, Mr. RICHARDSON, and many others, including, it must be acknowledged, that delightful and popular painter of rustic life and scenery, Mrs. ALLINGHAM. A member of the Society who has always something fresh to say is Mr. ALBERT GOODWIN, by whom, besides certain Italian sketches of a poetic veracity that only old lovers of Italy can fully appreciate, is a study of *A Sunlit Valley*, put in with a breadth and limpidity of touch that will astonish people who know only his dainty and deliberate finished work. Mr. ALFRED FRIPP, like Mr. GOODWIN, has a fine sense of those effects of gradation and quality of light which escape common observation; in *Durdle Door, Coast of Dorsetshire*, he gives all the tenderness of after-glow and opalescent half-light on a curve of beach, irregular cliff, and gentle green sea. The water is the only part of this drawing that a little jars the chord of colour; it seems to us rather too uniformly emerald. A single picture by Mr. NORTH, hung on one of the screens, has brought the right acknowledgment from the Society in a vote of full membership. It is merely a fantastic ochre-coloured palace at *Biebrich on the Rhine*, which has a circular block surmounted by a parapet and sculptured forms seen against the sky; in front a row of round-headed acacias in autumn gold, a glimpse of pale-shining water and of far-away mountain line, and a figure or two. The subject would certainly have attracted few; but by an execution of singular delicacy and a subtle management of warm light, transparent and brilliant to a degree, and yet soft and quiet throughout, Mr. NORTH has made out of nothing a gem of artistic worth.

In contrast to this work and to all work of the suggestive and assiduously delicate order are the studies of some recent members. Mr. C. GREGORY, for example, who received full honours at the same election as Mr. NORTH, is by contrast literal, trenchant, assailable. And yet is he also admirable, also brilliant, and holds forth certainly as much promise as any of the younger men. He shirks no detail, no difficulty in his many studies, too numerous to dwell upon singly; he is fond of a jumble of odd lines and queer perspective planes, and of "roba" of all kinds; paints the backs of houses in country towns, with courts and gardens and outbuildings—untidy picturesque places—with appropriate figures of pleasant everyday life; he is eminently cheerful and veracious in rather a prosaic, but clever and determined way; is sufficiently individual, moreover, to emerge by-and-by from all this careful imitative work into higher lines of selection and effect. The figure-painter, Mr. WAINWRIGHT, of north-country vigour, is strong and disagreeable in the study of a lady in black dress and hat, lolling in a chair against a background of brightly-figured tapestry, weary of *Le Monde où l'on s'ennuie*. Ugly rather than gracious, too, but undoubtedly clever, is the study by Mr. BREWTNALL of a girl in dark chapeau and wraps, turning her face aside in swift onward step to glance at the little dead bird on the snow, killed by *Cruel Winter*. At the same time there is always a thought behind Mr. BREWTNALL's abrupt manner: he designs with an intellectual purpose. Mr. GLINDONI's excellent draughtsmanship, good technique, and narrative faculty are, as is too often with him, marred by a disagreeable palate and a touch of stage situation in the pictures *Deceived* and *It might have been Worse*. These are among the many contributions which can hardly come under the title of either sketches or studies, if the latter be accepted as meaning in any sense preparatory work. Among the landscape members of mark many are absentees from this exhibition, notably Messrs. GEORGE FRIPP, A. HUNT, and GEORGE BOYCE, while Mr. POWELL only sends one drawing. To make amends we have the unusual apparition of a number of little deep-coloured sketches of effect by Mr. HOLMAN HUNT; a bit of coast, *Chidcock Beach*, by Mr. MARKS, R.A., who somehow seems to put into inanimate nature some of the quaint individuality with which he endows humanity; and much good work from Messrs. THORNE WAITE, W. PILSBURY, HERBERT MARSHALL, H. MOORE, and J. D. WATSON, to whom *genre* or landscape study come with equal ease; and a lovely sketch on *Loch Marée* by Mr. M. HALE, which suffers, like so many of its neighbours, by a white mount.

This question of mounts is a crux in the winter exhibition. Certainly the greater number of the drawings lose quality by the rule, and it must be remembered that in the close hanging each drawing has the margin doubled by the mount of its surrounding neighbours, the effect of which the intervening frame is not strong enough to overcome. Why toned mounts are not oftener used is a matter of surprise. Furthermore, the general effect of the gallery is much marred by the glare of the mounts. Indeed, the hangers seem to have given up their duties in despair, and let the hanging go by mere questions of seniority or of carpenters' fit, as the case may be. The culminating failure is the head of the room, where a large drawing in pale greys and greens, *Canadian Falls, Niagara*, one of two contributions from H.R.H. Princess LOUISE, is hung beneath a head of *Hassan Ben Moosa*, in Mr. HAAG's most assertive style, framed ornately in dark wood, while around are grouped some of the least effective drawings in the room, or, at any rate, least effective in this juxtaposition. Members whose drawings hang on the screens fare better. Naturally in a central position here has been placed the solitary but eventful contribution of Mr. ALMA TADEMA, R.A., *A Declaration*, wherein the actors of the story are in the fashion made so familiar to us, attired in classic robes, although their faces date within our circle of London to-day, seated on a carved marble bench of illusive silvery grain, with a blossoming Judas tree and a grey blue sky behind to give sweetness and glow. It is said that the value set on this by no means highly-finished or large drawing is about equal to the income of a good college living, or the cost of a race-horse, or the price of a diamond aigrette for my lady to wear on gala days.

In addition to the artists already named as elected to full membership must be included Mr. POYNTER, R.A., Mr. MARKS, R.A., Messrs. BREWTNALL and HERBERT MARSHALL.

Mr. J. H. HENSHALL has been admitted associate, and will strengthen the ranks of the "positive" school of figure painters.

#### DR. SCHLIEMANN'S TROJA.\*—II.

IT would be difficult to find a book that is a better commentary on JULIET's question, "What's in a Name?" than Dr. SCHLIEMANN's new volume. The author and his admirers—or, in other words, the greater part of the readers of the book—take an interest in Hissarlik, and in the objects there discovered, because of the influence of the magic word "Troja." If they were judged by their intrinsic merits, the products of the excavations would have attraction for few except the members of the small Anthropological Society. There were not many things met with which would be considered worth the attention of the antiquaries who meet in Burlington House; and it may be predicted with confidence that Dr. SCHLIEMANN's discoveries will never induce the Dilettanti Society to expend a shilling in the further exploration of the "Plain of Troy." Dr. SCHLIEMANN attributes great importance to the collection of pottery and other work which he exhibited at South Kensington, and which is now in Berlin. It was curious, and some of the jars were remarkable for their capacity, but few of the examples had any claim to be called beautiful. They all were indicative of a low degree of civilisation, and the remains of builders' work figured in Dr. SCHLIEMANN's book correspond with them. In prehistoric objects art is rare, and those from Hissarlik were, as a whole, neither better nor worse in style than objects which have been exhumed in many parts of the world. If Dr. SCHLIEMANN's property had been added to the Christy collection, it would not appear remarkable, or separated by any novel characteristics from the other examples of the ancient potters' or metal-workers' craft. But one does not associate epic poems with the Christy or Lane-Fox collections, and why should we do so with the Schliemann collection? It is difficult to define the relationship between a poet and his times; but if we judge by what occurred in our own early literature, we may say that the poet's surroundings were superior to his art. When the English muse could do no more than prattle in rhyme there was a noble architecture, and therefore the subsidiary arts connected with building were in an advanced state. We are far from asserting that Greek architecture and craftsmanship was in HOMER's day as superior to the "Iliad" as an Early English cathedral is to our Anglo-Norman metrical romances. But what we do say is that both "Iliad" and "Odyssey" refer to a condition of art which has no correspondence with anything that was found by Dr. SCHLIEMANN. To ask us to believe that ANDROMACHE and HELEN worshipped such hideous things as the "headless female idol with an incised ornamentation," or the abominable "female idol of bronze or copper," or drank out of the amorphous "vase with four feet in the form of a cat," should be accounted a sort of instigation to leze majesty and punished accordingly. If we must accept the Hissarlik remains as having inspired HOMER, the charm of his poetry has vanished. Dr. SCHLIEMANN has evidently a sincere admiration for the old poet, but there never was a man—and we are not forgetting the translators—who has done so much to convert the poetry into prose. He has an unhappy talent for degrading the loftiest conceptions. When he ascended Mount Ida Dr. SCHLIEMANN tells us he repeated several times the verses describing the scene between JOVE and JUNO, but in spite of his enthusiasm the whole Troad, with its hills and rivers, appeared to be "on a plate!" He tests the power of the god's eyes by his own. Because his vision was limited so was JOVE's. If Dr. SCHLIEMANN had explored the top of the hill who knows but Fortune, who has been so favourable to him, might have revealed the very telescope or field-glass which JOVE was obliged to use whenever it was necessary to survey mankind from Ida? People who accept Dr. SCHLIEMANN's revelations will rejoice to learn that the lotus which sprung forth to form JOVE's couch was a kind of clover (Dr. MAHAFFY will probably say the shamrock is the exact species), and that the hyacinths gathered by the Doctor are "decidedly identical with the Homeric Hyacinthus."

The world will insist, for a while at least, on identifying Hissarlik with Troy, and if people must have a material city miraculously preserved for their edification, Hissarlik will serve as well as another. But it seems to us that the true way to gauge the worth of Dr. SCHLIEMANN's explorations would be by first eliminating all notions of HOMER and Troy. We have at Hissarlik the site of various settlements, and enough materials exist to help us to illustrate different degrees of civilisation. A part of the materials has been made available, and scientific archæology is indebted to Dr. SCHLIEMANN for what he has done during more than ten years, but much more may be done by him if he will forget HOMER and think only of History. So much is revealed to us in "Troja" we cannot but regret that more important information remains entombed through the influence of a hobby.

Dr. SCHLIEMANN claims a capital importance for his explorations in 1882 on account of the light which they have thrown upon architecture. One discovery was, he says, in connection with the defensive walls and walls of houses in the city he calls Troy. As we have already mentioned, they were made of unburnt bricks, and in some places were baked *in situ*. Everyone knows that unbaked bricks or courses of mud are a primitive mode of construction, and have been found in many parts of Asia and Africa. NIMROUD's palace, if we are to accept RICH's account, was "built with unburnt brick, mixed up with chopped straw or reeds, and cemented with clay-mortar of great thickness." There are expressions in the scriptures which may be supposed to refer to work of that kind, as when EZEKIEL says, "I digged through the wall with mine hand." The Greeks called a house-breaker a wall-breaker, and JOB speaks of those "who dwell in houses of clay whose foundation is in the dust." The wall on the east of the Acropolis in Dr. SCHLIEMANN's second city differs from the ordinary clay construction, as the western side has been dried by means of a fire; the nature of the ground did not allow of the drying of the eastern side. A fire appears to have been lighted at the base of the wall, and, in order that some of the heat might reach the interior, openings were left at regular intervals, which were afterwards filled with stones. Dr. SCHLIEMANN's architect was able to discern differences in the colour of the walls, which arose from the varying influence of the fire:—

Dr. Dörpfeld observed round the channel, first, a circle which had been completely raised to a glowing heat throughout, and has now a light colour; this is followed by a black ring, which has received its colour from the black vapour of the fire. Still farther from the channel the bricks are completely baked, and have a dark red colouring; the joints, which consist of another material, being light red. The farther the bricks are distant from the channel the less red is their colour, and the less thorough their baking. In the less baked or badly baked portion of the wall the shells contained in the bricks have preserved their white colour, whereas in the thoroughly baked portion they have been blackened by the fire. The wall is covered on both sides with a clay coating 0.001 mètre thick. It is highly probable that the brick wall of the second city was built throughout in a similar manner; but this is certainly the first example ever found of a citadel wall having been erected of crude bricks, and having been baked *in situ*.

There are several examples of this class of work. One is in connection with the remains of a temple. But even more remarkable is the discovery that the projecting ends of the clay walls of the pronaos of this temple had been cased with vertical timbers in order to preserve them. The thickness of a wall was about 4 feet 9 inches, and as there were six pieces of timber, the average size of each was about 9 inches square. They were placed on foundation-stones, a wall plate intervening. From this discovery the stability of the ancient clay walls is more easily understood, and it may be assumed that the parts which were liable to injury were always protected by wood.

But the discovery also suggests that *parastades*, or the timber casing of unburnt bricks, was the original from which the antæ which are found in Greek temples of a later date were derived. The Doric and Ionic antæ are merely ornamental, but the primitive antæ may have helped to take part of the weight of the roof, besides protecting the walls. That the antæ were under some traditional *régime* is plain from their treatment. In Doric temples they were without flutings, and the caps differ from the capitals of the columns, while in Ionic examples among other differences there are the two planes in the shaft, which are difficult to explain.

\* *Troja: Results of the Latest Researches and Discoveries on the Site of Homer's Troy.* By Dr. Henry Schliemann. John Murray.

The remains of what Dr. SCHLIEMANN calls "the Greek and Roman Ilium," and which are nearest the top of the hill of Hissarlik, are not of great interest. Part of a wall for defence was found, having rusticated courses. All the more ancient buildings, with one exception, are built of a shelly conglomerate, "whereas those of the Roman time consist for the most part of marble with foundations of a soft calcareous stone." It is worth noting that in the Roman wall every stone that is visible bears a mason's mark of a single letter, while in the large foundation-stones there are generally two, or an attempt at a monogram. Fragments of a small Doric temple were found. It was evidently rude in style. There are twenty flutings in the shaft of a column, and the echinus, instead of being a fine elliptical moulding, is almost a straight line. Under the triglyph there are only five guttæ, instead of the customary six, although on the mutule above there are six. Some fragments of a larger temple are also illustrated, but the artist has made the flutings of the column convex instead of concave, so that they look more like cablings. We are informed that "the roofs, as well as the panelled ceiling were of marble," and that large marble blocks of the strotæra ceilings have escaped destruction, partly because they were too heavy and unwieldy to be moved and to be cut into splinters. On this subject the Doctor might well have allowed his architects to give us more information. Parts of a Doric Propylæum were found, and it is supposed to have led to the Acropolis. Dr. SCHLIEMANN says it is Roman work, and indeed a Greek would disown it. The theatre is described as having been magnificently ornamented with Doric, Ionic, and Corinthian columns. A slab is engraved on which ROMULUS and REMUS with the wolf are shown. It is more remarkable for the arrangement than for the execution. In the middle are the wolf and the children, above are a couple of stags apparently feeding on trees, while beneath is a grotto with a satyr. A Corinthian capital from the theatre is of a better type than was to be expected in so remote a place.

Between the "Second City" and the "Greek and Roman Ilium" there is a wide interval of time represented by the intervening strata, which have not been thoroughly explored. In the third settlement there was no great advance over the one below, for we are told that "the houses with but few exceptions cannot have been more than one storey high. They have no particular characteristic ground plan, but consist of several small chambers irregularly grouped, the walls of which are not even parallel." The custom of baking the bricks when the walls were formed was also adopted. The builders in the fourth city were of an economical turn of mind, like our modern builders of suburban villas. They used the walls of their predecessors, and the houses and gates of the two periods appear to have coincided in position. The walls are generally very thin, and it is supposed that the houses could have had but a single storey. There was a larger area in the fifth city, but the walls of the houses were generally of unbaked clay. About the sixth or "Lydian" settlement, so little is said by Dr. SCHLIEMANN, a reader can hardly fail to conclude that Professor JEBB was right when he said that the Lydian settlement had no real existence, and should altogether disappear from the section.

It is the opinion of Field-Marshal MOLTKE that Bounarbashi, from its strategical importance, is more likely to have been the site of Ilium. Dr. SCHLIEMANN appears to have again examined that site as well as others in the district, but his confidence in Hissarlik remains unshaken. He has also travelled elsewhere in Greece, and gives in "Troja" an interesting account of what he saw. Professor VIRCHOW has said that Dr. SCHLIEMANN's excavations, apart from their connection with the "Iliad," have an "imperishable value," and whenever the results are considered in a scientific way that phrase will express the opinion of archæologists. But at present they are regarded from an imaginative standpoint, and therefore justice is not done to them: they are esteemed for what they are not, rather than for what they are.

A Winter Garden and Lounge has been added by Baron Huddleston to his residence at Ascot, connected to the dwelling-house by a corridor. The work has been carried out by Messrs. Messenger & Co., horticultural builders, of Loughborough. The interior is fitted up with rockwork and fountains by Messrs. Nieman & Cornish, of Orchard Street, W.

## PARIS NOTES.

THE general meeting of the Society of French Artists was held last week at the Palais de l'Industrie, under the presidency of M. Bailly, supported by the other office-holders of the association. According to the treasurer's report, the assets amount to 355,448 frs. 45 c., against which there are no liabilities whatever; 200,000 frs. are deposited as a reserve with the Caisse des Dépôts et Consignations, and the remainder is invested in Government securities. The meeting decided, in opposition to the opinion of the managing committee, that the meetings of the various sections of the society shall be held before the regulations of the annual Salon are drawn up, a month previous to the meeting of the committee for that purpose.

The exhibition of drawings by modern masters from the year 1783 down to the present day, to which reference was briefly made in last week's *Architect*, is being organised by the Society of Artist-Painters, Sculptors, Architects, Engravers, and Draughtsmen, founded by Baron Taylor in 1844—a body now numbering upwards of 7,000 members. The Minister of Public Instruction and Fine Arts has placed the galleries of the Ecole des Beaux-Arts at the disposal of the society for the above purpose from February 1 next. A special managing committee has been formed from among the most prominent members of the association, who will be entrusted with the selection and arrangement of the exhibits. The proceeds of the exhibition will be applied to some charitable purpose in connection with art.

An important set of fresh regulations to be complied with in the construction of new buildings within the Paris boundaries has just been issued. The most noteworthy provisions are as follows: (1) The roof-ridging must form a passage at least 28 inches wide, and be accessible to the firemen and inhabitants in case of fire; it is to be bordered on one side by an iron rail placed at a height of 12 inches. (2) Around the edge of the roof there must be an iron parapet at least 32 inches high, with uprights and rails, the open spaces of which are to be strongly trellised to prevent the fall of firemen, workmen, or of materials, when repairs are being made. This parapet may be made in ornamental open ironwork, but must always be surmounted by a hand-rail. (3) Iron bars forming a ladder provided with hand-rail are to be cemented into the masonry for the entire height of the common walls and of the party walls running at right angles to the frontage on the street, courtyard, or garden; this ladder must be built in the wall itself, and supported in no way by the roof. A means of issue must be provided, either by a garret window or a trap-door in the roof itself, to enable the inhabitants to gain these ladders easily in case of fire. (4) Wherever possible there must be two staircases in each house, issuing by different doors; and, in cases where this is found to be absolutely impossible, iron ladders of the kind above referred to must be established throughout the whole height of the courtyard front.

The *Venus of Milo* is not at present to be found in its accustomed place at the Louvre. The gallery in which it was exhibited has been found to be affected by damp, and the ground beneath is to be vaulted in order to prevent the injurious humidity. The statues that surrounded the *Venus* have been removed to the room known as that of the "Héros Combattants," while the *Milo* itself now reposes, in its three fragments, on straw in one of the store-houses of the museum. To prevent visitors being entirely disappointed, an exact reproduction of the statue has been executed in plaster and placed by M. Ravaissou in the room containing the Ducaze collection. The excavations above referred to will require a year for completion, and are a continuation of the work commenced some years ago under the Musée des Antiques. The soil is to be taken out to a depth of nearly 12 feet under the whole of the ground floor galleries; and the cellars thus made will be vaulted in masonry or roofed with iron beams.

Especial interest will attach to that part of the new basement in which were lately discovered the ruins of an old building of date anterior to the reign of Francis I. These remains, buried at a depth of 13 feet, have been cleared, and appear to be those of an oratory with its dependencies. No reference is made in the archives of the Louvre to the existence of any such ruins, and some hopes are entertained that the further excavations may result in other finds of a like nature.

The Louvre authorities have just purchased for 8,000 frs. a remarkable specimen of decorative sculpture, in the shape of a

house door, coming from Valentia, in Spain, and dating from about the year 1490. Two piers, made up of several small columns, support a large pediment, surmounted by a group representing the *Annunciation*. The sculptor has sought to lead the look up to this by a succession of angels' faces and scrolls all directed upwards. The two figures of the group face one another, the Virgin in a kneeling position on the right, and the Archangel upright and opposite to her, with a lily in his hand. This door gave entrance to the mansion of Sorell, the treasurer of Charles V. He was condemned to death for peculation.

The celebrated Gallo-Roman remains, exhumed by the Père de la Croix at Sanxay, are threatened with destruction by process of law. The reverend father writes to one of the Paris papers to say that he has been summoned in due legal form before the Poitiers Civil Court by the owner of one part of the soil in which his excavations have been made, to demolish the temple, baths, and theatre of the discovered town, and restore the land to a fit state for cultivation. There can be no question as to the law on the matter, and in default of intervention on the part of the Government, M. de la Croix will certainly have to comply with the summons. The case affords, however, an amusing instance of the often-conflicting nature of legal enactments; for had the owner's wishes been immediately carried out by the Père, the latter would have laid himself open to a suit for damages from the Government, which possesses his legal offer of the site and ruins as they stand—an offer that can be closed with at any time before a certain specified date. Of course, it appears impossible to admit for a moment that the perpetration of such a piece of vandalism can be allowed, and the State will doubtless interpose, and expropriate the land to its own use. The Historic Monuments Commission has already voted 10,000 frs. towards the preservation of the ruins, and the Council-General of the Department in which they stand has also offered to contribute for the same purpose. Moreover, a petition to the Minister of Public Instruction and Fine Arts praying him to hasten the acquisition is being prepared by all the archaeological societies of the country. As the matter at present stands, it is possible that a special Act of Parliament will be required to counteract the inevitable decision of the local tribunal, and save the invaluable remains from destruction.

The Académie des Inscriptions et Belles-Lettres last week held a special meeting to elect successors to the two seats vacated by the deaths of MM. Laboulaye and Dufrémery. By the almost unanimous vote of the members present, M. Paul Meyer, Director of the Ecole des Chartes, was elected to replace M. Laboulaye, and M. Maspero, the well-known Egyptologist and Director of the Boulaq Museum at Cairo, was named to succeed M. Dufrémery.

### LORD OVERSTONE'S PICTURES.

THE high position which Lord Overstone, says the *Times*, so long held as a trustee of the National Gallery was not derived only from his having formed a collection distinguished above all private galleries for the finest masterpieces of the Dutch School and those works of Murillo and Claude which gave it a European reputation, but from his fine taste in art, tempered with sound judgment, directed by a public spirit and an earnest concern that grand pictures should be brought to exercise their elevating influence upon the people. One day Lord Overstone noticed a good picture on the walls at Christie's, and took Sir Charles Eastlake to see it. They took their seat near the auctioneer; biddings began and went on, one opponent standing in the crowd at the back of the audience. As the biddings had now reached the highest point Sir Charles thought proper to go, he and Lord Overstone decided to give up to their opponent, and they missed their bargain. As they were leaving the room together, who should come up to them but Mr. Gladstone, who began expatiating on the merits of his purchase to their mutual astonishment. The picture might possibly have been the fine Bonifazio of the Beckford collection, which was long an ornament in Mr. Gladstone's collection, and which was sold with the rest of the Prime Minister's works of art in 1875, when Lord Overstone bought it, as did also the large onyx cameo of *Zeus and Thetis*, which is engraved as the frontispiece to Mr. Gladstone's "Homer." The Overstone collection has not been seen by the general public in consequence of the pictures being hung in the house in Carlton Gardens—the house which he bought of the widow of Mr. Huskisson soon after the sad railway accident by which the Minister was killed. The principal pictures, however, were lent to the famous Art Treasures Exhibition, of which Lord Overstone

was a great promoter; and more recently some were contributed to the first Exhibition of Old Masters at Burlington House. At the old British Institution some of his pictures were always to be seen. At Carlton Gardens there are about seventy pictures, nearly all of first-rate interest, and of the Dutch and Flemish painters. Nine of these may be called masterpieces of their kind, and at the head of them stand a superb *Waterfall*, by Ruysdael, a large work in an absolutely perfect state, as fresh as it left the hand of the master; an equally fine *Water Mill*, by Hobbema, in his purest and richest colour; two Vanderneers, a moonlight and an evening wood scene; a Rembrandt, portrait of an old lady in a ruff; Jan Steen's *Twelfth Night*; a delightful little Vandervelde calm, and a fine upright Hackaert. These all came from the collection of Baron Verstolk de Soelen, one of the most celebrated private galleries at the Hague. This collection was bought *en bloc* by Lord Overstone (then, in 1846, Mr. Samuel Jones Loyd), Mr. T. Baring, and Mr. Mildmay. The story of how these three connoisseur bankers divided their bargain is told by Lord Overstone. They met to make their choice, but every man wanted the best pictures. At length Mr. Loyd proposed they should settle the point by an auction among themselves, and he officiated as salesman. As it turned out, he seems to have beaten his companions, at any rate, with the Ruysdael and Hobbema, which are pictures without a rival. From the Redleaf collection, Mr. Wells's, sold at Christie's in 1848, came a very beautiful De Hooe, *Courtyard of an Inn*, and a remarkable Isaac Ostade, *The Country Inn*, a large upright picture; and the lovely landscape by Claude, so celebrated under the name of *The Enchanted Castle*, the drawing of which is in the "Liber Veritatis," the picture being painted in 1664 for the Conestabile Colonna at Rome. The picture represents the Castle of Falkenstein, the scene of the beautiful legend of the Lady of Falkenstein, and is altogether enchanting. In the collection at Carlton Gardens is a very beautiful little picture of *The Virgin and Child in Glory*, by Murillo, which closely resembles the large picture by the master formerly in the collection of Marshal Soult, which was purchased by Lord Overstone soon after the Soult sale in Paris in 1852, from the family. This magnificent picture, the history of which is extremely interesting, is at Lockinge House, having been presented by Lord Overstone to his son-in-law and daughter. It has often been spoken of as *La Vierge Coupée*, because for many years it hung in the Soult Gallery, with the figure of the Virgin and Child by another hand, the original having been cut out of the picture and stolen when it was the altar-piece of a church in Seville—it was said by the sword of an officer. The most interesting point in the history of the picture in connection with the Overstone collection is that the original Virgin and Child cut out from the great work had been for many years in the possession of Lord Overstone, who bought it from Mr. Gray, of Haringhay, a well-known amateur; but it had never been supposed that it belonged to the large picture. It happened that one day Lord Overstone, walking in Pall Mall, met the late Mr. Senior, who immediately told him that there was a young French painter sent over to England in the hope of discovering a picture by Murillo which was supposed to have come to this country, and made the request that he might be allowed to see the pictures at Carlton Gardens. It was, of course, arranged that he should see them, and when he did he recognised the bust figure of the Virgin and Child as belonging to the picture in the Soult collection. His offers to purchase were of course fruitless; but the discovery was made, and Lord Overstone naturally determined to obtain the *Vierge Coupée*, in which he succeeded some time afterwards, through the negotiation of the late Sir Charles Eastlake; and the fine work was thus, after so many years of deprivation, restored to its original state by the skilful aid of that expert artist, the late Signor Pinti. At Lockinge House there are besides many good pictures of the modern English School, one of the greatest works of Stanfield, *The Castle of Ischia*; and a large sea piece by old Crome—*Yarmouth*. Here also, which is the residence of Sir Robert Loyd-Lindsay, are two fine examples of Bonifazio, a remarkable Bassano, a large Cuyt, and a most beautiful work of Lorenzo di Credi, *A Coronation of the Virgin*. The last-named has an interest beyond its own, as it was the favourite picture of Mr. Rogers, the banker-poet, and always stood at the foot of his bed. It was an equal favourite with Lord Overstone, who bought it at the sale of Mr. Rogers's pictures, and placed it on an easel in his own study at Lockinge House. It will be remembered in the first Exhibition of Old Masters at Burlington House in 1870. At Overstone Park there are several very fine pictures of the English school, of which the most remarkable are a large Italian landscape by Richard Wilson; *The Siege of Gibraltar*, by Wright, of Derby; *Titania Sleeping*, by Stothard; *Edinburgh from the Castle*, by David Roberts. There is also a marvellous little work by Memling—*The Saviour Enthroned*.

The Rev. A. Roberts in a sermon lately preached at Windsor described some of the houses for the working-classes in the town as pigstyes; but on a challenge by the Mayor it was found that the residents made no complaint, and expressed themselves as being quite satisfied with the dwellings.

## GLOUCESTER CATHEDRAL.

A LECTURE in continuation of one delivered a year ago was delivered lately by Mr. E. A. Freeman, in the Chapter House of Gloucester. The subject was the history of the abbey and cathedral. According to the report in the *Gloucestershire Chronicle*, Mr. Freeman said that early in the thirteenth century the nave of the church was covered with a stone vault. During the twelfth century the entries dealt largely with the endless fires which vexed church and city. Like most other Christian churches, Gloucester had its story of the Christian child tortured to death by the Jews. Taking the story as it stood, there really seemed very little evidence to bring the crime home to the Jews, beyond the assumption that none but the Jews were likely to do it. Many as were the times that kings held their court at Gloucester, it was only once that the minster of St. Peter beheld the crowning of a king. While the church of Serlo, if Serlo's it all be, was still untouched, before the nave was vaulted, before the east tower was built, or rebuilt, the young Henry III. received the kingly unction within its walls from the hands of the Bishop of Winchester. The two great churches of the Hwicciai land came at that moment into special prominence. The guilty father was buried at Worcester, the as yet innocent son was crowned at Gloucester. The next time a childish Henry received a crown from a Bishop of Winchester it was in another land (at Rheims in 1429), and under circumstances exactly opposite. Six years after the coronation, in 1222, followed the building of the eastern tower, the work of the monk Helias, of Hereford, whose death was recorded in 1237. Two years later came the dedication, at which the chief minister was the bishop of the diocese, Walter, the patriot who, twenty-six years later, stood by Earl Simon on the day of martyrdom at Evesham. Three years later again was made the vault over the nave, the work of the monks' own hands. In 1242 the south-western tower was begun; at some time before 1246 it was finished. Afterwards, in one of the endless fires, several parts of the conventual buildings perished—the great chamber, the cloister, and the little bell-tower. We may conceive that in the middle of the thirteenth century the west front of Gloucester abbey, like those of Chartres, of Amiens, of Canterbury, till a rebuilding in this century, had two unequal towers, of inequality so marked that the northern and more ancient was known as the "little tower." At St. Peter's, owing, we are told, to the prayers of the crowds of people that came together, the damage went no further; the main body of the minster was saved. But the next year the church of Llanthony, near Gloucester, was utterly burned, with its four towers. The building of a new refectory in 1246 followed fast on the building of the southern tower. A new dormitory was begun in 1303, and finished in 1313. Under Abbot Reginald, who sat from 1263 to 1284, we hear nothing of building, but his reign was a memorable one in the history of the abbey. The house of St. Peter was to send forth a new colony of a different kind from its dependent priories on the Welsh border. It marked the development of the English Universities, and the collegiate system with them, that in 1283 "our house at Oxford" was founded by John Gifford. In him the monks of Gloucester found an enlightened benefactor. It did not become them to lag behind in making the most of the advantages which were offered by the growth of learning, and of the opportunities for learning. They had now their own hall—Gloucester Hall, the site of the present Worcester College—as a dwelling for those of their body who were designed to keep up the tradition of Benedictine culture in a new shape. Fourteen years later the new plantation bore fruit. The *Chronicle* records with natural glee how William Brook, a monk of Gloucester, received the degree of doctor in divinity, another monk of the house disputing with him. The Abbot of Gloucester, Genage, was present with a goodly train, and the inceptor was loaded with gifts. Three years later Dr. Brook had the pleasure of admitting his former opponent, Laurence Honson, to the same degree. Abbot Genage, the prelate of lordly presence and worshipful boldness, whom the great Edward deemed the most venerable man in his whole realm, was the giver of many gifts to his church, besides the beginning of the dormitory in his days. But the second great time of building in the minster itself began with his successor, Thokey, in 1306. The first work was the reconstruction of the south aisle of the nave about 1318. It was, as everyone knew, one of the richest examples of work in the ordinary style of the fourteenth century. Professor Willis pointed out the kindred between its windows and those of Merton Chapel. The re-casing of this aisle was the only architectural work of the abbacy of John Thokey; but an event of his day led to great architectural works in the days of his successors. We had seen the church of Gloucester become the burying place of a prince whom England twice rejected without trial; it had now to become the burying place and something more of a prince whom England no less emphatically rejected after trial. Of all strange forms of devotion surely one of the strangest was that which saw a saint and martyr in King Edward II. Yet to that abnormal worship the Abbey of Gloucester owed its present form. He was half inclined to put it the other way, and to make a new count in articles of deposition against the unworthy king that his misguided devotees had cost us the minister of Serlo in its perfect form, and

hindered us from studying the contrast which we should otherwise have been able to mark between its eastern and its western limb. The connection of Abbot Thokey with Edward of Caernarvon began early. In the days of his father the prince visited the abbey. He dined at the Abbot's Hall, which was adorned with pictures of the kings of the English. Was it treasonable imagining of his father's death when he asked whether they would ever have his likeness among his forefathers? The abbot, under a prophetic impulse we were told, answered that he trusted one day to have his in a worthier place than that. When, therefore, he had run through his course of evil, when he had lost his crown by a lawful sentence, and his life by unlawful violence, when the abbots of other monasteries, of Bristol and Kingswood and Malmesbury feared to receive his body, Abbot John, of Gloucester, went to the Castle of Berkeley with a car adorned with the arms of the Church of Gloucester; he bore away the body of the deposed king, and with a solemn procession of monks and citizens buried it on the north side of the high altar of the minster. Soon after this Abbot Thokey resigned his office into the hands of John Wigmore, in whose abbacy of eight years, from 1329 to 1337, great changes began. The *Chronicle* now recorded with delight the many oblations of the faithful at the tomb of the prince from whom the estates of England had taken away the crown that they had given. Abbot Wigmore was a great builder. He built much in his own abbatial house, and also the Grange at Highnam; and now out of the offerings at the tomb of Edward he began a work which altogether changed the character of his church. The eastern part of Serlo's minster still stood untouched save by the carrying up of the mid-tower. Abbot Wigmore began a work which partly rebuilt and partly cased the whole eastern part of it in a new architectural style, of which he or his architect may be fairly called the inventor. Everybody had believed that the first beginnings of the Perpendicular style were to be found in the work of Bishop Edingate at Winchester; but here—as Professor Willis had shown from undoubted evidence—was work not quite fully developed Perpendicular, but so far advanced that it must be called Perpendicular, rather than any other style built between 1329 and 1335. All the essential features of the style were here, that specially English variety of the great Gothic family which, whether for good or evil, effectually distinguished the architecture of our land from that of every other. The south aisle of the nave was one of the most perfect examples of one style; the south transept, so very few years later, was a nearly perfect example of another. The change of taste must have come in with a rush. As marking an epoch in the history of architecture in England, John Wigmore ranked with the Confessor at Westminster, with William of Calais at Durham, with Roger of Caen at Sherborne and Malmesbury, with Hugh of Avelon in the choir of Lincoln. Abbot Wigmore, within six years of his promotion, completed from its foundation the aisle of St. Andrew, that was the south transept as they now saw it. The transformation of the Norman minster had thus begun, and the strange source of income which had enabled the brotherhood to begin it did not fail. The offerings at the tomb of Edward of Caernarvon still went on. They were so plentiful that some said if all had been spent on the fabric the whole church might have been renewed. Happily, this complete renewal was warded off, and in the parts which did put on a new dress at this time renewal did not always go beyond throwing a kind of veil over the elder work. In the days of John Wigmore's successor, Adam of Staunton, abbot from 1337 to 1351, the great vault of the choir was made at a great and costly expense, together with the stalls on the prior's side. Under Thomas Horton, abbot from 1351 to 1377, the work was brought to an end. The high altar, with the presbytery, and the stalls on the abbot's side were begun and finished. He also made the images and tabernacle work at the entrance of the north side; and in 1374 he finished St. Paul's aisle, that is to say, the north transept. The cost of his work was 781*l.* *os.* *2d.*, of which the abbot himself paid 444*l.* and the odd *2d.* He also began the cloister, which was finished by his successor, Walter of Frocester, abbot from 1381 to 1412. To him they owed the compiling of the *Chronicle*, which they had been following. It was continued into his own abbacy, but it ended before his death. But the transformation of the church was not yet done with, even so far as it was actually carried out. We had now mainly to trust to tradition as handed down by Leland. Abbot John Morwent, who sat from 1420 to 1437, undertook to bring the nave into harmony with the new forms which had been given to the choir and transepts. He began at the west end, where it was plain he pulled down the towers, as was done at Winchester and St. Albans. He could conceive no motive for their destruction, except a wish to give greater importance to a central tower, built or to be built; and in this case it must have been a tower to be built, or to be re-cast, whether the earlier tower was left standing for a season or not. At his hands the western limb of the church put on its present style. Thomas Seabrook, abbot from 1450 to 1457, began—it did not appear who finished—the central tower, the actual architect being one of the monks, named Robert Tully. The next abbacy, that of Richard Henley, lasted from 1457 to 1472, and in his day the Lady Chapel was at least begun. Outside hardly any signs of the elder work were allowed to appear. The whole, though spread over so long a space of time, was done

from one general design. The church was to be recast rather than rebuilt. The only part which had at all the character of an altogether new building was no part of the essential limbs, but the eastern Lady Chapel. Mr. Freeman compared the changes which had been carried out in various other cathedrals with those in Gloucester, and explained in detail the changes effected in overlaying the Norman work with Perpendicular work. Adam of Staunton was possessed beyond others with the English taste for a single gigantic east window, and he explained how this had been carried out. The Norman triforium was still in being, but it was veiled; but at Norwich it was in no way veiled. He reverted to the explanations given by Professor Willis in 1860, and observed that the Gloucester Perpendicular style, both of the fourteenth and fifteenth century, had a character of its own, which was shared by some other buildings in the same part of England, which may well have followed its model, such as the towers of Worcester Cathedral and Malvern Priory. He described the peculiar features of the style, and contrasted it with the Perpendicular of other parts of the country. The Gloucester builders, when they had once started their new style, went on using it, but the rest of England did not adopt it until later. With regard to the vaulting roof, Professor Willis had enlarged scientifically on the construction of the vaults of this period. Mr. Freeman proceeded to refer to the beautiful fan tracery of the cloisters, and to many other features in the cathedral buildings, and the points of contrast with other cathedrals which they afford, to detail which our space fails. For good or for evil, Gloucester Abbey was, in style, plan, and outline, one of the most English of English churches.

### THE VICTOR EMANUEL MONUMENT.

A DESIGN has been prepared by Professor Giulio Monteverde for the proposed tomb of King Victor Emanuel, which is to be erected in the Pantheon. The design is commonplace, and is better adapted for erection on a battlefield than in a temple like the Pantheon. The *Italian Times* gives the following description of the scheme; but what is called an urn is an adaptation of an Etruscan sarcophagus with a sloping roof:—

The ground-plan is a square of ten mètres, with small square projections at the four corners. A massive pedestal supports six steps, upon which two plinths rest, bearing the funeral urn. The higher edge of this urn, which is of a very primitive form, is eight mètres in height from the ground. The urn is adorned by the traditional cushion bearing the regal crown. At the corners are eagles, and in the centre the monogram of Victor Emanuel enclosed in a wreath of oak leaves. Four lions are seen crouching on the projections. Round the pedestal, which is richly adorned in the ancient Roman style, runs a band bearing the arms of the hundred towns of Italy.

Taken by itself, this design for the tomb of the first king of united Italy is grandiose; but this alone is not enough. We should consider whether this monument will harmonise with the building in which it is to be placed. The Pantheon was built when Roman architecture had attained its apogee, and it is the grandest monument bequeathed to us by those great builders of old. We must, therefore, be careful in adding any monument which may impair the glorious harmony of the great temple. We must say, frankly, that the design, as presented, does not to our mind fulfil all the requisites desired. Covered sarcophagi were only used in the primitive periods of Etruscan art, and in the decadence of the Middle Ages. We cannot, then, admit that such a monument can harmonise with the grand lines of the greatest of Rome's temples. No less can the petty shields with their crests and monograms, or the four lions of this monument, be considered as fitting the place. Archæology teaches us that the great builders of old always avoided breaking the interior lines of their buildings with erections in their centre. Whenever they were compelled to provide a place for a statue or altar, they elected to make an underground shrine. The temple of Vesta in Rome affords us a splendid example of this, as the place for the altar is excavated in the centre of this round temple.

Modern builders have also found that erections in the centre damage some buildings, and it is on this account that the porphyry urn containing the mortal remains of Napoleon I. has been placed in the centre of the crypt under the cupola of the Invalides in Paris. In our basilicas the Christian builders have tried to keep this æsthetic law in view, but have deformed most of these buildings by raising those bronze or marble canopies which we so often find to cut the lines of the architecture and hide the mosaics of the apsis. The Pantheon has hitherto been spared such treatment.

The canopy in this church, being close to the largest of the niches, does not injure the symmetry of the architecture. But now that a tomb of 18 mètres in height and 10 mètres in breadth is to be raised in the centre of the Pantheon, the inimitable beauty of this temple must certainly be lessened somewhat, as the chief niche is 9 mètres wide, and the chapels in the interior, as well as the entrance, are only 8 mètres high. And in this case, why should this renowned monument have been isolated, and why should

the belfries, built by Bernini, have been dismantled, if now we are to hide the beauties of the interior? Archæologists in future ages might think that Pope Urban VIII. had come to life again.

Everyone remembers the bad effect made by the temporary tomb which heretofore has been erected every year according to the design of Commendatore Rosso, and for the funeral ceremony in honour of the late king. To think, now, that the monument designed by Commendatore Monteverde should look more in keeping with the Pantheon is a vague belief. There is nothing, however beautiful it may be, that would make any worthy effect in this edifice built by Agrippa. When Michael Angelo was summoned by Julius II. to repair the *Torso of the Belvedere* he refused, saying that it would be impossible for anyone to touch it. We should have wished that a celebrated modern artist had answered the Honourable Guido Baccelli in the same terms.

Moreover, the tomb of Victor Emanuel, being placed in the middle of the Pantheon, would constantly be injured by the rain. We are told that this might be remedied by closing the large opening in the roof of the Pantheon by which air and light penetrate into the interior, but they do not consider that by thus closing these apertures the durability of the monument would be lessened. In that immense dome, deprived of air, damp might do great harm. After what we have said, the idea suggests itself that the tomb of Victor Emanuel might be placed where the high altar now stands. There no incumbrance would be possible, and there no fear could exist of damage by rain or by the flooding of the Tiber. There it would be seen by all who enter the church.

### THE CONNECTION BETWEEN THE FINE ARTS.

A LECTURE was delivered on this subject at Glasgow on last Sunday evening by Mr. Ford Madox Brown. The lecturer said that in choosing such a subject he did not wish to go into the matter philosophically, but rather to call attention to the undeniable evidence which they saw around them as lovers of art, as patrons of art, and in a sense as masters of art, of the importance of considering the arts in their various aspects generally, rather than investigating, as was more usual, one particular point. The fine arts were usually limited to four—poetry, music, painting, and architecture. The French Academy, it was true, admitted a fifth—dancing; but that evening he would omit the consideration of the latter branch. In its place, however, he would substitute another which was more indigenous to us—decorative art. For the purposes of illustration he must widen the definition of poetry so as to include all imaginative literature, for poetry, whether got up in feet, or verse, or stanzas, or merely uttered with the subtle cadence which they found in Carlyle's "French Revolution" or Walt Whitman's "Drum Taps," was still poetry, whatsoever its mere form. Science asked, "Why not join hands, you shall be as ourselves?" They could not join hands, however, but say with the French, "Art for itself." Art was a reflection of the universe. Whatever was beautiful in the universe, whatever was terrible, whatever was sad, found its expression in art. But in saying that art had hitherto stood alone, he did not wish in this age of science to be understood too literally. Art was to a certain extent indebted to science in connection with the study of anatomy in sculpture, harmony in music, and chemistry and perspective in painting and architecture; but still art would continue to flourish in the absence of all these. Speaking of the aids to the study and interpretation of the arts, he mentioned that he had lately visited Paris for the purpose of purchasing a set of the best-known casts of ancient sculpture for the Manchester Museum, and as the set only cost 500*l.*, he thought that no important city ought to be without one. The art student in England had many opportunities for study afforded him in the national collections, and the autotype process brought within his reach examples of Continental treasures showing most truthfully the touches of the great masters themselves. In music much progress had been made within recent years in this country, and Mr. Mackenzie's "Colomba" was an admirable example of the new school. Musical festivals in all the large centres were now given, at which the works of the greatest composers were performed to perfection. While in Amsterdam lately he was surprised to hear Wagner's music played on a street organ—a great improvement upon what was usually discoursed in this country upon these instruments, and even by such means anyone might be struck with the beauty of a composition, and led to seek to know it better. He then alluded at some length to what translators had done to admit of the classics, and the works of the most noted authors of all countries being studied in English. While in olden times every school of art had its distinctive features, in modern times all the poets and painters agreed in rendering the ideal in a scrupulously truthful manner. In music there were precisely identical ideas, and, in short, there was no divergence now between the arts of any country. The leading poets of England, France, and Germany, and the greatest painters and sculptors seemed, without exception, to have identical aims, only varying in degrees of power to carry them out.

## NOTES AND COMMENTS.

THE International Health Exhibition, which is to be held next year, will, it is to be hoped, be as successful as the "Fisheries." In the third, fourth, and fifth groups will be comprised all that pertains to the healthful construction and fitting of the dwelling, the school, and the workshop, not only as respects the needful arrangements for sanitation, but also the fittings and furniture generally in their effect on the health of the inmates. The most improved methods of school construction will be shown, and the modes of combating and preventing the evils of unhealthy trades, occupations, and processes of manufacture will form portions of the exhibition. The sixth group will comprise all that relates to primary, technical, and art education, and will include designs and models for school buildings; apparatus and appliances for teaching; diagrams, text-books, &c. Special attention will be directed to technical and art education, to the results of industrial teaching, and to the introduction of manual and handicraft work into schools. The objects that are included in the groups embrace nearly everything connected with the builder's art. But is it not an omission that with such a programme there is no architect's name on the Council?

It was announced lately that those records of the Stratford-on-Avon Corporation which relate to SHAKESPEARE and his times were to be autotyped under the direction of the well-known Shakesperian scholar, Dr. HALLIWELL PHILLIPPS. But unfortunately a difficulty has arisen, and as it is more or less a personal one, it may be a bar to the work. At first it was arranged that there was to be a sub-committee of three members to represent the Corporation, but afterwards it was converted into a larger one, which might be called a committee of the whole council. As was to be expected, obstacles were then raised, and from the restrictions that were put on his actions, it would appear that Dr. HALLIWELL PHILLIPPS was conspiring to destroy or to mislay the documents instead of reproducing them. It was proposed by the Corporation that the negatives should be taken in a room which was so dimly lighted that photography was impossible. Dr. HALLIWELL PHILLIPPS' practice has been to superintend the operations and to remove the documents one at a time, and in Stratford-on-Avon there is no man to whom the records are so precious. But the Corporation insist on standing on their rights as owners of the property, and will allow nothing to be done unless on conditions which are impracticable.

A TOWN SURVEYOR might reasonably expect that when there is an architect on the council he would be assured of fair play. In Leicester, however, Mr. MILLICAN, an architect and town councillor, has opposed the surveyor on apparently very trivial grounds. The charges were threefold. First, that the borough surveyor had advised on or superintended to some extent some private drainage in the parish of Knighton; second, that he had also advised on or superintended drainage in the parish of Evington, and also on some work in the parish of Ratcliffe-on-the-Wreake; and thirdly, that he had been engaged on the arrangement or supervision of drainage of a rather complex and extensive nature for the parish of Barrow-on-Soar. The discussion of the charges occupied a day—or rather so many friends of the surveyor spoke that the subject occupied nearly the whole time of the meeting. Judging from the report, Mr. MILLICAN at one time nearly forgot what was due to his professional dignity. One of the illegal works undertaken by the surveyor was a visit to the mayor's private house, which lasted three-quarters of an hour; another was a visit to a college; in the third the surveyor was consulted by a neighbouring township in which Leicester has an interest. The value attached to the charges will be judged from the division list—they were rejected by a large majority.

ARTISTS and students of the history of costume will do well to secure a copy of the letter on the architecture and costume of the new play "Claudian" which has been addressed to Mr. WILSON BARRETT by Mr. E. W. GODWIN, F.S.A. The period of the play—A.D. 360–460—was one of transition, and is not often represented on the stage or in pictures. There must have been difficulty in finding authorities for the various costumes designed by Mr. GODWIN. His description is clear

and complete, and shows the author's mastery of the subject. The obelisks, statues, and mosaics of the period have been turned to account, and, with his customary attention to details, Mr. GODWIN says he has gone to the objects in museum cases for weapons, personal ornaments, &c. A play which has been so skilfully superintended, and which affords opportunity for scenery and gorgeous dresses, should be as successful as the everyday scenes lately seen on the Princess's stage.

At a time when so much attention is given to the subject of labourers' dwellings, it may be well to inform the public that an exhaustive report on the condition of the St. Martin's district was prepared some years ago by Mr. C. F. HAYWARD, F.S.A. It is needless to say that in that district there are a great many squalid houses, which gave an opportunity to Mr. HAYWARD to investigate the most difficult conditions of one of the most important of social problems. He has entered fully into questions of finance, and has given abundant statistics to illustrate his conclusions. It would be a great advantage if his pamphlet were reprinted now.

SOME information respecting the wire used for electrical conductors was given by Mr. W. H. PREECE at the Institution of Civil Engineers on Tuesday last. Copper is almost universally used for insulated conductors, and the manufacture has been so much improved that it is now twice as good as it was in 1856. Copper wire has a breaking strain of 28 tons per square inch, while iron wire breaks with 22 tons. The best copper comes from Japan, Chili, Australia, and Lake Superior, but a great deal of pure copper is obtainable by electro-deposition. The ordinary best puddled iron is at present used only for fencing purposes, but a mild English Bessemer steel is largely used for railway telegraphs and for stays, although the resistance is very high, owing to the presence of manganese. The wire used by the Post Office is made from Swedish charcoal-iron. Swedish Bessemer, or a specially-prepared low carbon English Bessemer, is adopted by the Indian Government. Cast-steel wire, with a breaking-weight of about 80 tons to the square inch, has been adopted on the Continent for telephone currents; while in England, where speed of working is the prime consideration, electricians are satisfied with a breaking-strain of 22 tons on the square inch. In the colonies, where long spans are essential, and speed of working is not so important, the specification is 30 tons on the square inch.

WHEN RIP VAN WINKLE arose from his long sleep, he soon recognised that the world was changed. But occasionally we find men emerging from obscurity who believe that every thing has remained stationary. The "Aged Artist" who wrote to the *Times* a day or two ago, is evidently of that class. He saw some of the drawings in the early schools of design, and he is convinced that they came from South Kensington quite lately. At the end of a term a student, he says, brings home to his expectant parents "a few mechanical lines, hard and stiff as a wire, as all the result of the time and expense." His recommendation is "that a number of common bricks be shot down *pêle môle* on the ground for the student to copy." But unless we are mistaken, bricks contain only hard rigid lines, and it would be difficult to find one that is a model of a curve. The schools of the Science and Art Department may have their shortcomings, but they are entitled to justice; and it ought to be generally known that for a generation at least they have had a better style of drawing than that described by the "Aged Artist."

A CASE has been tried in the Clerkenwell County Court which illustrates the law in regard to hoardings. A cab was injured by coming into collision with a hoarding around the Victoria Chambers, Chancery Lane, and the owner claimed damages. For the defence the Act of 57 Geo. 3, cap. 29, was first relied on. It enacts that no one is to set up posts, bars, rails, or any enclosure without having a license and sanction from the surveyor of the district. But the judge appeared to be of opinion that the log of wood which is generally placed outside a hoarding, and was the cause of the collision, was unnecessary. Then it was argued that the builder was not responsible, as the hoarding had been let to Messrs. WILLING & Co., who also obtained the license for the alteration of the pavement. There could be no defence to this plea, and a verdict was recorded for the defendant, with costs.

## ILLUSTRATIONS.

DESIGNS BY THE LATE RICHARD C. PAGE.

THE illustrations in *The Architect* for this week will have a melancholy interest for many a young architect. Mr. RICHARD CHARLES PAGE, who died in a public infirmary about three months ago, might well be called a "representative man" by the junior members of the profession. He was a laborious student; he was zealous in the affairs of the Association; he was an able assistant, and of his honour, industry, and practical knowledge there could be no doubt. RICHARD PAGE had all the qualifications that are supposed to insure a successful career, but although he had passed his thirtieth year success never crowned his exertions. When one knows of what he was capable, it is sad to think that there were no commissions for so able a man, and that his friends will have to point to the designs now published when they refer to his powers. Under those circumstances the illustrations might be considered to be outside criticism, but they will sustain examination. In judging them, we should remember that Mr. PAGE was careful in adhering to the conditions that were stipulated, although it would have been easy for him to produce designs which were more showy and imaginative. As his friend, Mr. COLE ADAMS, said of him, "He fell short of his aims because of his integrity and truthfulness, which would not allow him to design a building which might be more attractive, but which would be contrary to the advertised requirements." Mr. PAGE was a sincere admirer of the late Mr. STREET, and from him, more than from any other architect of our time, he appears to have drawn inspiration.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE third ordinary meeting of the Institute was held on Monday evening, Mr. D. Brandon, F.S.A., vice-president, in the chair.

The CHAIRMAN stated that Mr. Horace Jones, president, was unable to attend through indisposition.

The business set down for the evening was the resumption of the subject brought before the Institute by Mr. E. C. Robins, F.S.A., at the previous meeting on November 19, and adjourned, on the motion of Mr. T. Roger Smith, to the present evening. Mr. Roger Smith was also an absentee by reason of indisposition. The attendance was scanty in the extreme.

## Fittings of Buildings for Applied Science Instruction.

Mr. E. C. ROBINS, F.S.A., began by drawing attention to the loss that the scientific world had sustained in the death of Sir William Siemens, who had taken part in the first lecture on this subject, and had intended doing so in the second; but on the very night the paper had been read he died. Mr. Robins then began to describe the fittings of mechanical laboratories as follows under the heads of fittings, for—1, lecture-room; 2, general laboratory; 3, special laboratory and testing-room; 4, engine-room; 5, workshops; 6, melting-room and smithy; 7, drawing-office; 8, museum. Under the first head Mr. Robins pointed out that the system of teaching mechanics had not hitherto been developed to the same extent as physics and chemistry, but that Professor Perry at Finsbury College had endeavoured to elaborate a system through which all pupils of the college might pass. The Central Institution, South Kensington, would in all probability furnish a fine example when completed, as it had been taken in hand by Sir Frederick Bramwell. A separate lecture-room was required for mechanics, which should also be used as a laboratory and drawing-room, every alternate row of benches being supplied with movable tables, thus leaving passages between the others for the draughtsmen; grooves and recesses for colours, &c., should also be provided in the tables. In reference to black boards, Mr. Robins spoke of a board devised by Professor Thomson of Glasgow, and so arranged that by the aid of levers the lecturer could move it with the greatest ease, and without having to stop writing on the board while moving it. In all mechanical laboratories both floor and walls, as also the ceilings, should have beams let in to which apparatus of various kinds could be secured. In the general laboratory all students in the college should find some work prepared for them. In the past this laboratory had been more of a private laboratory, where the professor, assisted by one or two of the senior students, had conducted his experiments. Mr. Robins then specified the dimensions most suitable for a general laboratory, and two smaller and subsidiary rooms, which should also be provided. In the special laboratory should be the testing machines of various kinds for materials such as iron, steel, cement, oils, fuels, &c. There should also be arrangements for testing the efficiency of hydraulic, steam, and transmission machines, for researches in hydraulics, the

resistance of ships, &c. As the special laboratory might be required for some one or more of these purposes, it was obvious that the architect must consult with the professor who would have charge of the laboratory, to become cognisant of the special requirements of the case. The engine-room should have a high pressure and conducting engine, with expansion valve, controlled by a good governor, and the pipes to the evaporation conductor in the roof should be placed internally, and secured from the effects of changes in the weather. The shafting should pass through all the rooms, especially through the workshops. The workshops would be for learning the use of tools and machines in iron, steel, and wood. The iron workshops, wood workshops, &c., should be altogether distinct. Store-rooms must be provided in connection with the workshops. The melting-room should have a smithy and a brass furnace and moulding trough. A good drawing-office was indispensable. For every twenty students 1,600 square feet—80 square feet to a student—should be allotted. The lighting should be good, and the light should come in at the left front of the student. A black board might also be provided for this room. A museum for apparatus, models, and specimens of tested materials, &c., &c., was most desirable. Mr. Robins next took up the question of heating and ventilation proper to applied science schools, and spoke in favour of the use of fans for blowing in and for drawing out the air, since it was necessary to preserve a constant movement in the shafts by which the vitiated air was extracted, and this movement in the draught-places must not be less than 5 feet per second. The system of ventilation carried out by Mr. Robins at the Society of Arts had by its success justified the expectations formed as to its efficiency, and for it Mr. Robins had received a vote of thanks from the Society. The ventilation of these schools had to deal not only with getting rid of vitiated air arising from many people being collected together, but the fumes and noxious vapours resulting from the experiments carried out in these buildings had also to be dealt with. The heating and ventilating arrangements Mr. Robins then described in considerable detail, as carried out or in progress at Finsbury College, the Central Institution, the Yorkshire College, Leeds, the Merchant Venturers' School, Bristol, the meeting-room of the Institution of Civil Engineers, &c.

Professor ARMSTRONG, who made use of the plans on the walls to illustrate his remarks, described some recent experiments made in regard of ventilation, the results of which had been tabulated and hung on the wall of the room. He also described the satisfactory working of a small fan driven by an electric motor, and his remarks tended to show that a greater velocity could be imparted by a fan to the air in the shafts than by other means, for experiments had been made to utilise the waste heat of furnaces, and other expedients, with no practical results, and the only thing that had been found sensibly to raise the velocity was lighting a ring gas burner which had been arranged within the outer shaft.

Mr. PHIPPS then made some remarks, and in the course of them referred to the ventilation of the Bute Hall, Glasgow, the new schools at Edinburgh, &c. He was unable to speak of the performance of the system at the Bute Hall, as the opening of the building had been postponed, but the principle was to insure a current of air from outside as a means of ventilating public halls and places of assembly. Air on being propelled into a room must necessarily find its way out—a matter of no difficulty in assembly-halls, where doors were constantly being opened, &c. Independent outlets, however, existed, which allowed the air to escape when the doors and other means of outlet were closed.

Professor PERRY remarked that a statement of the velocity with which air passed through a certain orifice gave no information of the amount of draught, as the velocity would be greater or less according to the size of the orifice. Various velocities had been mentioned without allusion being made to the size of the orifices through which the air passed. Mr. Perry then referred to calculations made by Professor Ayrton and himself, which demonstrated the superiority of ventilation by means of fans. The ventilation of the future he believed would be by machine-driven fans, and he hoped that Professor Armstrong's experiment with a fan and a small electric motor would lead people, especially architects, to look into the system at Finsbury College, where they could judge of its advantages. The laboratory of the past, as Mr. Robins had said, was a private room where the professor, very often unassisted by any student at all, had worked out his experiments and published his results, valuable results, and all very well in their way; but it was impossible to help seeing that a great change had come over not only the teaching of chemistry but of physics and mechanics; and architects, like other people, must keep their minds open in view of these studies becoming a matter of necessity in every college. Architects would have to make their arrangements accordingly, as the small space hitherto allowed for the laboratory would be no longer tolerated. Mr. Perry then described the black board constructed by Professor James Thomson of Glasgow. It was necessary that the lecturer should not rub out a single line of a mathematical formula. A long board was therefore required, and one that would move with a touch of the finger, or of the chalk. All this Mr. Thomson's arrangement enabled one to do. The common mechanism used—two chains and a heavy balance weight—could only be set in

motion with difficulty, owing to the friction of the parts. Architects might find Mr. Thomson's principle to be of use to them in circumstances where heavy objects had to be hung.

Mr. H. MCLACHLAN, the holder of the Godwin Bursary, then read a short paper describing some technical German buildings.

The thanks of the meeting were then awarded to Mr. Robins, who replied, and the meeting was adjourned.

### A ROYAL PICTURE.

A PICTURE recently acquired from the Strawberry Hill collection for the Queen was exhibited at last week's meeting of the Society of Antiquaries by Mr. J. C. Robinson, F.S.A., surveyor of the Queen's pictures. In a paper by Mr. Robinson, which the secretary, Mr. Knight Watson, read, Horace Walpole's account of the picture was quoted. The picture is that of an English king and queen and several members of their family represented at prayer under tents. Over their heads is a representation of the combat of St. George and the Dragon. Walpole, though of opinion that the picture was painted in Henry VII.'s time, took it to be meant for Henry V. and his brothers, Henry's queen, her sisters, and two other ladies, whom it was difficult to identify. The portraits were said to be imaginary. Mr. Robinson does not quite agree with Walpole that the faces were imaginary. He thinks there is individuality in them, although they bear signs of having been coarsely repainted. He perceived in the picture a marked Flemish influence, and is inclined to think it the work of an excellent Flemish painter of the school or following of the Van Eycks. Probably it was executed about 1500. Mr. G. Scharf also read a paper on this picture, which he said had once been purchased for 6*l*. When it passed into Walpole's hands it cost him 38*l*., and he had written that "the price of antiquities had so risen that he had expected to have paid more." It was, in Mr. Scharf's opinion, clearly a picture of Henry VII., his consort, and his children. It was curious that Walpole had failed to discover this, although he had assigned the date of the picture to Henry VII.'s reign. In its original state the picture had been a most elaborate and refined specimen of Flemish art. The exquisite finish of the painting of the goldsmith's work in the picture, and the subtlety exhibited in the folds of the drapery, showed a close affinity to the works of Gossaert and Mabuse; but from its date Mabuse could not possibly have painted this picture.

### DUNFERMLINE FINE ART EXHIBITION.

THE first exhibition of the Fine Art Association of Dunfermline was formally opened by the Earl of Elgin on Saturday afternoon. There was a large attendance. Lord Elgin, in declaring the exhibition open, said that art exhibitions were of modern creation. In days of old the fine arts depended very much on the patronage of great men of the earth—on the rich and powerful. That patronage was still extended to artists and men of genius in this country and throughout the world. But he could not forget that one of the greatest ages of art in the history of the world was that of Athenian art, and that under the auspices of the Athenian democracy those great Grecian sculptures were created, some of which were now preserved to the country. But the object of exhibitions such as theirs, and of the Science and Art Department of South Kensington, was to diffuse throughout the community a love of all that was comprehended under the name of art. No one could come and see that exhibition without surely carrying away with him something of the feeling of the beauty and harmony of order—of a sense of the pleasantness of quiet, and the violence of contention and strife; and he would be a great deal the better when he left the room than when he entered it.

### THE NEW EDDYSTONE LIGHTHOUSE.

AT the ordinary meeting of the Institution of Civil Engineers on November 27, a paper on "The New Eddystone Lighthouse" was read by Mr. William Tregarthen Douglass, C.E.

The necessity for the construction of a new lighthouse on the Eddystone rocks had arisen in consequence of the faulty state of the gneiss rock on which Smeaton's tower was erected, and the frequent eclipsing of the light by heavy seas during stormy weather. The latter defect was of little importance for many years after the erection of Smeaton's lighthouse, when individuality had not been given to coast-lights; but with the numerous coast and ship-lights now visible on the seas surrounding this country, a reliable distinctive character for every coast-light had become a necessity. The tower of the New Eddystone was a concave elliptic frustum, with a diameter of 37 feet at the bottom, standing on a cylindrical base 44 feet in diameter, and 22 feet high, the upper surface forming a landing platform 2 feet 6 inches above high water. The cylindrical base prevented in a great measure the rise of heavy seas to the upper part of the tower, and had the

further advantage of affording a convenient landing-platform, thus adding considerably to the opportunities of relieving the lighthouse. With the exception of the space occupied by the fresh-water tanks, the tower was solid for 25 feet 6 inches above high-water spring-tides. At the top of the solid portion the wall was 8 feet 6 inches thick, diminishing to 2 feet 3 inches in the thinnest part of the service-room. All the stones were dovetailed both horizontally and vertically, as at the Wolf Rock Lighthouse. Each stone of the foundation-courses was sunk to a depth of not less than 1 foot below the surface of the surrounding rock, and was further secured by two Muntz metal bolts  $1\frac{1}{2}$  inch in diameter, passing through the stone and 9 inches into the rock below, the top and bottom of each stone being fox-wedged. The tower contained nine rooms—the seven uppermost having a diameter of 14 feet and a height of 10 feet. These rooms were fitted up for the accommodation of the light-keepers, and the stores necessary for the efficient maintenance of the lights; they were rendered as far as possible fireproof, the floors being of granite covered with slate; the stairs and partitions were of iron, and the windows and shutters of gun-metal. The oil-rooms contained eighteen wrought-iron cisterns capable of storing 4,300 gallons of oil, and the water-tanks held, when full, 4,700 gallons. The masonry consisted of 2,171 stones, containing 62,133 cubic feet of granite, or 4,668 tons. The focal plane of the upper light was 133 feet above high water, its nautical range was  $17\frac{1}{2}$  miles, and in clear weather it overlapped the beam of the electric lights from the Lizard Point. The lantern was of the cylindrical helically-framed type adopted by the Trinity House. The glazing was 2 feet 6 inches higher than usual for first-order lights, this addition being necessary to meet the requirements of the special dioptric apparatus. For the white fixed light exhibited from the three lighthouses of Winstanley, Rudyard, and Smeaton, at the Eddystone, the Trinity House determined on substituting, as a distinction, a white double-flashing light at half-minute periods, showing two successive flashes, each of about  $3\frac{1}{2}$  seconds' duration, divided by an eclipse of about 3 seconds. It was also decided to show from a window in the tower, 40 feet below the flashing-light, a sector of white fixed light, to cover the Hand Deeps, a dangerous shoal  $3\frac{1}{2}$  miles north-west from the lighthouse. It was further arranged that a large bell should be sounded during foggy weather, twice in quick succession every half-minute, thus assimilating the character of the sound-signal to that of the light. Two bells of 40 cwt. each were mounted at opposite sides of the cornice, in order that a windward bell might be sounded during fog. The optical apparatus for the main light consisted of two superposed tiers of lenticular panels, twelve in each tier. Each lens-panel subtended a horizontal angle at its foci of 30 deg., and a vertical angle of 92 deg., being  $47\frac{1}{2}$  deg. above the central plane of the lens, and  $44\frac{1}{2}$  deg. below it; and was composed of a central lens and thirty-nine annular rings or segments, there being twenty-one above and eighteen below the central lens. The twelve panels in each tier were fitted together so as to form a twelve-sided drum, each lens having its focus in a common centre at a distance of 920 millimètres. These lenses subtended the largest vertical angle of any yet constructed for coast illumination, the increased angle and consequent additional power being obtained by the adoption of heavy flint glass for the six highest and the three lowest rings of each panel. The light was derived from two six-wick "Douglass" burners, one being placed in the common foci of each tier of lenses, the illuminant being colza oil. With a clear atmosphere, and the light of the Plymouth Breakwater lighthouse (ten miles distant) distinctly visible, the lower burner only was worked at its minimum intensity of 450 candles, giving an intensity of the flashes of the optical apparatus of 37,800 candles; but whenever the atmosphere was so thick as to impair the visibility of the Breakwater light, the full power of the two burners was put in action, with the aggregate intensity of 1,900 candles for the lamps, and an intensity of the optical apparatus of 159,600 candles. This intensity was about 23.3 times greater than that of the fixed light latterly exhibited from Smeaton's tower, and about 3,282 times that of the light first exhibited in the tower from tallow candles. The new tower was built at a distance of 130 feet from Smeaton's lighthouse, a large portion of the foundation being laid below the level of low-water spring tides. The estimate for the work was 78,000*l*., and the cost 59,255*l*.. The first landing at the rock was made in July 1878, and the work was carried on until December. Around the foundation of the base of the tower a strong cofferdam of brick and Roman cement was built for getting in the foundations. By June 1879 the work was sufficiently advanced for the stones to be laid in the lower courses. On July 17, 1880, the cylindrical base was completed, and the thirty-eighth course by the early part of November. On June 1, 1881, the Duke of Edinburgh laid the last stone of the tower, and on May 18, 1882, completed the work by lighting the lamps and formally opening the lighthouse. The edifice was thus erected and fitted up within four years of its commencement, and one year under the time estimated. The whole of the stones, averaging more than two tons each, were landed and hoisted direct into the work from the deck of the steam-tender *Hercules* by a chain-fall working between an iron crane fixed at the centre of the tower and a steam-winch on the deck of the *Hercules*, which was moored at a distance of thirty fathoms from the rock.

The Town Council and inhabitants of Plymouth having expressed a desire that Smeaton's lighthouse should be re-erected on Plymouth Hoe, in lieu of the Trinity House sea-mark thereat, the Trinity House made over to the authorities at Plymouth the lantern and four rooms of the tower. For taking down and shipping Smeaton's masonry the *Hercules* was moored at ten fathoms from the rock, and the stones were shipped, after the removal of the lantern, by her steam machinery by a process exactly the reverse of that by which the stones of the new tower were landed. After the removal of the structure to the floor of the lower room, the entrance-doorway and well-staircase leading from it to the lower room were filled in with masonry, and an iron mast was fixed at the centre of the top of the frustum.

### A GREEK MONASTERY.

A CORRESPONDENT of the *Daily News* who has lately visited some of the Greek monasteries about Mount Athos, gives the following account of them: On the peninsula are twenty large monasteries, besides a considerable number of smaller ones, of askites, a word connected etymologically with the English adjective ascetic, of the cells of hermits, and of smaller houses which are let out to monks who wish to engage in tilling the ground. Each of the twenty monasteries has a representative who lives at Karyes, and the twenty form the council which governs the Holy Mountain.

A visit to one monastery gives a very fair idea of the arrangements in all. Nearly all were constructed at times when it was necessary to be ready to resist pirates. Greeks and Venetians, Arabs and Genoese, have attacked the fastnesses of the mountain with more or less success. Each one, therefore, resembles a Middle Age fortress. The walls are high; there is but one entrance, which could always be well defended; and many of the dwelling-places are built on the top of the lofty walls. As space must always have been an object, the houses of wood project over the walls. There is no reason to doubt that the appearance of the monasteries is very much what it was six or seven hundred years ago, and the painter in search of picturesque combinations of old buildings will go far—even if he succeed at all—before he finds such curious corners, groupings of towers, houses, churches, campaniles, and projecting stones as he will in such monasteries as Vatopedi. This particular one may be taken as a type of the rest. The fortress-like buildings, surmounted by wooden houses, form a striking object for miles around. Within the walls are massed together among quaint houses in artistic confusion ancient churches, refectory, library, watch-towers, and other buildings which the requirements of a thousand monks have rendered necessary. Everything, however, is orderly and clean. Here and elsewhere the student of architecture should come who wishes to see what was the Byzantine idea. Mr. Ferguson, in his "History of Architecture," has called attention to the rich effect which the interior of Saint Sophia must have presented while it was a Christian church, from the fact of its walls being veneered with dark-coloured marbles, its columns being of the same beautiful material, and its mosaics being in keeping with the general tone of its veneered walls. What the eye of an architect has in great part reconstructed for the church of the Divine Wisdom may be seen in actual existence in many of the churches of the Holy Mountain. The general impression which these churches produce may be compared to that of a modern drawing-room, where the glaring white of a quarter of a century ago has been got rid of, where the colour is subdued, and where a general uniformity of richness and tone has been produced by means of Eastern tapestry and decorations. In the churches there are indeed no carpets, but the floor is composed of various coloured marbles, worked together like parqueterie, and showing that no labour has been too great to secure the result desired. The mosaics on the ceiling give evidence of a similar care, while the walls are covered with frescoes. It may be said at once that the majority of the latter are utterly worthless as works of art, except that the effect of them as a whole is in harmony with the decoration of the church. Some of the frescoes are, indeed, valuable as works of art, and are by Panselinos, the Cimabue of the Eastern Church. It is difficult to say which are really his works, because the monks have the habit of attributing everything to him which is especially well done. Before dismissing the frescoes it is worth noting that in these churches and to ignorant men they must have succeeded in telling a large part of the Bible history. Very quaint and curious some of them are. In the heaven the artist has found a place for Homer, Plato, Aristotle, Sophocles, and other Greek worthies. The hundreds of pictures will be invaluable to anyone who cares to study the costume or the domestic architecture of the Roman Empire of the East during the Middle Ages. Many, perhaps most of them, have been copied over the old drawings within the last century, but the art of the Eastern Church is curiously non-progressive, and the old pictures are reproduced as faithfully as possible, and much more so than they deserve as works of art. When the paintings represent saints, or the Virgin, the closeness of imitation

is of the most servile character. Every line, and every piece of false drawing, is faithfully reproduced. Such, at least, has been, and is to a great extent still, the rule, though I may mention that both in Athens and in the new Greek cathedral in Pera, the pictures of saints have been painted by modern artists of merit, who have altogether refused to bind themselves to the absurd artistic traditions of the Church.

The furniture of the churches in Mount Athos harmonises admirably with the interiors and the shape of some of the thrones, stalls, lecterns, and other fittings is particularly graceful. If it must be admitted that Byzantine art is art in decadence, yet here at Mount Athos it is at least seen at its best. So seen, it is impossible to deny that it has a beauty of its own, and that Byzantine churches in their interiors must have had a harmony of colour and of decoration generally which is usually wanting in those of the West.

### THE NEW PARLIAMENT HOUSE, VIENNA.

THE Imperial Parliament of Austria met for the first time this week in the new buildings in the Ring Strasse, Vienna, which covers an area of about three acres. It is described as forming part of a very noteworthy and striking collection of architectural triumphs. It faces an immense square, which contains the recently-opened Town Hall in the Gothic Renaissance style, and just opposite is the new University in Italian Renaissance, while the new Hof Burgtheater, still under construction, in the style of the gayest Italian early Renaissance, faces the Town Hall. Many other splendid buildings are scattered right and left of this noteworthy square: for instance, the famous Votiv-Kirche, in the purest French Gothic style, the new Palace of Justice, and the two Imperial Museums. But what distinguishes the new House of Parliament from all its neighbours is that, standing on the sloping terrace in front, one overlooks at a glance not only the palatial buildings just mentioned, but a considerable part of the old city, with the ancient cathedral of St. Stephen.

The architect, Theophil von Hansen, deserves to be congratulated on the success of his plans. The front of the House is a combination of three Greek marble temples in the purest style, the middle one, which is the largest, forming the entrance to a centre hall of extraordinary splendour, whilst those on either side serve as entrances, that on the left to the House of Lords (Herrenhaus), and that on the right to the House of Commons (Abgeordnetenhaus). The length of the entire front is 608 feet, and the width of the building 433 feet. The above-mentioned State Hall, separating the two Houses from each other, is 135 feet by 76 feet, and its height is 43 feet. Its crystal glass ceiling rests on twenty-four monoliths of red marble, with gilded capitals, each of these columns being 27 feet high, and the walls are covered with a profusion of gold, marble, and other costly materials. On the other hand, and in contrast to all this splendour, the assembly rooms themselves, for which the whole palace was erected to accommodate, show a marked degree of poverty, not only in their adornments when compared with this hall, but especially in the matter of space. It seems to be the fate of modern architecture to answer well for any other requirement than usefulness and practicability. The Lower Chamber, for instance, which, like the Upper, is built in the form of a semicircle, contains five seats less than the present number of members, and as it has long been in contemplation to increase this number by at least a fourth, the absurdity is very marked. The Lower Chamber, as it now stands, has 354 seats, and the Upper House 192. The building comprises also several committee-rooms, rooms for party meetings, refreshment-rooms, reception-rooms for the presidents and vice-presidents, and so forth, but the galleries for the public in the people's chamber are ridiculously narrow, although in Austria the sittings of Parliament are unrestrictedly public, and the places for the representatives of the home and foreign press are so few in number that it will be considered a rare distinction to be admitted either permanently or occasionally. The works have already been in progress for nine years, and when all the gilding and painting and embellishing is completed, the cost will amount to 10,000,000 florins, or over 800,000*l.*

### BUCKFAST ABBEY.

ONE of the signs and results of the prolonged resistance of the British Celts to their Saxon conquerors in the West of England is the extreme scarcity of very ancient abbeys in Devonshire. Benedictine monasticism was hated as "English," and the British clergy would not even eat at the table or drink from the cup polluted by a Saxon ecclesiastic. As a consequence, only two out of twenty-six Devonshire abbeys date from before the Conquest. One of these is that of Tavistock, the other is the Abbey of Buckfast. Buckfast Abbey lies in the valley of the Dart, between Ashburton and Buckfastleigh, the rapid, foaming river sweeping in a deep curve round the meadows on which it was built. The house was already wealthy in the time of Edward the

Confessor, when 240 villeins and serfs were employed in the cultivation of its lands, and it remained a wealthy house down to its dissolution, owing mainly to its wool trade, which is still carried on in a mill adjacent to and partly constructed from the abbey ruins. In the middle of the twelfth century the monks adopted the Cistercian reform. A deed of Henry II. is still extant (confirming the abbey in its possessions) which bears the signatures of Theobald, Archbishop of Canterbury, and of Thomas à Becket, then a layman and chancellor. A charter of Richard I., granted at Bury St. Edmunds in 1189, further confirmed the monks in their "lands, tenements, mills, fish-ponds, homages, and reliefs, sac and soc," &c., and frees them from "geld and danegelt, hidage and scutage," and other imposts. In 1236 the abbot and monks became members of the Merchants' Guild at Totnes. In 1297 Edward I. was a guest at the abbey. William Slade, who was abbot in 1414, was a distinguished scholar and artist, and largely augmented the convent library. In 1421, a dispute having arisen between Abbot Beaghe and the monks, an award of certain arbiters was read in Chapter, whereby it was settled that the abbot was entitled to order attendance on his guests "according to the ancient and worthy usage" of the abbey, but was not to obtain privileges or exemptions from Rome to the detriment of the house, or, on account of his age and infirmities, to interfere in its government. The last abbot was Gabriel Donne, who was promoted by Henry VIII., and who surrendered the abbey to the king in two years after his election. For this he received an annuity of 1,800*l.* of our money, with the rectory of Stepney, *sine cura*, and was made first a Prebendary, and then a Canon of St. Paul's, before the high altar of which he was buried, after founding a still existing scholarship at Trinity Hall, Cambridge. The arms of the abbey present an example of that play upon words, technically called a *rebus*, of which the mediæval men were so fond. The arms of Buckfast display a buck's head made fast by an abbot's crozier. They are: Sable, a crozier in pale argent, the crook or, surmounted by a buck's head caboshed, of the second, horned gules. The abbey and lands were granted by King Henry to Sir Thomas Dennis. In 1629 they belonged to Sir Richard Baker, the historian. They then passed to the family of the D'Oleys, when the lands were divided. The site of the abbey remained uninhabited till 1806, when a tolerably good Gothic house was built on and partly from the ruins. Of these latter but little remain. There are numerous widely-scattered fragments, a north and south entrance, archways, and a very well-preserved Perpendicular tower of four storeys, known locally as "The Abbot's Tower." The building presents several features of architectural and antiquarian interest, and is undergoing a process of careful and scrupulous restoration under the care of a competent architect. It is to be again inhabited, for the abbey site has recently passed into the hands of a thriving community of Benedictine monks of strict observance, who were lately expelled from a French abbey in the diocese of Sens. Their advent is interesting as an example of "survival" such as could exist nowhere but in a country at once so conservative and liberal as England. The late proprietor sought, and succeeded, to establish by legal process a number of "rights" to which he considered himself entitled as representative of ancient owners, and the result is that the actual prior of Buckfast enjoys several old abbatial rights and privileges which date back from the customs and legislation of mediæval England.

### ARTISANS' DWELLINGS IN DUBLIN.

A REPORT has been prepared for the Dublin Corporation by Mr. Arthur Dudgeon, C.E., upon the utilisation of some of the city land for sites for artisans and labourers' dwellings. The writer says:—

There are two sites available for the purpose in Barrack Street, one having a frontage of about 240 feet and the other a frontage of about 160 feet. Both sites are suitable, and, in my opinion, afford an excellent opportunity for putting in operation the Act of 1866 with every probability of success. I suggest that two blocks of buildings be erected, and that the ground-floor frontages, at the level of and facing Barrack Street, the New Street, and Ellis's Street should be utilised for shops, for which there is a good demand in the neighbourhood. There should be no basements, but above the shops there should be three or four storeys of tenement dwellings, the approach to which should be by staircases leading to galleries or corridors extending the whole length of the buildings in the rear at each floor level, so that separate access may be obtained to each tenement or set of rooms direct from the galleries. Objection is often raised to artisans' dwellings being erected four or five storeys in height, on the ground that the working classes object to have to ascend such a height, and that therefore the top storeys would probably remain unoccupied. Experience, however, proves that such is not the case, but that, on the contrary, a demand exists for rooms at the higher levels. The buildings should be well and substantially constructed, and it would be true economy to make the floor and rooms fireproof, not only for the comfort and security of the tenants, but for the greater stability and longer life that would be

thus given to the structure. . . . In connection with these dwellings, which should afford accommodation not only for families, but for single females and widows, there should be a lodging-house for single men upon the system which is found to work so well in Glasgow. There should also be baths, and a small public wash-house, the wash-house being reserved for the use of the tenants of the dwellings for one day in each week. . . . Buildings such as in my opinion are suitable for the two sites proposed would contain about 670,000 cubic feet, exclusive of the single men's lodging-house, baths, and wash-house. 170,000 cubic feet would be absorbed by the necessary foundations and business premises, with shops and rooms in the rear upon the ground floor at street level, and the balance would be occupied by the upper storeys. These upper storeys, containing 500,000 cubic feet, would provide accommodation for 600 adult individuals, giving each adult about 800 cubic feet gross, or, deducting the walls, floors, water closets, sculleries, &c., from 500 to 600 cubic feet net, whilst the total number of adult individuals accommodated in the buildings, including those in the business portion, would be about 708. I estimate the cost of the buildings, including the capital value of the land, at 20,000*l.*, and the cost of the single men's lodging-house, baths, and wash-house, with the land for same, at 5,000*l.*

The Corporation have adopted the report, and application is to be made to the Commissioners of Public Works for a loan of 25,000*l.*, to be repaid by annuity in thirty-five years at 5 per cent., or, if this cannot be arranged, in forty years at 5*l.* os. 8*d.*

### ON OPEN SPACES IN TOWNS, WITH SPECIAL REFERENCE TO THE REQUIREMENTS OF ARTISANS' DWELLINGS.

BY JOHN HONEYMAN, F.R.I.B.A.

THE paper which I read at the recent congress of the Sanitary Institution of Great Britain, "On the Advantages of Low Ceilings in Small Houses," was intended to direct the attention of those who are interested in the improvement of the dwellings of the poor to one—and not the least important—of those collateral questions, which must be understood and weighed before it is possible to form an intelligent opinion on the greater and more complex problem. The intention of the paper was popularly misunderstood. The suggestion that low ceilings could in any sense be advantageous, or even permissible, seemed at first sight to prejudiced minds to be opposed to all sound sanitary doctrine; a dangerous heresy, in short, certain to lead to the multiplication of rookeries, the increase of overcrowding in an aggravated form, and the erection of high tenements in narrow lanes. It was perhaps not surprising that men connected with municipal bodies here and elsewhere in Scotland should take this very erroneous view. For years they had been getting, or struggling to get, powers to reduce density of population by preventing the erection of high tenements, and requiring the houses of the poorest to have lofty ceilings, and were they to be told at this time of day, when the Lord Advocate's Police and Health Bill had been discussed and amended and presented to Parliament, that they were altogether wrong, and that it was better for the poor people that they should have high tenements and low ceilings? The idea was preposterous, and the teaching (whether true or false, apparently) should not be listened to.

But obviously the question whether a high ceiling in a small house is good or bad may be considered quite apart from the consequences involved, and thoughtful men will so consider it—first on its merits, and then, as I shall ask you to consider it to-night, in its bearing on the regulation of buildings with the view of improving the dwellings and promoting the general welfare of the great mass of our workmen, and more particularly the poorest of the wage-earning classes.

What I ventured to advance in the paper already referred to was that, as a rule, a house with a low ceiling is superior to one of the same capacity with a high ceiling in these respects—roominess, cheapness, comfort, and healthfulness. I also incidentally pointed out that, this being so, it was wrong to prohibit the erection of dwellings with low ceilings; and those who did not take the trouble to consider what I said misunderstood me to advocate the erection of high tenements in narrow streets, without regard to light or air, in order that the working classes might be provided with cheap houses whether suitable in other respects or not. Of course, I never advocated anything of the kind; but local sanitarians, and to some extent our local press, being sent off on this false scent, rather lost sight of the much more important question regarding the best form of room for the special purpose intended. Whether cheapness be or be not the primary essential of a workman's dwelling may be a matter of opinion; but whether a high or a low room is most easily and comfortably ventilated is a matter of fact capable of demonstration by actual experiment. But, having ascertained the best form of room, the next step is to determine how the greatest number of such rooms can be grouped together with due regard to essential sanitary conditions, and this entirely because

subject to such conditions cheapness is undeniably the most important element to be considered. Such aggregation of dwellings will not produce overdensity, but will prevent it; because, if essential sanitary conditions are secured the land cannot be overcrowded with dwellings, and if cheapness is secured the dwellings will not be—or need not be—overcrowded with occupants. The evils of both kinds of overcrowding are generally recognised, and the propriety of arming local authorities with power to control them is admitted; but in this, as in every other case where one man may for the common good be legitimately interfered with in doing what he likes with his own, there must be no doubt about the necessity of the interference or about the proper kind or extent of it; and, quite apart from the question of the curtailment of individual liberty, the legislature ought to take care that it does not sanction such interference as must inevitably defeat its own purpose and leave it without justification. This caution is especially requisite in dealing with land—the utilisation of it for building purposes, and the proper distribution of houses in towns. The mistake common to most building regulations which aim at this is that they are based on an absolutely false assumption—namely, that it is better and more conducive to the health of an urban population to cover the ground with low tenements of houses having lofty ceilings than to cover a smaller area of ground with lofty tenements of houses having low ceilings. In our own case here in Glasgow those who framed such regulations—refusing or despising advice which was as disinterested as it was sound—seem to have set their minds on compelling owners of land and builders between them to give the poor people handsome houses, and they framed their “provisional order” and their Police Bill accordingly, without apparently considering that they could not compel owners and builders to let their handsome houses at low rents; and that the poor people who could not afford to pay high rents—in whose interest they professed to be acting—must therefore be compelled to herd together or remain out in the cold. Ceilings must be high, tenements low, and free spaces, “exclusively belonging to them,” wide, and let the poor people either pay for this improved accommodation or go to—or go—to the model lodgings, shall we say? That is not an alternative to set before our poor fellow-citizens who have the laudable ambition to occupy a house of their own. Apart from the existence of indefensible laws, and the threatened imposition of more, there is no reason why we should not have an abundant supply of healthy cheap dwellings even in the central districts of the city. In this matter of dwellings for the working-classes in town the element of cost can never be ignored; and in order to obtain the greatest amount of good for the greatest number we must not try how much we can compel builders to do, but rather how much liberty we can allow them, never losing sight of this, that if buildings cannot be erected profitably they will not be erected at all.

Now, passing from these introductory remarks, I shall assume that the utility of low ceilings has been proved. But if builders are left perfectly free to make storeys high or low, it by no means follows that they are to be allowed to erect new wynds and closes, or to cover the ground with tenements arranged in any way they may think best. On the contrary, it is obvious that having this liberty they can the better afford to submit—and therefore can more reasonably be required to submit—to some stringency of control in other things. For example, if you say that a tenement is not to be more than 40 feet high, and at the same time insist upon each storey being 10 feet high from floor to ceiling, no more than three storeys could be erected within that limit, whereas if you fix the height of the tenement and say nothing about the height of the storeys, the builder would easily get four in the height, and this might make all the difference between profit and loss, and so between the work being done or not. Such a case I have been told recently occurred in connection with some of the City Improvement Trust ground. A party agreed to take a considerable plot if allowed to make the tenements upon it four storeys high. The Dean of Guild, however, could not sanction this owing to existing self-imposed restrictions, and the whole transaction consequently fell through—the ground remains unoccupied, to the serious loss of the ratepayers generally, as well as of the artisan class in particular, whose supply of dwellings is restricted because it would not pay to erect these tenements less than four storeys high. Precisely in the same way it will be found that granting greater freedom in regard to the height of storeys will make it easier to deal satisfactorily with free spaces; and this is the point which I wish more particularly to illustrate to-night.

First, let me clear away a popular misconception. Free spaces are not required for the purpose of limiting density of population. You may have a very dense population with ample free spaces and quite the opposite with none. Their use is to secure a proper supply of light and air for dwellings; density can be dealt with otherwise. Many years ago my friend Mr. Salmon proposed that it should be limited by simply prohibiting the erection of more than a certain number of separate dwellings on an acre, but obviously this might result in every bit of the acre being covered with small enclosures which, though low, would cause an amount of stagnation in air spaces more prejudicial than the existing state of things; and in any case if we descend into details it would probably be found that the proposal is impracticable, for it must

be remembered that we have to deal with old building ground as well as new, and some acres in Glasgow, and in every other city, would give us a pretty considerable list of proprietors whose exact share of density, or priority of prescription, it would be difficult to determine. But what is density, or rather, over-density of population? In point of fact over-density only begins where dwellings are so crowded or so arranged that some of them cannot get a sufficient supply of light and air. Its existence is determined not by the number of the houses but by their arrangement—a most important distinction. By some arrangements a population of 1,200 can be comfortably housed on an acre without hurtful over-density, by others not half that number without over-density of the most objectionable kind. The prevention of the mere aggregation of dwellings, therefore, is of secondary importance; indeed it is absolutely unnecessary as a sanitary measure, if proper safeguards are provided against close, unwholesome arrangements; and we must never lose sight of this consideration, that we cannot afford unnecessary restrictions. The more we extend freedom in one direction, the more we may venture to curtail it in another without making building as a profitable investment impossible. It is a curious illustration of the complexity of the whole subject to find that the height of ceilings, the density of population, and the extent of free spaces are so intimately related. At first sight the connection is certainly not very obvious—I shall now endeavour to explain it.

We must begin with a distinct idea of what is required. After what has been already said you will, I trust, be prepared to admit that what we require above all things is light and air for every dwelling. Some may be unwilling to give up the idea that free spaces are required in order to spread out the population; but even they will admit the paramount importance of light and air. For my own part, I deny that it is an advantage to spread out the population, and at all events there is no necessary connection between the two things. Whether for many or for few, we must have light and air for all. Now, if you imagine a tenement or block of houses seven storeys high standing north and south, with a free space of say 100 feet on every side, it will be found that every dwelling in it can be as fully supplied with sunlight and air as if the tenement were only two storeys high. If you had only 50 feet of free space you would still have plenty of light and air, and you would still have some sunlight in every apartment—front and back—daily. The disposition of the block in relation to the meridian is important. It will be observed that if it be erected running east and west, whether high or low, only the windows facing south would have any sun; the windows towards the north, and the ground on that side, would never have sunshine summer or winter, whether the tenement be high or low; and in the second instance, with the restricted free space matters would be worse, for in winter at least the ground in front as well as behind would be sunless. I have great faith in sunshine as a sanitary agent, and “a pleasant thing it is to see the sun,” and the more pleasant things we can let into our workmen’s houses the better; still, it must be acknowledged that wind is even more valuable as a purifier, and if the winds have free play along the open spaces running east and west they will go far to compensate for the loss of sunshine. But here again notice that, if you are dependent on the wind and keep your free spaces clear of obstructions, it is of no consequence whatever, whether your tenement is seven or only two storeys high, or whether the space be 100 or only 50 feet wide. If the space be closed in at the ends after the manner of our hollow squares, that is a different matter; we are considering the case of detached blocks, and what I insist upon is, that with free course for the winds of heaven around them, the height is immaterial and cannot interfere with the healthiness of the separate dwellings. Other circumstances may be disadvantageous, but so far as their healthiness is influenced by free spaces the sum and substance of all that can be said is, that if the space be clear of obstruction it is possible to make the dwellings on either side of it healthy either in high or low tenements; if it be properly disposed in relation to the sun, it is possible to make them all bright and cheerful as well as healthy—and therefore probably healthier—and for the same reason it is desirable, though not essential, that the spaces should be wide and the storeys low. We thus see the danger of arbitrary rules interfering with what may be at once the most healthy and economical arrangements; and the propriety of encouraging the owners of land to extend the area of free spaces as much as possible, and of preventing them from curtailing it unduly. The favourite policy of municipal bodies has an opposite tendency. By hard and fast rules as to the width of courts, the formation of mews, lanes, &c., they prevent better arrangements than such rules secure, while by limiting the height of tenements and insisting upon each storey being needlessly high, they discourage any voluntary surrender of free space and practically convert the minimum which they demand into a maximum. That there may be no misunderstanding about this, let us contrast with some minuteness the arrangements possible on ground restricted in these respects and on ground without restriction.

Let us take a piece of ground 250 feet by 150, bounded by streets 50 feet wide, the ends of the parallelogram facing east and west; on such a plot, if unrestricted, it would be quite easy to place three blocks of dwellings running north and south, with a

space of 57 feet between each; and if the storeys are 8 feet high the total height of each block, if five storeys high, will be 45 feet. The open spaces between these blocks would be dried and brightened by the sunlight every day when there was any, and every dwelling would get a share of it forenoon or afternoon. If we suppose there are four dwellings entering from each landing, the total number will be 180. There is no good reason why these blocks should not be six storeys high, but, restricting them to five storeys as above, we have on the plot 180 houses, with ample provision for every one of them being supplied with light and air, and so far as the disposition of the buildings on the ground is concerned, that is the only essential requisite. The planning of the buildings, the number of the apartments in each dwelling, the means of ventilation, &c., are important matters of course, but they have nothing to do with the question immediately before us. The houses can be arranged healthfully in the way I have described.

Now let us see how we can utilise the ground if it is laid off according to our Police Bill or the self-imposed restrictions of our Improvement Trustees. In the first place, we must run a mews lane through it from east to west, and we must then arrange our tenements along each side of the parallelogram, and we must not make them more than 35 feet high if they are 40 feet wide, and less if they are more, so that they cannot be more than three storeys high; and assuming, as in the other case, that there are four houses on each landing, the total number which we could possibly put upon the ground would be 120. In the other case we had 180 larger houses, the tenements being 5 feet 6 inches wider, and we could quite easily, if required, have had other 70 without altering the sanitary conditions of any of them—that is, 250 houses against 120. Now, there would be some conceivable excuse for such restrictions if it could be shown that they secured healthier conditions in the 120 houses; but, so far from this being the case, it is easy to show that the very opposite holds good. Every one of the 120 houses would be worse than any one of the 250 in some respects, and half of them would be worse in every respect. So much depends on the elucidation of this point that it is necessary to go somewhat into detail, and to compare carefully the various sanitary possibilities in each case.

Now, the 250 dwellings would be superior to all of the 120 in these respects—first, they would have low ceilings with proportionately larger floor areas. They would, therefore, be roomier, warmer, and better ventilated. Everyone will admit that each of these points of superiority in a dwelling contributes to its healthiness. Secondly, the 250 houses would be cheaper than the 120. A person could afford to take one of them who could not afford to take one of the others. If, therefore, nothing but the dearer house could be had, the only possible alternative for the poor man would be to share one of these houses with another poor man, the difference being this—and I beg you will take special notice of it—that in the one case you have two poor families occupying one house, in the other you have each of these poor families occupying a separate and superior house; and I ask you to say which of these conditions is most conducive to the health of the community? It may perhaps be objected that, given the cheaper dwellings, the poor families would club together all the same. To some extent no doubt they might, but observe in the other case, where only dear houses are obtainable, they must. Besides, let not this be forgotten, that the two poor families would be more healthily housed in a large low house than in a small high one. We have thus seen that in two particulars all the 250 houses will be superior to any of the 120. In one respect only would any of the latter be superior to the former—about half of them, if facing south, would have a few more hours' sunshine, or the possibility of it, as one side of each tenement would be exposed to the sun; but this apparent advantage is more than counterbalanced by the exposure of the other side to the north and the exclusion of the sun—partial in summer and total in winter—from the streets and open spaces. It has been said that wind dries such spaces more effectually than sunshine, but that is certainly not borne out by my observation in the streets of Glasgow. I have often noted that while the streets running east and west were wet, those running north and south were perfectly dry, and this with west and even with north-west wind. But be this as it may, you will, I dare say, agree with me that "baith's best," and if so, you will acknowledge the superiority of the tenements with many dwellings. In these, as we have seen, both sides get a share of the sunlight which freely plays on every corner of the open spaces, while in the other these spaces, with their dismal mews lane, remain cold and damp and cheerless; so that while we may admit that in certain circumstances this arrangement benefits a few of the dwellings at the expense of others, its inferiority on the whole is unquestionable.

Lastly, if we make the number of dwellings the same on both plots—120 on each—we get a very much larger area of free space by the first arrangement than by the second, because having sixty in each block we may omit the centre block altogether. We have thus not only better houses, as we have seen, but a free space of 2,647 superficial yards, while by the other arrangement it is impossible to get more than 1,944 yards. The blocks would be a little higher in the first case than in the second—only 12 feet—but with a street 50 feet wide in front of them, they would have a free

space behind of 159 feet 6 inches; whereas the tenements made according to our police regulations, though much longer, could only have a free space of 70 feet behind them. In this respect there is no comparison between the two; and surely the public interest demands that the better arrangement should be permitted.

(To be continued.)

### MIDLAND ARTS CLUB.

THE members of the newly-formed Arts Club held their first social meeting at the Grand Hotel, Colmore Row, Birmingham, on Wednesday. The meeting, which was the first of a series of monthly gatherings of a similar kind proposed to be held in connection with the club, was largely attended by members and friends, and was in every respect of a most successful and enjoyable character. Among the numerous art exhibits distributed about the room was a fine collection of original paintings, mostly lent by the artists who are members of the club; amongst them a life-like portrait of the late Mr. J. H. Chamberlain, by the honorary secretary, Mr. Edward Bingley; a very ambitious and successful *Study of a Silver Birch Stem*, by Mr. Acton Butt; and an equally meritorious work of a similar character, by Mr. Wellesley Cotterill, deserve special mention. A very attractive collection of water-coloured landscape and figure sketches, by Mr. S. J. Barnes; a well-filled folio of original drawings by Mr. Showell; and a collection of etchings, by Mr. Derrington, also attracted much attention. Architecture was well represented by a number of artistically-conceived and well-drawn designs by Mr. Henman and Mr. John Cotton; and the president, Mr. Joseph Moore, lent a number of commemoration and presentation medals, all fine examples of art medal-work. Mr. W. A. Langston, who was responsible for the musical portion of the programme, gave several selections on the pianoforte, and other musical contributions, vocal and instrumental, were given by different members, and contributed materially to the success of the meeting.

### THE DUNFERMLINE HIGH SCHOOL.

A MEETING of the promoters of the new High School and Dunfermline Burgh School Board was held last week for the purpose of hearing a report by the committee on the competitive plans for the building. The Earl of Elgin occupied the chair. The report was as follows: Keeping in view the terms of the remit of date September 6 last, your committee, after considering the matter, agreed to solicit plans from a limited number of architects, and to offer a premium "of 15*l.* 15*s.* to be paid to the architect (other than the architect appointed) who, in the opinion of the promoters, should lodge the most suitable plans, and 10*l.* 10*s.* to the architect who, in their opinion, should lodge the next best plans." The architects from whom it was agreed to solicit plans were: Messrs. J. C. Walker, John Starforth, Peter L. Henderson, and Anderson, Edinburgh; James A. Mercer, Liverpool; Messrs. Campbell Douglas and Sellars, H. & D. Barclay, & Ritchie, Glasgow; John Melvin & Son, Alloa; and Andrew Scobie & John Houston, Dunfermline. Of these Messrs. Walker, Anderson, and H. & D. Barclay declined to compete. Plans were received in due time from the others, and, after much anxious consideration, your committee beg to recommend the plans prepared by Mr. Mercer and Messrs. F. & G. Holm as being the most suitable, taking into account the funds at the disposal of the promoters. Further, they recommend that the premium of 15*l.* 15*s.* be awarded to Mr. Scobie, and the premium of 10*l.* 10*s.* be awarded to Mr. Starforth. The recommendations were adopted.

Messrs. Blomfield, Scott, and Street.

SIR,—I should be glad to be allowed to make some reply to the letter signed "Not an Architect," which appeared in your issue of Nov. 24; and first let me say that the words "a few instances within my own knowledge"—the latter of which are italicised—seem to be treated with rather undue emphasis, inasmuch as two of the places are labelled with wrong names, and can only be guessed at by the context.

With regard to the church and vicarage at East (not West) Heslerton, I can only say that there was an organ-chamber in that church—whether or not it has been put to other uses I do not know. The contractor for the vicarage was allowed to use some tiles at his particular request, on the distinct understanding that they were to be replaced if defective; but, owing to the death of Mr. Street, the builder was, I believe, enabled to make a compromise which, under other circumstances, would not have been

possible. The little shingled bell-turret at West Lutton, which is dubbed by "Not an Architect" simply "Luttons," has certainly no staircase, nor was it necessary to make a sacrifice of effect by putting one when a ladder would answer the purpose.

As for the painting over of a brass screen at the same church, that, I think, cuts at least equally as much the other way. Only the other day I was told of some oak stalls of Mr. Street's design being varnished—for the sake of harmony perhaps—and I cheerfully offer this contribution to the list of "Not an Architect," as belonging to the same category as the last item in his count.

Mr. Street was induced for a short time to discontinue the use of felt in roofing, by the destruction of the roof of a church of his in London owing to the ignition of that material. Weaverthorpe church was no doubt built at that period, and the omission, though perhaps not pardonable, is quite explicable. About the disasters at Christ Church, Dublin, and Torquay, I know nothing, but I think the works can stand on their own merits. I have had a proof quite lately that in the latter case at least the authorities are quite the reverse of discontented with what they have got, and both Mr. Roe and Sir Tatton Sykes have testified in many ways to their appreciation of their architect's work. The reredos question at Luton Hoo seems to concern the eminent sculptor employed there more than the architect, and the latter could hardly have failed to let his client know of the sculptor's increased demand, even if the latter did not take the thing into his own hands.

Yours obediently,

Nov. 29, 1883.

ARTHUR EDMUND STREET.

SIR,—I have only now seen a letter in *The Architect* of November 24, signed "Not an Architect." Allow me to contradict authoritatively an inaccurate statement as to Christ Church Cathedral. It is incorrect to say that Mr. Street "left the drains in the crypt without any outlet." It is not the fact that the crypt used to "fill with water," and it is untrue that fifty or any letters were ever sent to Mr. Street on this subject. Mr. Street was dead before the necessity for deeper drainage appeared. The crypt was elaborately drained at the restoration at a depth of 18 inches under the floor level. It was but recently noticed that rapid disintegration of the masonry of the piers was going on, partly from exposure after many centuries to the air, partly from moisture drawn up by capillary attraction from a low level. Excavations proved the existence of springs so copious below the levels of the drains that it was thought advisable to find an outlet at a still lower level under the foundations some 10 feet under the floor level. It was found necessary to make an intercepting drain on the north side at a previous time, but the action of the copious subterranean springs existing on the hillside, on which the cathedral stands, was only discovered by the experience and observation of some years, and was not such as Mr. Street could be reasonably expected to be informed of, or to require extraordinary or exceptional dealing with.

So admirable is the restoration of Christ Church Cathedral as a whole, and so evident at every hand the personal devotion of Mr. Street's mind to it, that no one here, I think, would be ungenerous enough to cavil at trivial deficiencies in details, or unreasonably expect provision against every unforeseen circumstance which may be developed in the years after a work has left an architect's hand.

Your obedient servant,

THOMAS DREW, R.H.A., Architect.

Chapter Room, Cathedral of the Holy Trinity,  
Dublin: December 3, 1883.

SIR,—Mr. Blomfield's assumption that I want to injure professionally a person quite unknown to me, is absurd. His peculiarly snappish style provokes a retort. I leave him in the competent hands of "A Provincial Architect," who deals far heavier blows than I did at "the cormorant-like spirit" of some who bring the whole profession into discredit. "A Provincial Architect's" good suggestion that local architects might be employed to see to work designed by their greater brethren, was, I believe, urged upon Mr. Street in the case of Dublin Cathedral, and declined. Hence many of the mistakes which had to be rectified afterwards at great cost, and some others which are irremediable, e.g., the combed ashlar and glass-papery carving. It might be a question, Who is to pay these gentlemen's fees?

If I have mistaken Mr. Christian's sayings or doings about the high roofs at St. Albans and Southwell, I beg to apologise to him. The St. Albans case is most to the point; and there he was one of the deputation whose report to the Royal Institute of British Architects caused that body to pass a resolution begging the St. Albans people to stay their hands, and refer the roof matter to the arbitration of the Royal Institute of British Architects. The last paragraph of his letter of Jan. 18, 1879, seems only to advocate a roof of "oak and heavy lead." Mr. Christian, by-the-by, is the only architect I know of who has the courage to use teak for church work. I remember a very costly restoration of Street's in which he paid nine shillings a foot for oak for a concealed roof, while teak might have been had in baulks of 40 feet long for just half the money—a puzzle to one who is

Dec. 4, 1883.

NOT AN ARCHITECT.

#### Mission Chapels.

SIR,—Can any of your readers inform me the names, accommodation, description of materials used, and cost of any plain mission churches built within the last six years in conformity with the rules of the Incorporated Society for the Enlargement, Building, and Repairing of Churches and Chapels? Any communications on the subject, either through your valuable journal, or addressed to D. P., care of Mr. J. W. Bells, Nuneaton, Warwickshire, will be much appreciated by

Yours faithfully,

ONE INTERESTED.

#### ARCHÆOLOGY.

**Roman Villa at Frilford**—Another important addition to the archæological discoveries which have of late been made in Berkshire or upon its borders is recorded. Mr. James Parker, of Oxford, has completed the excavation of a Roman villa in an arable field at Frilford, near Abingdon, and succeeded in making a very accurate plan of its formation. As nearly as can be made out, the villa consists of eight or ten rooms, the largest of which is about 16 feet square, and the whole series are about 70 feet in length and between 20 feet and 30 feet in breadth. At the south-eastern corner of the dwelling, where the larger rooms are situated, was found a singular hypocaust, or subterranean stove for heating the building. Mr. Parker says that the hypocaust is usually composed of hollow tiles about 8 or 9 inches square; but in the present case there are twelve piers—he cannot call them by any other name—made out of the stone of the neighbourhood, built together, each pillar being from 2 to 3 feet in diameter, and it was between these pillars that the warm air ramified to heat the building. Some of this construction is unfortunately gone, as it was situated only a few inches beneath the surface of the soil. At this point was also found a large quantity of tessaræ, some of which were interesting from the fact that they were of white marble, and therefore must have come from another district. At a little distance to the east are traces of one or two other chambers, but only vestiges of the walls remain, the greater portion having evidently been taken away at some former period. Part of the bottom of this chamber or chambers is composed of concrete made of pounded tile, about an inch thick, apparently for holding water, while underneath the lower wall were found a couple of drainage-pipes in the most perfect condition. One of these appears to have communicated between the bath and what was apparently a pond a hundred feet off. The level of this pond being higher than that of the bath somewhat puzzled Mr. Parker and those with him, it being difficult to see how the water got there if its purpose was to supply the bath, while, on the other hand, it was not easy to determine how if it was used as a drain for the bath the water could be made to flow uphill. The problem was not much elucidated by the discovery in the depression of a large quantity of old bone, &c., which seemed to indicate that it was used by the Romans as a rubbish-hole. Some excavations being made, a large stone was found beneath the rubbish, and underneath the stone a hole which appeared to communicate with the bath, and this somewhat cleared up the mystery regarding the use of the supposed pond.

**The Saxon Cross, Chester-le-Street.**—A paper "On the shaft of an inscribed Saxon cross discovered during the recent restoration of the church at Chester-le-Street," by Professor George Stephens, of Copenhagen, was read at a late meeting of the Newcastle Society of Antiquaries. The materials of the paper had been furnished by Mr. Robert Blair and the Rev. G. F. Browne, and the shaft had been drawn and chemityped about one-seventh by Professor Magnus Peterson. The shaft was discovered during the repairs of the church in June last. The square block consisted of close-grained sandstone, 2 feet 11 inches high, by 8 inches broad below and 7 above. There was no direct evidence of the age of the stone, and the opinion of the writer was that "Eadmund," the name inscribed on the stone, was that of some unknown local magnate. What was characteristic in the inscription was the intermixing of Runic and Roman letters. The full significance of this stone and similar things was very uncertain; but every find helped them onward in the difficult study. When all our sculptured memorials were carefully drawn and published, they would be able to understand much which was now more or less hidden from them. The Rev. Dr. Bruce said it was very curious how the Roman letters were now progressing. The Roman alphabet was the language of all the English speaking people, and some of the Eastern languages were now being rendered in Roman characters. Even the people of China and Hindoostan were in some cases adopting the Roman characters. Such a progression was very remarkable.

**The Italian Government** have conferred the Great Silver Medal for Art and Science upon Mr. William Emerson, F.R.I.B.A., and Mr. R. E. Cooper, C.E., in recognition of the merits of their design for the Victor Emanuel memorial. An illustration of it appeared in *The Architect*.

## CHURCH BUILDING AND RESTORATION.

**Edinburgh.**—The new St. Michael's Church was opened on November 28. The site is at the junction of the Slateford and North Merchiston roads. The style is early thirteenth-century Gothic. There are three aisles, divided by stone pillars supporting richly-moulded arches, and a lofty clerestory. Towards the east end there is a transept for the organ, the arch of which rises into the clerestory. At the opposite end, over the principal entrance, a massive tower—20 feet square inside—rises to the height of 130 feet above the street. Access to the different floors in the tower and to the roof of it is obtained by a turret staircase, which rises at one corner above the parapet. The length of the church inside is 130 feet, the width 62 feet 6 inches, and the height to the ridge, 70 feet. A small portion of the west end of the nave serves as a vestibule, and is covered by a small gallery. The screen dividing this vestibule from the church is of panelled woodwork, having stained glass in the upper panels. The pews are arranged with a centre passage, and one in each of the aisles, and accommodate fully 1,000 people, allowing a width of 20 inches for each. The pulpit stands at one side against the westernmost pier of the transept. There is a reading desk at the other side, and at the end against the east wall is a large and elaborate screen with illuminated panels containing the Creed, the Lord's Prayer, &c. The pulpit is of walnut. The panels of it and of the reading desk are filled with paintings of the fruits of the Bible on a gold ground, which were executed by the Hon. Mrs. Hope. There are two doors of egress towards the east end of the aisles, and a minister's door giving access to the vestry from the platform. Adjoining the church at the west end are a session-house, two large halls for Sabbath-school purposes and meetings, and a beadle's house. The halls, as well as the church, are heated by hot-water apparatus. The east gable has three large lancet windows with clustered shafts between, and a panel of similar design at each side, underneath which an elegant arcading with clustered shafts extends across the gable. The capitals are carved, and the mouldings enriched with dog-tooth ornament. There is no tracery in any of the windows. The floors of the porch, vestibule, and subordinate passages are laid with encaustic tiles. The lamps, specially designed by the architect, will be of polished brass. The architect was Mr. John Honeyman, of Glasgow, and the clerk of works was Mr. J. McIntosh.

**Liverpool.**—The foundation-stone of a new Scandinavian church for Liverpool, with the title of Gustafs Adolfs Kyska, was laid on Saturday, the 1st inst., by Mr. Samuel Smith, M.P., the Bishop of Liverpool, assisted by the Swedish pastor, conducting the religious part of the ceremony. The building, of which Mr. W. D. Carøe, M.A., of London, is the architect, comprises a church to seat 550 adults, a large reading room and lecture hall in the basement, and an attached residence for an assistant pastor. The architecture will be a new departure from the types commonly seen in this country. The various simple characteristics of the early architecture of Scandinavia in its different developments in Denmark, Sweden, and Norway, have been freely employed and united to form an at once harmonious, picturesque, and very inexpensive group. The greater part of the funds have been contributed by the King and people of Sweden and Norway. The site of the building is at the corner of Park Lane and Cornhill. Mr. John Shillitoe, of Upper Norwood, London, is the builder.

## SCHOOL BUILDINGS.

**Stratford-on-Avon.**—Board schools to accommodate 400 children, erected at a total cost of 5,600*l.*, have been lately opened. The schools are situated in Chestnut Walk, and have been erected from the designs of Mr. Milne, architect, of London. The cost per head is about 10*l.* 10*s.*

**Bacup.**—A chapel and school are about to be built at Troughgate, Britannia, near Bacup (Lancashire), for the trustees of the Methodist Free Church. The chapel will be seated for 500 adults, and the school will accommodate 500 scholars. The plans have been prepared by Messrs. Maxwell, Tuke & Hurst, architects, Southport, and the works will be carried out under their superintendence.

**Tranmere.**—This school has been completed from designs by Mr. G. E. Grayson. The first floor is fireproof throughout on Lowe's improved system of iron beams, cross joints, and cement concrete. The upper surface is of Lowe's wood blocks laid in patent preservative composition. The blocks are long and narrow, with joints quite close, resembling parquetry. Similar blocks have been used elsewhere in Liverpool. In one basement where they are set the weight to be carried is generally about two tons per superficial yard, and although the basement has been flooded occasionally, the blocks have remained unloosened.

**Worcester.**—The Sunday-schools erected for St. Mary Magdalene parish have been opened. The walls of the building are faced externally with brown and grey Bromsgrove stone, in random courses, rough punched, and relieved with Bath stone bands. Internally with red-pressed bricks to the height of 4 feet

3 inches, and above this height with Ironbridge buff-coloured bricks, and an intervening band of red and buff bricks in diaper pattern. The windows and other dressings are of Bath stone. The roofs are all of pitch pine, open timbered, plastered between the rafters, supported by well-framed trusses having arched ribs, and are covered with red Broseley tiles. The internal joiner's work is of yellow deal varnished. The floors are of wood blocks laid herring-bone pattern on a bed of concrete, and the entrances are laid with Webb's encaustic tiles. The works have been carried out by Mr. J. H. Beard, from the designs of Mr. Lewis Sheppard, Sansome Walk, Worcester.

## NEW BUILDINGS.

**Bank of Scotland, Edinburgh.**—The scaffolding which has surrounded the dome of the Bank of Scotland for some months has been removed, and the alterations which have been carried out on the lantern and dome can now be seen. Some time ago it was found that the oak pillars which carried the lantern had begun to decay in consequence of the very exposed situation, and the directors decided, on the recommendation of their architects (Messrs. Kinnear & Peddie), to have them removed, and galvanised iron pillars substituted. At the same time, it was decided to make an alteration in the design of the lower part of the lantern where it springs from the dome, which had not been very satisfactory in appearance. Mr. Bryce's design had apparently been founded upon that of the well-known dome and lantern of a church in the Forum in Rome, adjoining the column of Trajan, in which the base of the lantern is corbelled out from the top of the dome, instead of springing out of it without any increase of diameter, as is more usual. The result in the case of the bank, however, was to give the lantern an appearance of instability, or at least insecurity, and the narrow neck where it actually rose out of the dome destroyed the appearance of continuity between the two which was required for a satisfactory and graceful outline. This has now been got over by the introduction of scrolls at the eight corners of the base of the lantern, and by spreading out the base between them. These have been also executed in galvanised iron, and the whole is now practically indestructible. When engaged on these works, the directors also directed Messrs. Kinnear & Peddie to inquire into the security of the building from lightning; and, after consultation with Professor Tait, Messrs. Ritchie, under the direction of the architects, added to the number of the points, and ascertained by testing that the earth connection was of good conducting capacity.

## GENERAL.

**Royal Society of Painters in Water-Colours.**—The following artists were elected on November 30: Members—H. Stacey Marks, R.A., E. J. Poynter, R.A., Edward F. Brewtnall, Charles Gregory, Herbert M. Marshall, J. W. North. Associate—J. H. Henshall.

**The Cambridge Antiquarian Society** have offered to present their collection to the University for preservation in the new Archaeological Museum.

**Mr. Belt** has received a commission to execute a bust of the Earl of Shaftesbury for Exeter Hall.

**Mr. George Reid, R.S.A.**, has prepared a series of drawings of the river Tweed, which are to be reproduced by M. Durand for the Royal Association for Promotion of the Fine Arts in Scotland.

**The Calcutta International Exhibition** was opened on Tuesday by the Marquis of Ripon. The weather was, however, exceptionally unfavourable.

**A Faculty** is to be obtained for restoring Lindfield parish church, in accordance with the plans of Mr. Somers Clarke.

**The Guarantee Fund** for the Fine Art and Industrial Exhibition, proposed to be held at Wolverhampton next June, has reached the sum of 7,000*l.*

**The Sculpture** of the mausoleum from Halicarnassus is now arranged in a new gallery at the British Museum.

**Mr. G. A. Audsley** on Wednesday delivered a short address at the Dundee Fine Art Exhibition on the subject of "The Importance of Home Culture in Taste and Art."

**Dr. Stubbs**, Professor of Modern History at Oxford, has been appointed a trustee of the National Portrait Gallery, in place of the late Lord Somers.

**The Irish Poor Law Unions** have adopted schemes for the erection of 6,744 labourers' cottages, at an estimated cost of 580,978*l.*, or about 86*l.* each.

**A New Palm House** is to be erected in the Botanic Gardens, Glasnevin, co. Dublin, at a cost of 4,300*l.*

**The Contract** has been signed for the construction of a new bridge over the Tiber in Rome.

**The Coventry Chamber of Commerce** on Monday adopted a resolution approving of the establishment of a technical school for the city.

**Mrs. John Elder** has purchased thirty-five acres of the lands of Fairfield at the cost of 37,500*l.*, with the intention of presenting them as a public park to the people of Govan.

# SUPPLEMENT

TO THE

# ARCHITECT

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, DECEMBER 8, 1883.

### TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Supplement to THE ARCHITECT."

### TO AMERICAN SUBSCRIBERS.

All subscriptions are payable one year in advance, and may commence at any date.

The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.

Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED to GILBERT WOOD, 175 Strand, W.C., London, England.

In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—

To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order

### ADVERTISEMENT SCALE.

For Two Lines and under	£0 2 6
For every Additional Line	0 0 6
For Quarter Page	2 10 0
For Half Page	4 10 0
For a Page	8 8 0

On pages preceding and following matter, special rates.

Public Companies' Advertisements, 12l. 12s. per page; 1s. per line.

Special arrangement may be made for a series of insertions on application at the Office, 175 Strand, London, W.C.

### EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

### NOTICE TO THE PUBLIC.

By the Post Office arrangements THE ARCHITECT can now be sent to any part of the United Kingdom by an affixed Halfpenny stamp; hitherto the postage has very frequently been twopence per copy. The Publisher will be happy to forward, for 20s. per annum, post paid, THE ARCHITECT, to residents in towns and neighbourhoods to which there is no easy access by railway. Terms for the half-year, 10s.

Our readers are invited to address us on subjects of interest to themselves or the public. We shall be always ready to insert letters asking for a solution of any suitable questions of a professional or practical nature, and to receive replies to such inquiries.

### COMPETITIONS OPEN.

ABERDEEN.—July 1, 1884.—The Testamentary Trustees of the late Mr. John Steill, of Edinburgh, hereby notify that they will Receive Models for a Colossal Statue of Wallace, in Bronze, with Basement of Granite Blocks, to be placed on the Mound in the North-West part of the Duthie Public Park, near the City of Aberdeen, in conformity with Instructions left by Mr. Steill, at a cost not exceeding £3,000. Intending Competitors, on Application, accompanied with a Remittance of 10s. 6d. to Mr. John Otto Macqueen, 19 Bridge Street, Aberdeen, will be supplied with Copies of Mr. Steill's Instructions, Conditions of the Competition, and Lithograph Plan of the Duthie Park, showing Sections of the Mound. The Author of the Accepted Model will be employed to Execute the Work; and the Author of that next in order of merit will Receive a Premium of £50.

CAPE TOWN.—Jan. 30.—The Town Council of the City of Cape Town invite Plans and Specifications, accompanied with approximate estimate of cost, of a System of Drainage. Selected Plans and Specifications to become the absolute property of the Corporation. All others will be returned free of expense. Premium of 250l. A plan of the City, with levels, may be seen, and further information may be obtained, on application to the South African Loan, Mortgage, and Mercantile Agency, 9 King William Street, London, E.C.

LONDON.—March 1, 1884.—The Commissioners of H.M. Works and Public Buildings are prepared to receive Designs for New Buildings proposed to be erected in Whitehall for the Admiralty and War Office. Mr. A. B. Mitford, Secretary, H. M. Office of Works, 12 Whitehall Place, London.

### CONTRACTS OPEN.

ASHBOURNE.—Dec. 17.—For Repairs to Railway Tavern. Mr. George Marshall, Ashbourne.

AUDENSHAW.—For Converting Dwelling-houses into Stores, Offices, and Board Room. Mr. J. H. Burton, Architect, Warrington Street, Ashton-under-Lyne.

BAIPEP.—Dec. 8.—For Alterations and Additions to the Workhouse. Mr. George Eyre, Architect, Codnor, Derby.

BIRMINGHAM.—Dec. 8.—For Supplying and Fixing Speaking Tubes and Electrical Communication, Lift, and Fireproof Doors; also Clock for Tower, Parish Offices, Edmund Street. Mr. W. H. Ward, Architect, Paradise Street, Birmingham.

BLYTH.—Dec. 21.—For the Erection of the Thomas Knight Memorial Hospital at Blyth. Mr. J. Hogg, Architect, 4 St. Mary's Place, Newcastle-on-Tyne.

BOLTON ABBEY.—For Building Memorial Tower of the late Lord Frederick Cavendish. Messrs. Worthington & Elgood, Architects, 110 King Street, Manchester.

BRADFORD.—Dec. 11.—For Rebuilding Manufactory, Warehouse, and Offices for Messrs. Glover, Son & Co., Limited. Mr. Wilson Bailey, Architect, 9 Market Street, Bradford.

CHIPPING NORTON.—Dec. 18.—For Construction of Goods Shed, Plans, &c., at the Engineer's Office, Paddington Station.

CLACTON-ON-SEA.—Dec. 10.—For Enlargement of the Waverley Hotel. Mr. Charles Bell, Architect, Dashwood House, 9 New Broad Street, E.C.

CONSETT.—Dec. 15.—For Building Two Blocks of Seven Cottages, One Block of Fifteen Cottages, and Additions to Twelve Cottages, Leadgate. Plans at the Offices of the Consett Iron Company, Consett.

COWLING.—Dec. 15.—For Building Parsonage House and Offices. Messrs. Holland & Son, Architects, Newmarket.

CULTS.—Dec. 11.—For Building Boiler and Engine Houses and Keeper's Cottage. Mr. William Boulton, Town House, Aberdeen.

DEWSBURY.—For Restoring and Enlarging Parish Church. Messrs. Kirk & Sons, Architects, Market Place, Dewsbury. Mr. A. E. Street, M.A., and Mr. A. H. Kirk, Joint Architects.

ELGIN.—Dec. 24.—For Building Town Hall. Messrs. Matthews & Mackenzie, Architects, Aberdeen.

ESTON.—Dec. 8.—For Building Boundary Walls to Cemetery. Mr. Henry Leggett, Clerk to the Eston and Norby Burial Board, Normanby.

FELIXSTOWE.—Dec. 11.—For Enlargement of the Suffolk Convalescent Home. Mr. E. F. Bisshopp, Architect, Museum Street, Ipswich.

GOSFORTH.—Dec. 10.—For the Continuation of Linden Road and West Avenue, Park Estate, South Gosforth. Mr. Edward Shewbrooks, Architect, 2 Market Street, Newcastle-on-Tyne.

GREENOCK.—Dec. 19.—For the Works of the Third and Remaining Section of the Municipal Buildings. Messrs. H. & D. Barclay, Architects, 136 Wellington Street, Glasgow.

**HALIFAX.**—Dec. 14.—For Building Shed and Alteration of Premises, Hare Street. Mr. John Willey, 30 Southgate, Halifax.

**HOPE HALL.**—Dec. 13.—For Building Twelve Through Houses. Mr. Joseph Wilson, Architect, Queen's Road, Halifax.

**KITTYBREWSTER.**—Dec. 11.—For Building Wooden Shed. Mr. W. Moffatt, Secretary, G. N. S. Railway, Aberdeen.

**LEEDS.**—Dec. 11.—For Building Engine Erecting Shop. Mr. William Hill, Architect, 11 Park Square, Leeds.

**LEICESTER.**—Dec. 12.—For Taking Down Boundary Wall to Borough Gaol, and Building Boundary Wall on Improved Street Line. Mr. J. Gordon, C.E., Borough Surveyor, Town Hall, Leicester.

**LEYTONSTONE.**—Dec. 12.—For Building an Addition to Female Imbecile Ward at the Union Workhouse. Mr. F. E. Hilleary, Clerk, Guardians' Offices, Union Road, Leytonstone.

**LLANISHEN.**—Dec. 31.—For Construction of Large Storage Reservoir with Embankments, Valve Well, Culverts, Gauge Basins, &c. Mr. J. A. B. Williams, C.E., Queen's Chambers, Queen Street, Cardiff.

**LYMM.**—Dec. 11.—For Erection of New School Buildings and Master's House for the Governors of Lymm Grammar School. Mr. F. R. Hawby, Architect, 8 St. Ann's Place, Manchester.

**NORTH SHIELDS.**—Dec. 11.—For Building Additional Boys' Classrooms at Eastern Board Schools. Mr. F. R. N. Haswell, Architect, North Shields.

**OSWESTRY.**—Dec. 18.—For Construction of Railway Station. Plans at Engineer's Office, Paddington Station.

**PAR.**—Dec. 20.—For Erection of Station Buildings. Plans, &c., at the Office of the Engineer, Plymouth Station.

**PORTO RICO.**—Dec. 31.—For the Harbour Works of San Juan. Forms of Tender, &c., at the Consulate-General for Spain, 31 Billiter Street, E.C.

**SHEFFIELD.**—Dec. 15.—For Retort House and other Buildings for a Gas Works at Rockingham Colliery. Messrs. Newton, Chambers & Co., Thorncliffe Ironworks, near Sheffield.

**SHEFFIELD.**—Dec. 8.—For Erection of the Montgomery Hall, New Surrey Street. Mr. C. J. Innocent, Architect, 17 George Street, Sheffield.

## SEWER GAS.

AS AN ABSOLUTE PREVENTIVE  
of the entry of Sewer Gas into Dwelling  
Houses by way of the most dangerous inlets,  
viz., the waste and overflow pipes from cisterns,  
baths, lavatories, and sinks, DOULTON & CO.  
strongly recommend the use of

## MANSERGH'S IMPROVED GULLY.

By the insertion of this Gully in the line  
of drain OUTSIDE the house, the common and  
UTTERLY USELESS bell-traps may be dispensed with,  
and direct communication with the sewers is  
effectually broken.

"This is undoubtedly a most important and  
effective trap for preventing the entrance of sewer  
gases into dwelling-houses."—LANCET.

PRICE 10s. 6d. EACH, COMPLETE.

MANUFACTURED BY

AND  
100 SOHO STREET, LIVERPOOL.

**W. H. LINDSAY & CO.,**

PADDINGTON IRON WORKS, LONDON, W.,

AND SANDYMOUNT FOUNDRY, LLANELLY, CARMARTHEN.

**PATENT WROUGHT-IRON SASHES WITH WROUGHT BOSSES**

SPECIALLY ADAPTED FOR WAREHOUSES, SCHOOLS, AND PUBLIC BUILDINGS.

CABLE LIGHT

The Patentee begs to call particular attention to the great strength of this construction. The Bars and Bosses, being of malleable wrought iron, form an exceedingly firm joint at the intersection of bars. They are durable, and of light appearance, the Bosses being small and not unsightly. They can be made at very short notice, and at the price of an ordinary cast iron sash.

PRICES UPON APPLICATION.

CABLE LIGHT.

CLOSE BAR SASH (obviating use of Window Guards).

ORDINARY WAREHOUSE AND SCHOOL SASHES.

VENTILATOR

Back view of Boss, full size.

Section through Boss, full size. These can be glazed flat, like ordinary wooden sashes, without the corners of the pane being chipped off.

Front view of Boss, full size. Obscuring no appreciable light.

**THE BEST AND MOST EFFICIENT VENTILATOR.****BLACKMAN'S  
PATENT AIR PROPELLER**

FOR THE MOVEMENT OF

**LARGE VOLUMES OF AIR.**

CONSTRUCTED ON AN ENTIRELY NEW PRINCIPLE.

Exhausts or Blasts incomparably more Air than any other form of Fan, at a fractional relative cost in power and price. Suitable for the removal of heated and foul Air, Steam, Dust, or Smoke from any Manufacturing Premises; and for the Ventilation of Factories, Paper, Cotton, and Woollen Mills, Churches, Hospitals, Hotels, Theatres, Laundries, Printing Works, Steamships, Mines, Sewers, &c., and for the Drying of Malt, Hops, Wool, Sugar, Grain, Timber, or any other product.

# The Architect.

## THE DWELLINGS OF THE RICH IN FAULT.

It is with no intention of disparaging the popular cry for an improvement in the poor people's houses of our great metropolis, or of even diverting attention from it for a moment, that we ask leave to speak of the houses of our rich people in the same metropolis, as being a subject for corresponding complaint. The dwellings of the poor, if anything

practical can possibly be done for them, seem to be now in a fair way of being somehow or other sooner or later taken in hand by somebody, and we are quite prepared to do our own humble part, as we have already done, in discussing the matter with our readers as occasion may offer; but at the same time, seeing that the public mind is thus seriously engaged in the consideration of home comforts and discomforts in one direction, we hold ourselves fully entitled to take an inquiring glance at them in another.

It is as well to explain at once that we do not propose to go over the familiar ground of sanitary appliances; we will let the reader suppose a rich man's house to be, not only as old GEORGE ROBINS put the case in one of his famous advertisements, "an earthly paradise with a water-closet on every floor," but very much as Mr. E. C. ROBINS and his colleagues of our own day would have it, so thoroughly well drained that the owner might, in the words of an enthusiastic foreman, "in a manner of speaking, eat their dinner off the apparatus." In a word, after Dr. CORFIELD and Mr. ROGERS FIELD have completed all that their utmost ingenuity can accomplish, it is well known that DIVES still is not happy in the materialities of his home in Belgravia, any more than is LAZARUS in the Seven Dials.

Of all the "demons" which, as some good people accustom themselves to say, are at the bottom of bricks and mortar, perhaps the worst is the insatiably greedy demon of ground-rent. The peculiarly mischievous function of this tempter of mankind as a building animal is all the more mischievous because it is a strictly simple mathematical function. So long as two and two make four (so runs the insidious argument), it cannot be denied that it is the interest of the landowner to put as many houses upon his land as the market will allow—in other words, as the public will consent to live in, to lend upon, and to purchase. The ground that is occupied by the houses is worth very much more money than that which is only occupied by the gardens; and if this philosophy is so indisputable as it is in respect of the humble tenements of the poor, whose ground-rents are small, *à fortiori* must it be so in the case of the fine mansions of the rich—or, let us say, the "desirable residences" of the well-to-do—whose ground-rents are large.

One house is so like another throughout the interminable ranges of our West-end Streets, Roads, Hills, Vales, Gardens, Squares, Terraces, Places, and all the rest, that a very brief description will answer for the whole. In front of the house is the dirty, noisy, public thoroughfare, and at the back either a lead flat over the kitchen, or a stuffy back yard, humorously called in the Building Act an "open space," of the regulation size of 100 square feet or as little more as can be. The prospect or view from all the front rooms alike extends over the width of the roadway, and terminates generally in the front rooms of the houses opposite. The prospect from the back rooms extends over a double line of back-yards, and again terminates in the back rooms of a row of other houses. The air at the front comes off the road, and at the back off the yards.

The interior of such a house is, in its degree, somewhat tightly packed with elegant and costly furniture; and, as England is growing richer every day, the standards of elegance and cost are every day growing higher. In some instances the sooty atmosphere of the town causes an aspect of dinginess and a condition of dust to pervade the house as a permanent institution; in others there is produced (at no inconsiderable cost, by the way, in one form or another) an appearance of comparative freshness and cleanliness; it may be said,

however, that the abodes of dinginess and dust are in the majority.

The inmates during the day are chiefly more or less elegant women, frequently very elegant indeed in even the less appropriate interiors; at the door in the afternoon stand well-appointed equipages; in the evening there is unbounded family comfort, and from time to time most handsome hospitality. And it is not too much to say that not infrequently, when the fine ladies of such an establishment read in their morning papers of "a day in the country" having been provided for some ragged school, or perhaps see from their windows half-a-dozen pleasure vans conveying the delirious little people on such a godsend expedition, they cannot help thinking—as the duchess's lap-dog would have given its ears to be a street-dog for a single hour—that a day in the country a little earlier than the middle of August would be a godsend indeed for many of the dwellers in their stately quarter. For ten months in the year continuously are they shut up in a dull and stuffy house, with nothing in front but a more or less dirty or dusty street, traversed chiefly by tradesmen's carts and cabs, and resounding with barrel-organs, and with nothing in the rear but a wretched little yard, to look out upon which, however, from the "back drawing-room," ignoring as much as possible the neighbours' bedroom windows, is at least, if only by contrast, peace and repose. And when we remember that such a house stands at a rent of so many hundred pounds a year—in fact, from two hundred to fifteen—it may surely be said that its surroundings are out of character with its pretensions. What is more, it is plain that no amount of sanitation, or embellishment, or elegance, or other liberality of living within can in any degree make up for the entirely unladylike and ungentlemanlike character of that which is external.

It is obviously the greed of ground-rent that has brought all this about—a much less excusable greed of ground-rent, moreover, than that which drives away the poor from their slums—and although it is pleasant to observe in some quarters of the expanding suburbs that a little more space is being allowed in one way and another for air and greenery, yet it is almost more unpleasant to see in too many other localities that the crowding of houses of a good class for the sake of ground-rent is still carried on as defiantly as ever.

What is to be done for these rich people it is almost as hard to tell as to devise a cure for the overcrowding of the poor in the squalid alleys which are now so bitterly complained of. But, unless something can be done, however little, we are simply spreading all round London an ever-widening jungle of housebuilding, which, the wider it grows, the more unamiable it must be. Let us at least propose one thing. No architect who properly appreciates the principles of domestic comfort will hesitate to accept it as a rule that every good house ought to have its *open-air space*—just as much as its drawing-room—a "lung" all its own, however limited in dimensions, by means of which its inmates may, as their individual habits go, with head either covered or uncovered, saunter for an hour, or smoke a cigar, or lounge over a book, or sit at needlework, or whatever else; in short, amongst the "apartments" of the house there ought to be one on the open outside, in which to breathe the unsophisticated air of heaven. Whether in summer or in winter, in fair weather or foul, to be able to "put one's nose out of doors," as the vernacular cogently expresses the case, is a privilege that can never be unwelcome, and, one would think, can scarcely be dispensed with.

The ideal which we have in the mind's eye for every dwelling-house of good class in London comprehends in this respect a certain extent of open court in the rear—not necessarily larger than a large room—towards which the back wall of the house shall present a pleasing design, and the back door a sufficiently stately access. It may be paved with a pleasing pattern of tiles. The enclosing walls may be similarly covered. Privacy, at least on the ground level, may be complete enough. Shrubs and flowers may be disposed in vases. A basin for gold fish may occupy the centre; perhaps, when a constant supply of water comes, a small fountain may play. Seats, according to taste, may be placed where desired. A little summer-house may occupy some proper position; or perhaps an awning, perhaps a hammock, may serve the usual purposes. Whether an occasional tree might or might not be admissible is only a question of cleanliness; for, obviously, it is cleanliness that would be the chief consideration. In this outdoor adjunct, as we imagine it, kept as scrupulously clean as the drawing-room, we see no reason why the finest

of fine ladies and the daintiest of children ought not to be able to enjoy themselves freely—as freely at least as the atmospheric conditions of the island and the town permit, and more than this we cannot of course pretend to aim at. Until something of this kind becomes common in London and other large towns, the dwellings of the rich, we say, are, in their degree, almost as much in fault as those of the poor.

### ART IN CHALDEA AND ASSYRIA.\*

OUR readers know that in the Louvre the hall of Assyrian antiquities stands opposite, and at some distance from, the hall of Egyptian antiquities. The arrangement may have been made without any thought of the relation between the two departments of art, but nevertheless it is suggestive of their position if judged by a common standard. If we compare the representations of men and animals by Egyptian and Assyrian artists, we can hardly fail to observe the great difference in the physique. In Egypt the men and women would appear to have been rather slim, and the contours of the figures suggest muscles that are more fitted for certain kinds of activity than for strength. The domestic animals would not gain prizes at an English cattle show. But when we turn to Assyrian remains, we have figures in which the muscles are abnormally developed. No matter whether it is a warrior, a horse, a lion, or a bull, the vigour which comes from powerful thews and sinews seems to be the quality which the artist was most ambitious to express. The muscles are so much alike in the figures that they might almost be changed from one animal to another, or from a man to an animal, without entailing loss of character. In other countries painters and sculptors were allowed to follow their natural instincts, and seek for beauty of form and line; but in Assyria it was strength which was deified. There it was not a mere figure of speech to say a king was as brave as a lion or as strong as a bull; it was also made palpable in the hardest stone that he possessed leonine or taurine qualities.

MILTON may be said to have described the history, as well as the art, of Assyria, when speaking of mere strength he said it was "vast, unwieldy, burthensome, proudly secure, yet liable to fall." At one time Nineveh, the capital, was so magnificent that the descriptions of it were supposed to have been imaginative, until the discoveries of Sir A. H. LAYARD and M. BOTTA demonstrated that ancient traditions are not always erroneous. The sculpture is suggestive of massive structures that, like Egyptian temples, would outlast many generations. But in two or three hundred years the city, that according to JONAH would take a three days' journey to encompass, was completely obliterated. XENOPHON passed over it with his Greek companions, but was unable to recognise its position. The influence of Assyria on the history of art was no less forgotten, and it was reserved for our own time to discuss the relationship between Assyrian, Greek, and Western art. Another subject is allied with the latter, and that is from whence did Assyria obtain its art? MM. PERROT and CHIPIEZ, who have undertaken the laborious task of writing an universal history of art, have brought out that portion of it which relates to art in Chaldea and Assyria. It will be remembered that their history of Egyptian art lately appeared, and the new portion is on the same plan. Painting, sculpture, and architecture are considered, and, as far as is practicable, whatever is stated is founded upon existing remains. Sir FREDERICK LEIGHTON recommended the work to the students of the Royal Academy, on Monday evening, and it is no less adapted to a much larger body of readers.

The sculptures that formed a part of Assyrian palaces are, as we know from the remains in the British Museum and the Louvre, most massive in style. It might be assumed that the remainder of the work in those buildings corresponded with them. There seems to be no doubt that the walls were of great thickness, and that an extensive area was enclosed by them; but whatever interpretation we may put upon the remains or on the views of buildings shown in the reliefs, it is impossible to produce a restoration that is in perfect keeping with the sculpture. In the first place, sun-dried brick (which was used in the walls), although covered with slabs or stucco, is not so

worthy a material as the fine stone of the figures, and is, moreover, limited in its capabilities. It must have been as difficult to give dignity to building made of those bricks as to a modern concrete house. The upper parts of the buildings are said to have been constructed of timber, and consequently we may assume that they were light rather than massive, and they may have had some analogy with what is seen in Persia. In Egypt there was also a contrast between the sculpture, the painting and the building, but in another way, for the figures, although they may be large in size are not large in style, while the buildings have the grandeur and severity of mountain forms.

The first question that arises is why was not stone used for the walls as well as for the sculpture, so as to impart greater dignity to the buildings? M. CHIPIEZ has to admit that it is difficult to understand the neglect of stone. His explanation is one that has been used in connection with many Asiatic and African works. The labour that was available was of an unskilled kind. It was not equal to undertaking works of masonry, but after a few weeks in training the most stupid of captives would be able to knead and mould clay for walls. For the arches and vaults masons and bricklayers were needed, "but with these exceptions the whole work could be confided to the first comers, to those armies of captives whom we see on the bas-reliefs, labouring in chained gangs like convicts." Then, as now, architects were compelled to accept expediency as a guide. As M. CHIPIEZ says: "They did not dare to rouse the displeasure of masters who disliked to wait; they preferred rather to sacrifice the honour and glory to be won by the erection of solid and picturesque buildings than to use the slowly-worked materials in which alone they could be carried out." It is needless to say that this character of the Assyrian architects is imaginative, but it will suggest the difficulty of discovering an explanation for the practice of erecting houses of clay in a country where stone was within reach. In Chaldea there were no quarries of stone, and the use of brick was accordingly imperative, but there was a trade in metal and plates of bronze, and sometimes even more expensive metals were employed to conceal the meanness of the material in the walls.

Architecture which has to depend upon the use of clay and timber is deprived of opportunities for displaying grandeur in treatment or constructive skill. The town that is seen on the slab found at Kouyundjik is not unlike those which are printed on the lids of boxes of wooden bricks for children's use. The wall of the fortification is apparently strengthened by counter-forts, which are but a short distance apart, and are crowned with a crenellated battlement. It is remarkable that the wall appears to have had a vertical face, instead of being "battered," and this peculiarity is adhered to in the restorations, although the height is often very great. In work of this kind the utmost effort would be the construction of an arch and a vault, and the arch is introduced with a liberality that is almost Roman:—

The vault was supreme in certain parts of the building. Its use was there so constant as to have almost the character of an unvarying law. Every palace was pierced in its substructure by drains that carried the rain-water and the general waste from the large population by which it was inhabited down into the neighbouring river, and nearly all those drains were vaulted. And it must not be supposed that the architect deliberately hid his vaults and arches, or that he only used them in those parts of his buildings where they were concealed and lost in their surroundings: they occur also upon the most careful and elaborate façades. The gates of cities, of palaces, and temples—of most buildings, in fact, that have any monumental character—are crowned by an arch, the curve of which is accentuated by a brilliantly-coloured soffit. This arch is continued as a barrel vault for the whole length of the passage leading into the interior, and these passages are sometimes very long. Vaults would also, in all probability, have been found over those narrow chambers that are so numerous in Assyrian palaces were it not for the ruin that has overtaken their superstructures. Finally, certain square rooms have been discovered which must have been covered with vaults in the shape of more or less flattened domes.

The Assyrian palaces, as we have said, covered a great deal of ground, but the section of SARGON's palace is more suggestive of an embankment of a reservoir, or a bastion of a fortification, than of a building. There are different levels, and if the parts are connected by arches and vaults, there is an approximation towards the complete structure, according to the French theory. It has also been supposed that the upper

\* *A History of Art in Chaldea and Assyria.* By Georges Perrot and Charles Chipiez. Translated by Walter Armstrong, B.A. Chapman & Hall, Limited.

surface of the embankments was sometimes levelled and used as a place of assembly. A remarkable example of one has been devised by M. CHIEPIEZ. It has a pavilion, which is supported by four masts or columns, and near it are standards which correspond with those shown on the Balawat strips of bronze in the British Museum. The column is of importance in connection with Assyrian architecture, and it had a symbolic as well as a constructive use. The volutes seen on some may have been the originals of those which mark the Ionic order, and the base was sometimes supported by a figure of an animal.

The unscientific character of Assyrian construction is seen in the placing of the sculptured slabs. Nothing was done to secure the connection between a slab and its backing of clay. We are told that "no trace of any tie is to be found. A 'tooth' has been given to the inner faces of the slabs by seaming them in every direction with the chisel, and perhaps some plastic substance may at the last moment have been introduced between them and the soft clay, but no trace of any other contrivance for keeping the two materials together has been found."

It is evident that, with such a system of construction, the interior of the palaces must have been rather limited in size. Arches and vaults of large span were impracticable with baked clay. The rooms that are seen in the illustrations by MM. PERROT and CHIEPIEZ are accordingly small. It will be remembered that Mr. FERGUSON got out of the difficulty by supposing that the upper part of a palace was constructed of timber. His Nineveh Court at the Crystal Palace, which was a remarkable work, was designed on that system, and it certainly appeared to have more of an Assyrian or Eastern character than the buildings in the book before us. The question, however, is whether recent excavations may not have given us more information, and in France it would be said that MM. PERROT and CHIEPIEZ are nearer the truth. The subject is discussed with great fairness by those authors, and we refer our readers to their book as a compendium of all that is known on Assyrian art.

### PARIS NOTES.

THE two immense paintings representing, one, *Napoleon I. giving the order to promulgate the Commercial Code*; the other, *Napoleon III. and the Empress attending the Inauguration of the Tribunal of Commerce*, which are to be removed from the Chamber of Audience at the Tribunal of Commerce, by order of the Municipal Council, will be rolled up and relegated to the store-rooms of the city in the Boulevard Morland. They will there keep company with many other canvases in exile from political causes—a portrait of Louis XV., one of Napoleon I., by Lefèvre; several of Louis XVIII., two of Charles X., and many of Louis-Philippe. There are only two of Napoleon III., Flandrin's magnificent painting of the last emperor having been pierced and destroyed by bayonet thrusts during the Commune.

Important decorative works have lately been executed at the Château de Chantilly, the seat of the Duc d'Aumale. Some fine carved wood screens, of the sixteenth century, have been placed in the chapel, near the altar by Germain Pilon; and a new balustrade, said to be a masterpiece of ornamental ironwork, has been added to the grand staircase.

The Central Society of French Architects has just elected the following officers for the coming year: President, M. Questel, member of the Institute; vice-presidents, MM. A. Normand and de Joly; chief secretary, M. Lucien Etienne; assistant secretary, M. Paul Wallon; editing secretary, M. Eug. Monnier; keeper of the archives, M. Raulin; treasurer, M. Feydeau; auditors, MM. Bailly, member of the Institute, Uchard, and J. Hénard.

The new managing committee of the Société Libre des Artistes Français met on Monday last, at the studio of M. René de Gatines, to elect its officers, with the following result: President, M. Dalou; vice-presidents, MM. Humbert and Saint-Pierre; general secretary, M. René de Gatines; treasurer, M. Polack; secretaries for painting and engraving section, MM. Schmitt and Langlois; secretaries for sculpture and architecture, MM. Brisseau and Thabard.

During the debate last week in the Chamber of Deputies on the Fine Arts Budget, M. Marius Poulet, one of the members for the Department of the Var, moved an amendment to reduce the

grant for historical monuments by 400,000 frs. He stated that the section provided for the repair of fifty-two churches at a cost of nearly 1,000,000 frs., and objected to the outlay on the ground that the buildings were almost all of the same style of architecture. He therefore proposed to reduce the grant by one-half, urging, moreover, that the work was negligently performed and the control inadequate, as the architects acted at the same time as inspectors. The reporter replied that it was creditable to France that she should have preserved the historical monuments of religious art, and the amendment was negatived by 384 to 79 votes. Some discussion occurred as to the advisability of applying the site of the old Cour des Comptes to the purposes of a museum similar to the one at South Kensington, the Government promising to give the subject special study. The Gobelins Factory will have to wait another year for the 300,000 frs. required for repairs, although some of the workshops are so damp that the tapestries are injured on the looms. The Budget Committee preferred to carry out the construction of the Conservatoire des Arts et Métiers, and the House confirmed its recommendation.

Visitors to the old Hôtel de Ville may remember two fine bronze statues, one of Louis XIV., by Coysevox, the other of François I., by Cavalier, which ornamented the peristyle of the Cour Louis XIV. They escaped the destruction of the building by fire, with very slight damage, which may easily be repaired. The statues were lodged provisionally in the old Salle Saint-Jean, but have now been sent to the founders to be restored, after which they will be erected in one of the courts of the new Hôtel de Ville.

The Salles des Caryatides at the Louvre, which had been closed for nearly a year, has been completely restored and is again open to the public.

M. Dalou's bas-relief, *Mirabeau aux Etats-Généraux*, is to be cast in wax for the Chamber of Deputies, by M. Eugène Gonon, at a cost of 25,000 frs.

The exhibition of Sellier's works at the Ecole des Beaux-Arts opened on Monday last. The artist, who was a native of Nancy, carried off the Premier Grand Prix de Rome in 1857, the subject for the year being *The Raising of Lazarus*. Among his competitors on that occasion were Hector Leroux and Léon Bonnat, who each obtained a second Grand Prix; and Benjamin Ulmann, an Honourable Mention. He was placed *hors concours* in the Salon exhibitions after 1865, and in that year received a medal, to which a "second class" was added in 1872. While great as a draughtsman, Sellier is also one of the few painters of the modern school who have approached the nearest to the magical effects of Rembrandt's wondrous chiaro-oscuro.

The board of directors of the Musée des Arts Décoratifs is fitting up a laboratory for the reproduction, by means of photography, of the collections belonging to the museum, as well as other works of art selected in public exhibitions or belonging to private owners. Sets of these photographs will be placed at the disposal of workers in the various branches of art industry and of pupils attending schools of design.

Mdlle. Rosa Bonheur has for some time past been in a very precarious state of health. She was obliged to pass the last winter in the South of France, but has since been residing at her villa near Fontainebleau. During the past few weeks she has been gradually growing so much worse that Mdlle. Bonheur has been to Paris in order to have the attendance of the leading physicians. We are happy to learn that this step has already been rewarded with some success, a considerable improvement having manifested itself in her condition during the past day or two.

The death is announced of M. Ulysse Butin, the painter, at the early age of forty-six. His principal works were scenes of seafaring life, and in this line he had gained a great reputation.

The apse of Notre-Dame Cathedral is now under repair, several of the turrets having fallen into a state of dilapidation under the combined attacks of time and weather. At the same time the roof is being releaded, and the grand entrance restored.

**Mr. Albert F. Bellows**, one of the best known of American artists, has recently died at Auburndale, Massachusetts. Mr. Bellows was born at Milford in 1830, and studied art first at Boston, and subsequently in Paris and Antwerp. He was one of the early members of the American Society of Painters in Water Colours, and in 1859 he was elected an Associate of the National Academy, and two years later made an Academician.

ART IN RELATION TO TIME, PLACE,  
AND RACE.\*

BY SIR FREDERICK LEIGHTON, P.R.A.

STUDENTS of the Royal Academy,—The subject on which two years ago, on a like occasion, I addressed you from this chair was, you may remember, the relation in which art stands to morality and to religion. I shall ask you this evening to consider with me a subject, not, I think, less interesting—namely, the relation of artistic production to the conditions of time and place under which it is evolved and to the characteristics of the races to which it is due. Do not be unduly alarmed at such a prospect; in the very vastness of the subject is your greatest safety; for it is needless to say that the limits of our time, were there no other hindrance, will not suffer me to deal with more than a fragment of so wide a topic, or to present to you that fragment in other than baldest outline. It will be enough if, by putting before you a few suggestive facts, I am able to quicken your interest in and to lead you to explore for yourselves a very fascinating and far-reaching field of thought. This is my sole and sufficient aim to-night.

*The "Family Air" in Art.*

If, in your study of the works of painting or of sculpture to which you have had access either in permanent galleries or in temporary exhibitions, or of the numberless architectural works at home and abroad which photography brings within the reach of those to whom it is not given to travel, you have passed from the examination of individual examples to a more comprehensive consideration of the broad groups into which they fall, according to the countries which have produced them, and to the period of their production, you cannot fail to have noticed the definite and distinctive physiognomy—the family air, as it has been well called, which marks these several groups; and if, pursuing further this train of thought, you have endeavoured to penetrate the nature of this distinctive physiognomy, you have perhaps been led to note the harmony which, in each case, exists between it and the atmosphere, mental and moral, within which it took shape. This will have become equally clear to you whether you have compared, one with the other, the art of different countries or the art of different epochs. So, for instance, in passing from a work by Rubens to one by Velasquez, the opulent splendour of the one and the concentrated gravity of the other will have, may be, brought before you more vividly than could many words the deeply contrasted characteristics of national temper by which Nature had divided two peoples long united in unnatural bonds of political union—Spain and Flanders. Or, again, if, in the comparison of the ogival architecture of England with that of France or of Germany, you have discovered in each school the expression of distinct national characteristics, you will have felt not less clearly in the contrast between the solemn and mystic gloom of a Northern cathedral and the radiant serenity of a perfect Grecian temple the antithesis which exists between the Mediæval and the Hellenic world. And no doubt the sense will have grown upon you that this harmony between the work and its surroundings is not fortuitous, but rather that art is an organism fed and formed by the same forces which shape the current of the general spiritual life of which it is, indeed, but one among many forms of expression.

You may have observed, in the next place, how vitally one of the arts especially, architecture, is affected by the physical conditions of the country in which it is practised; and, lastly, in following the stream of art to its remoter sources, you have, perhaps, been struck with its continuity and with the part played in its evolution by inheritance or by example. From land to land, from age to age, you may have traced through their various vicissitudes certain recurring ideas and forms; nay, if you have descended from the higher regions of art to the humbler sphere of design which is called industrial, you will have found in more than one commonplace of contemporary decoration devices conceived dim ages ago in the lands of the Pharaohs, or on the plains of Shinar. So, for one instance only, the not too formidable animal whose toothless and trunkless head seems to "roar ye an't were any nightingale" from the back of your armchair, or on the handle of your teapot, and whose feet so fitly end the legs of your sofa or of your sideboard, has its prototype in carvings inspired on the quick in far Assyrian days, and is the last transmitted counterfeit of lions that once writhed on the spears, or yawned round the golden throne of a Sargon or a Sennacherib.

*Mystery of the Æsthetic Principle.*

Well, it is on these formative influences of surroundings in time and place, and of inheritance or example, that I wish to say a few words to you to-night—mere suggestions, I repeat, of an outline which you may, if you so care, fill in at your leisure for yourselves. But here a word of caution is necessary: the further you penetrate into this subject the more, I make no doubt, will you feel its fascination; but with this fascination will come also the risk of overrating or misinterpreting the bearing of each new fact that seems to throw light upon your investigations—the danger will

arise of unconsciously fitting fact into theory, instead of testing theory by fact, and of forgetting, in the neatness of a chain of reasoning wrought from materials too partially selected, the darkness which shrouds, for all our seeking, the inmost springs of the æsthetic life in nations and in men. We must content ourselves, as we watch that life in its intermittent flow, with noting the affluents which feed it, the banks which mould its current, and the elements which tinge its waters, confessing that the initial forces which determine the hour and the place of its birth, and the times of its fulness and of its failing, remain indeed a mystery of which the key is still withheld from us.

*Main Influences.*

The main influences which determine the bent and growth of art are these: First, and primarily, the temper and genius of a race; then the social and intellectual state of a community or nation at a given moment; thirdly, example, whether by unbroken transmission of inheritance, by the resuscitation of a tradition, or through a stimulating contact with other nations; and, lastly, the influence, partly moral and partly material, of surrounding physical conditions. These several agencies overlap, no doubt, as well as co-operate; it is, however, if not strictly philosophical, convenient for our purpose to speak of them as separate. Let us now endeavour to see them at work.

*Egyptian Art in relation to the People.*

It is evident that of these various influences the third—namely, example by contact or inheritance—will be less and less perceptible as we ascend the stream of time. As we leave ever further behind us the complex life of modern nations, with their unceasing interaction one on the other, and that burden of intellectual inheritance which is not always an unmixed blessing to their art, we see the problem of growth becoming more simple, till we reach, at last, a period in which external impulses are all but inappreciable, and in which art, shaping itself closely on the wants and the conditions of the land and the people from which it springs, is the faithful and unalloyed expression of the genius of that people and the resources of that land. Such a land we find on the banks of the Nile, and such a period in the unrecorded dawn of Egyptian civilisation. Here, at least, the problem of evolution is reduced to the simplest form known to us west of the cradle of our race, though not to the simplest form conceivable; for although one branch of Egyptian art—sculpture—had reached a very high, perhaps its highest, level between 3,000 and 4,000, or, according to Mariette and Maspero, between 4,000 and 5,000 years before the Christian era, the Egyptians were not, it is believed, indigenous on the Nile. For our present purposes, however, they may be considered practically a primitive race. What manner of people were they? They were a people endowed with brilliant gifts, and of whom a prominent characteristic was their piety. "The Egyptians are religious," says Herodotus, "far beyond any other race of men." Piety was printed on all their works. They believed in an after life, and on that after life their thoughts were chiefly bent. They traced to the heavens the origin of their royal throne, and believed that in a far, unchronicled past the gods themselves had ruled within their land; the right hand of the immortals was extended over them in protection; their pontiff kings visibly represented the godhead upon earth, and at their death were in their turn taken up into the heavenly ranks. They were a race which during long centuries—those early centuries in which its arts took shape and ripened—grew up in unchallenged peace to strength and conscious greatness, knowing as yet no rivals, drinking in daily the deepening sense of a security unassailable and immemorial. Visibly favoured in a climate beyond example steadfast and serene, and in a soil lavish of every gift, they were above all made confident in the sight generation after generation of the ever-renewed blessing of the great stream in whose waters that soil was each autumn born anew; and so to the sense of abidingness would add itself that of unexhausted wealth and plenty. I said that they were pre-eminently pious—dwelling constantly in thought on the life of which the gate is death. We need not enter here into their complex creed concerning the soul and the intelligence, the body and its double; it is enough for us to note that in their belief a material form was needed after death as a home and resting-place, until the day of doom, for that surviving "double"—that eidolon—which was an incorporeal counterpart of the body. To furnish this tenement for the double was, therefore, a sacred duty, and it was accordingly provided in two ways—first, by embalmment of the corpse itself, and, further, for the event of injury to the mummy, by the manufacture of stone or wooden counterfeits made in its exact image, and for greater safety these were frequently very numerous. Such, then, being the mental attitude and such the custom of a race with strong plastic and building instincts, what sort of art should we look for in it? Should we not look for an art in which the temples of the gods and the abodes of the dead were the most salient feature? And should we not further expect of such a people that whatever connected itself with the glorification of those gods, or with the exaltation of earthly rulers scarcely less divine, or with the service of the departed, would be the inspiring motive of their graphic and plastic art, as well as of their architectural production? And this art being an entirely spontaneous and sincere expression of the national temper, should it not convey to

\* An address delivered on Monday at Burlington House to the students of the Royal Academy.

us a sense of strength, of dignity, of stability, and of repose? And would not the consciousness of unlimited resources find expression in a tendency to the excessive in size? Well, these are precisely the characteristics which we never fail to find in the monuments of Egypt, and in so much of her plastic art as is not purely domestic in character and descriptive of private life. Those whose fortune it has been to stand by the base of the Great Pyramid of Khoofoo and look up at its far summit flaming in the violet sky, or to gaze on the wreck of that solemn watcher of the rising sun, the giant Sphinx of Gizeh, erect still after sixty centuries in the desert's slowly-rising tide, or who have rested in the shade of the huge shafts which tell of the pomp and splendour of hundred-gated Thebes, must, I think, have received impressions of majesty and of enduring strength which will not fade within their memory.

#### *Egyptian Sculpture.*

But if the general character of these monuments bears the impress of the moral temper of the Egyptian people, we shall find a special requirement of their faith exercising a direct and vital effect on the development of their sculpture and of their painting; in the case of the former, first for good, and afterwards, indirectly, for mischief. I mean the duty, which as I have told you they held sacred, of supplementing the embalmed corpses in the tombs with images of the deceased in stone or wood. Out of this duty arose necessarily a vast activity in the field of sculpture; but the object of the artist was to produce, I said, in these images an exact counterfeit of the outward form and features of the departed, in order that the second life—the life in the shadow of the tomb—might mimic as faithfully as possible the old life in the light of day; and the result was, as might be expected, a remarkable development of individualisation in treatment of form and figure; in fact, a vigorous and uncompromising school of portraiture. This view of the causes which influenced Egyptian sculpture in its origin is very lucidly set forth in the admirable work of Messrs. Perrot and Chipiez, which I commend to your study, and in which you will find it supported by a series of most excellent illustrations. While, however, so large a demand for works of sculpture had a very stimulating, and, at first, a very wholesome effect on plastic art, the very extent of that demand became eventually a source of harm, and we may safely attribute to it some not small share of the stagnation and eventual decline of this branch of art on the banks of the Nile. For in exact proportion to the necessity for rapid and almost unlimited production would the obstacles to thoughtful treatment and a close study of nature increase; the sculptor would fatally tend to become a mere manufacturer and purveyor, and in the speed to which he was compelled life and character would more and more surely disappear from his work. Be this as it may, we see in Egypt this strange thing—that the earliest efforts of sculpture which have come down to us are in general the best. Certain wooden panels, for instance, carved in low relief, which are preserved at Boulaq, and which display a delicacy of workmanship and a spontaneity of treatment seldom equalled in Egyptian art, are believed by M. Maspero, under whose guidance I had the good fortune to see them, to date back to the third dynasty—that is to say, to over forty centuries before the Christian era. And the qualities which distinguish the most perfect phase of this art are precisely a subtler perception of individuality, and a more unreserved obedience to Nature, than we see at any subsequent period. Our acquaintance with this epoch of Egyptian art is of very recent date, and it had been till quite lately much the custom to take an exaggerated view of the stagnancy of Egyptian sculpture to which I just now alluded; a truer appreciation both of the achievements of that art, and of the phases through which it passed, is now beginning to prevail; meanwhile we must, I think, be on our guard lest we now fall into an opposite error, ignoring unduly the limitations from which the sculpture of Egypt never freed itself, and forgetting that if in fifty times a hundred years it underwent marked and considerable modifications, those changes did not bring improvement with them after a certain early period. Of this arrested growth the causes must in great part remain obscure; the explanation which I have suggested, and of which I would not overrate the bearing, applies only to funereal art; and though no doubt the whole current of plastic production would be affected by the vicissitudes of its main affluent, we must look for other causes to account for the strange and pulseless monotony which we see in the treatment of the statues of the gods. One of these M. Perrot is inclined to seek in the necessity imposed on the artist of representing those gods as a monstrous compound of man and beast—a necessity which shut him out from any inspiring ideal. Much, again, of the absence of action in Egyptian statues, and of the empty smoothness which so often characterises their modelling, he attributes to the extreme hardness of the material in which they are habitually wrought, and which, while lending itself to a high polish, was extremely difficult to carve. To these causes we may add the absence of any fecundating contact with other races. But behind and beyond them all, we must recognise as the primary agent a certain peculiarity and inertness of the race, a narrow but tenacious spirit of which, whatever may be its sources, we find the perfect counterpart only in the great Turanian empire of the East—the not less ancient land of China.

#### *Egyptian Painting.*

I could have wished to say, also, in this place a word on the harmony which exists between Egyptian building and the scenery in which it is set, but for this time leaves me no leisure; I have yet, before passing to other lands, to glance briefly at Egyptian painting. Of this our knowledge is drawn wholly from the tombs. Like sculpture, it owed its chief impulse to the views of the Egyptians in regard to a suspended life within the grave; for not only were meat and drink laid for their sustenance before the dead, but just as to the mummy were added supplementary semblances of the body, so also was the painted semblance of food placed about it in its long abode; nay, more, as the ghostly inmate could no longer wander forth into the world, the world was piously brought in effigy to him in the tomb, and on the walls around him he saw unfolded each scene of daily and domestic life, in the sight of which he might once more seem to himself to sow and to reap, to count his hoarded gain, to carouse, and to rehearse in all things his vanished earthly days. Here, more than elsewhere, we find the Egyptian artist untrammelled by material, and we are accordingly struck with an increased vivacity of dramatic treatment and the greater freedom with which he handles the human form; here, too, we note a certain cheerful *bonhomie* which was a characteristic of the race. I have spoken of these designs as paintings, but they would be more accurately described as outlines filled in with colour; for throughout Egyptian art colour appears solely as a flat tint. It is a prevalent opinion that the Egyptians were colourists, skilful harmonisers, that is, of subtle tints. In this opinion, though not unmindful of the harmonious effect of some of their enamels in which the original tints are still preserved, I find some difficulty in concurring; faded and bleached by the sun, the coloured hieroglyphs which still enliven some of their buildings are no doubt very delightful in their play of tones, and to many paintings on papyri or on mummy cases decay or golden resins have given the delicacy of fresco or a glow as of mosaics; but the sight of well-preserved paintings of comparatively recent discovery has left grave doubts in my mind in regard to the colouristic aptitudes of the people which produced them. This, however, is worthy of notice—that we see in Egyptian painting the first use of that combination of green and blue which was to be the dominant note of so much that is most beautiful in Eastern coloured decoration.

#### *The Semites and Art.*

Next to Egyptian art in order of antiquity and closely connected with it, is that of the two great Semitic empires which had their seat by the waters of the Tigris and the Euphrates. To these I now turn. And here a perplexity awaits us. We have learned to think of the Semitic race as marked out scarcely more by its monotheism than by its lack of gift for the plastic arts. Void of artistic impulse, the Jews, we know, saw in the Second Commandment not only a warning against idolatrous worship, but a distinct decree of the Almighty against the production of graven images even for purposes of teaching or of delight. Renan, in his "History of the Semitic Languages," says on this subject much that is suggestive and interesting. "The desert," he writes, "is monotheistic; sublime in its immense uniformity, it revealed to man the idea of the Infinite but not the sense of an incessant creative activity which more fertile regions breathed into other races." "Nature," he adds elsewhere of the Jew, "had little place in his thoughts"; and further on, "Music, the subjective art *par excellence*, is the only one he knew." It is to a brooding and introspective habit of mind that he attributes the absence in this race of any craving for plastic expression, which is, we know, in its essence a desire to recall sensations aroused by outward objects. Here, then, is our perplexity; for if, turning from the Jews, we look to their kindred Semites in their own ancestral Chaldea, we see them under skies as broad and in more unbroken plains, amid pursuits, too, originally similar, moulded to a temper wholly different; to them the wilderness was not monotheistic, to them the sky's unclouded span brought no lesson of one Lord, supreme and solitary; it led them rather to the complex science of the stars, and to that belief in their influence over the destinies of men which has played so great a part in the annals of mankind; and, finally, we see them evolving in due course an art full of power and of objective vitality, an art of which the fruitful seeds were to fall one day on the lap of Greece herself. These, I say, are perplexing facts, and show with what caution we must, even at this early stage of the world's history, handle the ethnological test. Their partial explanation we must, no doubt, seek in the fact that the Jews were of far more unmixed Semitic blood than were the Chaldeans and Assyrians, who are, when first we meet them, already blended with an Accadian—that is to say, a Turanian stock.

#### *Assyrian Art.*

Meanwhile, we shall not find on closer inspection that the landmarks of race have been as wholly removed as might at first sight seem; and the foremost sign of this is the complete absence among this Semitic folk, in Assyria at least, of the monumental tomb—the outward mark of the absorbing prominence of the subject of death in the Turanian mind; and we shall further find that, striking as are the achievements of the sculptors of Nineveh,

those artists did not practically get beyond the carving of flat surfaces, and that nothing in the shape of an Assyrian or Chaldean statue has come down to us for which any serious merit can be claimed. The more than summary sketchiness which is imposed upon me forbids my dealing separately with Chaldean and Assyrian art; it will suffice to say that if the fortune of war gave alternate supremacy to Babylon and to Nineveh the art of the two nations was practically one growth; we may note, too, that as power gravitated from the gentler Chaldean to his ruder brother in the north, the religious spirit of the former yielded to the warlike genius of the latter, and while what remains to us of the first Chaldean empire is of a religious character, the architecture of Assyria is mainly palatial and expressive of the power of a ruthless race of kings; for Assyria, in the days of its greatness, was as a vast camp spread about the throne of a fighting monarch, and the Assyrians, a breed of warriors fierce and without fear, casting down their enemies, in the words of Isaiah, "as a tempest of hail and a destroying storm." And the pride of splendour, too, was strong within them. Would you see an Assyrian king in all his love of luxury and in his lust of blood? Then look where Assurbanabal sits with his queen, carved on an alabaster slab now in the British Museum. Among the palm-trees of the royal gardens, his weapons laid aside, but at hand, he reclines on a sumptuous couch, curiously wrought, and spread with stuffs from the famous looms of Babylon; opposite to him, on a throne, sits the queen; each of them has taken from a dainty table, which divides them, a cup of wine, and is about to drink; the feast is spread in the chequered shadow of a vine, for the sun is fierce overhead, and attendants placed at each end of the couch strive with long fans to simulate a breeze; the birds seek refuge in the branches; minstrels are not wanting, and the sound of harps thrills through the summer stillness; over all a drowsy peace. And now look closer; on what is the great king gazing across the bubbles of his wine? Not at the golden date palms, not at the purple grapes, not at the simmering plain, not at the sky's blue tent, not even, I fear, on the features of the queen. His eye rests, in placid contemplation, upon an object hung full in view on a bough before him, the sweetest sight of all—a ghastly fruit plucked newly from its trunk—his enemy's hated head, dangling, dishonoured, upside down! With such a people, and with such a line of kings, what artistic expression shall we look to find? We shall look for an art masculine and somewhat truculent, in which the prowess of the sovereign in war and in the chase—for were not the sons of Nimrod great huntsmen before the Lord?—shall be the leading theme: official annals, so to speak, of high royal deeds. We shall expect no domestic subjects; none of the quaint idylls of homely life which the Egyptians loved even after they, too, had begun to blazon butchery on their walls; few scenes prompted by piety. And such is, in fact, the art we find; and the execution of it is strikingly expressive of its spirit, for the hand of the artist found in the yielding alabaster, in which he mainly worked, a fitting substance wherein to plough and hack the thews and sinews which he loved to mark with such uncompromising vigour.

#### *Influence of Materials in Assyrian Art.*

And here, in comparing the grim accentuation of these Assyrian sculptures with the vacant polish of so many images of Egyptian workmanship, in which the limbs remain engaged within the granite block, you will do well again to note the bearing of material on the development of art in early days. I alluded just now to the royal hunting pieces in the Assyrian sculptures. That these should be good was natural in a people passionately fond of sport; but it is not easy to account for the immeasurably greater dramatic insight here displayed in the representation of wild beasts than in the rendering of the human form. In all essentials I know nothing quite equal to the portrayal by Assyrian artists of lions maddened or struck down in the chase. Their lesser skill in the treatment of human beings has, indeed, been attributed to the fact that they never saw their subjects except closely draped from head to foot; but this explanation, though ingenious, seems to me wholly inadequate, and we must in this case, as in so many others, be content to wonder in doubt and ignorance. One word on Assyrian architecture in so far as it touches our subject of to-night. Stone, if not in great quantities, was accessible to the builders of Nineveh; nevertheless they built in brick, for their architecture, like all their art, had its origin in Chaldea—that is, in a country where there was no stone, but where, on the other hand, clay abounded for the making of bricks and tiles. But the broad and empty surfaces of their buildings, surfaces almost wholly unrelieved by mouldings—for this form of enrichment did not, with such a material, readily suggest itself in so early a stage of art—required profuse adornment to satisfy Assyrian love of splendour and to be worthy of Chaldean tradition. Here stone found its opportunity, and soon colossal monsters, human-headed, but limbed like a bull, and winged—types of strength and wisdom—took post at gateways and approaches, while long lines of sculptured frieze ran, level with the eye, along the interminable walls. To this enrichment of the ground-line of their palaces the use of stone by the Assyrians was limited; above this line another mode of adornment was chiefly used, namely, a casing of glazed and coloured tiles, wherein you see the origin of that marvellous decoration which to this day in the

same regions throws its enchantment over fields of wall-space hardly less flat and free from moulded features. For internal embellishment and for detached structural supports, Assyria had wood and metal, a combination, indeed, which lies at the origin of all decorated columnar forms. Of such piers or columns material evidence no longer exists, except it be in charred fragments; but other reasons beside structural requirements would suffice to convince us that they had existed. In the first place, as is acutely argued by Mr. Fergusson, in his most suggestive and valuable work on architecture, it is no doubt of these supports that we see the reproduction in stone in the wholly borrowed art of Persia; secondly, their use in tents and ædicles, and as a decorative feature in windows, practically involves their application to a more important function; and, lastly, the deep influence on Ionic art of this among many Assyrian forms implies in itself its large and general use; and thus this architectural feature, which attains its highest beauty of abstract form in the porch of the Erechtheum, has for its first rude ancestor a cedar pole and a curl or two of copper.

Two or three more points may be noted here in passing: the first is that astronomy determined the shape and colour of one type of Assyrian temples—temples which were also observatories. Their storeys were seven in number, the sacred seven; and each storey bore the colour proper to one of the heavenly spheres. Another is, that in Assyria we for the first time see the arch used as an important decorative and decorated feature. Another, that we first discover in an Assyrian bas-relief an instance of a new constructive feature—the gable roof.

#### *Early Greek Art.*

In Egypt and in the Mesopotamian kingdoms, we have seen two forms of art, akin in some respects, but nevertheless separate and individual, both bearing strongly the stamp of the race, the country, and the times which gave them to the world, both marked by a strange inertness and persistency. Let us now look, for a moment, and in conclusion, at an art in which whatever was best in them rose to a fuller and nobler life—an art which we can compare no longer to a broad and sluggish stream, but which is as the sudden upleaping of a living source, reflecting and scattering abroad the light of a new and a more joyous day; a spring at which men shall drink to the end of all days and not be sated; the art of Greece. Nothing that I am aware of in the history of the human intelligence is for a moment comparable to the dazzling swiftness of the ripening of Greek art in the fifth century before Christ; and we marvel at it the more from the contrast it presents to the secular torpors of the races from which it drew its alphabet. I fear, too, that when we have ascribed this lightning speed of growth to a peculiarly happy balance and interaction of various elements of race, and to not less favouring circumstances of place and time, we shall not have gone far on the road to understanding it, and we shall perhaps here more vividly than ever feel our ignorance of the mysterious affinities—the occult chemistry of nature, if I may so call it—through which certain racial ingredients produce in varying combinations results so strangely different. Nevertheless, it will not be without interest to apply for a moment to this evolution the same methods of inquiry which have guided us hitherto this evening.

#### *Ionians and Dorians.*

The earliest historic records of Greece are but recent as compared with those of Egypt or of Chaldea, and it is only in occasional glimpses that we discern the footprints of civilisation in this chosen land during the obscure centuries which preceded the Dorian invasion, or, indeed, as far as art is concerned, the era of the Olympiads. Looking back to the age in which we first descry them, we find the land occupied by a race which we call Pelasgic, and which seems to have held not only all the lands washed by the Ægean from Lydia to Cape Tænaron, but to have pushed round the head of the Adriatic and spread itself out over Italy. This race was, perhaps, the earliest wave poured by the Aryan tide from Asia into Europe; but it preceded the later immigrants into Greece by such an interval as to form a very distinct stock, and, whether or not by an assimilation with earlier occupants of the soil, they appear before us in the three lands with certain of the attributes of a Turanian people—that is to say, as mighty builders, and, notably, builders of tombs. They were followed on the scene by a purer Aryan race, which, descending from the Phrygian heights to settle first on the western skirts of Asia Minor, overflowed towards the fifteenth century in all directions, southward even to Egypt, but especially westward, by the islands, to Greece; there so blending with the Pelasgic stock that they soon learnt to boast themselves Autochthons. Lastly, another offshoot of the same family, after making its way across the Hellespont to settle in the Thessalian highlands, burst forth in the eleventh century and swept, conquering, over the land. These two races, akin in origin, and yet profoundly unlike, were known as the Ionian and Dorian peoples; and their rivalry is the history of Greece. Of the earlier Pelasgic or Pelasgo-Ionic race few, but important, vestiges are preserved to us, the most remarkable being sepulchral monuments, such as the tombs, or so-called treasure-houses, of Orchomenos and Mycenæ; walls, also, and gateways, of massive style and masonry, reveal them to us as a great building people; and in

all these remains we trace a distinct Assyrian influence, either due to the Ionians themselves or to Phœnician middlemen, or perhaps to both. With the rule of the Dorians a complete paralysis seems to have fallen on the artistic life of the country as far as architecture is concerned, and to have held it in abeyance for several centuries. Whether or not this lethargy is directly attributable to the genius of the dominant race—a race of soldiers and of law-givers, and averse to art—it is difficult to say; this much, however, is beyond doubt—that, although the Dorians made their own and gave their name to a style of architecture without a rival for dignity of chastened form, in the region in which their race and spirit were more than elsewhere seen pure and paramount—the Spartan State—the arts, if we except martial music, had absolutely no existence; and it is, therefore, the more difficult to evade the conviction, combated though it has been by weighty opinion, that the Doric style was not of Doric origin, but was, indeed, in great measure borrowed, about the days of Psammetik or earlier, from prototypes still seen at Karnak and at Beni-Hassan. However this may be, when Greece emerges at last into historic light we find her building art born, so to speak, anew; of the old Pelasgic form we see no trace, but in its place two stately styles—the one, indeed, Asiatic, and the other Egyptian in its inspiration, but both purified and made nobler in the alembic of the new Greek spirit.

#### *Supremacy of Aryan over Pelasgic type.*

And here we may note, in passing, an interesting circumstance which had much bearing on the plastic art of Greece. In the slow welding process, from which resulted that perfect poise of intellectual and bodily gifts which we associate with the Greek name, the elements of race seem to have distributed themselves differently in the spiritual and in the physical order; for while in the former the Aryan type was strongly modified, it prevailed wholly in the latter. In the art of the Periclean age, of which the high truthfulness was one of its noblest attributes, no vestige survives of the Pelasgic type, as we see it, for instance, in Etruscan art, or where its last trace lingers on the marbles of Ægina—a tradition, perhaps, even there, rather than a record. In its stead we find a new ideal of balanced form wholly Aryan, and of which the only parallel I know is sometimes found in the women of another Aryan race—your own.

#### *The Land and People of Greece.*

But if the Greek spirit is, as I said, the outcome of a subtle balance and interaction of various elements of race, let us see how far art, which is perhaps its most characteristic outcome, was further favoured by external circumstances. And, first, a word or two of the land. Let us look at the map. Here are no vast alluvial plains such as those along which, in the East, whole empires surged to and fro in the throng of battle; no mighty flood of rivers, no towering mountain walls; instead, a tract of moderate size—a fretted promontory, thrust out into the sea—far out, and flinging across the blue a multitude of purple isles and islets towards the Ionian, kindred shores. In scale nothing excessive; everywhere measure and moderation. And of this sobriety, which is equally removed from all extremes, this *μηδὲν ἄγαν*, which is the keynote of all things Greek, you find no completer type than in the famous little land where Athens rose and reigned. Spread out to the sun within a girdle of nobly-simple heights, and sweeping gently to the sea to catch the western breeze, it was blessed in an atmosphere of which you must have felt the breath to understand its penetrating sweetness. Attica was not in those times parched and thirsty as we see it now; the dusty olive-groves, which to-day are white along the arid track where Kephissus should flow, are not the “thousand fruited” bowers ringing with the nightingale of which Sophocles sang so lovingly. Nevertheless, as compared, for instance, with Southern Italy, Athens was not exceptionally favoured in her soil. It was a soil liberal, but not lavish, demanding labour, but rewarding it—a fit surrounding for a joyous, wholesome, active life. Such was the Greek land. On this land we have a race built up as we just now saw, and whose religion was rooted partly in ancestor worship, but mainly in the worship of the personified forces and phenomena of nature. Distinctively, it was a race whose dominant thought was not death, but life—an intense life, in which their gods and goddesses shared, but with a higher and ampler vital energy; for these gods, whom they made in their own image, however Xenophanes might chide, walked freely among them, mixing in human affairs, met at every turn, each the ideal of a particular type. Behind these bright divinities, dimly seen, the Moiræ loomed, asserting and embodying those instincts of order and inexorable law which found such noble utterance in the mouth of Æschylus. And this race, very limited in numbers, was further divided into yet smaller communities. When we think, for instance, of Athens, with which our chief concern is, the idea of multitude never presents itself to our minds—we think of a handful of free men; and, indeed, restriction of numbers was part of its own ideal of the perfect state. Now, a first result of these moderate numbers would be the increase in dignity and importance of the unit; and given, of course, the peculiar intellectual vivacity of the race, we should be prepared to see, for the first time in history, the spectacle of a free State, and of that only true conception of such a State which associates its collective greatness with the worth of

the individual citizen. Out of this conception a race, enamoured in a manner till then undreamt of with the pursuit of ideas for their own sake, would be led to form an ideal of a citizen who, while he should be merged in the State in which he is a living force, should render himself worthy to serve it by the fullest and most evenly-balanced development of his being in all its varied capabilities; and this full and evenly-balanced development we see in Athens. How Athenian education was based on this ideal you know. You know that a noble training of the body went hand in hand with the discipline of the mind. You know how high a place was assigned to athletic sports, and that an athlete three times crowned had claim to the public tribute of a statue. And you have learnt what was in the eyes of Greeks the dignity of that bodily frame, which they shared with the gods themselves—a body not, in their simple view of life, at war with the spirit, but working harmoniously with it towards one common central ideal of perfection.

#### *Conclusion.*

Now, the bearing of these things upon our train of thought has not escaped you; you have felt, no doubt, that in a society so constituted and so composed, art, but more especially the sculptor's art, would find a favouring atmosphere such as had never before existed nor can ever exist again. You understand in it the abundance and high level of production, and do not wonder at the multitude of statues which thronged the Altis and the precincts of holy Delphi. And you feel perhaps with fresh force how faithfully in its nobility and its serenity, in its exquisite balance, in its searching after truth, and in its thirst for the ideal, Greek sculpture mirrored at its best the mind of Greece. That these attributes were not less conspicuous in Grecian painting we may confidently assume, however limited and indirect our knowledge of it is. It is, perhaps, in that painted earthenware which has been preserved to us in such profusion, chiefly in Etruscan tombs, that we waylay the Greek draughtsman in his most spontaneous mood. I need not remind you how inexpressible a charm his simplicity, his sincerity, and his unfailing dignity of vision have cast over these precious relics, which we have gathered at the hands and in the homes of the dead.

And here I must, for the present, leave the subject of which I have to-night roughly sketched the outline of a fragment, to resume it, perhaps, at some future time. I have brought you to the culminating point of art in ancient days, the loftiest in many respects to which it has ever risen, and in following its course through various lands have endeavoured to illustrate, as I had promised, its organic connection with the temper of the times and of the races which have produced it. In doing so I have sought only to interest you: I have aimed at no moral lesson. Nevertheless, it may be well, in taking leave of the art of Greece, to remember that if of the attributes which went to make it supreme some are indeed beyond the control of men, two, and not the least bright, are within the reach of all—simplicity, I mean, and truth.

### LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

A DINNER of the Leeds and Yorkshire Architectural Society was held at the Great Northern Railway Station Hotel, Leeds. The chair was occupied by Mr. C. R. Chorley, J.P. (one of the vice-presidents), in the absence of the president (Mr. E. Birchall), and among the gentlemen present were Mr. J. Barran, M.P.; the Mayor of Leeds, Mr. Edward P'Anson, Mr. Cole A. Adams, Mr. Medland Taylor, Mr. T. Smith Woolley.

The Chairman proposed “The Leeds and Yorkshire Architectural Society.” He congratulated the society on the success which had attended it since its commencement, and the steady advance it had made in every one of the objects it had in view.

Mr. J. W. Cannon (one of the vice-presidents) replied. He said their first object was to promote the technical education of architectural students. This they did by offering prizes, by arranging courses of lectures and classes for instruction in design, and by visits to buildings in progress, or to completed ones of special interest. The results had not been all that they could have liked, but they had been sufficient in some few cases to satisfy them that they were pursuing the right course. Their second object was that of fostering a fraternal feeling amongst architects; and their third object was that of gaining the aid and sympathy of those outside their profession who were interested in their work.

Mr. G. B. Bulmer (the honorary secretary) proposed “The Royal Institute of British Architects, the Architectural Association, and kindred societies.” Mr. E. P'Anson, who responded, remarked that the work of the architect expressed the tone and the refinement of the age, and endured to future generations to record the history of the times in which he lived. The toast was also acknowledged by Mr. Cole A. Adams, Mr. Medland Taylor, and Mr. T. Smith Woolley.

Mr. J. B. Fraser proposed “Art,” and Mr. R. Thompson responded. Mr. H. May proposed “Science,” which Professor Thorpe acknowledged. The toast of “Literature,” proposed by Mr. W. H. Thorp, was responded to by Mr. T. Wemyss Reid and

Mr. C. Pebody. Mr. T. Ambler proposed "Law," and Mr. J. W. Middleton replied. "Medicine" was proposed by Mr. G. Corson, and acknowledged by Dr. Eddison. Mr. Leonard Cooper proposed "Trade," and Mr. C. Scriven responded. "Our Visitors" was proposed by Mr. E. Dodgshun, and Mr. C. J. Wright replied.

## SIR CHARLES DILKE ON SCIENCE AND ART

AT the distribution of the prizes to the students of the Hammersmith School of Art Sir Charles Dilke said that in the whole South Kensington system the word "science" was put before the word "art." He blushed to say that his sympathies were rather with the art than the science side. Science in these days seemed more able to take care of itself than art. Goethe expressed this by saying, "Take care of the beautiful; the useful can take care of itself." In these days when science ran riot about us, he was inclined to think that art needed more care and attention at the hands of the community generally than science. As a democratic politician he thought he could defend that point of view from a democratic standpoint. Science had been called democratic, but art was still more democratic. It had been contended that science in the long run rather tended to make the rich more rich, and sometimes in its indirect effects the poor poorer. Before moral and intellectual pleasures, however, all men—poor and rich—were potentially equal, and the poor man who had feeling was superior to the rich vulgarian who was unblest by that sense. But although art was undoubtedly democratic, unfortunately it entered less into daily life than it had done in many cases in the past. The sensationalism, worry, and fuss which might be considered the chief characteristics of the age were fatal to art. Many might with sadness quote the phrase, "What shall it profit a man if he gain the whole world but lose his own soul." He would ask whether, in inventing the telephone and other things in the present day we were not, to a certain extent, losing our soul. We were losing the love of the morally beautiful and the morally true, but he believed this was only a passing phase. Let art men refuse to be crushed by their scientific friends, and let them make that which, according to Darwinian principles, all ought to make, a fight for life. Art studies were peculiarly a relief from the worry of life at the present day. Let them remember that virtue, though obscured on earth, not less survived all material change by lasting loveliness. He agreed with Mr. Ruskin that the very imperfections of an old hand-made picture-frame were preferable to the perfect evenness and polish of the modern machine-made article. But at the same time mere ancientness was not in itself a thing of beauty, as many misguided people evidently thought. He had found in the course of his recent peregrinations among the very poorest of this city, one gentleman whose occupation threw a lurid light on this subject. He (Sir Charles) had said to a lady whom he found in an extremely poor dwelling, "What is your good gentleman's occupation?" She said, "He is a 'worm-eater.'" It turned out that the gentleman lived by making holes to imitate worm-holes in so-called old woodwork. He was not one who believed that beauty consisted in worm-holes.

## ON OPEN SPACES IN TOWNS, WITH SPECIAL REFERENCE TO THE REQUIREMENTS OF ARTISANS' DWELLINGS.\*

BY JOHN HONEYMAN, F.R.I.B.A.

(Continued from page 362.)

BUT we may extend the comparison further, and consider how the sanitary condition of such tenements would be affected by their multiplication. Here, again, we shall find that nothing is gained by the burdensome restrictions already referred to. If we take an area embracing, say ten such plots as we have already described, and providing 2,500 houses by one arrangement and 1,200 by the other, it will be found that the air will circulate more freely among the 2,500 than among the 1,200; every one of the former will be better supplied with fresh air than the latter. That is another most important point as affecting the health of the occupants, and the explanation of it is obvious. It will be observed, by reference to the block plan that the blocks of building on the unrestricted ground are each only 150 feet long; whereas, in the other, they must be 250. Now, if we imagine the wind blowing across the blocks either directly or diagonally, we shall find that there will be a smaller area of comparative stagnation in the first plan than in the second; and when the wind blows on the ends of the blocks, especially when the wind is light, there is a slight but certain gain in the blocks being short and the disconnecting spaces of 50 feet numerous; so that it would appear

that in whatever way we choose to look at it we find that better and more healthful arrangements are possible than those which municipal authorities seem bent upon prescribing; for, I need hardly remind you, that this arrangement which I have shown to be so much the best is prohibited alike by the regulations of our Improvement Trust, and by the clauses of the Burgh Police and Health (Scotland) Bill.

But it may be said that we have left out of sight one element affecting directly the health of a community with which these restrictions are intended to deal, namely, over-density of population; and although I refuse to admit that, subject to the conditions already noticed, over-density as a mere sanitary evil is possible, I do not deny that within reasonable limits the restriction of density is for many other reasons desirable. But taking this for granted, it by no means follows that we are to run away with the idea that the only way to limit density is to compel people to arrange their houses in long dismal rows between streets and mews lanes. There is no necessary connection between the disposition of the houses and the number of them. The limitation of the number is quite compatible with perfect freedom in every other respect. If it is possible on any intelligible principle to determine the number of people who ought to be allowed to live on an acre of ground, there can be no difficulty in determining how many, or what fraction, should be allowed to occupy a square yard, and so to apply the restriction to any area. This evidently would facilitate the imposition of the servitude—for servitude it is, and to that extent an instalment of "state socialism." But if such a restriction were coupled with greater freedom in other respects it would probably not be seriously objected to; and it would certainly be the most straightforward and effectual course. Let us contrast it with the method hitherto pursued, and which it is proposed to perpetuate. Reverting to our previous illustration, it is evident that for our present purpose the area to be restricted must extend to the centre of the streets; we have thus a fraction over 6,666 superficial yards to deal with. We have seen that by the present regulations the greatest number of small dwellings which could be put on this area would be 120, and we have also seen how they must be arranged on the ground. Now, assuming that this is the proper limit of density, the limitation would be effected (without reference to arrangements) directly and effectually by prohibiting the erection of dwellings on the ground to a greater extent than in the proportion of one to 55·5 superficial yards, or the occupation of dwellings to a greater extent than say one individual to every 11·1 yards. I must note in passing that the restriction in the number of dwellings only would not be enough, the primary object being the restriction of the number of dwellers; but if a builder knows that such a servitude exists he will only provide such accommodation as he can profitably let for the number intended, and he cannot complain if the police interfere when that number is exceeded; he would in fact have no legitimate ground of complaint. We have thus a distinct rule easily applicable to properties of all sizes, strictly limiting the density of population, and yet leaving the proprietor quite unrestricted in other respects.

Let us see how such a rule would work in ordinary cases. Taking the plot we have been already dealing with surrounded by 50 feet streets, let us suppose that a builder takes a portion of it near the middle with 30 feet of frontage; by this rule he would know that he would only be allowed to erect ten dwellings upon it. If he took a corner plot with the same frontage he would find himself at liberty to erect fifteen dwellings; and the reason for the difference is quite apparent in the greater amount of free space which the street at the end secures. But under the provisions of the proposed Police Bill he could not possibly get even this moderate density of population on the corner ground, as he would either have to cover too much area, or go too high. In this connection we see what an important element the height of ceiling becomes in determining the amount of free space available for each tenement; because, the number of dwellings being limited, it is evident that the more these are piled on the top of each other the greater will be the area unbuilt upon. I do not mean to say that high tenements are superior to low ones, but what I do say emphatically is that there is no reason why they should be inferior in any respect except convenience, and that as in many instances the choice must be between high tenements or none, to prohibit them is unjustifiable on either economic or sanitary grounds, and in large cities must hinder, more probably than anything else, the satisfactory solution of the difficult problem with which we have to deal. To exemplify this it may be useful to compare the two modes of dealing with a limited area such as we have just referred to, having a frontage of 50 feet and licensed—shall we say?—for ten dwellings. If we put two of these on the ground floor, four on the first floor, and four on the second we can have the number of dwellings in a three-storey tenement occupying an area of say 2,000 feet and being 33 feet high. The width of the free space in this case would be 35 feet. But if we put only two dwellings on each floor the tenement would have five storeys and would be 44 feet high and the width of the free space would be 49 feet. Now in certain circumstances—as for example where the frontage is towards a very wide street or square—this last arrangement would unquestionably be the best. In any circumstances it

\* An address delivered at a meeting of the Glasgow Institute of Architects.

would be better than the other in some respects—as, for example in having only two houses on each landing instead of four, and in having houses a fourth larger—for in the above calculations I have allowed for the increased floor area to secure similar cubic capacity—and it will be observed that while the free space behind the low tenement is only two feet wider than its height, the free space behind the high tenement is five feet more than its height. Of course this result is only possible with eight-foot ceilings. But, as we have already seen, where we have a large plot of ground to work upon much better results can be obtained, even where this stringent rule as to density applies, if other stringent useless rules as to mews, lanes, height of ceilings, width of courts and stairs, &c., are dispensed with, but not otherwise. It is therefore evident that without such rules we would be in a much better position than with them, being able to obtain, with the same density of population, larger free spaces, and at the same time larger and better arranged houses.

So far I have assumed that the limit of density which proposed police regulations would in a roundabout way secure is a proper limit, but I by no means think that it is; on the contrary, it is demonstrable that a very much larger number of healthy dwellings can be erected than in the proportion of 1 to every 55 yards of ground, and any limitation of this large number is unnecessary, and therefore indefensible—the inevitable result of it being to increase house rent without any compensating economic or sanitary equivalent. The need of interference with density only arises where the crowding together of houses prevents the proper supply of light and air to every one of them. Every one will acknowledge that buildings should not be allowed—whether high or low—which have not in front of the windows of every dwelling they contain a sufficient free space properly ventilated. Three things seem necessary for the proper distribution of dwellings in towns, and they ought to be secured by legislative enactment. First, wide streets; second, spaces through which the air can circulate freely; and third, a sufficient cubic capacity for each dwelling. These can be secured without the imposition of onerous servitudes on property, which only tend to frustrate every effort to ameliorate the condition of the poorer working classes. With wide streets, free spaces behind, and a minimum cubic capacity secured, perfect freedom in other respects may be allowed, because in houses as in other things, competition comes in to prevent inconvenience or discomfort in minor details.

It would be easy to show, did time permit, how the acquirement of each of these three sanitary essentials is facilitated by giving up restrictions as to the height of ceilings, the height of tenements, the limitation of the number of dwellings in each block, and the like, but I can now only briefly refer to them. First, as to streets. The health of a district—so far as it is influenced by a plentiful supply of light and air—depends on the extent of its street area more than on anything else. If the streets are broad and short—that is, intersected at frequent intervals by other streets,—the thorough ventilation of back areas becomes a very simple matter. Now it is to be observed that the extent of street area is not only the most important factor in the healthful environment of dwellings, but it is also that over which local authorities have the most complete control. These authorities acting on behalf of the inhabitants of a burgh have a right to say to any one wishing to connect new streets with theirs, that they will allow him to do so on certain conditions—conditions which shall prevent the possibility of over-density, or the risk of the addition to the burgh of any badly-arranged new district. It may suit a person laying off land for building purposes to make his streets 30 feet wide, but the authorities are quite entitled to say—"that will not suit us; your streets must be 60 feet wide or we will have nothing to do with them, either now or hereafter. In other words, if you think it worth while to have your property under our surveillance you must give up and vest in us a certain proportion of the area." This requisition of 30 feet is in no sense a confiscation. It is simply the price which the owner of the land has to pay for the privilege of having his land properly connected with the burgh and thereby enhanced in value. It is perfectly clear that if he were allowed to make the streets the width which suited himself merely, he would gain the privilege without giving anything in return. The difference between the width which would serve his own purposes and the width required for the purposes of the community is all he is called upon to give. In this way (and I know no other), it is possible and legitimate for the community to obtain a small share of that rather elusive commodity, "the unearned increment of the land." If the land is not intended for houses but for business premises or works the same principle should apply; the same width of street would not be required, and this would be a matter of arrangement. In either case the rights of the community should be asserted, and their demands, if not extravagant, would not be seriously resisted; but you will readily see that the addition of such restrictive burdens as we have before considered, would make even a moderate demand for wider streets intolerable.

The bargain once made, and the streets laid off with ample area in proportion to the building plots, it is evident that the relation of the purchaser of one of these plots to the authorities is entirely different from that of the man who originally held and laid off the

ground, because the streets have been laid off for a definite purpose, namely, to give access to these building plots, and the right to form the streets for this purpose has been already paid; therefore the authorities have no further claim on the land. Indeed, it may be said that a proportionate share of such payment has been actually included in the price of each plot, which, moreover, unlike the street, has not been bought for a definite purpose, but for one of many conceivable purposes. With the owners of such plots, therefore, the authorities must negotiate on a totally different footing, if they think it necessary to interfere with the full utilisation of the ground, because clearly such owner cannot be asked to make any further concession unless he is paid for it, and for the same reason, on areas already built upon, additional width of street cannot be justly demanded without full compensation. I think this distinction has been too much lost sight of. Of course no one would think of proposing that such owners should be left free to do anything on their plots prejudicial to the general health or safety; but, saving this only, they are entitled to the fullest liberty. It is peculiarly necessary to bear this in mind when we are dealing with the second essential—free spaces other than streets; and instead of asking all we would like, we must be content with only so much as we are prepared to prove absolutely necessary.

It is clear that the utility of such free spaces depends on their ventilation more than on their width; thus, a court 57 feet wide (as on the block plan) is better than a square twice the width; yet our latest Police and Health Bill would prohibit the erection of houses more than two storeys high in such courts, while it would allow a square 100 feet each way to be surrounded with houses 50 feet high. In any regulations of this kind the ventilation of the space must be taken into account, for it cannot be doubted that a 20-foot lane entirely open at both ends would be healthier than a hollow square 60 feet wide surrounded by houses of the same height. The width of the space must also bear a certain relation to the height of the houses, but this is of less importance, for the height of a building in a narrow street will hardly affect the ventilation, but it will affect the light. There are these two things to be considered—the height of the buildings and the kind of space. There would therefore be considerable difficulty in graduating the requirements to suit all circumstances, but none in devising a better method than that hitherto in vogue.

Lastly, as to the cubic capacity of houses I shall only say that I think it of very great importance that a minimum of capacity should be prescribed. It is evident that the liberty I ask in the matter of height of rooms justifies the demand that their area shall not be unduly restricted, and at the same time does away with any serious difficulty in meeting it.

In conclusion I must remark that many recent writers on artisans and labourers' dwellings seem to expect too much from increased stringency of legislation on the subject; but such legislation must be prudent and discriminative as well as stringent. The stringency must be confined to one or two points essential for the general well-being of the community, and must not descend with mischievous minuteness to unimportant details. The question we have to face is not—How are we to provide good healthy houses for the working classes? It is a question much more difficult to answer—and the difference cannot be too much insisted on—it is this—How are we to provide good healthy cheap houses for the working classes? and you may depend upon it that that is not to be done by stringent regulations which are not absolutely necessary, or which are in any way at variance with the maxims of sound political or social economy. But, gentlemen, another mode of clearing away the whole difficulty has been proposed, and if the country is prepared to adopt it, such considerations need not trouble us a moment. It would make short work of economic maxims and vested interests, for it is nothing more or less than "the good old plan" which, at a very early period of our history, served as the law of the land. That is the panacea which a Cabinet Minister of the present day is not ashamed to advocate. "Political power" is the direct and proper means to the end. By the extension of the suffrage and the redistribution of seats that power is to be placed in the hands of men not "paralysed by incurable timidity in dealing with the sacred rights of property," as our present legislators are; and then of course all is plain sailing! That is how Mr. Chamberlain would clear away all difficulties. "It will be his duty," he tells us, "to tell the people at large" that in this way they can get what they want, if they cannot get it by more legitimate means. They can have the right of might if no other, and it will be their own fault, not his, if they have not full scope for the exercise of that right.

It would be difficult to imagine anything more calculated to paralyse the energies, and alienate the sympathies, of every well-wisher of the working classes than such a declaration by a member of Her Majesty's Government—a declaration which, I shall take the liberty of saying, is as scandalous as it is impolitic.

**Mr. Hormuzd Rassam** has obtained from the Royal Academy of Sciences of Turin the first grand prize of 12,000 frs. (480*l.*), in consideration of the services he has rendered to science by his Assyrian and Babylonian discoveries, the results of which are deposited in the British Museum.

## NOTES AND COMMENTS.

THE equestrian figure which has been placed on one of the pedestals of Blackfriars Bridge as an experiment, is a sample of those works in which French sculptors are adepts. It is very clever, and boldly executed; but, if compared with FOLEY'S *Outram* or *Hardinge*, the difference in style will be apparent. It is only a dexterous artist who could model such a group as M. CLÉSINGER'S, but probably he could produce fifty models of the same class in the course of a year. Why the Corporation should desire to have equestrian figures is not evident—unless from the affection in which the "men in armour" are still held. If it were only a question of scale that had to be decided, why were not casts obtained of one or all of the "Four Continents" which form part of the Albert Memorial? If they will insist on equestrian figures, there will be a difficulty in deciding who are to be the subjects. At one time the Duke of WELLINGTON was inevitable, and so was Sir WILLIAM WALWORTH. But who would occupy the remaining pedestals? JOHN GILPIN as a train band captain might serve for one. What famous equestrian from the City is available for the last—unless a member of the present Corporation is immortalised?

IT is with regret we have to record the death of Mr. RICHARD DOYLE, an artist who appeared capable of displaying his humorous genius for many years to come. We might almost say that he never did full justice to himself. As a youth, he helped his father with the "H.B." sketches, and when he joined the staff of *Punch* it was his delight to caricature the figures which were produced by the high art and mediæval painters of those days. His fancy found more play in the sketches of fairies, which were happily introduced in connection with poems and articles. A design for the cover of *Punch* superseded one by LEECH. His "Manners and Customs of Ye English" were in a different style, and there appeared to be a prospect of his increasing the enjoyment of the public in co-operation with JOHN LEECH. But MARK LEMON, the *bon vivant*, believed that he was destined to be a champion of orthodoxy, and, with some of his gay companions, resolved to uphold the Ecclesiastical Titles Bill. Self-respect compelled DOYLE to resign, but, to his credit, it must be said that his skill was not given to any rival periodical. He etched the illustrations for THACKERAY'S "Newcomes." With the exception of "The Travels of Brown, Jones, and Robinson," "The Bird's-eye Views of Society," an occasional title-page, and book illustration, he rarely drew on the wood after he left *Punch*. In that journal he was most at home. Mr. DOYLE produced some water-colour scenes from fairy-land, which found a place in the Grosvenor Gallery.

WHEN RICHARD DOYLE forsook *Punch* he had not arrived at the maturity of his powers. His successor, Mr. TENNIEL, has vastly improved since 1851, and DOYLE'S skill in drawing and invention would in that time have also grown. As a humourist, however, he has had no successor. DOYLE'S designs did not need a witty description in type to give them point. His scenes could be appreciated by men who did not know a word of English, and some of his Californian situations would overthrow the gravity of a Red Indian. In the illustrations of "The Newcomes" there are indications of more gravity. A deeper spirit is also seen in the bird's-eye views, as in "The Music-hall," where the trapezist is seen risking his neck, while many of the spectators will not be at the trouble of raising their heads to look at him. In scenes of this kind we see how well DOYLE could realise types of character; and although there was less individuality about his men, women, and children than about LEECH'S, they are equally true; and hereafter DOYLE'S may be of more use to the historian and critic.

THE difficulty of providing dwellings for the London poor is seen from the little effect, compared with what is needed, that has been accomplished by the various Artisans' Dwellings Companies after a large expenditure of money. The Artisans and Labourers' Dwellings Company, George Street, Westminster, has a capital of 1,638,670*l.*, and 169,957*l.* additional from deposits, mortgages, &c. It has accommodated about 30,000 persons in 3,935 houses, many for two families, and 177 of the houses are in the provinces. The Improved

Dwellings Company, 34 Finsbury Circus, has a capital of 778,500*l.*, of which 316,000*l.* is borrowed from the Public Works Loan Commissioners. It has accommodated about 20,000 persons, in 4,066 rooms in 29 blocks; and it has other blocks in course of erection, for which a loan of 11,000*l.* has been obtained. The Metropolitan Association, 8 Finsbury Circus, has a capital of 234,082*l.*, of which 46,327*l.* consists of loans. It has provided accommodation for about 6,000 persons, or 1,257 families in 14 blocks. The Victoria Company has a capital of 112,695*l.*, of which 32,275*l.* is in loans, and provides accommodation for about 3,300 persons, or 666 families in 14 blocks. It will be seen that the total capital employed exceeds two millions, and not more than 12,000 families are accommodated.

SUBSCRIPTIONS are sought in order to present a testimonial to Mr. REID, who for so long a time has been connected with the Print Room of the British Museum. There are few students of the collections who are not in some way indebted to Mr. REID, whose courtesy was equal to his knowledge of the history of engraving. Through new arrangements, Mr. REID surrenders the management of the Print Room, and there is a general impression that his retirement is not of his own choice. A public servant who has done so much to make the treasures of the Museum accessible to artists and students deserves a reward, and we have no doubt that the sum of 500*l.* will be shortly collected. MESSRS. SMITH, PAYNE & SMITHS, 1 Lombard Street, have consented to receive subscriptions, which may be paid to the credit of the "Reid Testimonial Fund," or they will be received by Mr. F. SEYMOUR HADEN, or Mr. W. G. RAWLINSON, 17 Savile Row, W.

ON the 7th inst. a rather dramatic scene was witnessed in the Divorce Court of the New Law Courts. Some of the jury described the difficulties under which they performed their duty, and the impediments which had to be overcome before the box was reached. The Judge declared he had no responsibility, and was unable to provide in any way for the safe condition of his court. It should be remembered that the courts have been handed over to public use before they could be said to be complete. There has been no outlay on anything conducive to comfort, and it is needless to say that so long as nothing is done to adorn the walls, courts, waiting-rooms, and corridors must present a cheerless aspect. In the original estimates little more than the shell of the building was included, and Mr. STREET anticipated that he would be able to obtain funds to complete his work. It is now the duty of the Office of Works to authorise whatever is necessary for the lighting, heating, and adornment of the building.

ACCORDING to a statement prepared by the manager of the Edinburgh Street Tramways there are 981 miles of single lines of tramway open for traffic, constructed at a cost of 7,146,341*l.*, or an average of 7,284*l.* per mile. The number of miles run by the cars in the year was 42,185,758, and the number of passengers carried was 295,721,171, or nearly nine tramway journeys for each inhabitant of the three kingdoms. Roughly speaking, the revenue per mile is 1*s.*, the average fare of each passenger conveyed being only 1*7*/<sub>4</sub>*d.* The present working cost of tramways averages 79.22 per cent. of the gross receipts, and of this percentage 43.16 per cent. is spent in horse-haulage alone. Some substitute for this kind of haulage is accordingly desirable and Mr. BRUCE PEEBLES, C.E., is able to testify from his observations, that the wire-cable system is found to answer perfectly in American cities.

THE following artists have been invited to take part in the first exhibition of the newly-founded Cercle des Vingt, to be held at Brussels: From Belgium—MM. ALFRED STEVENS, F. ROPS, MELLERY, HEYMANS, and STOBBAERTS, painters; DE VIGNE, VAN DER STAPPEN, and VINÇOTTE, sculptors. From France—MM. GERVEX, painter; ROTY, medallion engraver; ENGELBERT, MERCIER, and RODIN, sculptors. From Germany—M. LEIBL, painter. From Holland—MM. ISRAËLS' père, MAUVE, and MARIS, painters. From Italy—M. GEMILÒ, sculptor. From Norway—M. BERGH, painter. From England—Mr. WILLIAM STOTT, painter. From United States—Messrs. WHISTLER and W. CHASE, painters.

## ILLUSTRATIONS.

## RAILWAY INN, WEST HOATHLY.

WE give an illustration this week representing the Railway Inn, which has recently been erected and opened opposite the West Hoathly station on the Lewes and East Grinstead line. The building has been designed in style after the old Sussex houses, and from the rapid rise in the ground a picturesque effect has been secured by raising the ground-floor, with half-basement under the front portion, and approaching the covered porches to the front entrances by means of outside steps. The house is built of red brick up to the level of the first floor, and the ground storey has been erected with hollow walls. The upper portion is of wood framing filled in with brick nogging and covered with ornamental vertical tiling, and the roofs are covered with plain tiles.

There is the following accommodation: On the ground-floor—parlour, bar, bar-parlour, tap, kitchen, scullery, &c., and outbuildings. The entrances to the house, bar, and tap are totally distinct. There is good cellarage in the basement under the front portion of house; on the first floor there are seven bedrooms; and to the south of the premises good stabling has been erected.

The work has been executed for Mr. DASHWOOD, of the Brewery, East Grinstead, and satisfactorily carried out by Messrs. CHARLWOOD BROS., builders, of the same town, the architects being Messrs. JOHN T. CHRISTOPHER and E. EMLYN WHITE, of 16 Bloomsbury Square, W.C.

## HOUSE AT BURGESS HILL, SUSSEX.

THIS illustration is taken from a drawing which appeared in the Royal Academy this year. The architect of the building is Mr. MERVYN E. MACARTNEY, Hart Street, Bloomsbury.

## NEW PREMISES, TRURO.

THE premises shown in the illustration have been lately erected for Mr. BLAKE. The building is on the site of the old high cross, and is near the new cathedral. The walls are of brick, with box-ground Bath dressings, which were supplied ready worked by Messrs. PICTOR & SONS. The architect is Mr. JAMES HICKS, of Redruth.

## LIBRARY CHIMNEYPiece, ABBEYFIELD, SHEFFIELD.

OUR illustration shows a carved oak chimneypiece and over-mantel to a library, which has the walls wainscotted with oak, fragrant cedar book-shelves, and a ribbed plaster ceiling of old South Yorkshire type, from the designs of Messrs. M. E. HADFIELD & SON, Sheffield, for Mr. B. WAKE. The woodwork has been well executed by Messrs. DEALEY & HORNER, Mr. TONY having executed the carving, and Messrs. STUART & SMITH the stove grates.

The painted tiles are by Mr. E. PAGE TURNER, 68 Newman Street, W., and illustrate countries visited in a tour round the world by two members of the family for whom the work has been executed. The jamb to the left of the spectator represents America; animals and birds, with the *Wellingtonia gigantea*, form the background for miniature pictures representing scenes in the States; a portrait of President GARFIELD is given at the top; over this is the first frieze panel, which contains a view of the Niagara Falls. Above the shelf, on the same side, are two panels with scenes in New Zealand; heads of the natives are introduced, birds, and the bones of the extinct *Dinornis*, are painted. In the pediment over the portrait, in the centre, Australia is represented, kangaroos in flight being the middle subject; on either side are the lyre bird and the emu, native tree ferns, and smaller birds filling up the interstices of the design. On the right are panels corresponding with those on the left; in these are painted views in India and Ceylon; below in the frieze the camel market at Aden is represented. This picture and the one of Niagara are supported on either side by shields bearing the arms of England, the United States of America, the empire of India; and Arabia, Egypt and the Nile are illustrated in the jamb below by views, birds, animals, and palm trees. The stove panels and painted hearth also bear out the general idea, although treated in a different key of colour, the tiles in the oak woodwork being in rich tones to harmonise, while those of the stove and hearth

are painted in a more cheerful hue. A strictly decorative treatment has been observed throughout both in drawing and colour.

## THE STARVED MONK'S TOMB, TEWKESBURY ABBEY.

THE tomb that is shown in the illustration is, like all works of the kind elsewhere, attractive to visitors to Tewkesbury. The figure is beyond the province of art, but the beauty of the shrine is unquestionable. The original drawing is by Mr. R. KNILL FREEMAN, F.R.I.B.A., of Bolton.

## CHAPEL OF ST. ERASMUS, WESTMINSTER ABBEY.

ALTHOUGH the Abbey of Westminster has often formed the subject of various paintings and drawings, it is far from being exhausted. There are many parts which are yet unknown to painters and to the public. One of them is the entrance to the little chapel which is supposed to have been dedicated to St. ERASMUS. It formed the subject of a capital water-colour drawing which was exhibited this year in the Academy, and is now reproduced by the ink-photo process.

## THE ARCHITECTURAL ASSOCIATION.

THE third ordinary meeting of the Association was held on Friday evening, the 7th inst., Mr. Cole A. Adams, president, in the chair.

In allusion to the late Mr. R. C. Page, the President said that the editor of *The Architect* had very kindly promised to publish some of Mr. Page's designs. These had now appeared in *The Architect* of that week, and he thought it would be only a pleasing duty on their part that they should ask the honorary secretaries to write a letter to thank the editor of *The Architect* for the courtesy he had extended to them as a body. The suggestion was adopted.

Mr. BERRY, hon. secretary, announced that, by request, the attendance at some of the classes had been postponed from Christmas week to the first week in the new year.

Mr. E. INGRESS BELL then read the following paper:—

## "Papers."

For the origin of the peculiar form of address which is known as a "paper," and which has—not inaptly—been called a "lay-sermon," we must, I suppose, go back to the time of the Greek philosophers, or perhaps to a still earlier date. It was natural when there was no printing-press, and the multiplication of MSS. was both costly and slow, that the poet and the rhetorician should seek to impart their views, when called upon to do so professionally, by means of oral instruction. And it was also natural that, instead of addressing themselves to individual inquirers, they should speak to assemblies of pupils and followers. There are, to my mind, few more attractive pictures in the whole range of ancient history than that of the Greek philosopher, thoughtful and dignified, draped in the most artistic costume ever devised, pacing the cool recesses of the portico and expounding the mysteries of his system of ethics or of art. Groups of eager listeners are disposed picturesquely on the broad steps, or recline against the massive columns, in every variety of graceful attitude, and under every conceivable effect of warm light and purple shade. Above, the blue unclouded sky; in the foreground, dark masses of myrtle or ilex brightened by flashes of colour in rose-bush and oleander, and the whole scene girt in with a belt of grey mountains or the far-off horizon of emerald sea. Such surroundings as these were in themselves an education. I need not sketch for you their modern counterpart. The lecturer spoke from tablets upon which the heads of his discourse were graven—a mere outline generally—to be filled up *ex tempore*. His theme was simplified by copious illustrations, which in the process of delivery would surely occur to the nimble Greek fancy. Sometimes the lecture was written—prepared with the most anxious care and the nicest art, and polished to the highest pitch of literary finish. There are speeches of Demosthenes still extant which were never spoken, in which every expression was weighed and every word artfully adjusted to the end in view. And the example he set was followed by many of his rivals.

The addresses of the Sophists, as they were called—in no invidious sense—were for the most part spoken by those who were accounted masters of particular arts to those who were supposed to be comparatively ignorant of them. The peculiar form of address which is delivered to those who are themselves more or less proficient in the subject-matter is of comparatively modern invention.

It might have been supposed that the invention of printing, with all its marvellous facilities of reproduction, would have almost wholly superseded the practice of oral instruction. But this has not proved to be the case. Either because one is more impressed by what one sees and hears than by what one reads, or more probably from the presence of the

element of personal curiosity, or for some reason unexplained, the address delivered in person maintains its ancient popularity. Although even the American railway porters read Mr. Mathew Arnold's works, it is nevertheless worth his while to cross the broad Atlantic and address in person the crowds of eager listeners who never fail to present themselves at his lectures. Indeed the "paper" promises to become the most popular of all forms of literary exercise. Its modern revival dates from the foundation of the Royal Society, which is but little over two centuries old. That society was instituted for the "improvement of natural knowledge." Its motto is "Nullius in verba." Its proceedings were to be "rather by action than discourse, chiefly attending some particular trials in chemistry or mathematics." The members were to communicate to each other their discoveries at such times as their affairs would permit. They were to "reason freely on the works of nature, pass conjectures, and propose problems on any mathematical or philosophical matter which came in their way." It is sad, but instructive, to have to record that within ten years of the foundation of the society its first historian thought it expedient to inveigh against the prevailing tendency towards luxury and redundancy of speech; and so warm did he wax on this point, as to wish that "eloquence might be banished out of all civil societies as a thing fatal to peace and good manners." He sighed over the evil as inveterate, and knew not where the desirable reform was to begin. So rapid was the progress of the "new learning" which was then agitating all the foremost minds of Europe, that at every meeting some member or members had something to communicate to his fellows. I cannot now stay to recount the strange discoveries and still stranger speculations with which the early records of these meetings abound. But I may remark in passing that to this day the meetings are less formal than of other societies, and I believe I am correct in saying that no syllabus of papers is prepared for the coming session. The society in this respect lives from hand to mouth. But the supply is un failing. The present distinguished President, in his inaugural address, pointed with pardonable pride to nearly two thousand printed pages as the record of the verbal activity of the closing session. The Royal Society has been the parent of a numerous progeny, and the system of the communication of matters interesting to the members has developed into the reading of set papers—a custom which has taken deep root, and threatens to divide mankind into two great families, those who read and those who listen. The first subject in the realm has graced it by his example. One princely brother reads what another princely brother writes, and the royal seal is thus set upon the spreading practice. I did attempt to get at the statistics of the subject, but after accounting for nearly 500 papers delivered in London alone during one session, I found a friend, the secretary of a private dramatic club, arranging a course of papers for private reading and discussion, by a few ladies and gentlemen devoted to the drama. In the face of this evidence of a practice conducted in secret—like the rites of some proscribed sect—it was obviously impossible for me to complete my calculations. If to the known number of papers read in London we add the suspected number of unrecorded instances, and then add a due proportion for all the considerable towns in the kingdom, we reach a total which is little less than amazing. And now the question arises—What is the outcome of all this immense intellectual activity? That also is obviously unascertainable and incalculable. It is, no doubt, considerable. It may be greater than I suppose; but I still think matters may be so ordered that the result, whatever it may be, shall be augmented. A little streamlet, which has for ages trickled down the crag side unregarded, is caught in its descent by a modern philosopher, and by wise conservation and direction of its energy is set to turn certain cylinders, and to generate that subtle and mysterious current which is given off, at the distance of a quarter of a mile, an intense light—white, brilliant, and abundant. Do you think that the broad and deep stream—the ever-widening flood and torrent of "papers"—papers social and scientific—papers æsthetic, artistic, architectural, archæological, antiquarian, and amorphous, give out a light proportionately brilliant and abundant; or, are you of opinion that a great portion of this cataract of learned disquisition—this oratorical Niagara, if I may so call it—passes away in mere confused noise and runs to waste?

And now, having said so much, you may perhaps infer that I would abolish, or at least curtail, the practice of reading papers. Not at all. I think the custom may with advantage be extended. But first it must be systematised; and the attempt can better be made by such a society as this than by more august bodies. There are many lines of inquiry and subjects of collective study open to you which could not be pursued by other bodies without compromising their dignity. It has been noted that fewer books are written by architects nowadays than heretofore. There are compilations of various kinds, and some hybrid volumes which approach, as nearly as the proprieties will permit, the tradesman's illustrated circular. There is also but a feeble struggle for the prize essays on professional subjects, although prize designs bring up crowds of competitors. The further cultivation of the "paper" amongst students would go far to remedy this defect. It has been said that the way to understand a subject is to write a book about it; and I will engage that no one, however conversant he may

have been with his theme, ever set to work honestly to prepare a paper about it without leaving off a wiser man than when he began. The incidental advantages attaching to this form of literary exercise are numerous and obvious, and have often been insisted upon. For my part, I confess that I think a little improvement is practicable, and I would ask your permission to suggest a few points for your consideration, with a view to conserve and systematise the forces at command. Although I wish to treat the subject in the abstract, and make my remarks as impersonal as possible, I must nevertheless keep in view the constitution and aims of the Association whose members I am now addressing.

Papers may be roughly divided into the following classes: 1. Those which embody the results of experience. 2. Those which formulate opinions. 3. Those which record observations. I might add a fourth division for those papers which resemble the later homilies of the Archbishop of Grenada, as reported by Gil Blas; but as papers of this class are never met within these walls, their consideration need not delay us. The papers in the first class—viz., those embodying the lessons of experience—are analogous to the lectures of the university professor. It is not to be expected that many papers of this character can be furnished by the general body of the members, who, for the most part, have their experience to gain. Such papers will, as a rule, be contributed by members who, having passed through the ranks, are engaged in the active duties of their profession. We are glad to accept from one the results of a lengthened experience of the legal side of architectural practice, and to accept them without question. If we want to get at the last lights on, say, the construction of theatres, we must learn from certain architects who are specialists, and in the same way, if we want to be posted up in hospital construction, successful house planning, church design, and so on, we must go to certain other specialists, and the addresses which these gentlemen may be good enough to prepare for us should pass without discussion. A few questions may follow such to elicit further information; but we should listen to them as to experts, and take thankfully the fruits of their long years of study and practice. The second class of subjects—viz., those which formulate opinions—are almost equally unsuited for treatment by young men. Opinion, to be worth anything, should be based upon experience, and experience comes with age. The opinions of young men are necessarily immature and notoriously unstable, their instability being only equalled by the confidence with which they are advanced. If this were a mere debating society, any subject would serve as a field for the practice of dialectics, and as a school for acquiring the art of public speaking, but it aspires to more practical ends, and merely speculative matters should absorb but a small part of our attention. We now come to the third class of papers—viz., those which are the records of personal observation—of which an excellent recent specimen will be fresh in the recollection of you all. This is a class of paper peculiarly fitted for the members of the Association, and one which should, it is thought, be more assiduously cultivated. Every year the seekers after knowledge go further afield, and every year the search grows more keen. Nothing would so much sharpen observation and help towards systematising the results as the knowledge that it was to be put into shape for the benefit of fellow-students. If the experiences of such were embodied in a compact and business-like paper, illustrated by equally business-like sketches, the greatest possible benefit would accrue to all concerned. For such a form of literary and artistic exercise is twice blessed—"it blesses him that gives and him that takes."

It is upon every account desirable that the Association should lean as little as possible upon extraneous support, and that the papers read at these meetings should as far as possible be contributed by the younger members. The record of personal observation affords one means to this end. But there are other opportunities of the same nature which appear to be but little used. If, as Bacon says, reading makes a full man, writing an exact man, and speaking a ready man, here we have an opportunity of acquiring all the literary virtues at once. It is a matter of common remark that one is more impressed by what one hears than by what one reads, and doubtless many a book that would otherwise be comparatively sterile, would, if translated into a lecture, bear fruit. It may be asked, Why should one member give up his time for the benefit of his fellows? I only mention this objection to express my belief that it would not weigh with the members of the Architectural Association; but as the labourer is worthy of reward, I would suggest that the permission to read a paper before the assembled members should be regarded as one of the prizes of the Association. I speak under correction, but my own opinion is that there would be a keen competition for the honour, that much unsuspected talent would very soon become apparent, and many an obscure little rill would show itself in a new character as a brilliant light.

Now a word as to the discussions which naturally follow certain papers, and which are often the least satisfactory part of the entertainment. As I have said, some papers should be received without discussion. Some demand the concurrent testimony or the criticism of those to whom they are addressed. Such papers should be so framed as to contain propositions upon which distinct

issues should be raised, and which should be spoken to explicitly. This part of the proceedings is often at present independent of all restraint. The worst of papers has some sort of coherence, consistency, and aim; but in the resulting discussion any member may start some wholly irrelevant subject, and lead the entire meeting off the track. This is constantly done; the scent is lost, and the stragglers, blown and winded by a fruitless run, are only recalled by the chairman's vote of thanks for the always remarkably excellent paper—a paper, notwithstanding its excellence, which often leads to no practical result whatever. This feature is not confined to any particular body, and is no more frequent here than elsewhere. Papers which are to be followed by discussion should have an interval between the reading and such discussion, so that the speakers may have time to think over the matter. Distinct propositions should be advanced, and the succeeding remarks should be rigorously kept to the subject-matter. By this means we might hope to get a sort of consensus of opinion upon many interesting topics, and essays prepared with much care would fill a useful function, instead of being, as they now too often are, the mere amusement of an idle hour. And such papers should not be too much spun out. Let me quote once more from the history of the Royal Society, and the rules which they endeavoured to impose in the matter of the communications addressed to that learned body when those communications had a tendency to become wordy and diffuse: "There has been a constant resolution to reject all the amplifications, digressions, and swellings of style; to return back to the primitive purity and shortness, when men delivered so many things almost in an equal number of words. They have exacted from all their members a close, naked, natural way of speaking—positive expressions, clear senses, a native easiness, bringing all things as near the mathematical plainness as they can." I confess to being an offender in nearly all these points; but that I may not be regarded as an utter castaway, I will so far "reck my own rede" as to summarise the foregoing propositions, which are:—

1. That papers embodying matters of professional experience should not be attempted by young men, but should be thankfully received from experts without cavil or critical discussion.
2. That papers formulating mere opinions should generally be avoided by the younger members of the Association.
3. That papers of observation are their peculiar province, and should be sedulously cultivated as a useful exercise to both readers and hearers.
4. That papers embodying and condensing the researches of distinguished writers could be made a valuable discipline for those who would undertake the necessary analysis, and the reading of such would prove a valuable service to the general body.
5. That the reading of a paper should be regarded as a distinction confined almost entirely to the active members of the Association, the permission of the executive being a guarantee of the excellence of the essay.
6. That the resulting discussion on any paper suitable for such should be severely regulated, and tend to the direct confirmation or the reverse of distinct propositions.
7. That all irrelevant and purely conversational comment should be repressed.

It is rarely the case that architects in full practice can afford the time to prepare papers for the edification of their younger brethren in the profession, although they all no doubt have the will. But that many of them would furnish the necessary materials for the compilation of such papers I have no doubt. And there could be no better exercise for a young man than a careful study of the works of any architect who had shown himself a master in some special work of art, whether ecclesiastical, domestic, civic, or what not, with the view of ascertaining the secret of his success. A series of working drawings of Board schools, for instance, would form a most valuable exhibition, and it would be invaluable if accompanied by a carefully compiled account of the principles embodied in the several designs, the accommodation secured, the difficulties of site or foundations surmounted, the constructive methods adopted, and the cost. A similar series for science schools, or for municipal buildings, for markets and other important works, might follow at decent intervals, and would form an educational exercise of the highest value. It is not likely that the members themselves could, from their own practice, obtain the materials for this form of paper; but I should be much surprised if the courtesy, which always allows the members of the Association to inspect actual works in progress, stopped short of rendering facilities for this sort of comparative examination of the works of the more successful architects of the day. Criticism should, of course, be suppressed; the object being to learn from the successful works of an acknowledged master the lessons which his works convey.

There is still another field open to the earnest student. From time to time books are published which embody the thought and work of a life; books which are too expensive for a young man to buy, and if read and studied thoroughly as they deserve to be, would take up a larger share of time than in this busy age is likely to be spared for the purpose. It would be not only a profitable exercise for the individual, but a wholesome economy of the energies of the general body of students if one, to whom the requisite facilities required be given, would master the subject, reduce it to a  *précis* , and give an intelligent verbal rendering of it, with appro-

priate comment and illustration. With some such modification the "paper" may not only retain its strange attractiveness, but become increasingly useful. In conclusion I admit, without reserve, that I am a shocking example of the system I deprecate; but I shall be content to account myself the last and worst specimen of a faulty system if, by drawing attention to this matter, I can be the means of inaugurating a better.

Mr. STANNUS proposed a vote of thanks to Mr. Bell for the paper he had read. In allusion to the suggestions thrown out in it Mr. Stannus observed that most people would read the digest of a work which they would not attempt to wade through in the form of a ponderous book. No writer there was he thought that could not be boiled down, or even evaporated to dryness. The Association had always been looked on as the opportunity for the budding orators of "another place" to try their powers of speaking. The first speech he had ever made was before the members of the Association, and it had been a great breakdown. Others, he hoped, would, under similar circumstances, receive the same consideration that had been extended to him on that occasion. If discussion wandered somewhat from the point it should be looked over, so that they might acquire the power of enunciating their opinions before a number of people. A young architect never knew how soon he might be called on to speak in public, for example, before a committee, &c.; therefore he hoped they would at times be allowed to digress, for the sake of the practice it gave the younger members in speaking. He agreed with Mr. Bell that the reading of a paper should be considered an honour. He thought the junior members might write and submit papers to the committee for approval. Papers also might be written on selected subjects, and when the month of October came round, they would not have to go in search of papers. In referring to the medals given for the best papers read at the Institution of Civil Engineers, Mr. Stannus said that a prize might be given for the best paper read in the session, whether by a member of the Association or not, and one for the best paper read by a member of the Association. It might also be worth while from time to time to publish a collection of the best papers, with such improvements as might occur to the authors.

Mr. J. A. GOTCH seconded the vote of thanks, and remarked that these suggestions were valuable ones, but that the difficulty would be to carry them into practice. If the number of essays sent in last session in competition for the Essay prize were any criterion of the power of writing essays, that power seemed to be extremely limited, for only two essays were sent in. In his opinion it was already a great distinction to read a paper at the meetings, but he was not sure that they would increase their audience if they did not go outside the Association for papers. No man was a prophet in his own country, and they would find the room empty when a paper came to be read by Harry or Dick, &c. Then, again, as a first requisite a paper should not be dull, and if they were going to have much boiling down—even to dryness, as Mr. Stannus said—it would be done at considerable peril. Instead of dry bones they wanted flesh and blood, and the more beauty the flesh and blood had the better. They ought, therefore, to be most careful before they did anything which would make papers less interesting. It was a difficult thing to write a paper worth reading, and in the next place it was very difficult to read a paper properly. He had had a good deal to do with various societies, and his experience was that few succeeded in either. Papers should also be simple, and if they were to give papers such as Mr. Bell suggested on Board schools, the audience would either go out of their minds or out of the room. Complicated figures were always avoided in political speeches. Anything distinctly dry or skeleton-like was always better delivered in the form of an article or a pamphlet than as a paper. They came to the meetings to be partly instructed and partly amused, and they did not want to go away with a headache. In a word, he considered that a paper should be as simple and elementary and as lively and pleasant as possible, and anything in the way of dry details should be given otherwise than orally.

Mr. W. H. PRATT said there were two points of view to consider papers from—whether papers should be written to attract an audience or written in such a way as to be of value for readers. He considered it was important that papers should be given for hearing rather than for reading, because more knowledge and information was gained by listening to a paper than from reading it afterwards. Mr. Bell said they should lean as little as possible on extraneous help in the matter of papers; but he did not agree with Mr. Bell in this. The Association had up to now done extremely well by going outside their society for papers, and it had attracted large audiences. In addition, they got the results of men of experience put before them. The aim of the committee had been hitherto to get persons who were practical architects to give them such papers as Mr. Bell had suggested, and in matters of detail improvement might perhaps be made. It would never do for architects to hand over their materials for another person to work up into a paper. If they could not have the men themselves, it would be better to go elsewhere for a paper. In an association of students, what Mr. Bell had said as to young architects not speaking or reading papers without experience must not be taken too strictly, or it would do harm to the discussions. It would

rather be an advantage not to be called to order, if at times they transgressed.

Mr. C. H. BRODIE said he differed from Mr. Gotch when he said that members would not come to hear their fellow-students read papers. The contrary happened on the occasion of two previous papers—one on "Italy," and another on "Sketching Tours."

Mr. F. T. BAGGALLAY said that in the papers read to them they had from time to time listened to a great variety of subjects. Sometimes the papers were archæological, and discussed why certain bits of pottery had been built into walls of buildings, and sometimes they listened to papers scientific and deep, so deep that the lecturer, seeing by the countenances of his audience that it was too deep for them, rushed to the black board, and did very accurate sums, which only mystified his audience the more. They had, however, few papers from which they could carry away useful ideas. What they wanted was to be able to carry away something to think of, and which might be further developed at a future day.

Mr. A. T. ELLISON said he thought that there would be no difficulty in getting papers written by the members if the proper steps were taken to get them. At the end of the session a list of subjects might be prepared and members invited to write on the subjects; the committee could then select the best papers out of those submitted. Every young architect ought to learn how to put his ideas before an audience in proper form, and he thought there ought to be a class in which they might be able to practise speaking. He had often asked members to join him in practising speaking and debating. The class of construction, in which papers were read and discussed, was, he had noticed, one of the best attended of the classes.

Some other members having joined in the discussion,

The PRESIDENT said Mr. Bell's paper had provoked more discussion than any before that he remembered. The numerous remarks it had elicited showed how general the interest had been; and if it tended to increase the number of papers, the increase would be desirable if the papers were as interesting and as pleasantly delivered as the one Mr. Bell had just read to them. The time of the Association was already so filled up that anything in the shape of a debating society would have to be established outside the Association. It was merely necessary to point out what great advantages London possessed in respect of such societies. The President then put the vote to the meeting.

Mr. BELL, in reply, commented on various remarks which had, he thought, been made in misapprehension of his real meaning. With regard to what Mr. Gotch had said on his suggestion to have some papers, as studies of the works of architects—Board schools, municipal buildings, &c.—that such papers would result in tables of statistics, and drive people out of the room or out of their minds, he would remind them that Mr. Gladstone used to make the Budget read like a fairy tale, so that people were sorry when he had finished. He had certainly no intention of appearing to try and repress young architects; rather the gist of his paper was that young men should be encouraged and led to esteem it an honour to address their fellow-students. He felt it was a great misfortune the younger men so seldom came forward, for he could not believe that in an army of young architects numbering over 1,000 there were not many who could not bring before their fellow-students what they would be glad to hear.

## SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE usual monthly meeting of this society was held on Monday, Mr. Ramsay of Kildalton, M.P., in the chair. Before proceeding to the business in the billet, Mr. J. R. Findlay, the secretary, called attention to a group of four *figurine*, or small statuettes of terra-cotta, from Tanagra, in Boeotia, which he had obtained in Naples. These charming little figures, which were first prominently brought into public notice at the International Exhibition in the Trocadero in Paris in 1878, were found in considerable numbers in the ancient necropolis of Tanagra. The tombs were of two kinds—an earlier series, with painted vases, and a later, which consisted of cists formed of slabs of tuft arranged in rows. The *figurine* were found sometimes in the cists, sometimes on the covering stones. Their object was not explained in ancient literature; but they are works of art of a very high class, exhibiting a peculiar beauty and sweetness of expression, and are valuable as giving types of the familiar life of the Greeks that are nowhere else to be found.

The first paper, by Dr. Robt. Munro, F.S.A. Scot., Kilmarnock, gave an account of the megalithic monuments of Holland, and their associations with analogous remains in Northern Europe, from observations made during a recent tour through the Low Countries and Scandinavia. The museums of Holland, he remarked, are not rich in prehistoric remains, and, with the exception of a remarkable group of rude stone monuments called "hunebedden," or giants' graves, which are found in the north of the country, Holland possesses no megalithic remains of any kind. These "hunebedden," of which Dr. Munro visited a considerable number, situated chiefly in the province of Drenthe, are elongated chambers, the sides and ends formed of large stones set

in the ground, supporting enormous covering stones. When there was an entrance to the chamber, it seems to have been placed usually on the long side facing the south, the direction of the chambers being generally east and west. In some instances they were surrounded by a second range of smaller stones, but only a few show indications of having been formerly covered by an earthen mound. No traces of bronze or any instruments of metal have been found in them, and Mr. Franks has assigned them to the age of polished stone implements. During the years 1866-68 these monuments were threatened with complete destruction, owing to the peasants having commenced to break up the stones for road metal; but fortunately the Government interfered, and purchased the land on which they were situated, and they are now preserved as national monuments. Akin to these megalithic monuments of Holland are the "jettestuer," or giants' graves, of Denmark, of which Dr. Munro described a characteristic example visited by him at Roeskilde. The chamber was about 8 yards long, 3 yards broad, and rather over 6 feet high. The roof, which was formed by four immense blocks of stone, was supported by fifteen great slabs set also on end, which completed the circumference of the chamber. This sepulchral construction differed from those in Holland by being wholly covered by a great conical mound of earth. The objects found in these Danish chambered mounds are entirely of the Polished Stone Age. Dr. Munro next described the Stone Age burials of Sweden. In this country the megalithic tombs are confined chiefly to the southern provinces, and number in all about 500. Their variety of construction is greater than in Denmark and Holland; Hanover, Oldenburg, and Mecklenburg are rich in similar monuments of the Stone Age, and Dr. Munro exhibited photographs of several in the district of Stralsund and the Isle of Rugen, taken for Dr. Rudolf Baer, to whom he was indebted for duplicates. In conclusion, he referred to the chronological sequence of the burial customs deduced from a comparative examination of the contents of these tombs in Northern Europe.

The second paper was entitled "Notes on some Continental Museums—in France, Central Germany, and Belgium," by Dr. Joseph Anderson. The nature of the national collections in the museums of St. Germain, Mayence, and Brussels was described and the methods of arrangement indicated. Dr. Anderson also noticed a number of the provincial museums of France, Germany, and Belgium, instancing those of Amiens and Rouen in France, Bonn and Cologne in Germany, and Namur in Belgium, as collections of interest and importance. In conclusion, he drew attention to the characteristics of the Scottish collection as compared with the national collections on the Continent, the most important of which he had now at different times examined. While there were on the Continent national collections that were of greater extent than that of Scotland, he had nowhere seen one more completely illustrative of the whole consecutive history of culture within a national area, and nowhere a collection of such importance so inadequately accommodated.

In the third paper, entitled "Notes on some Continental Churches," Mr. J. R. Walker, architect, F.S.A. Scot., called attention to the characteristic features of some of the finest of the Gothic and Romanesque churches of the north of France, the Rhine, and Belgium, illustrating his remarks by an extensive series of photographs and a number of drawings of fonts made during a recent tour in company with Dr. Anderson. After adverting to the differences that distinguished the contemporary Gothic architecture in France and England, he noticed the special characteristics of the cathedrals of Amiens and Rouen, the former of which—admittedly one of the most beautiful in Europe—is nearly contemporary with Salisbury; the church of St. Ouen, one of the most splendid specimens of ecclesiastical architecture in Normandy; Notre Dame, in Paris, with its peculiar horizontality of feature; and St. Denis, the Westminster of France. Passing next to the Romanesque churches of the Rhine, a group in every way worthy of the most careful study both by the antiquary and the architect, he noticed the interesting church of Worms, which retains a peculiarity common to many of the German Romanesque churches, viz., the possession of a double choir, one east and one west; the church of St. Alban at Mayence, begun in the tenth and finished in the eleventh century; the church of St. Castor at Coblenz, and the cathedral at Frankfort, standing in the midst of the old town, with its picturesque old wooden houses, recalling the older parts of old Edinburgh; the cathedral of Limburg, romantically situated on a rock rising high above the town; and the still more ancient and peculiar church of Dietkirchen, further up the Lahn. A volume might be written on the churches of Cologne and the magnificent works of art they contain—the Church of the Apostles, St. Gereon, and St. Mary in the Capitol, the last of which, for symmetry of plan and beauty of internal effect is not excelled by any other church in Germany. The cathedral itself, and the church of Great St. Martin, next to it, are most conspicuous in the town. The churches of St. Severin, St. Andrew, St. Cunibert, and St. Ursula have each their special features of interest, and in many of their chapels and treasuries the works of mediæval art—fonts, monuments and shrines, or other relics—are numerous and important. The splendid minster of Aix-la-Chapelle, the churches of Liège, Brussels, Antwerp, Ghent, and Bruges were also noticed.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

THE following is an example of the home exercises in the class of construction which are to be worked by the members:—

Find the centre of gravity of the cross section of a cast-iron girder 2 feet deep, bottom flange 18 inches by 2 inches, top flange 6 inches by 1 inch, thickness of web at top 1 inch tapering to 1½ inch at bottom flange. Where is the "neutral axis?"

A rod of wrought iron 2½ inches diameter, and 20 feet long, is used as a vertical tie in a roof, and the stress is such as to elongate it one-eighth of an inch. What is the pull in the rod? what is the "limit of elasticity" of material?

A cantilever, 8 feet long and 9 inches deep, of 1 cross section, is fixed into an 18-inch brick wall so as to project 6 feet 6 inches. Find the horizontal stress in either flange if a weight of 1 ton is suspended at its extremity.

If three of the above cantilevers are placed 10 feet apart, what will be the minimum necessary height of the wall resting on these cantilevers? Specific gravity of brickwork equals 112 lbs. per cubic foot. What are the forces and couples (if any) keeping these cantilevers in equilibrium?

## THE ROYAL ACADEMY SCHOOLS.

THE prizes obtained by the students of the Royal Academy of Arts were distributed on Monday at Burlington House. Sir F. Leighton, P.R.A., remarked that before delivering the formal address which was expected from him on an occasion like this, he desired to say a few words on the competition. When the works which were submitted to the members of the Academy did not rise above the average level of merit, or when they in some cases fell slightly below it, silence would be natural and admissible. But if the level were in some cases higher than usual—and that, he was happy to say, was the case this year—mere justice, as well as his own inclination, compelled him to take note of so gratifying a fact. Before doing so, however, he should wish to repeat what he had said on a previous occasion, and what could not be said too often—namely, that a large competition and award of prizes could only give an incomplete, an unsatisfactory, and an inadequate expression of the impression which had been made upon the body by the whole series of the designs in the competition. It would bring before them the fact that certain works were better than others; but it did not tell them by how much those works were better than the others, nor could it bring before them that close and nice balance—a matter very often of a single vote or of two votes—which existed between the work of a student who went away covered with honours and the work of another who went away unrewarded and unrecorded. It appeared to him that this consideration might afford a certain comfort to those among his audience who felt that they came under the latter category. In three classes very excellent work had been brought before the members of the Academy—viz., in the painting of the head from the life, in the cartoon of a figure life size, and in the 10% premium. But there were two classes in which the work rose to a higher level. One was that of the sets of six drawings from the life, in which the work was very excellent; and the other was the competition in sculpture. They all knew with what warm and vigilant interest he watched the development of this great art among them, and what he said on his own behalf he might also say on behalf of all his colleagues. Therefore they would the more readily believe with what unfeigned satisfaction and joy he hailed every such sign of vitality and strength in that branch of their study.

The distribution of the prizes was then proceeded with as follows:—

Historical painting—*St. Peter denying Christ*—gold medal and travelling studentship (200*l.*), William Mouat Loudan. Landscape painting—

Calm and deep peace on this high wold,  
And on these dew-drops that drench the furze,  
And all the silvery gossamers  
That twinkle into green and gold

—Tennyson, "In Memoriam," XI.—Turner Gold Medal and Scholarship (50*l.*), Robert Octavius Rickatson. Landscape painting—*An old English Country Inn*—Creswick Prize (30*l.*), H. A. Olivier. Painting of a figure from the life, silver medal, first, not awarded; second, George Goodwin Kilburne. Painting of a head from the life, silver medal, first, Emily Merrick; second, George Walton, disqualified owing to having received the same medal last year. Copy of an oil painting—*Virgin and Child*, by Van Dyck—silver medal, first, not awarded; second, Kate Bannin. Copy of landscape—*Landscape*, by Pietro Francesco Mola—silver medal, not awarded. Cartoon of a draped figure—*Antigone pouring the Offerings over the dead body of her Brother*—

... from a vase of bronze, well wrought, upraised,  
She pours the three libations o'er the dead

—(Sophocles, "Antigone"), silver medal and prize (25*l.*), Maurice William Grieffenhagen; silver medal (extra), William Henry Mar-

getson. Design in monochrome for a figure picture—*The Martyrdom of St. Sebastian*—Armitage prizes, first, 30*l.* and bronze medal, not awarded; second, 10*l.*, Charles Douglas Richardson. Design for the decoration of a portion of a public building—*The Angel appearing to the Shepherds* (St. Luke ii.)—prize (40*l.*), Margaret Dicksee. Drawing of a figure from the life—silver medal, first, George H. Sydney Cwell; silver medal, second, William Dickson. Set of six drawings of a figure from the life—first prize (50*l.*), John Ernest Breun; second prize (25*l.*), Herbert Sydney Percy; third prize (15*l.*), John Evans Eccles; fourth prize (10*l.*), Sidney Paget. Drawing of a head from the life—silver medal, first, Annie Mary Youngman; silver medal, second, Christine Connell. Drawing of a statue or group—silver medal, first, Edward Clegg Wilkinson; silver medal, second, Minnie Jane Shubrook. Drawing of a statue or group—prize (10*l.*), Harry Windsor Fry. Perspective drawing in outline (open to painters and sculptors only)—*One of the Staircases leading from the Embankment to Waterloo Bridge*—silver medal, no competition. Line engraving of a drawing of a figure from the life—gold medal and prize (25*l.*), no competition. Composition in sculpture—*Socrates Teaching the People in the Agora*—gold medal and travelling studentship (200*l.*), Henry Bates. Set of three models of a figure from the life—first prize (50*l.*), George James Frampton; second prize (20*l.*), Frederick William Pomeroy. Model of a design—*Aeneas Bearing Anchises on his Shoulders from Troy*—first prize (30*l.*), Arthur George Atkinson; second prize (10*l.*), Emmeline Halse. Design for a medal—saving life—silver medal, no competition. Model of a figure from the life—silver medal, first, Frederick William Pomeroy; silver medal, second, Henry Bates. Model of a statue or group—silver medal, first, not awarded; silver medal, second, Arthur James Wall. Model of a statue or group—prize (10*l.*), Agnes Pringle. Design in architecture—an academy of arts—gold medal and travelling studentship (200*l.*), Edwin George Hardy. Set of architectural drawings—the two eastern bays of the north cloister of Westminster Abbey—silver medal, first, Thomas Maclaren; silver medal, second, Albert David Smith. Set of architectural designs (upper school)—a London house—prize (25*l.*), Reginald T. Blomfield. Set of drawings of an architectural design (lower school)—prize (10*l.*), Thomas Ward. Perspective drawing in outline (open to architects only)—*The Tower and Spire of Bow Church*—silver medal, William Toogood.

Sir F. Leighton next delivered his address, which is printed on another page.

## LINCLUDEN ABBEY.

AT the monthly meeting of the Dumfriesshire and Galloway Natural History and Antiquarian Society, Mr. Barbour, architect, read the first of two papers on Lincluden Abbey, which has recently been undergoing excavation at the expense of the proprietor, Captain Maxwell of Terregles, and the architectural beauties of which have been thus revealed afresh. The abbey was founded in the last half of the twelfth century—about 1160—by Uchtred, Lord of Galloway. Archibald the Grim, Earl of Douglas and Lord of Galloway, converted it from a nunnery (in consequence of certain scandals) into a collegiate church and founded a chapel, in the reign of Robert III., where he erected a monument to his father, the Good Sir James. Princess Margaret (granddaughter of Robert Bruce), as Countess of Galloway, was a liberal benefactress of the establishment, and at her death she was buried in it—1450. The ruins as they have hitherto appeared are supposed to belong to the fourteenth century, but the recent excavations have exposed portions of the foundations of Uchtred's edifice. Mr. Barbour's paper dealt chiefly with the buildings following upon the foundation of Uchtred. The remains of the twelfth century, he said, show that the church, or part of it, was probably erected within a short time of the date of the foundation, but either its entire building extended over something like a century, or important alterations were made upon it at that distance of time after the foundation; that it consisted of a nave 56 feet by about 20 feet, a north aisle 9 feet wide, and which appears not to have been the same extent westwards as the nave; probably also a south aisle of like width, a chancel about the same width as the nave, but probably considerably shorter than the present one, short chancels being common at this period; and there would also no doubt be the other buildings necessary to the establishment. The nave was separated from the aisles by arcades, which if they extended westwards as far as the nave would be of four bays; the piers and western responds were probably cylindrical, and the eastern responds were clustered and rested upon pedestals which received the ends of steps ascending to the high altar, and the piers were united by depressed pointed arches, recessed and double splayed on section, and having a hood moulding; the western doorway was about 4 feet 3 inches in width, and it had a semicircular arched top, two of the rings of which were decorated with zigzag ornaments, and the steps of the doorway descended to the church; the windows, when after a lapse of some time the building had been completed or had important alterations made on it, were divided by mullions and tracery, and some of the tracery had circular-top openings cusped; the walls were of the

red sandstone of the district, probably found at the river-side near the site; the floor was of sandstone pavement, and the roof, the construction of which we do not know, was probably covered with slates, large numbers holed for pins being found embedded in the walls of some of the latter parts of the ruins. The church was in style principally transition from Norman to Early English, but with some parts in the latter style well developed. It was small, and not highly decorated, but not, as has sometimes been suggested, comparatively rude. The architectural style in which it was built, and which characterises a great number of the finest mediæval buildings in England and Scotland, was well worked out, and the design was simple and massive, but not without some touches of lighter ornamentation.

### THE NEW LAW COURTS.

THE report of what passed in Sir James Hannen's court on the 7th inst., illustrates, says a correspondent of the *Times*, the two prevailing characteristics of the New Law Courts—darkness and draughts. Let me endeavour to give some idea of the extraordinary qualities of the building in these two particulars.

Access is given to the various courts, offices, and rooms which surround the central hall by three "corridors," as they are called, one of which is for the exclusive use of the judges, the second for barristers and others concerned with trials in progress, the third leads to various offices and rooms. Most of the judges' corridor is fairly lighted, the rest is as described by Sir James Hannen. The barristers' corridor is almost always, even throughout the brightest days, lighted by the electric lamps. The third corridor is so dark that gas is indispensable there even at the brightest noon in summer. Judging from the complaints of the jurors in Sir James Hannen's court, there seem to be stairs or passages to be traversed by jurors which are dangerously dark. Under the courts is a series of waiting-rooms for witnesses, but these are so gloomy and forbidding that they are never used. Nobody would stay there a moment who could by possibility escape. Adjoining these are prison-like chambers where juries who do not at once agree are locked up. Here the want of light amounts to more than a mere discomfort, since it is often impossible, for example, to examine documents as effectually as this should be done when fraud or forgery is alleged, otherwise than imperfectly. The refreshment-rooms, it may be added, are scarcely less repellent, and the profits to be made by the contractors for this department can be but lean, owing to the essential unattractiveness of the rooms, which can never be made agreeable resorts, and are, moreover, difficult to find. The real truth is that the interior arrangements of the whole building are characterised by the gloom and confinement which would be appropriate enough to a Carthusian monastery, but which are altogether out of place and highly inconvenient in a great and busy centre of public business. The normal penumbra in which London has to do its work surely did not require aggravating, and to an absurd degree, by express design.

It appears that the Probate and Divorce Court, and therefore also, probably, the other contiguous courts on the west side of the central hall, since these are similarly constructed, are *loca facta furentibus Austris* in respect of draughts. The Courts of the Queen's Bench Division have all this defect in various degrees. In the course of the present week either judge or jury, or both, have made complaints of no less than five of these courts, and in one of them both judge and jury have done so loudly and repeatedly. The very important case of *Priestman v. Thomas* was conducted under considerable difficulty owing to the state of the court. Judge, jury, and the public were treated like the bad angels in "Paradise Lost," who, as will be remembered, in order that no experience of excessive discomfort might be wanting to them as arch-culprits, are represented as having been alternately baked and frozen. Milton's imagination, however, fell short of conceiving the miseries of an oppressively heated and dried atmosphere traversed by chilling blasts, which is, unhappily, a too familiar state of affairs in the new courts. Only a very small proportion of the complaints which are made from the Bench and the jury box—whence the only audible complaints can come—are reported in the newspapers; but the number which have found their way into print within the last few days should, surely, have engaged the very grave attention of those who are responsible for the evils which have now been sufficiently proclaimed.

The state of things which exists at this moment may be described as follows: The intention of the whole arrangements for ventilation is that air shall be pumped up through holes in the floor and be drawn off by "exhausts" near the ceiling, so that there may be a constant upward flow. In practice, the exact reverse of this occurs. There is a steady, and almost unrelenting, descent of cold air down the walls behind and at each side of the Bench, forming a current (the "plunging draught" of the Probate Court) which sweeps across the seats and desks immediately below the Bench. This current finds its way upwards in a broader and less exactly defined stream near the public gallery, and escapes mainly by the two exhausts on either side of that gallery. The

downward current which has been mentioned is but little felt when the external temperature is about the same as that within the courts, but it becomes stronger with colder weather, and may thus be expected—and the prospect is not encouraging—to attain in January a malignant vigour which it does not yet by any means possess. It has often been found sufficiently active to blow smouldering brown paper at once into a flame. Owing, no doubt, to the interruption caused by the gallery over the jury box, the set of the main current is down the opposite corner of the court. Its course is readily made visible by means of a small balloon anchored to the desk below the Bench by a thread about 2 feet long. The balloon is kept by the current in a position which causes the thread to maintain an angle—almost always of many degrees, and sometimes of more than 45 degrees—with the perpendicular. The jury, though they frequently have good reason to complain, are thus entirely out of the track of the worst of this current, and it is mostly deflected from the Bench by the canopy, with the further aid, in some cases, of a screen.

The evil is greater in some courts than in others. No. 3, which has been referred to in connection with the trial of *Priestman v. Thomas*, is one of the best, and the adjoining court, No. 4, perhaps the worst. The condition of this latter court was the occasion of much serious illness last spring. In every court the intensity of the evil varies from time to time, occasionally ceasing altogether, and then suddenly becoming once more almost intolerable—indeed quite so, except to persons very exceptionally constituted.

If any attempts have been made to remedy evils which were felt from the very first moment that the courts were occupied, and fully admitted many months ago, such efforts have entirely failed of effect; but others will have to be made until success is achieved, since it is quite impossible that the present state of things can be indefinitely endured. Some real and honest exertion should be at once made to mitigate now, and eventually cure, the mischievous evil which has been described, which is a very serious one indeed to many people, and is the subject of unceasing complaint on all sides.

### THE DUOMO, FLORENCE.

THE new façade of the cathedral has been uncovered. Over the central door is a bas-relief of Our Lord in glory, surrounded by angels, blessing the city. Directly under the great rose window is a large statue of the Blessed Virgin, holding the Infant Saviour in her arms. The niche in which this statue is placed is decorated with twisted columns, inlaid with mosaics of red, gold, and green. On each side are ranged the Twelve Apostles in separate niches. In the arch of the centre door is a fresco, representing the Virgin receiving oblations, with the lilies symbolical of the city at her feet. This fresco will, eventually, be replaced by a mosaic of the same subject. A provisional model of the two systems for completing the topmost part has been placed over each wing. The tricuspidal, or pointed form, is placed to the right of the great door; and on the left side, nearest to Giotto's tower, is the basilicata, which is generally considered to be the most in keeping with the character of the edifice. Public opinion is much divided on this question. On the architrave of the centre door is the coat of arms, carved in the stonework, of the late Pius IX., who gave 3,000 frs. and a precious mosaic towards the building fund. To the right are the arms of the House of Savoy, who contributed 100,000 frs. To the left those of the House of Lorraine, who gave 42,000 frs. and all the woodwork. Besides these are several other coats of arms of the principal donors, also carved on the stonework, amongst others those of the Earl of Crawford and Balcarres, Prince Demidoff, Signor Peruzzi, late Syndic of Florence, and the Archbishops Limberti and Cecconi. The entire expense of the façade up to the present time has not exceeded 900,000 frs. In the bank there remains 40,000 frs. towards the completion of this grand work.

### THE BUILDINGS OF BARI.

THE following account of Bari (the original Bari of the West) appears in the *Guardian*, and forms part of Dr. Freeman's series, "Iter ad Brundisium":—

Bari seems, at least in its history, as much Greek as Italian or Norman. It would seem neither unnatural nor unpleasant if Greek were still the tongue of the seafaring folk of Bari, much as a Norman in his own land often carries an air about him which would make Danish seem a much more natural speech for him than French. But the great buildings of Bari belong to that mixed Norman and Italian style of which we have already seen something at Bitonto. The architectural attractions of the city are chiefly to be found in two great churches and one smaller one. The castle, standing by the sea, should have its landward side walked round, and the walk will reveal much of picturesque outline and a little of good detail. But it is the churches, above all the great abbey of St. Nicolás, which are the glory of Bari. They all lie in the old town by the sea; the old town of narrow

and crooked streets, in which it does not much matter which way you go, you are sure to come either to the castle or to one of the churches before very long. Very different are things in the new town, which we may rejoice in as we look at it as a sign of Bari's abiding or renewed prosperity, but which can raise no feelings of pleasure on any other ground. Its streets, crossing each other at right angles, are indeed carefully dedicated to the worthies of Bari; but, unless we can always remember which of several perhaps not very familiar worthies watches over each of several angles which are exactly alike, it is easy to take a wrong turn and to put oneself under the care of Andrew of Bari when we ought rather to be commending ourselves to Robert. And under either protection we yearn in the wide straight streets for some physical shelter from the Apulian sun, and wonder why modern Rome, modern Athens, and modern Bari should have so much less common sense than Bologna, Padua, and Corfu had in days long past. Still amid this rectangular labyrinth the sea is a help on one side, while on another the tall tower of the metropolitan church of St. Sabinus beckons us into the older streets, whose narrowness and crookedness at least supply shade. That tower, one of the tallest and stateliest of Italy, we naturally assume to be a detached campanile, without a fellow and standing apart from its confederate buildings, church and baptistery. So it doubtless would be in a purely Italian city; but here we are in the city where the Norman displaced the Greek. The two great churches of Bari, like that of Bitonto, have their towers wrought into the building in Norman fashion, and at the *duomo* the great round baptistery is also merged in the same mass with the church and its towers. Both of the great churches of Bari have east ends of the same kind as that at Bitonto; the apses are swallowed up; the place where the great apse should be is marked by a single splendid Romanesque window. The eastern towers of St. Nicolas have never been carried up; at St. Sabinus the southern one has perished, but the northern one still soars in all its majesty, thoroughly Italian in its conception, but rather to be called Norman in its detail. St. Nicolas has also another pair of unfinished towers at its west end, standing at once beyond the aisles as at Wells and Rouen, and in front of them as at Holyrood. They flank a grand Italian front which one would think would be finer without them. These western towers are absent in the metropolitan church; but that has a most perfect octagonal cupola over the crossing, the grouping of which with the two lofty eastern towers, if there was any point from which it could really be seen, must have been wonderful. Thus in both churches something of a German outline has either been consciously brought in or has been incidentally stumbled on. The four towers of St. Nicolas, the octagon and eastern tower of St. Sabinus, will easily find Rhenish fellows, though we should perhaps have to go as far as Angoulême for a single tower of equal majesty mourning over a vanished brother. In other points the external arrangements of the two great churches of Bari have much in common. The rose windows, the coupled windows, the blank arcades, are much the same in both. So is the choice of animal forms for the fanciful supports of columns. In most places the lion discharges that function—in a building designed by lions we should doubtless see something different. So we do here at Bari, where the solid forms of the *pachydermata* are, perhaps discreetly, preferred to the lighter *carnivora*. The elephant, we think, is to be found in both churches, and the huge earth-shaking beast is represented so as to remind us both of Pyrrhos and of Hannibal; some have the smaller ear of India, some the larger of Africa. The hippopotamus appears only in the west front of St. Nicolas. Had the daring shipfolk who bore away the saint's bones from Lykia made their way to the Nile also?

When we pass the threshold of the two buildings we see that their fate in modern times has been very different. St. Sabinus has suffered much as Bitonto has suffered. The upper part of the building is hidden in just the same fashion, and ugly tricks have been played with the columns and their capitals. St. Nicolas, on the other hand, has been left comparatively alone. The chief changes which it has undergone must have taken place not very long after the original building. The original plan was much the same as that of Bitonto—three arches from columns, a massive pier, then three more arches from columns. But this arrangement was disturbed at an early time by throwing three spanning arches across the nave. The effect is so striking that we can hardly regret their presence; but it is perfectly easy to see that they are insertions, and, though they are essentially of the same style, yet they differ in their details from the original columns. These last all approach more or less to the Corinthian type; in the under-church the patterns are more varied. Here are still the wonder-working relics of St. Nicolas, and the balsam or "manna" which flows from them may still be drunk. In the *duomo* the under-church has been restored out of all ancient character, but it still keeps an ancient Byzantine picture.

As so often happens, the secondary church of Bari altogether surpassed the mother church in historic fame and local honour. To ourselves, the fact in its history which comes home most nearly is that it was here that Urban held his council, here that Anselm, to the satisfaction of all Western minds, refuted the creed of the East, here that he interceded with the pontiff and the assembled

fathers on behalf of the king who had wronged him. Here, too, it was that the keen eye of English Eadmer spied out on the shoulders of the Archbishop of Beneventum the splendid cope which is no longer to be seen at Beneventum. Such little touches in those days often brought the ends of the world together in a way to which in our days of more general intercourse nothing answers. When French was the polite language alike at Dunfermline and at Jerusalem, when the Latin-speaking clerk was at home in any corner of the West, when the few men of the West who had learned Greek spoke it so that a Greek could understand them, when men passed to and fro between the civil services of England and Sicily, communication between distant parts of Europe was in some ways easier than it is now. Bari, one of the chief places for setting out on crusades, must for a long time have been a thoroughly cosmopolitan city. We do feel that the ends of the earth have combined to meet at Bari, when we find the place of honour in the church of St. Nicolas at Bari held by a princess of Bari, who became queen of the greatest Slavonic kingdom. Emblematic figures of Bari and Poland support the tomb of Queen Bona, and her epitaph describes her husband Sigismund, the first of that name, as not only the mighty king of Poland, but Grand Duke of Lithuania, Russia, Prussia, Mazovia, and Samogitia.

Messrs. Blomfield, Scott, and Street.

SIR,—Mr. A. E. Street is misinformed. Heslerton vicarage had been finished and inhabited some time when I was there, in June 1831, *i.e.* in his father's lifetime.

At Weaverthorpe (which by-the-by is a twelfth-century church) the vicar complained to Sir T. Sykes that there was no felt under the lead (as stipulated for). Sir Tatton came with Street, who averred the vicar was mistaken; but on their mounting a ladder the vicar was found to be right.

At the church of Luttons Ambo (which is the title of the united parishes), the brass screen was painted *by Street's direction*; and the churchwarden—a large farmer—told me there was not a ladder in the parish long enough to reach a broken bell-rope.

St. John's, Torquay, is no doubt right now; but still the mortar in the outer courses of the exposed south-west walls (used in spite of warning) *had* to be replaced by cement.

Mr. Drew has a short memory. *Less than a month ago* he stated that the crypt drains in Dublin Cathedral had no outlet till he provided one. Whether he knows it or not, there *were* above fifty letters written to Street about the completion of the building, and left unanswered—written, on behalf of Mr. Roe and the chapter, by a gentleman who is now abroad. Perhaps Mr. Drew will deny that the Caen stone on the north side is decaying, or that the *strong-room* had a plaster ceiling!

I am glad to have started a discussion sure to be beneficial, and must thank you, sir, for opening your columns to one who is

Dec. 8, 1883.

NOT AN ARCHITECT.

## LEGAL.

Court of Session, Edinburgh.  
(Before Lord M'LAREN.)

ANDERSON AND BROWNE *v.* J. B. HOWARD.

This action has been taken out of court. It was raised by Messrs. Anderson & Browne, architects, to recover from Mr. J. B. Howard payment of 542*l.* 10*s.* 6*d.*, in respect of architects' fees, commission, and outlay, said to have been incurred on the defender's employment in connection with the building of the new Lyceum Theatre, Grindlay Street, 462*l.* 10*s.* of the sum claimed being in respect of designs, &c., for the new theatre, at the rate of 2½ per cent. on the estimated cost of 18,500*l.* It was alleged that on February 12 the defender terminated his employment of the pursuers, in consequence of their rejection of his proposal to appoint a London gentleman—Mr. C. J. Phipps—to be joint architect, instead of consulting architect, as had been arranged. The defender maintained that his instructions to the pursuers were to prepare plans for the building at a cost not exceeding 15,000*l.*, and to be ready for occupation not later than September 1; that after the lapse of six weeks they submitted sketch-plans at a cost of 3,500*l.* beyond the sum named, and defective and insufficient in many of the details requisite in a theatre; and that as they then rejected a renewed offer to appoint them joint architects with Mr. C. J. Phipps, architect, London, he entrusted the preparation of plans and the construction of the building to that gentleman. Messrs. Anderson & Browne have accepted 300*l.*

Messrs. Blomfield and Street will, on Tuesday next, set the clock and bells of the New Law Courts in motion, at 11.30 A.M.

### CHURCH BUILDING AND RESTORATION.

**Bispham.**—The rebuilding of the parish church, Bispham, Lancashire, is now completed, and the part just finished comprises the nave and south porch. The chancel, organ chamber, and vestry were commenced some two years since. The old foundations of the nave and tower have been adhered to throughout, the addition to the former comprising one bay at the east end. Accommodation is provided for 311 persons. Externally the church is faced with Yorkshire parpoints and Longridge ashlar masonry, and internally with Stourton stone. The roofs are in one span, with open-framed principals, the ceilings boarded. The chancel windows, and several of nave, are filled with stained glass. The church is one of the most effective and striking in appearance in the Fylde district. The rebuilding throughout has involved an outlay of about 4,000*l.* under the superintendence of the architect, Mr. John Lowe, F.I.B.A., Manchester.

**Glasgow.**—Oatlands Church has been endowed. It was dedicated in October, and has been designed by Mr. John Honeyman, F.R.I.B.A. The style is Gothic. In the lower part of the front are two richly-sculptured entrance doorways. Above these are four pointed windows, and in the upper part of the gable is a large circular window. Flanking the gable are two large massive turrets. The side, which is plainer in character than the front, is relieved by a gable and belfry. The interior is 83 feet long and 48 feet broad, and is divided into a central and two side aisles by rows of iron columns supporting the roof and side and end galleries. Accommodation is provided for 900 persons. The interior has been decorated by Messrs. A. & J. Scott.

### NEW BUILDINGS.

**Baths, Pollokshields.**—The Pollokshields Baths Company Limited, are about to erect baths. The front elevation of the buildings is two storeys in height. The principal entrance is placed in the centre of the main building. On either side of it in the upper floor are two large oriel windows in connection with the reading and billiard rooms, which each measure 34 feet by 24 feet. These windows embrace one side of their respective apartments. The east portion of the front has an entrance to the bathmaster's house, which is on the upper floor. There is also in this portion an inclined passage leading to the furnace-rooms, washing-house, stores, &c., which are all in the basement. Entering through a vestibule, 8 feet square, having at either end double-folding, glass-panelled doors, the entrance hall is reached. It measures 21 feet by 18 feet, and in the centre of it is the first flight of the stair leading to the upper floor. The hall communicates direct with the swimming-pond, 75 feet long by 35 feet wide, and running from 6 feet 6 inches to 3 feet 6 inches of depth of water. The pond is constructed of concrete, and the sides and bottom are covered with white enamelled tiles. Provision has been made for easy access to the walls in case of any accident or leakage. At the four corners of the pond are recessed steps for facilitating access to the water. Attached to the sides of the pond at the water level are ten shell-pattern basins, which will act as overflows. The floor round the pond is covered with encaustic tiles, and all round the three sides are placed dressing-boxes for gentlemen, and also costume apartments for ladies. Washing-rooms, provided with douche, spray, needle, and other baths and conveniences, are placed at either end of the pond. Above the boxes is a gallery giving large accommodation for spectators during competitions, and which may serve as a comfortable lounge on ordinary days. Separate shoots communicating direct with the washing-house beneath are conveniently placed for receiving wet towels, &c. The roof over the pond is of open timber construction, and the tie-beams and posts will be made ornamental features. Its height above the floor of the pond is 28 feet. At the west end of the pond is placed the gymnasium, measuring 24 feet by 17 feet. The bathmaster's room is so situated that it commands the entire area of the swimming-pond house. On the left of the entrance-hall is the boot-room, and to the east of it again are the private plunge-baths and ladies' dry costume room, 15 feet by 14 feet. To the extreme east are the apartments in connection with the Turkish baths. These consist of (1) cooling-room, 30 feet by 20 feet, having semicircular ceiling with enamelled glass roof lights; (2) tepidarium, or hot-air room, 20 feet square, having domed roof with starlights; (3) sudatorium, or hottest room, 9 feet square, treated in a similar way; (4) shampooing-room, 10 feet by 7 feet; (5) lavatory, 12 feet by 7 feet; (6) Russian bath-room, 9 feet square. The Turkish apartments are heated by flues running round them. These give a very large area of heating surface, and enable the apartments to be heated to from 120 to 200 degrees without destroying the purity of the air. The fresh air before being admitted into the room is heated to a high degree. Great attention has been paid to the lighting and ventilating of this and every other part of the establishment, these being so necessary for comfort and successful sanitation. To the right of the entrance-hall is the card-room, 24 feet by 15 feet, with lavatory. All the departments—viz., swimming-pond, Turkish bath, private

baths, and reading-room, with adjuncts—are separate and complete in themselves, and have their own approaches. The plans for the baths have been prepared by Mr. James Hamilton, I.A., 132 West Regent Street, Glasgow.

### ARCHÆOLOGY.

**Biron Brass, Manchester.**—A paper on some fragments of an old brass in the Lady Chapel of the Manchester Cathedral was read by the Rev. E. F. Letts at a late meeting of the Lancashire and Cheshire Antiquarian Society. Tracings of perfect figures on the brass, which is a memorial of Sir John Biron, were found in the Chetham College, and these Mr. Letts compared with the matrix still existing in the Lady Chapel. The shape of the crest enabled him to identify it as that of the Biron family, of Clayton, the ancestors of Lord Byron. An oblong label over the lady's head was very puzzling, but the figures of three sons and five daughters at the base showed that the parents were Sir John Biron and Dame Margery his wife, who were living in 1460 or 1470. She was daughter of Sir John Boothe, of Salford, whose crest at this period was a double one—a Catherine wheel and an Agnus Dei. This accounted for the oblong label. Mr. Letts gave an account of the knight's career, and concluded with the hope that the brass might be restored.

### GENERAL.

**Sir Frederick Abel, C.B., D.C.L., F.R.S.**, has been elected chairman of the Council of the Society of Arts, in succession to the late Sir William Siemens.

**Mr. Lance Calkin** has been elected a member of the Incorporated Society of British Artists.

**The Marquis of Lorne** will open the Exhibition of French Art at Glasgow on the 18th inst. It is anticipated that the exhibition will be rich in examples of French furniture.

**Messrs. W. & A. Beresford Pite**, of 5 Bloomsbury Square, have been appointed by the Guardians of St. Giles and Bloomsbury as their architects to carry out the additions to their workhouse in Short's Gardens, Endell Street, W.C.

**Plans by Mr. Milburn**, architect, of Sunderland, have been selected for a Board school to be erected at East Boldon.

**The Royal Archæological Institute** will, next year, visit Newcastle-on-Tyne.

**The Report** just presented to the Metropolitan Board of Works as to the plans deposited for railways and other works in the metropolis for the ensuing session contains a list of forty-seven schemes, viz., twenty-one for railways, thirteen tramways, two electric lighting, and eleven other works affecting the metropolis.

**Mr. William H. Thorp**, of Leeds, has now in the press "An Architect's Sketch-Book at Home and Abroad." The letterpress will be illustrated by seventy-five full-page illustrations of subjects from England, Belgium, and the Moselle. In the part given to England many of the views are of Yorkshire castles and halls; in that to Belgium, the Flemish architecture of the old cities is very fully illustrated; and the mediæval buildings existing on the banks of the Moselle make up the remainder of the work, which is likely to be a success.

**A Part of the Parapet** of the large tower of Lincoln Cathedral fell during the gale on Tuesday.

**Messrs. Cassell, Petter & Galpin** have issued a new edition of their quarto "Illustrated Catalogue," which exemplifies the perfection of modern woodcuts.

**A Mission Hall**, which has been adapted by Messrs. Smith & Brodrick from a grammar school, was opened in Hull by the Archbishop of York on Tuesday; and on Saturday last the Hull Borough Asylum, which was designed by the same architects, and has cost about 72,000*l.*, was opened, and formally transferred to the Corporation.

**The Scheme for a London Central Fish Market**, sent to the International Fisheries Exhibition, and which was awarded a fifty-guinea prize, is to be officially published. Mr. H. H. Bridgman is the architect.

**Messrs. S. Snell & Son** have prepared plans for the extension of the Hull infirmary, which have been adopted. It is proposed to extend the building laterally, and to isolate the centre, thus separating the administrative from the hospital department; also to erect a building for out-patients, with an opening to Brook Street. The proposed extensions are estimated to cost 38,000*l.*

**The Alexandra Palace and Grounds.**—Notification is given of an intended application to Parliament next session by the London Financial Association (Limited) for leave to bring in a Bill for the repeal, modification, or amendment of certain sections of the Muswell Hill Estate and Railways Act, 1866, and of the Alexandra Palace Act, 1877. Power will also be sought to enable the Association, or the owners for the time being of the Alexandra Palace and the lands annexed thereto, to sell or otherwise deal with the palace and lands free from the restrictions imposed by the Acts mentioned, or subject to other provisions which may be prescribed by the Bill.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, DECEMBER 15, 1883.

### TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*\*\* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—“Contract Supplement to THE ARCHITECT.”*

### TO AMERICAN SUBSCRIBERS.

*All subscriptions are payable one year in advance, and may commence at any date.*

*The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.*

*Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED TO GILBERT WOOD, 175 Strand, W.C., London, England.*

*In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—*

*To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order.*

### COMPETITIONS OPEN.

ABERDEEN.—July 1, 1884.—The Testamentary Trustees of the late Mr. John Steill, of Edinburgh, hereby notify that they will Receive Models for a Colossal Statue of Wallace, in Bronze, with Basement of Granite Blocks, to be placed on the Mound in the North-West part of the Duthie Public Park, near the City of Aberdeen, in conformity with Instructions left by Mr. Steill, at a cost not exceeding £3,000. Intending Competitors, on Application, accompanied with a Remittance of 10s. 6d. to Mr. John Otto Macqueen, 10 Bridge Street, Aberdeen, will be supplied with Copies of Mr. Steill's Instructions, Conditions of the Competition, and Lithograph Plan of the Duthie Park, showing Sections of the Mound. The Author of the Accepted Model will be employed to Execute the Work; and the Author of that next in order of merit will Receive a Premium of £50.

CAPE TOWN.—Jan. 30.—The Town Council of the City of Cape Town invite Plans and Specifications, accompanied with approximate estimate of cost, of a System of Drainage. Selected Plans and Specifications to become the absolute property of the Corporation. All others will be returned free of expense. Premium of 250l. A plan of the City, with levels, may be seen, and further information may be obtained, on application to the South African Loan, Mortgage, and Mercantile Agency, 9 King William Street, London, E.C.

LONDON.—March 1, 1884.—The Commissioners of H.M. Works and Public Buildings are prepared to receive Designs for New Buildings proposed to be erected in Whitehall for the Admiralty and War Office. Mr. A. B. Mitford, Secretary, H. M. Office of Works, 12 Whitehall Place, London.

WALMER.—Jan. 21.—Designs are invited for Laying Out the Estate of St. Clare for Building Purposes. Messrs. W. & T. Denny, Walmer.

Office: 175 Strand London, W.C.

# BELL'S ASBESTOS.

## BELL'S ASBESTOS FLOORING FELT.

This article is manufactured from specially prepared Asbestos fibre, and by its use any building can be rendered comparatively fireproof at a very small cost. This material should be used as a substitute for brown paper, under the carpet, and it can be taken up and relaid as often as required; it may be laid between the flooring-boards, on the ceiling before plastering, and on the walls. Doors of pine or other wood should be so constructed as to have a sheet of the felt in the centre, so that either side being burned the other remains intact. In houses so protected fires would be localised to the rooms in which they originate. Asbestos felt, being a non-conductor of heat, is superior to any other sheathing, and used under slates has no equal. It yields no dust, lies quite flat, is soft to the tread, and its low cost places it within the reach of everybody. Made in rolls of 36 inches wide.

## BELL'S ASBESTOS BOILER AND PIPE COVERING COMPOSITION.

For Coating every class of steam pipe and boiler. Non-combustible, and easily applied when steam is up; adheres to metals and preserves them from rust; prevents the unequal expansion and contraction of boilers exposed to weather; covers 50 per cent. more surface than any other coating, and is absolutely indestructible. It can be stripped off after many years' use, mixed up again with 20 per cent. of fresh and applied again. The composition is supplied dry, and only requires to be mixed with water to the consistency required for use. A horizontal boiler, 17 ft. 6 in. long, 15 H.P. gave the following results: Temperature on plates, 186 deg. ditto on covering, 84 deg.; 1 ton of coal was saved per week, and although the fire was raked out every evening, 20 lb. of steam were in the boiler next morning. The following Testimonial refers to this covering:

Offices of Wimbledon Local Board, Wimbledon, Nov. 28, 1883.  
Dear Sir,—It may interest you to know that we have exactly 40 per cent. in fuel through using your covering.—Yours truly,  
W. SANTO CRIMP, C.E., F.G.S.

## BELL'S ASBESTOS SASH-LINE CORD

Is unaffected by heat and damp, and renders unnecessary the use of metallic wire and chains. Ropes made in the same form have great tensile strength, and being indestructible by fire are of incalculable value for fire-escapes.

## BELL'S ASBESTOS FUEL.

For gas fires. This genuine Asbestos Fuel is composed of the finest hand-picked Asbestos, and its weight is about half that of any other Asbestos fuel.

## BELL'S ASBESTOS PAINT.

For coating woodwork. This paint is absolutely fireproof. The following Testimonial refers to this Paint:—  
"Glasgow Herald and Engineering Times" Office, Glasgow.  
Mr. JOHN BELL 14th Nov., 1883.  
SIR,—As one of the means that helped to save the buildings extending from Buchanan Street to Mitchell Street from the recent great fire I think it fair to say that your Asbestos Paint, which was applied to the outside hoist of the "Engineering Times" case-room and other portions, gave valuable proof that it materially aided in resisting the flames from the immediately adjoining tenement while the fire was rapidly destroying it and threatening us in the most serious form. Since the fire, and to assure myself further of the value of your Asbestos Paint as a fire-resister, I placed a piece of wood, with your paint put on more correctly than in our case, into one of our furnaces, with the result that it was brought out without a fibre of the wood being touched, while similar pieces of wood thrice coated with Irish Lime at once got into a flame.—Yours truly,  
(Signed) ALEX. SINCLAIR.

To avoid spurious imitations, and to secure the receipt of genuine goods, all orders should be sent direct to the undermentioned addresses, and not through agents or factors.

ILLUSTRATED PRICED CATALOGUE FREE ON APPLICATION TO

## NEW PRESENTATION VOLUMES PUBLISHED BY CASSELL & CO., LIMITED.

Now ready, in one Magnificent Volume, price 31s. 6d.

### Picturesque Europe.—The British Isles. Popular Edition, with

26 EXQUISITE STEEL PLATES from Original Drawings by Birket Foster, Harry Fenn, W. Leitch, E. M. Wimperis, and others; and about 400 Illustrations on Wood, by the First Artists of the day. Can also be had in 2 vols., price 18s. each.

"It is impossible to convey any idea of the wealth of beauty to be found in these pages."—*World*.

Now ready, complete in 2 vols. 4to, price 9s. each.

### Gleanings from Popular Authors. Containing upwards of 200

SEPARATE TALES, Poems, and Sketches by the best English and American Authors. With Original Illustrations on nearly every page, by the Best Artists.

"Great taste has been shown in the selection, which includes some of the finest specimens of modern literature. The charm of admirable literary work is enhanced by the beautiful illustrations to be found upon every page."—*Era*.

Complete in 6 vols., price 7s. 6d. each.

### Our Own Country. Containing about 1,200 ILLUSTRATIONS and

6 STEEL PLATES. Also issued, in Library binding, complete in 3 vols., 1s. 17s. 6d. the set.

"This beautiful work appeals to a very wide circle of readers. To those who have visited the places and scenes described and pictured, it must be a pleasure to turn over the leaves of this richly illustrated work, and by its aid revive old impressions hidden away in the corners of the memory; while those who are ignorant of the beauties of their native land, and find it impracticable to make personal acquaintance with them, could not go to a better source to have the defect in their education supplied."—*Times*.

Complete in 3 vols., price 9s. each.

### Old and New Edinburgh. By JAMES GRANT. With 600 Original ILLUSTRATIONS. Also issued in Library binding, £1 10s. the set of 3 vols.

"It is much better and completer than anything of the kind that has preceded it."—*Spectator*.

## CHRISTMAS AND NEW YEAR'S GIFTS—NOTICE.

A CLASSIFIED CATALOGUE giving full particulars of Messrs. CASSELL & COMPANY'S PUBLICATIONS, ranging in price from SIXPENCE to TWENTY-FIVE GUINEAS, will be sent on request POST-FREE TO ANY ADDRESS. It will be found of the greatest convenience to those who may be selecting Books for Special Reading, Educational Purposes, or Presentation, as it contains particulars of Several Hundred Books, so arranged as to show at a glance the various Works in this valuable selection, which can be procured at the Prices named at all Booksellers and at the Bookstalls.

CASSELL & COMPANY, LIMITED, Ludgate Hill, London.

## BELL'S ASBESTOS.

these less useful articles at my price, users are recommended to see that every 10 ft. length of the Asbestos Tape purchased by them bears my Trade Mark.

## BELL'S ASBESTOS CEMENT.

For the backing of firegrates and furnaces. The use of this fireproof material saves the expense and annoyance occasioned by the repairs so constantly required in the firegrates and kitchen-ranges of private houses.

## BELL'S ASBESTOS PUTTY.

For various kinds of steam and water joints.

## BELL'S PURE ASBESTOS CLOTH.

For chemical and other filtering. This cloth is specially manufactured for Maignen's unequalled water filters, for which a gold medal was awarded by the Special Commission appointed by Her Majesty's Government to receive the reports of the International Juries at the Fisheries Exhibition. By special arrangement with Mr. Maignen, his filters for houses, factories, and towns are supplied by this firm.

## BELL'S ASBESTOS BLOCK GAS FIRES.

The Asbestos Block Gas Fire is formed by placing inside the ordinary grate a hollow block (burner), composed of Asbestos, and perforated. An iron sole-plate, with a single gas-burner, is fixed at the bottom of the block. After being lighted a short time both the block and asbestos fuel throw out intense heat.

## BELL'S Special LONDON-MADE ASBESTOS MILLBOARD.

For Dry Steam Joints, made of the best Asbestos fibre, is well known for its toughness and purity, and is absolutely free from the injurious ingredients frequently used to obtain an appearance of finish, regardless of the real utility of the material. Made in sheets measuring about 40 in. square, from 1-64th in. to 1 in. and 3 millimetre to 25 millimetres thick. Each sheet bears my Trade Mark.

# The Architect.

## LORD COLERIDGE ON THE CERTITUDE OF ARTISTIC TESTIMONY.

ART, of the kind that is now legally called by the name of "artistic art," is emphatically *not* a thing upon which one man's opinion is as good as another's—a proposition which the whole world of English "artistic artists" will thank the accomplished Lord Chief Justice for affirming with earnestness.

There are some countries where, it is to be hoped, no man of culture would permit himself to imagine that the opinion of a dozen haphazard ratepayers in a jury-box could be considered to be more authoritative upon a delicate question of artistic authenticity than that of a phalanx of Royal Academicians. But it would seem that in England this view is held by many; indeed, as matter of practice in litigation, we shall be told any day that the summing-up of a judge, and the decision of a jury formally delivered, have a value—a real, and not a conventional value—compared with which the "impressions" of highly-cultivated specialists are of no account at all. What is even worse, the doctrine of lawyers is this—that in opposition to the evidence of eyesight from a witness void of understanding the evidence of learning and knowledge has no legal weight. To put the question on the simplest ground, it has just been laid down by high legal authorities that, when a person of intelligence and character, who knows of sculpture technically nothing, can take upon himself to testify that he saw a certain sculptor execute a certain sculpture, it is vain for the ablest professional critics of the sculptor's art to say that the witness must have been mistaken because of the quality of the artwork telling a different tale.

Lord COLERIDGE, on the other hand, says this—and we hope he does not stand alone among English lawyers in his opinion: "The character of genuine works of art is not in my judgment a matter of *opinion*, but a matter of *fact*." To appreciate the distinction which is here made between "opinion" and "fact," it is necessary to observe that these terms are used by Lord COLERIDGE not in a colloquial but in a legal sense. Evidence of fact, or direct evidence, is that which is furnished by a witness who states what he has actually seen or heard, or, for that matter, tasted, touched, or smelt. Evidence of opinion, or expert evidence, is that in which the witness draws conclusions by scientific argument. The value of direct evidence depends very much upon the credibility of the witness and his intelligence. The value of expert evidence depends upon the character of the data relied upon, and the extent of the specialist knowledge which the witness is able to bring to bear upon it. Perhaps one of the best illustrations of the distinction for our readers is furnished by the incidents of those controversies which are known as "light and air cases." The occupier of a certain room alleges that damage has been done to the lighting of his window by reason of a new house opposite being of different form from the old house which it has replaced; and so he wants compensation in money. He "swears," therefore, that he cannot see to do his work, and that he has to light his gas about an hour earlier. Against this evidence a scientific architect produces diagrams whereby he proves that the allegations are impossible—indeed, that the plaintiff might just as well say he had seen a ghost, or had weighed sixteen ounces into a scale, and found they made only three-quarters of a pound. In strict law this is a conflict between evidence of fact and evidence of opinion. Fact gives the evidence of his senses, and what is the use of Opinion saying it cannot be true? Is not the world full of people who try to make us disbelieve our senses? But the philosophy of the matter is obviously this—that in many cases evidence of so-called fact is in reality only evidence of opinion, and that of an inferior quality; so that in such a question, for instance, as the lighting of a room, it becomes plain to a scientific architect that the convictions of an unscientific casual observer are not only not facts, but opinions

that cannot be relied upon. We need only add that if it be seriously meant by lawyers that scientific conclusions are to be discredited, then science must simply wait for the better education of law.

To come now to the question which the Lord Chief Justice had specifically to deal with, we may formulate it thus: Is an experienced critic of art—of painting, of sculpture, of architecture, or of any of the "minor" order of "artistic arts"—to be entitled, or to be not entitled (human fallibility duly considered) to say authoritatively that he *knows* a certain artistic product to be, or to be not, the personal work of a certain artist (suppose him to be deceased), of whose acknowledged personal work a certain specimen is set before him as a criterion? To this question, we need scarcely say, no "artistic artist" would hesitate for a moment to give an affirmative reply. Does an ordinary tradesman understand the goods in his shop? Does one man know another's handwriting? Have we any difficulty in testing the "style" of an author? Why, even one lawyer's letter differs from another lawyer's letter, as one star differeth from another star in glory; and was not Lord COLERIDGE able to distinguish the "style" of Baron HUDDLESTON himself in so dry a thing as the very statement of evidence which was the subject of inquiry—"that learned judge having opposed matters of fact to matters of opinion with the remarkable ability of summing-up which old antagonists at the bar would well remember?" In a word, it is obviously a mere question of what His Lordship called "education" whether a man understands his business or not; and, if a man is properly educated to understand art, then he can read the handwriting of it anywhere, and with so little risk of mistake as to defy almost anything short of intentional and dexterous forgery.

We are not, of course, here discussing the BELT case over again. The legal issue is now a personal one, and it is the abstract question of artistic judgment, as a purely intellectual question, that we have alone to consider. But we cannot help pointing out, as a collateral matter, the error into which, in our opinion, many well-meaning people are disposed to fall in respect of the distinction which the bar and the bench alike have been led to draw between the "sculptor" and the "sculptor's broker." Readers of this journal do not require to be told that if the difference were to be too nicely discriminated between an architect and (we most humbly beg pardon) an architect's broker, where some of us would soon be it were profane to tell. Is it not Sir EDMUND BECKETT (one is always safe in such cases to ask whether it is not Sir EDMUND BECKETT) who lays down the axiom that an artist is one who does his work with his own hand, no matter whose head, if any, may be concerned in it? If we apply this principle—a *fortiori* if we let Sir EDMUND apply it—to certain useful and successful classes or species of architectural practitioners, it is well known that they separate into two distinct divisions or genera—namely, those who have got past the work of the hand, and those who have never come up to it. We may admit for this purpose, of course, that an architect, when an "artistic artist," does his work of composition, and must do it in the very nature of the thing done—indeed, cannot help doing it in the very nature of what does it—with his pencil in his hand. But, with the exception of a few tiresome clients of the clerical-archæological and amateur-pragmatical orders, who in England cares for all this? The object of the typical Englishman who, as he puts the case, is "unfortunately obliged to go into bricks and mortar," is certainly not to hand down to posterity an unquestionably authentic specimen of the hand-work of Mr. NORMAN SHAW or Mr. WATERHOUSE (as these architects well know), or even of such a man as the late Sir GILBERT SCOTT or Mr. STREET, but, in the first place, to get his work so done that his friends may pronounce it well done; secondly, to get it economically done; and thirdly, and too often chiefly, to get it done in his own way, so far as he understands the matter, or can make himself believe that he understands it. Let it be only remembered that this is "a commercial country," and where is the difference between the artist and the artist-broker? In architecture, at any rate, we very much fear, it is not easy to discover where it is. The hand-work of the "assistant," it would be idle to deny, especially when the assistant can "design from sketches," is often very much better than that of the master would be if he had the time to try it, or if he had the head; and the commercial Englishman is perfectly satisfied that it should be so, and indeed all the better pleased to think that, with the work of the expert artist,

he gets also the direction of the experienced man of business. Of the various arts of embellishment—perhaps to be now called “artizan art” by the lawyers—we need only say that the skilled workman and his master take up a still more “commercial” position with the public, and that their work is still none the worse, but all the better.

In sculpture, as we have taken occasion to point out very candidly long ago, the practice of perfunctory art-work is thoroughly recognised; and we may with the same candour now add that the assistantship of a class of highly-trained working artists of comparatively humble station and inferior general culture, who are not produced in this country as they are abroad, has been an element of the utmost advantage in English sculpture of the best class. This fact, indeed, ought not to be disguised, far less disputed. The time is probably coming when natives of our own land may be available for such work; but for the present the art schools of the Continent are better than ours, and this, amongst the rest, is the consequence.

In painting, the authentic work of the master's hand is in England an essential quality of art, while in some other countries it is not so much so, to say the least.

In no case, be it observed, do we defend “art brokerage” as a falsity in art. We cannot help saying that in many instances it is a practice of business which English people are not yet sufficiently ecstatic to dispense with, but to reduce its pretensions to a question of clearly discernible handwriting is what no experienced critic can ever fail to be able to do.

### THE PICTURE GALLERIES.

THE Christmas visitors to town will find an ample programme before them in the way of picture galleries and art collections of all kinds. Among the most popular will probably be the sketches of Thames scenery, which Mr. KEELEY HALSWELLE shows at Messrs. AGNEW'S, the result of twelve years' life in a house-boat and study face to face with the dear old river-side. The big pictures exhibited from time to time in the Royal Academy, Grosvenor Gallery, and elsewhere would hardly have prepared one for the variety of effect and season the painter has noted in the kind of artistic shorthand, the clever generalised style of these sketches. There has been so much of the proverbial English bad weather about Mr. HALSWELLE'S large Thames pictures that one is glad to find the sun shining in these sketches, and to realise what a quantity of capital material for a more varied range of treatment through change of season and of hour the painter has here gathered. Mr. HALSWELLE'S experiences of house-keeping on board a house-boat have been set forth in some of the weekly periodicals, and just at present form one of the topics in social circles.

Another favourite exhibition will be the complete little gathering, in the Fine Art Society's smaller room, of the mezzotint engravings of our venerable Academician, Mr. COUSINS. It has fallen to this excellent artist to translate into one of the most popular forms of engraving the works of some of our most popular painters—LAWRENCE, LANDSEER, REYNOLDS, MILLAIS, LEIGHTON. The method which COUSINS first learnt of S. W. REYNOLDS became in his hands an elaborate and somewhat mixed mode; there is something of the line engraver's line and dot and regulated stroke as well as the velvety stains and outlineless bloom of the mezzotint scraper. But Mr. COUSINS has had to work for the large demand of the present-day purchasers, not to provide a plate for a few happy collectors of splendid proofs. His fine hand as a draughtsman showed itself early in pencil portraiture of a sure and delicate kind, of which specimens are in this little exhibition. As an interpreter of touch he is happiest with REYNOLDS and LAWRENCE—with the latter on the whole happiest, and also with Sir F. LEIGHTON and with GREUZE. One or two of the LANDSEER plates are also very exquisite, notably *The Piper and Pair of Nut Crackers*. In reproducing Sir JOSHUA REYNOLDS the competition with the splendid mezzo engravers of REYNOLDS'S own time raises comparisons difficult to meet, but it may be remembered how Mr. COUSIN'S prints were received with quite a burst of applause when in COLNAGHI'S window they first appealed to the public.

Still on his way up Pond Street the visitor may come upon novelties, look in at Messrs. DOWDESWELLS, and see the

clever Alpine studies in oil and water-colour by Mr. J. M. DONNE, who threatens to win his way like ELIJAH WALTON among lovers of Swiss mountains, and that by a more veracious art if a less poetic. Then at the galleries of the Mediæval Art Society are Windsor tapestries from the Royal factory, excellent for weaving and disappointing in design, too much given to a hybrid style betwixt late Flemish and French manners, and the pictorial no-style of English history painting of the E. M. WARD and FRITH kind. Upstairs, a charming little special loan exhibition of old English wrought-iron work has been got together by Mr. DE WILDE, who shows also some capital specimens, lamp brackets and other things, from his own forges, he being one of a company of masters in handicraft of artistic worth who have studios in connection with this Society. Mr. ROGERS, the well-known master of wood-carving, shows a collection of old specimens and a few of modern work.

In a week's time the REYNOLDS pictures at the Grosvenor Gallery will be on view, and then the annual show of Old Masters, and the works of Mr. POOLE, R.A., at the Academy.

Meantime the Institute of Oil Painters, whatever that body may be—apparently those members of the Water-Colour Institute who are adept in both mediums—must be congratulated on a brilliant first inaugural exhibition of oil pictures. The handsome Piccadilly galleries have attracted not only the strength of the Institute, but outsiders of repute. Not only Messrs. LINTON and E. T. GREGORY and STANLAND, GREEN, SMALL, CLAUSEN, and other men of mark within the body contribute of their good work, but Mr. ALMA TADEMA sends a particularly finished interior with marbles *à ravir*, and a telling incident in Roman courtship; Mr. HENRY MOORE has the line with a splendid reach of dark-blue sea off the south coast; Miss EVELYN PICKERING is true to her sculpturesque power of design in *Sleep and Death, the Children of Night*; Mr. PARSONS helps the landscapists with a beautiful upright subject of trees and water, when the *Daylight Dies*; Mr. WOODS sends one or two brilliant and admirable Venetian sketches; there is a bit by VAN HAANEN, too; a semi-classic group by WATERHOUSE; a portrait of M. FANTIN, by himself; and so on. Really, to mention all the good things were to write pages instead of lines. Of padding and of poor work there is also abundance, but if, as seems indicated both by the public reception of this exhibition, and the excellent average of the pictures sent in, there is room for yet another annual show of modern oil pictures in the winter time, then we may allow that the start has been wisely as well as of a certainty brilliantly made.

### BATH IN THE SEVENTEENTH CENTURY.\*

IN the famous third chapter of MACAULAY'S History the condition of Bath towards the close of the seventeenth century is described, and, as usual, the city is made to appear far worse than a modern English town. The finest houses are said to have greatly resembled “the lowest rag-shops and pot-houses of Ratcliffe Highway.” The bedrooms of persons of quality were hardly fit for footmen; the floors of dining-rooms “were coloured brown with a wash made of soot and small beer, in order to hide the dirt;” there were no hearths or chimney-pieces of marble; the best apartments were hung with coarse woollen stuff, were furnished with rush-bottomed chairs, and had fireirons which cost from three to four shillings. The historian relied for evidence mainly on Wood's “History of Bath,” and he says that he consulted “several old maps and pictures of Bath, particularly one curious map, which is surrounded by views of the principal buildings.” It would be difficult to find more worthless representations of buildings than those which are made by map makers, ancient or modern, but they were well adapted for a writer whose ambition was to demonstrate how great was the revolution which his party had accomplished in the social life of England.

A drawing, executed by a pen and pencil, that was purchased for the British Museum in 1881, is enough to show how little reliance is to be placed on MACAULAY'S “curious map,” and his other authorities. It is dated 1675 and represents the King's and Queen's Bath, which was then open to the sky, the houses on three sides of the bath, the bathers, and the spectators. In fact, it is a photograph of Bath life in the seventeenth century. This interesting drawing has given rise

\* *The Bathes of Bathes' Ayde in the Reign of Charles II.* By C. E. Davis, F.S.A. Bath: W. Lewis & Son.

to a learned and readable essay on the Mineral Baths of Bath, by Mr. CHARLES E. DAVIS, the city architect, a gentleman who has done more towards revealing the greatness of ancient Bath than a host of WOODS, STOKELEYS, and COLLINSONS.

The first thing that the old drawing reveals is the superior character of the houses which were about the baths. They are very different from those which Lord MACAULAY found in Ratcliffe Highway. Eight are represented, and no two are alike in style. The majority appear to have ashlar fronts; two are rough cast. It is remarkable that, although the houses no longer remain, there are documents which have enabled Mr. DAVIS to identify them. Nearly all were lodging-houses or inns; for in those days the city was bounded by the Mediæval walls and gates, and it was difficult to find room for all the visitors, unless private houses were utilised. On the west side was a large house of five storeys, which has an inscription running along the top—"Annæ Reginae Sacrum, 1618"—in honour of the Consort of JAMES I. Next to it is another large house, with a curious balustrade, which may have been a copy of one in Bradford-on-Avon, designed by JOHN HALL. This house was built in 1653 by JOHN CHAPMAN (a member of a family that has been long connected with Bath), and he encroached upon the street and path. According to the Council Book, it was awarded and agreed by general consent on November 4, 1653, that the mayor's sergeants should go and forbid the workmen from making any further building until leave and license were given settling how far they were to go. On December 2 the subject was again brought before the Council, and it was arranged that a yearly rent should be paid for the 16 inches of encroachment. One member wished the rent to be 10s., another 50s., a third 60s., two said 40s.; but, as there were thirty-four who considered 20s. to be sufficient, that sum was agreed on. It was a wiser way of settling a dispute than ordering the house to be taken down, or entering on an expensive lawsuit. The name CHAPMAN is often found in the records. It occurs in the account for the funeral expenses of Bishop MONTAGU of Winchester, who died in 1618, and was buried in Bath Abbey. According to a contract in the possession of Lady NORTH, his tomb cost 200*l.* Through the liberality of an unknown benefactor, it was restored under the honorary superintendence of Mr. DAVIS. As it was constructed of alabaster and black marble, the old paint was removed, and only the decorations and coats of arms were regilt and painted. On the north side of the bath, among other buildings, was "the Cann office." It is no longer possible to explain the meaning of the word. A cantred office was the office of a hundred, and the Cann office may have been the place of meeting for the magistrates. Another supposition is, that as canna meant a measure for cloth goods, the house may have been the place where the standards were deposited. But may not the Cann office have been in some way connected with the drinking of the waters, or of some more palatable liquid before the "Dry Pump" was erected in 1662? Cann, according to old dictionaries, was a drinking vessel made of wood in the shape of a barrel, and at the time the sketch was made the Cann office was a wine-shop. Although the waters had been recommended in 1572, and were in repute during the seventeenth century, the first Pump Room was not commenced until 1705. Mr. DAVIS believes that an adjoining house was a coffee-house. There is no improbability in this, for in 1675 coffee was a fashionable drink, and a satire which appeared in 1672 states that, "he's no gentleman who drinks it not."

The baths are as remarkable as the surrounding buildings. In 1628 a Dr. VANNER wrote: "The King's Bath is the hottest, and it is for beautie, largenesse, and efficacy of heate, a kingly bath, indeed, being so hot as can be well suffered. The Queen's Bath is a member of the King's Bath, a wall onely going betweene them with a passage therein to goe from one to the other." The sketch corresponds with the description. The King's Bath is enclosed, and the Queen's Bath partly, by an open balustrade, which had been presented by Sir FRANCIS STONOR in 1624 as a recognition of the benefits he received from the bath. In the centre of the King's Bath was an octagonal building about 40 feet high, which enclosed the principal spring, and was called "The Cross." It was erected in 1664, at a cost of 150*l.* 4*s.* 8*d.*, and was removed in 1781. The four arms or transepts of this cross or "kitchen" had elliptical openings, with pilasters and pediments. They supported an octagon, which had an ogee domical roof covered with small tiles, which tapered off and was surmounted by a crowned lion guarding a shield. Altogether it was an effective

example of the English Renaissance of that time. The bath contained several niches, and attached to the walls were brass rings for the use of bathers, which had been presented in thankfulness for cures. One massive ring was from the notorious BARBARA PALMER, Duchess of CLEVELAND, who may have regained through the Bath waters some of that "superb and voluptuous loveliness which overcame the hearts of all men." A more worthy donor was JOHN REVET, the royalist brazier, who purchased and preserved during the Commonwealth the statue of CHARLES I., which is now at Charing Cross. He "received cure of a true palsie from head to foot on one side," a circumstance which is worth recording in an age when so many are paralysed by overwork.

A crowd of people are seen leaning over the balustrade and sitting in the windows, while the bathers disport themselves below. The sketch therefore suggests the fashions of 1675. There are twelve figures in the foreground, which are sufficiently large to indicate the costume of men and women. In 1672 a satire appeared, entitled, "New instructions un'o youth for their behaviour, and also a discourse upon some innovations of habits and dressing; against powdering of hair, naked breasts, black spots, and other unseemly customs." But there is nothing unseemly in the costumes which were in vogue in Bath three years later.

### PARIS NOTES.

CONNOISSEURS would appear to have no very high opinion of the value of the collection left by M. Thiers to the nation, which is to be placed in a separate room at the Louvre. The *Courrier de l'Art* doubts the authenticity of the pictures by Murillo, Ruysdael, Gerard Dow, Wouvermans, Neefs, Lebrun, &c. The greater part of the other paintings are, moreover, admitted to be only copies. M. Thiers was, in fact, accustomed to say that if he wished to purchase originals, all his fortune would not suffice, and that therefore he contented himself with copies. There are, however, some Florentine bronzes that will repay an inspection.

At the beginning of the present year the authorities of the Louvre Museum purchased for 200,000 frs. an oil painting—*Apollo and Marsyas*—attributed to Raphael. This picture is now on view in the Salon Carré. There are once more some doubts of its authenticity. French critics have not yet noticed it, but the journals are calling for an explanation or statement upon the subject from the Louvre authorities.

On Saturday was opened the Exhibition of the works of André Gill, the caricaturist, at the rooms in the Galerie Vivienne. About eighty pictures and three hundred comic illustrations to journals have been got together by M. Cohl, among them being the artist's first design published in 1862 in the *Revue pour Tous*, illustrating a parody of Victor Hugo's "Misérables," and a signboard painted by Gill for a restaurant proprietor at Montmartre, and representing a live rabbit tossed in a frying-pan, a punning allusion to the *lapin sauté*, which is so favourite a dish at suburban eating-houses. The proceeds of the Exhibition will be devoted to keeping the artist during the period of convalescence.

The Académie des Beaux-Arts met last Saturday to elect three corresponding members in the sections of sculpture, architecture, and engraving. The results of the election were as follows: Sculpture—M. Civillate, of Palermo, succeeds M. Jerichau, of Copenhagen, deceased. Architecture—M. Huypert, of Amsterdam, succeeds M. da Silva, who has passed of foreign associated members. Engraving—M. Tautenhoy, of Vienna, succeeds M. Mercuri, of Rome, who has likewise become an associated member.

The approaching marriage is announced of M. Idrac, the sculptor, with Mdle. Cécile Ballu, daughter of M. Théodore Ballu, architect of the Hôtel de Ville.

M. de Fallières, the new Minister of Public Instruction and Fine Arts, last week summoned a meeting of the Superior Council of Fine Arts to consider the three following questions: (1) whether the National Exhibitions, the first of which, held during the past autumn, met with but a moderate degree of favour from the public, shall be continued; (2) whether, if continued, these exhibitions shall be held every six, five, four, or three years; and (3) as to the best season of the year for holding the exhibition. After a long debate, it was decided almost unanimously that these State Salons shall be continued every three years, and that the

next shall be opened on May 1, 1886. In that year, therefore, the Annual Artists' Salon and the Triennial Exhibition of the Government will be held at the same time. Immediately the above decision was made, public, a representative committee of the Société des Artistes Français, consisting of MM. Bailly, president of the Association; Bouguereau and Guillaume, vice-presidents; Charles Garnier, Thomas, and Yon, secretaries, waited upon the Minister to protest against it, on the ground that the State Exhibition, being held in the Palais de l'Industrie, would deprive the artists of the locale that has hitherto been placed at their disposal every spring, and would thus prevent the Salon from being opened at all in 1886. In reply, M. de Fallières declared that the Government had not the slightest intention or wish to create any rivalry between its own exhibition and that of the Association, nor throw any obstacle in the way of the latter. He said, however, "it was his desire that the two exhibitions should be held at the same time, and he should do all in his power to carry out this plan;" but promised, on the other hand, that "he would submit the question to further consideration, with the view of finding a solution compatible with the rights of the State and the interests of the Association." Notwithstanding the cordiality and politeness that prevailed on both sides throughout the interview, it is evident that a considerable feeling of antagonism between artists and the Government is being aroused by this Triennial Salon.

M. Camescasse, the Prefect of Police, has just issued a fresh and very stringent set of regulations applicable to the *garnis*, or low lodging-houses, of Paris. (1) In future it is prohibited to let out any room below 2 mètres 50 cent. (about 8 feet 3 inches) in height, or presenting less than 14 cubic mètres of space per occupant. (2) The floor must be impermeable to water, and be frequently washed down, unless it be planked and waxed. (3) The walls of rooms containing more than two beds must be painted or whitewashed; those holding one or two beds only may be papered, but the paper is to be removed as often as the visiting inspector judges fit. (4) Every room must be ventilated to the satisfaction of the inspector, and those of more than four beds must contain a fireplace with open chimney or some other means of constant aeration. (5) It is absolutely forbidden to let or utilise cellars for lodging purposes, and basements can only be so used by virtue of a special police authorisation in addition to the ordinary license. This last is, perhaps, the most important and beneficial clause of the new regulations. At the present moment there are many *garnis* in which whole families are crowded into one small cellar far underground—for it must be remembered that Paris cellars are much deeper in the earth than is usually the case in England—most of the large houses let out in tenements having first a basement and then a cellar underneath, utterly excluded from light and the upper air. A special class of lodging-house inspectors has at the same time been created to watch over the observance of these regulations, any infringement of which will entail immediate forfeiture of the keeper's license, in addition to police court proceedings.

#### JUDGES v. ARTISTS ON ART.

JUDGMENT was delivered on Saturday last in the case of *Belt v. Lawes* in the Queen's Bench Division. Application had been made on the part of the defendant for a new trial, on the grounds of misdirection and the excessive damages (5,000*l.*). Mr. Justice Manisty and Mr. Justice Denman were of opinion that there was no misdirection, but agreed that the amount of damages should be reduced to 500*l.*, with costs, otherwise an order will be made for a new trial. Lord Coleridge, on the other hand, was of opinion that Baron Huddleston's charge to the jury was wrong in principle, that the damages were extravagant and excessive, and that there was a serious miscarriage at the trial. On the relative value of an artist's and a lawyer's opinion on an art subject the following remarks of the Lord Chief Justice are worth consideration:

An importance in some respects altogether exaggerated has been imported into the case. Under ordinary circumstances, whether a public writer was or was not justified in saying of a man that he was not a sculptor, but an ingenious and successful sculpture-broker, who presents to the public as his own work which has been invariably designed and executed by other hands than his (for this is the real gist and substance of the alleged libel)—this was a question hardly, in itself, worth the expenditure of very large sums of money and forty-three days of the public time. But some of the very greatest names in the country have been

involved, either personally or by reference, in the discussion. The Royal Academy has itself, so to say, been put upon its trial; and the case has assumed proportions and an importance quite incommensurate with the issues which it alone necessarily raised. The artistic character of the President will, I hope, survive the scathing criticism to which it has been subjected by my brother Manisty, but in that and other respects I intentionally abstain from making any reply to observations which, to my mind, were uncalled for, and which I therefore abstain from commenting on in any way. I will try not to add to the mass of the proceedings, and in giving my reasons for thinking the present verdict unsatisfactory I mean to be short and general. In one instance only shall I particularise the evidence which appears to me to be unsatisfactory, and in that case because it is a document which cannot be altered, though it may be argued about upon a second trial. Generally speaking, I desire to avoid detailed criticism upon evidence with which I am dissatisfied, for it almost always happens that the criticism is met by change. The evidence at the second trial is what a judge may say it might have been, or ought to have been, upon the first. I have already stated what I conceive to have been the true question in the case; it is perhaps better that I should also state what I conceive it was not. It was not whether Mr. Belt could make a passable model—one which to an uneducated or uncultivated eye would pass muster as a piece of sculpture. Most men of the least dexterity of hand could do as much as this. The question was not this, but whether fine works of art, admitted on all hands to be so, were really his work or the works of other men; and as to this, again, not whether, in the long course of work upon them, he may not now and then have actually handled the clay, or even carved the marble, but whether the completed work, the art in them, when they had art—what I believe logicians call the "formal cause" of them—that which made them what they are—was Mr. Belt's work or another's. Now this distinction is, in this case, of the last importance, because in sculpture, in the long and various process from the slight sketch or drawing to the completed marble, there is so much which is necessarily mechanical, and which a competent carving mason can do just as well as a Phidias or Michael Angelo. Help, therefore, up to a certain point, every sculptor, from the highest to the lowest, has, or may have, with absolute integrity—indeed, with universal knowledge and acceptance. But there comes a point in the modelling, and I should have supposed, but for what I have heard of Flaxman, there comes a point in the carving, too, where mechanism ends and original art begins. I imagine that this point is almost impossible to state in words with any approach to accuracy. I certainly will make no attempt of the kind, for I have no pretensions to, and disclaim altogether, any artistic knowledge. I have it not, and if I had it I think I should have no business to apply it. The law has said that a jury who may know nothing, and a judge who may know nothing too, are to determine, if necessary, as facts abstruse points of science or subtle and delicate questions of art. It is all the more important, therefore, that what is fact in such a matter as this should be clearly understood, and that what are the true principles of judgment should be correctly laid down. There comes then, somewhere and at some time in the process of sculpture, the point at which help ceases to be honest; when the real artist gives character to his work; when mere labour ends and execution begins. I deprecate the use of fine language to conceal cloudiness of thought; and if I seem to use it, it is only because I despair, as I have said, of describing with any accuracy a fact which is a fact, but which is to be felt rather than expressed. Yet this fact—whether Mr. Belt had help which was not honest—is cardinal to the cause. If he had not—if he had no more help than every sculptor has or may have—then he is a real sculptor, and is (subject to a subordinate question as to the amount of damages) entitled to keep his verdict. If the evidence shows that he had such help, that the completed works which he put forward as his own were not his own in character nor in art, then he is a mere sculptor-broker, the verdict is wrong, and the case should be tried again. I have said "if the evidence shows," because I conceive the issue to be one of fact, but fact of a peculiar kind, and that the evidence to establish it must likewise be evidence of a peculiar kind. Now the character or genuineness of works of art is not, in my judgment, a matter of opinion. Anything, no doubt, may be said to be matter of opinion as to which men will not take the trouble to inform themselves. But a knowledge of art is like a knowledge of science; it is matter of education and experience; and it seems to me that you might almost as well disbelieve a body of astronomers, who tell you that the earth moves and the sun stands still, on the ground that very eminent members of society tell you, as a fact, that they have seen the earth stand still and the sun rise up in the east and go down in the west, as disbelieve a body of great artists who tell you that the same man did not make two works of art, because persons very high in the social scale, but with no knowledge or training in art, tell you as a fact that they saw the same man at work upon them. It is what I think (with deference) the fallacy of opposing "fact" to "opinion" in this matter that constitutes, to my mind, the error of the summing-up of my learned brother, and which has led the jury to a conclusion against the weight of the evidence. I

do not doubt that one fact is worth twenty opinions, "fact" and "opinion" being each used in its proper sense. But the words are not used in their proper sense if "fact" is confined to the physical fact of working manually on a bust, and the scientific conclusion of a body of men as to an artistic fact is called "opinion." It is not "opinion" at all; it is evidence of fact. No one who has ever been honoured with the intimacy or enjoyed the society of artists but must be aware how many things we overlook in works of art which are before our eyes, which are there, indeed, to be seen, but which it needs training or instruction to see. A copy and the original stand side by side, and a man of ordinary education can see no difference between them. A great artist comes, decides at once which is which, and decides it on grounds which are conclusive to the man of ordinary education, but which, nevertheless he would never have discovered for himself. I do not call this his opinion: I call this fact. Northcote the painter relates in his "Conversations" that Lord Kenyon, in a trial before him as to the genuineness of an engraving, listened with infinite respect to the evidence of the Academicians of that day, and told the jury that there was a great deal in this that he had no idea of, and that he supposed they were satisfied with the evidence of the artists. Lord Kenyon probably knew little of engravings, but he knew there was a great deal to know, and he listened to and followed those who could teach him. It seems to me that the question in this case was a question of fact; that there was a practical agreement upon it on the part of the witnesses best qualified to speak; that they were witnesses to fact, call it a fact of science or a fact of art; and that their evidence ought to have been, not in theory, but practically decisive. Now this was not the view taken by my learned brother. He opposed fact to opinion in a sense which, with all respect, I think, erroneous, and having once done so, the remarkable power and ability which his summing-up displays, and which any old antagonist of his at the Bar will well remember, were all the more certain to mislead the jury. Whether this is technically misdirection I really will not stop to inquire, but that he most powerfully impressed the jury with what I think a view of the evidence wrong in principle, and wrong in a point cardinal to the cause, I have no doubt. Of course, if it could be fairly suggested that a body of men such as the Academicians called in this case were corrupt or dishonest, that they gave their evidence not *bonâ fide*, but from an unhandsome wish to oppress a brother artist, such considerations as these were very proper to be put forward, and would be rightly taken into account. But in this case for such suggestions there is absolutely no ground. If Mr. Belt seriously for a moment entertained the idea that the eminent men who, unwillingly and under a *subpœna*, and without preliminary examination, gave evidence in this case, gave it from a fear of his rivalry or from a jealousy of his talents, his vanity amazingly misled him. The suggestion, to my mind, is utterly absurd. While fully, therefore, admitting the weight of such considerations—if they existed—I must add that there appears to me no reasonable ground for even suspecting their existence. I do not go at length into other questions.

It is understood that the compromise suggested by the two judges has been adopted.

#### MR. VAL PRINSEP ON ART STUDIES.

THE annual meeting of the Worcester School of Art was held last week, under the presidency of Mr. Val Prinsep, A.R.A., who distributed the prizes to the students. An address was delivered by the chairman, in which he said that he did not intend to lay down any rules for the art of painting or designing. Such rules no doubt did exist, but they had been broken time after time by the great masters so that he was bound to say the exceptions exceeded the rules in number. To give them practical advice he must either see them at work, or else he must himself work before them, palette on thumb. But he could perhaps lead them to think about the art which they had been studying, and if he succeeded in that he should be doing something to their advantage. First of all let him impress upon the students, and not only them but the ladies and gentlemen who had honoured him by coming there that night, the great importance of art. He did not mean his art alone, but all the arts. What was it that made life enjoyable to us, what was it that gave us pleasure beyond the beasts of the field? The cultivation and the enjoyment of the arts, literature, painting, music, and sculpture. Science occupied the reason. It did not appeal to the imagination as art did. Between our conscience and our Creator, nothing could improve the human mind so well as art, and art was nothing if it was not human. The great masters of the past had given us our ideal. When art declined, men became more barbarous, as was exemplified in the cruelty of the middle ages. Then came what was known as the Renaissance, and little by little art was built up to what it was now. Art was not antagonistic to religion. Far from it. He maintained that the best and holiest men were the most humane, and therefore the most accessible to art influence. Art was a great humaniser. But it must be studied before it could exercise its proper influence on mankind. He then proceeded to show how necessary it was

that art should be studied so as to thoroughly understand it. The reason that modern artists could not rival the great masters of the past was that they were too much hampered by convention and fashion, and the middle man, who went out and cried, "These be thy gods, O Israel!" The trashy novel was more successful than the fine poem, and the reason was that it required less study. He urged the students to study art thoroughly, so as to understand it, and warned them to beware of imitation. What all artists should aim at was individuality and naturalness. What he saw around him were things that were being done all over the country. The artists at South Kensington judged of the design, and did not think of the patience which had been taken over it. They should not be content with what they had there. He could assure them that it was only the first prize was worth winning, not for its intrinsic value, but because there were few first prizes. They must not be content with books and certificates; there were cartloads of them sent about the country. The gold and silver medals were within their reach, if they would work for them. They might ask him how to do it. He knew the difficulty, for he had passed through it, and he felt that he had yet much to learn. They must think what they had to do, and do it as simply as they could. They must strive after individuality, and avoid imitation, because he assured them that they would never imitate the merits of artists, but only the faults and peculiarities. He knew there were many amongst them who did not aim at making themselves artists. The profession would soon be overstocked if every one who learned to read and write became an author; but that was no reason why men should not learn to read and write. But there would be much employment for them as designers. The great fashion at present was the Japanese style, and he explained to them how the Japanese artist worked. If he had a bird to paint he followed it for weeks, until he had thoroughly mastered every line, and then he had no difficulty in drawing it. That was how their perfectness of line was arrived at. He advised them to go into the pleasant places about Worcester and study nature in every variety. Nature was but another name for the Deity.

#### ANCIENT ART THEORIES.

A LECTURE was delivered at the Edinburgh Philosophical Institution by Professor Butcher on "Some Ancient Theories of Art in its Relation to Life." Socrates, he said, was the first Greek who foreshadowed future theories of idealism in art. They must, however, look to Plato for the first outlines of a theory of art. So far as they knew, he was the first to combine in one idea the arts which were now called the "fine arts," but which he called the imitative arts—including sculpture, painting, music, and poetry. Art, however, had no interest for him as a separate branch of human activity, but only in relation to ethics and politics, and, above all, as an instrument of education. The fine arts to him had all one common character—they were imitative. Poetry, imitated by words and metre, music by sounds, sculpture and painting by form and colour. From his ideal state, Plato banished all kinds of imitative art. Going on to enumerate the reasons for this, it was shown by the lecturer that poetry was attacked by the philosophers on account of its being bound up with the current polytheism, as was also sculpture; and that of the different kinds of poetry the dramatic form was held to be specially dangerous. It taught men, it was said, to be actors and not citizens, to lose their own personality, and to be false to themselves. He (Professor Butcher) had been told that Carlyle, reading Plato rather late in life, exclaimed, "Why, that is what I have been saying all these years past!" Indeed, the duty on which Carlyle dilated of being what he called true men—to avoid all shams, shadows, semblances, hearsays, falsehoods, and all sorts of them was only another and more wordy version of what Plato expressed. The main charge against artists was that they imitated appearances—the outward form of things, and not their essence. He thought that underlying the objection to imitative art was the duty of being "true to ourselves." Plato also viewed the artist, especially the poet, as an inspired and privileged madman. When Socrates went to the poets and asked them the meaning of their own works he found they could give no rational account of what they had written. "They showed me," he said, "that not by wisdom do men write poetry, but by a sort of genius and inspiration; they are like diviners who say many fine things, but do not understand the meaning of them." The poet, then, stood so far on a lower level than the skilled workman, whose art was useful and intelligent, and based on rational principles; still further was he below the philosopher who spoke what he knew, and who had passed beyond the outward show to the hidden unity of existence. Now, if fine art was, indeed, only an art of fair show and misleading images, if the artist lacked insight into the truth of things, if he lacked that purpose, which even the craftsman had who worked for use, what, then, could be the end and aim of it? It was simply what was called in the "Sophist," "a more graceful and artistic form of pastime." It sought to please, and to please the masses. Some of them would probably accept that description of art as one of its highest titles to honour. But pleasure to Plato was a word of base

associations, and a democratic pleasure must needs be ignoble. Hence the fine arts were reckoned with rhetoric and sophism and other arts which looked not to what was best or truly wholesome, but to the pleasures of the moment. So, too, in the "Republic" imitative artists were classed with ladies' maids, barbers, wet and dry nurses, confectioners, and cooks. But not only was art useless, it was worse. Against dramatic poetry in particular this new charge was directed. Poetry stirred and stimulated the emotions, which ought either to be suppressed or controlled by reason. It was enfeebling to witness or sympathise with an exhibition of feeling on the stage which a man would count unworthy or degrading in real life. Socrates appealed to, says that, strictly speaking, the actor "is not in his right mind." Of the comic stage, it was said "that you laugh at buffoonery which you would be ashamed to utter, and the love of coarse merriment on the stage will at last turn you into a buffoon at home." And, in general, it might be said that "poetry fed and watered the passions instead of starving and withering them, and made anarchy in the soul by exalting the lower element over the higher and dethroning reason in favour of feeling." Such was the indictment against art. Let them see how Plato put the other side of the case. In the "Phædrus" art depended on inspiration; it was a revelation to sense of eternal ideas. Earthly beauty to Plato was the first step in the ascent by which the soul rose from the contemplation of fair forms to fair deeds, and from fair deeds to fair ideas, till it arrived at last at the contemplation of beauty absolute. The faculty of reminiscence which made this beatific vision possible was for Plato the common principle of philosophy and poetry; so that these, often disunited, met in a world which transcended experience, and whose truths were the master truths of all their being. They had thus two views of fine art in Plato apparently irreconcilable. The unmeasured attack in the "Republic" upon imitative art, and especially on the drama, was the more startling and paradoxical when they remembered Plato's loving perception of all that was beautiful, his gifted artistic nature, his poetic imagination, nay, even the dramatic form in which his own works were composed. But there were certain considerations which helped them, if not to harmonise the opposing conceptions, at least to see how the author of the "Republic" could in a different mood, and from another point of view, also write the "Phædrus." Plato, when he reviled art as merely imitative was thinking of art as it was; when he glorified it as the inspired expression of eternal beauty he was thinking of art as it should be—art leading to and at last merged in philosophy. Art could be admitted when he came to frame, not an ideal "Republic," but a real city in the "Laws." The rigour of his sentence against artists was abated. Imitative art had been condemned as a form of amusement and of pleasure. In the "Laws" he allowed that there was a pastime which was also education, a pleasure which was also discipline. Art was still treated as purely subsidiary to education, but it was possible to educate by a right use of pleasure. Art, then, must harmonise and discipline, rather than stimulate the emotions. Music was declared to be a chief agent in moulding and regulating character, and in schooling the emotions of human beings who were by nature irrational, restless, roaring sort of creatures. The worthiest poems to set to music were those which incited to noble effort. Comedy was to be studied only to avoid doing what was ludicrous in life. A noble life was the noblest drama, and the artist who could teach them to live such a life was the best poet. It was sometimes said that the Greeks looked on morality from the side of aesthetics, and that they worshipped beauty at the expense of virtue. Such was not certainly the law laid down by Plato. To his mind art and morality found their point of union in this—that both converged upon philosophy, and that in the ideal world they both were merged in the contemplation of true being.

#### DALLINGTON CHURCH.

A DESCRIPTION of the recent restoration of Dallington church was read at the annual meeting of the Northampton Architectural Society. The author, the Rev. J. C. Beasley, said an honest endeavour had been made to carry out the work at once in a liberal and conservative spirit. Certainly nothing could have exceeded the liberality of His Excellency Earl Spencer, to whose generous gift the parish of Dallington was indebted for this great improvement, and who, having entrusted the work to Mr. Edmund Law, unhesitatingly sanctioned the plans which he prepared. But not less truly might it be said that the work had been carried out with an earnest desire to conserve the main features of the building, and even the smallest details which seemed worth preserving. The only considerable alteration consisted in the lengthening of the chancel about five feet, but there could be no doubt the existing eastern wall was not only a very modern one, but that its position was not original. This was very evident from the fact that a small doorway on the north side, leading from the comparatively modern chapel, and originally, no doubt, inserted in the external wall, opened within the sanctuary, and not more than three feet from the east end. It seemed, however, worth while to test this matter further, and the foundations were examined.

Pretty plain proof was at once forthcoming that the church had extended eastward, but how far there was no means of ascertaining, as no angle was found on either side, and no traces of the east end. This was, however, easily to be accounted for by the fact that the ground had been disturbed for burials, and the search was for the same reason discontinued. When, however, the extension spoken of was carried out, fresh traces of the north and south walls were found at a lower level, so that it might be confidently asserted that the present chancel was shorter than it was in olden times. The extension might be regarded as a very great improvement. The chancel, as it existed prior to the restoration, was inconveniently small, and as there was every reason to believe that it had never been any wider, there was the more ground for gaining space in an eastward direction. Another addition would also probably be approved, even by rigid architectural conservatives, in the form of buttresses at the north and south angles of the chancel. These were designed after the patterns of very beautiful and simple specimens of the Early English type, which were found on the north side of the nave. Coming to the interior, the first point which demanded attention was the level of the church floor. It had been originally intended to have a step of about six inches at the chancel arch, but further consideration seemed to make this undesirable. In the first place, there was not the slightest doubt that the existing level was the old one, and the first result of raising it would have been to obscure the bases of the columns of the chancel arch. This, no doubt, might have been overcome by placing the step on the eastern side of the arch; but if this had been done the doorway on the north side, which is of really beautiful proportions, would have been utterly spoiled. Its dimensions were so small, that to have taken six inches from the height of the jambs would have been enough to make it look utterly unlike an entrance. One still stronger objection was that, if this course had been adopted, either the height from the floor to the wall-plate must have been diminished, or the pitch of the roof lowered, or the apex of the roof carried higher than that of the nave. Perhaps, in the view of many persons, the last alternative would be considered the least objectionable; but to his own mind nothing was more calculated to spoil a church than carrying a high-pitched chancel roof above the nave. On the whole, he believed they had adopted the best course when they decided to retain the existing level, and all the more so when, in clearing away some earth on the south side, they found fresh indications that this was the original one in the discovery of a portion of the old splints and the remains of a buttress. A step of bricks was placed at the entrance to the sanctuary, and the holy table stood upon a second of the same dimensions. The east window was of a very beautiful design, in the early Geometrical style, thus harmonising with the principal features of the work. It replaced one of very poor proportions and plain appearance, which had been inserted about fifty years ago. There was one window out of the three on the south side which was considered worth preserving. It was of the Perpendicular period, and had been carefully restored (though it had no pretension to beauty) and rebuilt. The other two windows, which were very poor imitations of it and worked in the roughest manner, had been replaced by windows of a somewhat similar design to that at the east end. The architect had planned to make these of still richer appearance by decorations on the inner side, but in taking down the plaster walls it was found that at some former period the jambs of two out of the three windows had been continued down to within about 2 feet of the floor level, thus forming a kind of stone bench. The centre window, however, had apparently not been treated in this way. This somewhat peculiar feature was considered well worth preserving, even at the cost of sacrificing some of the proposed decorations; and no one, he thought, now that the restoration had been completed, could doubt that the decision was a right one. The extreme narrowness of the chancel was its principal defect, and these wide and deep recesses went a long way towards remedying it. The effect from the west end was particularly good, the light and shade being broken up in a very pleasing manner. The arrangement has the further advantage of affording a seat within the rails, thus doing away with the necessity of placing a chair on that side, and trespassing upon the already cramped space. Immediately below the westernmost of the three chancel windows was a low side window—one of those curious insertions sometimes spoken of as leper windows, but there was, he believed, no authority for calling them by this name. Their use was extremely uncertain, but it had been suggested that they might have been used as confessional windows, and the speaker added that this curious though simple relic of a bygone age would be jealously preserved. No discoveries of any interest were found on the north side, with the exception of a perfectly plain square recess (which, no doubt, had been used as an aumbrey). On the eastern face of the wall over the chancel arch were found very plain marks of the old Early English roof, the pitch of which was very high, but corresponding as nearly as possible with the marks of a similar one on the wall of the tower, which was found at the time of the restoration of the nave. The ornamentation of the restored chancel had been carried out in a way which he hoped might be regarded as thoroughly suitable to a village church. The choir stalls—one row only on each side—were of oak; the tiling of the floor (by Maw & Co.) was of simple

but good design; and the floor of the sanctuary was laid in Mosaic tiles of a very beautiful description. The reredos was of Eden stone, and was designed to have the blank compartments ultimately filled in with stone figures of the apostles in alto relievo. The roof was of oak and harmonised in design with the general plan of the restored chancel. Lastly, Mr. Beasley added, he must mention that Lord Spencer's liberality in defraying the cost of the restoration had been met by the no less generous gift of a beautiful organ—built by Stringer, of Hanley—and for the design of which he was indebted to their architect, Mr. Edmund Law, who had spared no pains to bring the work as near perfection as possible, and to whom the parish would always remain under a heavy debt of gratitude.

### FREE SPACES IN LARGE TOWNS.

A DISCUSSION on Mr. Honeyman's paper which was published in *The Architect*, was opened on Monday evening by the Glasgow Architectural Society.

Mr. J. Sellars, the president, said that Mr. Honeyman very truly remarked, that in dealing with the question of "dwellings for the working classes the element of cost can never be ignored," and therefore the price paid for the ground on which the houses are built has to be taken into account, just as much as the cost of the stone and lime, in fixing the rent which must be charged for each house in order to get a fair return for the outlay. It was therefore of the utmost consequence that the builder should be allowed all reasonable liberties in arranging his houses on the ground. No one, however, would say that some such regulations as those laid down by the municipal authorities were not absolutely necessary. But Mr. Honeyman argued that the regulations in the new Police Act tended in the direction of rendering it impossible for buildings to be erected on any site which had to be bought and paid for, and profitably let at such rents as the lower class of workmen could afford. Mr. Honeyman had therefore prepared a plan, under which, by allowing greater liberty, especially as regarded the height of ceilings, a larger number of healthier and cheaper houses could be erected on specified areas of ground. Taking the area chosen by Mr. Honeyman for the purpose of illustration, Mr. Sellars went on to show that the greatest reduction of rent that could be expected, according to Mr. Honeyman's plan, would be 30s. a year. That, he admitted, would be an important difference in rent for working men, especially if, in addition, it could be demonstrated that the cheaper house was also healthier and more convenient. It was at this point, however, that a difference of opinion might arise. Speaking for himself, he did not think that a 10-foot ceiling was too high for a dwelling-house, but, while that was his personal opinion, he could not go the length of saying that if his neighbour thought that 9 feet, or even 8 feet, was sufficiently high, and he could prove that it was easier ventilated and better in many ways, and that he could find tenants for houses of that kind, he would prevent him erecting them. The cubic capacity being equal, he admitted the advantage of additional floor space gained by adopting low ceilings, although there was this to be said, that more floor space would just mean with many people more room for beds, and, therefore, more chance of overcrowding. The reply to this objection would no doubt be that that had nothing to do with the present question, and it was the duty of the sanitary inspectors to prevent overcrowding. But temptation should not be put in the way. It was difficult to say what should be the height of ceiling in such houses. The municipal authorities had drawn the line at 10 feet. They were asked to say no—draw it at 8 feet. But why stop there? There were no giants in those days, or if there were, they were not common in our domestic circles. Therefore, why not make the ceilings 7 feet, or even 6 feet 6 inches? He supposed the truth lay somewhere between the two extremes, and if he had to draw a line he would say 9 feet as a minimum, while he would recommend every person who asked his advice not to construct a house with a lower ceiling than 10 feet. He did not think that any person who built a house five or six storeys high, with ceilings of 8 feet only, would be likely to repeat the experiment, as he very much feared they would not let. He was quite aware that elsewhere such buildings were common enough, but custom was something, and we were not accustomed to more than four storeys. If hoists could be profitably and conveniently applied to tenements of dwelling-houses it might be different, but in the meantime three stairs were quite enough for children to climb. But, the other side would say, what was to be done if the 30s. difference in rent just turned the scale, and prevented the working man getting away from the insanitary den which he must occupy at present? Well, that question would not be easily answered if it was quite clear that there really was this difference; but he thought it could be shown that houses could be built as cheaply on this plot of ground under the Police Bill regulations as with less stringent regulations. He would deal with Mr. Honeyman's whole plot of ground, including the streets. It measured 300 feet by 200 feet. He would leave the end street 50 feet wide, but he would increase the width of the other streets from 50 feet to 60 feet. On this street he could erect buildings with four storeys instead of three storeys.

His buildings were 40 feet wide and 41 feet high. In this height he would have three storeys 10 feet high, and one at the top 9 feet 6 inches. Then as to the free space behind, he required to have three-fourths of the height of each building exclusively belonging to it—that was, 61 feet 6 inches—so that the distance of 200 feet from centre to centre of the street was thus occupied. He would thus put 160 houses on this plot of ground instead of 120; that was, of course, still twenty dwellings short of Mr. Honeyman's arrangement. But in this way the ground rent and the cost per house would be more nearly assimilated, the difference in the latter being only 3s. 8d. instead of 15s., and the difference in cost very trifling. Indeed, he was not sure but the difference in cost might now be against the unrestricted plan. Besides, his houses had a separate back green or paved area for each tenement, on which coal cellars and ash pits could be placed at much less expense than by having them under the building, as, he presumed, they would necessarily be in the other plan. Another very obvious advantage, and one which in favourable circumstances might prove overwhelmingly in favour of the restricted plan as a mere business transaction, would be that there was a much longer frontage—two-thirds more—available for shops, and the shops would front a wider street. If the locality was one in which shops were required the rents derived from them would far more than counterbalance the extra cost of ground per occupancy and the extra cost of building, if any, and would enable them to be let at a rent even less than on the other plan. The more he considered the restrictions as to widths of streets, heights of buildings, &c., contained in the Police Bill, the more he felt bound to recognise their wisdom as a whole. That was, however, altogether apart from the question as to whether they should be in a police bill at all, instead of a separate building act. At the same time it was undeniable that Mr. Honeyman had made out an excellent case in support of his views, and probably the true solution of the difficulty would be to relax the rules very materially in the case of the smaller class of workmen's dwellings in particular localities, or deal with special cases when they arose.

Mr. Howatt said he was much pleased with Mr. Honeyman's remarks, and he was clearly of opinion that if tenements were built north and south they would be blessed with the air and the sun, and this was a matter of very considerable importance. He did not think, however, that a 10 feet ceiling was more than should be required under the Act.

Mr. David Thomson said Mr. Honeyman had failed to distinguish between two distinct cases. There was first the case of vacant ground. In such a case, he would be strongly against crowding houses upon that ground. The great difficulty, however, was to deal with such sites as had been cleared by the Improvement Commissioners. These had been purchased at such prices that it was found impossible to erect workmen's houses upon them at remunerative rates with the present restrictions. He thought it would be well that the Commissioners should have power to frame special regulations for the reconstruction of these buildings; and Mr. Honeyman had demonstrated that such houses could be erected on such allotments as would be reasonably remunerative.

Mr. Gildard said emphasis had been laid on the houses being north and south. But in London, Edinburgh, and Glasgow the main thoroughfares ran east and west, and these arrangements could not be very readily upset. With regard to the other point, if the rooms were to have certain cubic contents he did not think there would be much reduction in cost by lowering the ceiling. The houses must be longer and broader, and there would be a heavier ground rent. He had found, however, in the course of his experience, tradesmen earning 30s. and 2l. a week occupying rooms only 8 feet square in front of the bed, and it seemed to him that such people did not want large houses, for 30s. a year reduction on the rent would be to them a matter of little consequence.

Mr. Miller (the secretary) said he believed Mr. Honeyman's principal object was to show how houses might be built so that the rents might be reduced, and there were many people, single women and others, who, instead of making 30s. or 2l. a week could only make 6s. or 7s. He (Mr. Miller) believed that if they honestly considered what caused the high death-rate it would be found that it was due to bad food, bad nursing and uncleanness. What therefore they had to do was to put as many houses on the ground as could be supplied with fresh air, to let them as cheaply as possible, at 1l. a year if that could be done, and then to punish the occupants if they did not keep them clean. Uncleanness, the presence of decaying organic matter was the chief cause of disease, and cleanliness should therefore be enforced; overcrowding must be dealt with by the sanitary authorities.

Councillor Gray considered Mr. Honeyman's paper a good set-off against the craze of two or three members of the town council, and suggested that the Association should send a deputation to that body on the subject.

The discussion afterwards terminated.

Messrs. William Sapeote & Sons have obtained the contract for the new church for the Old Meeting Trustees, Birmingham. The work is to be commenced immediately. Mr. J. A. Cossins is the architect.

## NOTES AND COMMENTS.

MR. MARKS, R.A., has completed two out of four decorative panels on a large scale. They are to fill semicircular spaces on a landing, of which the upper part is white and the lower part is lined with light oak in panels. The scheme of colour has been arranged to suit the position of the paintings. Mr. MARKS is one of the few English artists who know the value of white. In this case it may be said to be the predominant colour, and under the circumstances it is the most suitable. With white plaster above and at the sides, and the lightest oak underneath, rich or dark colours would become too heavy and the decoration too obtrusive. Birds form the subjects of both paintings. In one we have the bank of a river, with mountains beyond. Here and there in the foreground flat rocks crop out, with patches of green between them. Several white pelicans are seen on the bank, some standing and others lying. The second picture is also a river scene, but in a country that appears less bleak and stern. Here are white storks and cranes, with flamingoes of a delicate pink. Tall plants rise behind, and form a background. The birds are represented with an accuracy that would delight a naturalist, and the vigorous, decisive execution shows that the painter's hand has not been affected by the delicate finish that is seen in his small figure pieces.

It is proposed to have an exhibition of architectural sketches in the gallery of the Burlington Fine Arts Club. They will be restricted to those which are by architects who are no longer living, and are to be genuine sketches of works abroad, not designs for projected buildings. As a matter of course the majority will be of Classic or Italian buildings, for it is only within the last thirty or forty years that Continental Gothic was accepted as a subject for study. It is to be hoped that the committee may be able to obtain some of the sketches in Greece and Egypt by Professor COCKERELL and Mr. CHARLES BARRY. Although modern designs are not admissible, would it not be well to make an exception in favour of the few which are known to be by architects of the sixteenth and seventeenth centuries?

ANOTHER attempt is about to be made towards solving the difficult problem of housing workpeople in London. On Thursday the governors of St. Bartholomew's Hospital agreed to lease a plot of ground to MESSRS. ALTMAN & SIMS for the purpose of erecting industrial dwellings on a novel plan which has been devised by Mr. G. R. SIMS, the author (a son of one of the lessees) and is a result of his investigation of the condition of the houses of the poor. The site is in St. Luke's, and at present is covered with twenty-four small houses in Seward Street, and six houses in Central Street. The lease is for eighty years, and the yearly rent 680*l.*, or about 4*d.* per square foot. The lessees undertake to expend 20,000*l.* in the erection of buildings—which in principle will differ from the PEABODY or the WATERLOW model dwellings.

THERE is one city where architects are busy, but it is a great way off, being Minneapolis in Minnesota. It appears that the local architects are overworked, and it has been found necessary to send elsewhere for some plans, as the building owners are in a hurry. An immense quantity of building material has been ordered for delivery early in the spring, and contractors are said to be "piling up orders in advance," a feat which is not easily understood. Many an architect and builder in this country must wish that business followed the same law as the storms, and that it could be predicted to appear here quickly from the West.

THE following alterations of Bylaws 26 and 27 will be proposed at the meeting of the Institute of Architects on January 7, 1884: "Any fellow or hon. fellow shall be eligible to be nominated by the council as president, but no member who has filled the office for two successive years shall be again eligible for the presidency until the expiration of two years from the termination of his office." "Any fellow who is or has been a member of council shall be eligible to be nominated by the council as vice-president, but no vice-president who has filled the office for six successive years shall be eligible for re-election as vice-president until the expiration of twelve months from the termination of his office."

THE statue of Mr. GLADSTONE by Mr. ONSLOW FORD in the City Liberal Club is a clever work, but it is in a bad position, and is badly lighted. In all buildings of the kind where statues and busts of celebrities are inevitable, provision should be made for their display. This has not been done in Walbrook. The pose of the figure has been studied from life in the House of Commons, where the sculptor took his position on several nights. Mr. GLADSTONE is represented standing—one hand holds a small scroll, and the other is partly closed, the forefinger being extended in the way that is common with some orators. The dress is an everyday costume, the frock coat and trousers fitting rather loosely, and falling into folds that would look better in bronze than in white marble. The likeness is excellent, and the statue is a pleasing contrast to the conventional figures that pass for English statesmen.

AN examination of the interior of Edinburgh Castle is to be made by an officer of the Royal Engineers. The alterations that may be recommended will, of course, be determined by military necessities. Professor BALDWIN BROWN says that, so much of national history is associated with the building, it would be well if the public were allowed a voice in the arrangements. He asks: "Cannot the public bodies of Edinburgh, antiquarian, historical, artistic, make their influence felt by passing resolutions urging the matter on the favourable consideration of Government? If the Town Council, ever zealous in good works, will take the lead, the Society of Antiquaries, the Royal Scottish Academy, the Cockburn Society, the Architectural Association, with other bodies, would provide a powerful weight of public opinion sufficient to start the movement. The result would be to provide for the use of the garrison a noble hall, and perhaps other fine apartments, now divided up and put to casual uses, and to afford to the people of Edinburgh an additional reason for being proud of their city."

M. ULYSSE BUTIN, whose death was announced in last week's *Architect*, was born at St. Quentin in 1838, and was thus only forty-five years of age. His most remarkable works are *Suspense* (3rd medal, 1875), *A Fisherwoman, Departure for the Fishing* (1877), *The Sailor's Interment* (1878), *The Fisherman's Wife* (1879), and *The Anchor*, in 1881, for which he received the ribbon of the Legion of Honour. He was latterly engaged on a great decorative painting for the St. Quentin Hôtel de Ville—*The Comte de Vermandois Granting a Charter to the Town of St. Quentin*.

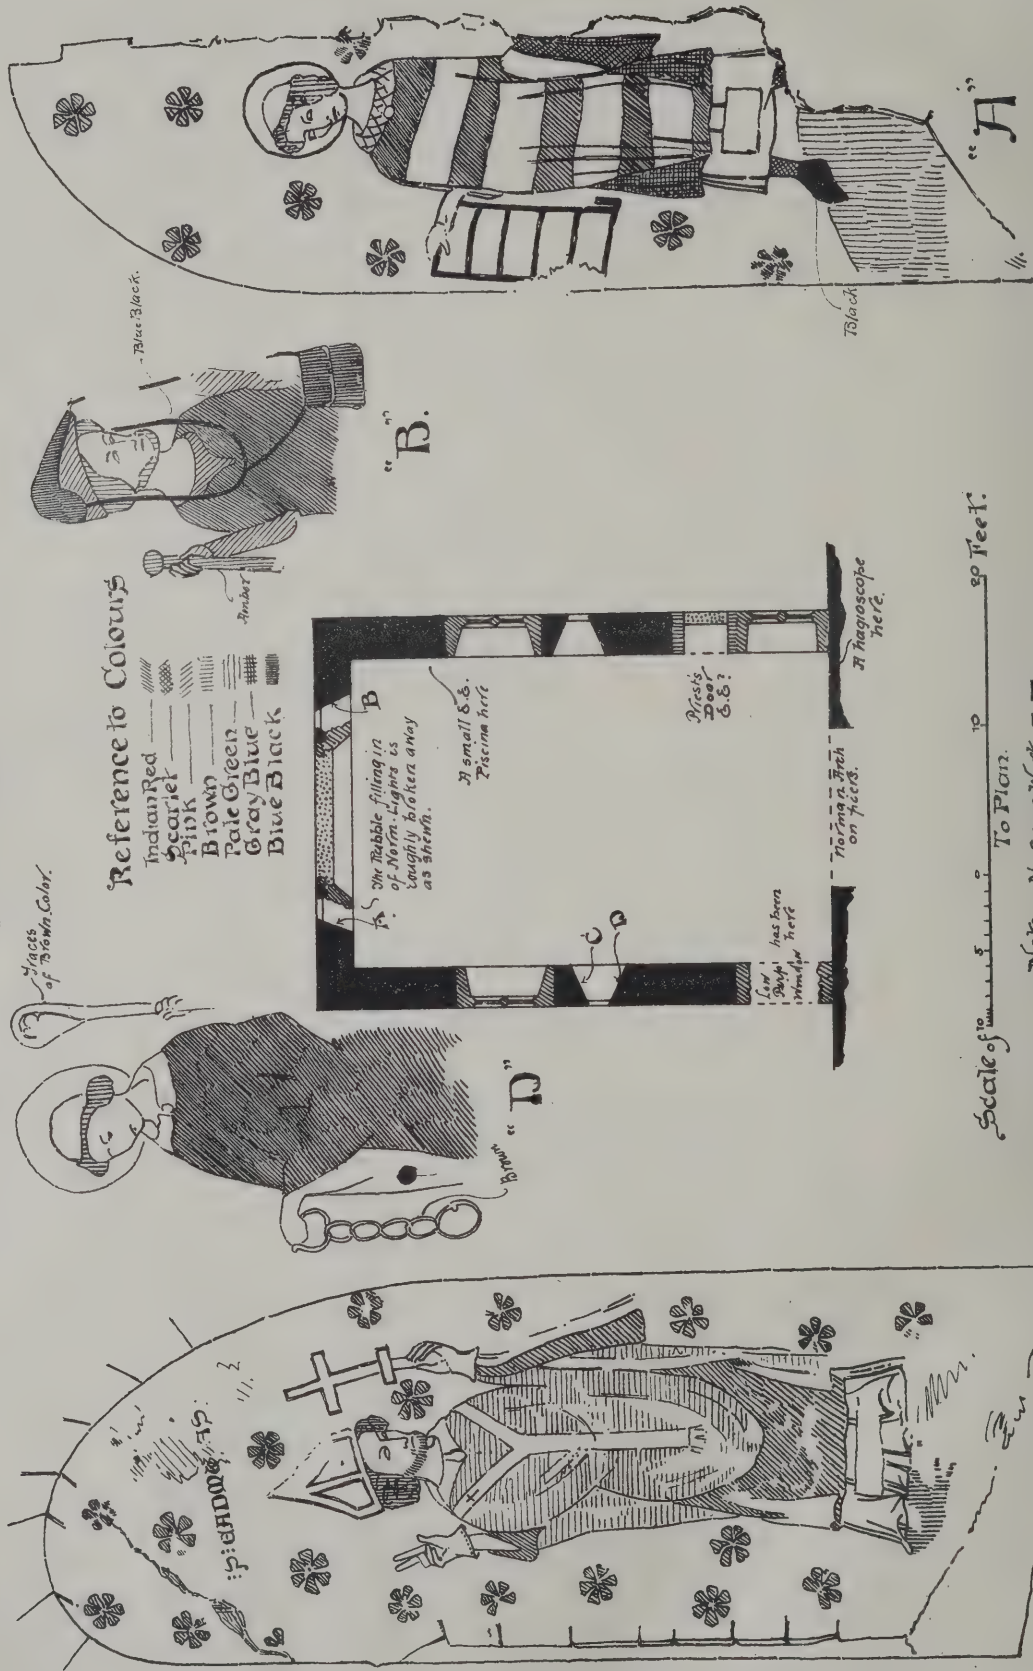

"A YOUNG ARTIST," who writes from Paris, has come to the aid of the "Aged Artist" who lately denounced the English art schools. "I work," says the writer, "in a large *atelier* in which there are students of every description, from absolute beginners to skilful artists, and I see one student fresh from a country village where she had literally had no teaching, beside another from one of the best-known British schools of art, at which she had taken high honours, both working from the same model with, according to the teacher's opinion, very equal skill. No doubt the latter is an adept at 'stippling,' but as that is an accomplishment little appreciated, except in South Kensington circles, it profits her nothing. I cite not from one instance, but from many. Girls from British schools of art are invariably considered mere beginners, and that from no prejudice, but because they show themselves incapable of drawing a human face. 'An Aged Artist' attributes the small results of our Government schools of Art to the badness of their system. From my own observation I venture on the bold assertion that the teachers are even worse than the system, though I believe this to proceed from an integral part of the system which very much narrows the field for the selection of teachers. I have myself been taught by several schools of art teachers, with the result that I have since had to unlearn all I learnt from them, and I have seen the works of others who hold high appointments, and certainly were they private teachers no parent would confide his children's instruction to them on testimony of their works." All this seems to be beside the question. In every school there are students to whom progress is almost impossible, and the "Young Artist" may have been one of them. The Government schools can point to several eminent painters as evidence of the value of what is taught under the Department.

## ALMSHOUSES WITH CHAPEL OR HALL, TURVEY, BEDFORDSHIRE.

THESE almshouses are now in course of erection for Mr. JAMES BARTON, of Oakley House, Camden Road, and Oxford Street, London, and will be permanently endowed by him. They are intended for twenty pensioners—ten married and ten single. Each tenement will accommodate four inmates, each having a separate living room and bedroom, with use of kitchen and scullery combined, and washhouses. The central portion of the building is intended and fitted up for the use of the superintendent of the institution. The buildings are in the Tudor style, with a frontage of 200 feet, and have a south aspect. The materials used for the facings throughout are red bricks, with bands of Luton greys and Bath stone dressings. The roofs will be covered with Bangor slates laid on boarding and felt, and with COOPER'S terra-cotta ridges. The glazing generally will be in quarry lights, the centre of the building having an oriel window on the first floor for the board-room, with ante-rooms and other conveniences, above which will be a turret clock by BENSON. The external doors are of English oak, with ornamental wrought-iron strap-hinges, handles, and latches.

An important feature in the ground plan is the large hall in the rear of the central block, intended for holding religious services and entertainments. There will be three three-light windows on each side, and the glazing will be in quarry lights, with upper parts in coloured glass. At one end is a chamber to receive a new organ of two full-compass manuals and independent pedals in oak case, with decorated 8-feet open diapason pipes in front, above which will be a circular stained-glass window, and on either side of the organ are ante-rooms. The organ is by Messrs. GRAY & DAVISON, of Euston Road. At the other end, approached from the board-room floor, is a small private gallery, running the entire width of the hall. The construction of the roof is of English oak timber, panelled throughout in best pitch pine, stained and varnished, and surmounted with a *flèche* for ventilation, covered with copper. There will be a dado round the interior, the walls above which will be distempered and coloured. Provision has been made for ventilating, and the warming will be effected by the introduction of hot-water pipes arranged in tiers, two on either side and at entrance. The hall and its approaches will be lighted by gas.

Upon the same estate several well-designed villa residences, with modern improvements, are being erected, for the occupation of persons wishing to avail themselves of the great educational privileges of the Harper Charity Schools at Bedford without the burden of high rents, rates, and taxes. The above are built adjoining the Pict Hill Estate, belonging to Mr. W. F. HIGGINS. The sites are high and dry, the neighbourhood particularly picturesque, commanding views of rich woodland beauty. The interesting village of Turvey, for many years the scene of the labours and ministry of the late Rev. LEIGH RICHMOND (author of "The Annals of the Poor," containing "The Dairyman's Daughter" and "Young Cottager"), is reached by Midland Railway from London—a distance of fifty-six miles—in an hour and a quarter. Close by are Olney and Weston Underwood, where once resided the poet WILLIAM COWPER.

The contractor for the almshouses is Mr. SAMUEL FOSTER, of Kempston, Beds. The clerk of works is Mr. WOLLORD. The entire works are being carried out from the designs and under the superintendence of Mr. J. S. MOYE, architect, 3 Southwick Street, Hyde Park Square, London.

## NEW BOARD SCHOOLS, ROCHDALE.

THE Rochdale School Board advertised for competition drawings for the erection of new schools to accommodate 500 children, and about thirty-eight architects responded to the appeal. The committee selected the design with the motto "Utility," by Messrs. MANGNALL & LITTLEWOODS, architects, Manchester, who were instructed to procure estimates and carry the work out, which is now finished and occupied. The contract was let to Messrs. PETERS & SONS, contractors, Rochdale, the total amount being under 5,000*l.*, including fittings and architects' commission.

We give view and plan. The mixed school for boys and girls is situated at the south end of the site in Derby Street, and is 60 feet in length by 20 feet in width and 20 feet in

height, and accommodates 120 scholars, allowing 10 feet of floor space for each scholar. Directly communicating with the school-room are four class-rooms, two of which will accommodate fifty-five, and the other two thirty-five scholars, each allowing 10 feet of floor space for each scholar. Hat and cloak-rooms and lavatories are provided for each sex in immediate connection with the entrances. The infants' school is situated at the north end of the site in Derby Street, the principal approach being from this end. The school is 48 feet in length by 20 feet in width and 20 feet in height, accommodating 120 children, allowing 8 feet of floor space for each. Two class-rooms, each accommodating forty children, communicate directly with the school-room. A white glazed brick dado, 4 feet high, will go round each school-room and class-room, which will have a pale green tinted band of another colour at the top and bottom. The ceilings to each school will be splayed on each side. The roof principals, being exposed to view, are in pitch pine, varnished. The boys' and girls' latrines are situated adjoining the west boundary wall, and will be on the dry-earth closet system and well ventilated. The infants' latrines are situated near to the back school entrance, and are approached by a covered passage.

The schools and class-rooms are to be heated by hot-water pipes. A louvred ventilating-shaft is fixed on the roof over each school, and communicates with openings in the ceilings regulated by doors, which open and close with pulley and cord. Fresh air is introduced every few feet along the walls of each school, at a height of about 7 feet above the floor, by means of SHERRINGHAM'S ventilators, and foul air is to be taken out at the ceiling level through BOYLE'S talc ventilators. The windows are also adapted for the free admission of fresh air by the simple plan of hanging the top part to fall inwards (regulated by cord and pulley), and the lower parts being sashes, afford means of cleaning.

The elevations are faced with red stock bricks, red terra-cotta being extensively used for the ornamental work, with masonry sparingly introduced where most required to throw off the water—namely, to string courses and sills and the upper part of cornices. The roofs are covered with green Welsh slates fixed to yellow pine sawn battens. The ridges are of red Staffordshire crested tiles. The internal joiner's work, such as doors, &c., are of pitch pine, varnished.

## MISSION ROOM, LEEDS.

THE exterior elevations to Brama Street and Park Court, which are very similar, are built of red pressed bricks with sandstone dressings. The interior of the large room is also lined with red brick, the heads, sills, jambs, and mullions all being moulded, and of stone internally as externally. There is a class-room provided, also a kitchen with special appliances for the preparation of teas. The hot-water pipes are heated by a gas furnace in the basement, and the building is ventilated throughout on ELLISON'S system. The architects are Messrs. S. E. SMITH and J. TWEEDALE, of Leeds.

## MISSION HALL, ST. MARGARET'S, TWICKENHAM.

THIS building, which was recently opened, has been erected from the designs of Mr. THOMAS R. RICHARDS, architect, 17 King Street, Cheapside, by Mr. F. SIMPSON, of Richmond. The interior has been made attractive in appearance. The whole of the woodwork is stained and varnished, and the windows are filled in with cathedral glass of varied tints. The building owes its existence mainly to the liberality of the honorary pastor of the Twickenham Baptist chapel, Mr. E. H. BROWN, who generously contributed one-half the cost.

## THE DESIGN FOR ALL SAINTS CHURCH, IPSWICH.

IN this design the church was made cruciform on plan, and has north and south porches, west entrance and tower at south-west angle, with baptistery in lower part of same; the transepts are shallow, and so arranged that an uninterrupted view of chancel may be obtained therefrom. Ministers' and choir vestries are provided, with separate entrance thereto, and with strong closet, lavatories, &c., in connection therewith, and heating chamber underneath. The organ is placed in north choir transept, and would be visible from all parts of the church. The nave has an open-timbered roof boarded on back of rafters, the lean-to roofs of aisles are treated inside to appear as span roofs, and the nave arches are groined into

same. The waggon roof of chancel is boarded and panelled with enrichments at intersections of ribs, &c., and all the roofs would be covered with tiles. The interior walling would be of buff, and the exterior of local red brick with moulded brick strings, &c., and Bath stone dressings. The broad spire also would be of Bath stone. The floor of church under pews would be laid with wood bricks on bed of concrete, the aisles, chancel, &c., having tile paving. The church would be exceedingly well lighted, ventilated, and heated, and the cost of the portion intended to be first erected would not have exceeded the stipulated sum. The architect is Mr. WILLIAM WYKES, of 124 Colmore Row, Birmingham.

#### MURAL PAINTINGS.

THE curious paintings shown in the illustration have been lately discovered in Frindesbury church, Kent. The sketch is by Mr. P. M. JOHNSTON.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE fourth ordinary meeting of the Institute was held on Monday evening, Mr. Horace Jones, president, in the chair. A paper was read by Mr. E. J. Tarver, on

#### English Architecture and Monuments of the Sixteenth and Seventeenth Centuries.

Mr. TARVER said he was led to the consideration of this subject by the course of lectures on the history of architecture he was now giving for the third session to the students of the Architectural Association, with the object of helping them to prepare themselves for the examination of the Institute, and for admission as associates. He had found when coming to the lecture on English Renaissance a difficulty that always existed in pointing out a successive development of the features of this style—if style it might be called, which combined the elements of two such antagonistic principles as were implied by Classic and Gothic design. At all former periods, after making due allowance for local varieties, the style throughout most countries—or, at all events, large districts—was more or less uniform, having been arrived at by a system of natural selection of obvious improvements as the need for them arose, and by a corresponding system of discarding such features and treatments as had been thus improved upon. In the period under consideration, on the contrary, architectural style was as much a matter of fashion as the literature of the day, and it had since then gone through more astonishing changes than were ever dreamt of even in the most fanciful days of James I. It would be admitted by most, though not by all architects, that the Gothic style as it existed at the beginning of the sixteenth century was capable of improvement—at all events in its details. While recognising the great merits of the general design of the buildings as a whole, and the care and forethought exercised in arranging the various threads that were to spread over a church interior from floor to roof without a single breach of continuity, it would be found that this system was the result of calculation rather than imagination, whereas both these elements were necessary to good architecture. Sense appeared to have been deadened in detail even more than in mass, as might be seen in the heavy and “lumpy” treatment of the canopy-work of Bishop Alcock’s Chapel at Ely Cathedral. Whence was the improvement to come? A comparison of this chapel with the companion chapel at the opposite side of the cathedral, erected by Bishop West, would prove that it certainly had come, in the course of thirty years, and in the shape of a finer sense of form acting upon the very same Gothic features that were then in vogue. The very plan of the pedestal was poetical as compared with its neighbours, and this feeling seems to have been carried throughout the whole treatment, even to the section of the mouldings. The explanation was that a new influence had been at work in the meantime, as might be learnt from the late Sir Digby Wyatt’s paper, read before the Institute in May 1868, entitled “The Foreign Artists employed in England during the Sixteenth Century.” This employment of foreign talent was a luxury indulged in chiefly by the rich; so it was not surprising to find that it escaped the architecture of out-of-the-way places, and that a style which cannot be called anything else than Gothic, however debased, survived in such places even up to the last century. Amongst the works which might be classed as luxuries were sepulchral monuments, and it appeared to the lecturer that, if any successive fashions were followed, they would be recognisable in these, which were, in many cases, architectural compositions; and further, that the headquarters of such fashions would be in London, and especially in Westminster Abbey. He had, therefore, looked about for a chronological list of these monuments; but, not finding one, he compiled a list from the little guide-book which is said to have received the approval of the late Dean Stanley, and then went steadily through the list, and visited each monument in order, noting the fresh features, not of the figures, but of the architecture,

as they appeared to have been introduced. In doing this, a fair margin had to be allowed for the time that elapsed between the death of the individual and the erection of the monument. Thus, when copying the date off a building, you know where you were, but the date of a monument was not conclusive evidence. In this dilemma, the lecturer applied to Dean Bradley for permission to see any register that might have been kept of the erection of the monuments, and was referred to the chapter clerk, who, however, was unable to help him. Assuming, however, that the monuments followed, on an average, within a few years of the death of the individuals, there was a fairly consecutive series to judge from. Mr. Tarver then proceeded to enumerate the monuments and their particulars, and afterwards compared them with the architecture of the period with which they were contemporary.

The monuments enumerated made up a long list. Among those referred to by Mr. Tarver was that of Dr. John Young (1516) in the Rolls Chapel, Chancery Lane. This was the first of several on which Torregiano was employed. There was no doubt concerning the Renaissance character of the monument, which had not a vestige of Gothic about it. The figure was executed in terra-cotta. The idea was that Torregiano was employed by Henry VIII. on it, previous to trying his hand on the more important one of Henry’s royal father. The monument of Ann of Cleves, who died in 1557, was interesting as introducing us to an acclimatised style, in which first appeared converging and diverging scrolls. In Lady Jane Seymour’s (1560) the ornament was characteristic of jewel work. That of Margaret Douglas, Countess of Lennox (1577) was the first example of an obelisk, and a monument of this period in St. Margaret’s, Westminster, had an hour-glass above it. About this time (1590) the delicacy to which jewel decoration had been carried could be seen in Blanche Parry’s monument, St. Margaret’s, Westminster; also could be first observed the return of the convex moulding under the pilasters, which quite altered the character of the work. This double moulding occurred also later as a cornice. In tracing the monuments downwards, Mr. Tarver pointed out the development in style that had been carried on, with a healthy freedom from slavish adherence to precedents, &c. The monument of Lord Norris (1601) stood clear of the wall, and was surmounted by a canopy. That of Queen Elizabeth was perhaps the most important of any up to date, and one great improvement in it was a feeling of stability observable in the canopy that was wanting in the canopy of Lord Norris’s monument. Mary Queen of Scots’ monument, carried out more than twenty years after her violent death, agreed with that of Elizabeth in form and composition.

In that of Sir George and Lady Elizabeth Fane a pair of curtains drawn aside appear, and in that of Sir Christopher Hatton and his lady the figures occupied a novel position. Francis Hollis (1622) appeared in Roman armour. Sir George Holles’ monument (1628) showed a figure in plate armour, surmounted by a warrior in Roman armour. In 1628 the use of Ionic columns occurred for the first time. The Countess of Buckingham’s and her husband Sir George Villiers’ was a specimen of what became common in churchyard tombstones quite a hundred years later. In 1635 swags and draperies were getting mixed. Ben Jonson’s (1637) was a monument remarkable for its simplicity. At this time the architecture was becoming subordinate to the sculpture. The monument of Francis Lord Cottington (1652), in black marble, was of exceptional design, characterised by a delicacy and refinement which was indicative of great thoughtfulness. The list terminated with the monument of Lady Grace Gethen (1697), when Mr. Tarver proceeded to examine examples taken from various counties in England.

The paper was illustrated by a large series of architectural and monumental drawings, the latter being placed beneath the architecture corresponding to the period, and arranged as far as possible in chronological sequence.

Mr. WYATT PAPWORTH moved a vote of thanks to Mr. Tarver, who, he said, had referred to his book in terms of praise. The gradation in the monuments laid before them by Mr. Tarver was novel and most interesting, but hardly enough justice had, he thought, been done to the architecture, the buildings referred to being scarcely of sufficient importance to class with the monuments—such monuments, in particular, as those of Mary Queen of Scots and Elizabeth. No buildings were mentioned that could be ranked with them for comparison. While compiling his work he had not been able to find any names of the designers of the monuments. A few supposititious names of architects were met with, and the names of John Thorp and Inigo Jones were put to a considerable number. Whether the architecture should be attributed to them was doubtful. Many buildings begun and finished since the death of Inigo Jones occurred in one of the published lists of Inigo Jones’s works. As to the authors of these monuments, he would say they were done by clever carvers—sculptors we should call them—and not designed by any architect; the buildings themselves being designed by architects. There was a great difference between London and country monuments, more real art being seen in the London ones, though occasionally some might have been sent into the country from London. Mr. Papworth said he had come across the plan of Eltham Palace, made by John Thorp. His name was not to be found in any reliable work, so that he

should be interested to know whether search among Government records, &c., would throw any light on the subject. The first work attributed to him was in 1560, and the latest 1612. The arrangement of the orders in the monuments was curious, and the use of the Ionic order commencing at so late a period required a little more search to see whether or no it was merely accidental.

Mr. E. C. ROBINS, F.S.A., seconded the vote. Referring to Mr. Tarver having mentioned Brinscombe Manor House as the only example of a building in which Inigo Jones employed mullions and transoms, Mr. Robins described a building in Gloucestershire where Inigo Jones introduced mullioned windows. The central portion of the building had been refronted by Inigo Jones, who introduced a Classic moulding as a cornice. The plan of the work followed the old lines, but the details were Classicised.

Mr. F. DOLLMAN said that up to the time of the religious convulsion in this country the monumental figures were always recumbent, with the hands folded in attitude of prayer. After that the figure began to move, but the idea of devotion did not seem to have altogether disappeared, and the figures were generally in a kneeling position. That afterwards gave way to what was intended for an attitude of meditation. This continued for some time, and then we came to the period of long flowing wigs and Roman togæ. Later again the figures came into a sitting posture, and last of all the figure rose up in majesty of self-assertion. These were the gradual changes that had taken place since the sixteenth century. A like change could be traced in the inscriptions from the early and brief ones, such as "*cujus animam propitiatur Deus*," to long Latin inscriptions, and the equally fulsome English ones, to the later ribald inscriptions, and those in the style of "suffering long time he bore," &c.

Mr. C. F. HAYWARD, F.S.A., remarked that it would be labour well spent to take note of such monuments as still remained, and recommended it as a task for the Society for preserving these memorials. Mr. Hayward thought that Mr. Tarver might have taken note also of the change in materials. The house at Sutton Place, Woking, was a splendid example of the use of terra-cotta, but no building had gone so far in the matter of Italian detail as Layer Marney Hall in Essex. The windows were mullioned; but instead of being Gothic-formed mullions, they were formed with pilasters, &c., and the heads were formed of dolphins instead of the usual trefoil heads. At Sutton the trefoil, cinquefoil heads, &c., occurred where Italian work and thought was uppermost. It was curious that such a wave of Italian influence had, so it seemed, swept over this obscure country corner, and to have been developed there as it had not been developed in any other part of England. A peculiar thing was the frequent introduction of dolphins, and their being so thoroughly worked up among the Italian details brought over to this country. In the tombs of Prior Draper and the Countess of Salisbury, in the Chantry chapels of Christchurch, Hants, Gothic detail was seen side by side with the most perfect Italian ornament, as though Goth and Italian had worked alongside of each other. Referring, again, to the terra-cotta, Mr. Hayward noted the perfect condition of that at Layer Marney before mentioned, and said he would like to know who made the terra-cotta. Was it made in England, or brought in from abroad? Investigations had, he believed, been made in fields in the neighbourhood to see whether the remains of kilns or such like could be discovered, and thus indicate the production of terra-cotta on the spot. If brought over, some record should exist of the fact. He believed there was some hope of getting some definite information, as an investigation of the rolls was being conducted.

Mr. EWAN CHRISTIAN said that the terra-cotta had probably been produced in the immediate neighbourhood, where moulded brickwork had been carried out from the thirteenth to the seventeenth century. He had found perfect mullions of terra-cotta in many old churches. In the church at Coggeshall—an ancient church—would be found most beautiful details of the thirteenth century, all in moulded terra-cotta, and the whole of that district abounded in materials for producing terra-cotta. Possibly the artists might have been brought from Italy to do the final work. A thing that struck him in the course of the paper was the enormous extent of this little island. Coming from New York a few years back, he astonished an American by saying how large a place England was. It might be merely a speck compared to the vast American continent. He had travelled in England for forty years, and from north to south, from east to west, it was crammed with interest. Mr. Tarver had taken only a small range, but it would be a work of time to describe all the beautiful monuments in this country. One might go into any church in any part of the country and objects of interest would be found. Speaking of a beautiful seventeenth-century monument in Devonshire, Mr. Christian said he was sorry to state that it was much dilapidated, and that led him to mention one of the peculiar difficulties as to monuments, that after a time, and from want of care, they fell into a state of decay, and the representatives of the families could not be got to do the repairs. Inscriptions were rarely met with on mediæval monuments, after which one gradually came down to the time of vain people, who proclaimed their virtues in monumental inscriptions. It reminded him of the story of the little girl who asked where the bad people were buried, as she saw only good people.

Mr. R. PHENE SPIERS remarked that there were a large amount of objects in houses which would compare with these monuments better than any façade of a building, and asked whether the carvers of the tombs, chimney-pieces, &c., were not a special class of persons apart from architects. The learning of such sculptors was, he fancied, greater in former times than now, and their education of a higher rank. With regard to Longleat and John Thorp, a suggestion had been made some time back by a member of the Institute that some of John of Padua's work meant for another purpose had been got hold of and used at Longleat. The Marquis of Bath had taken up the suggestion, and appeared to have arrived at the belief that something of the sort had been done there.

Colonel PRENDERGAST said that the talent and intellect of the period under discussion which would naturally have been spent on architecture, was more or less taken up in works of monumental description. Church building was at a discount, and large chapels were gaping for furniture. Families were thriving on church property; money was consequently spent on the glorification of the family, and this would account for the large sums spent on monuments.

The PRESIDENT, in putting the vote to the meeting, remarked that according to popular opinion John of Padua and John Thorp were one and the same person. He also said that near Kingston there was a brickfield which was asserted to have been used for the works at Hampton Court Palace, but with what truth he could not say.

Mr. TARVER, in reply, said he thought that he had pointed out that the progress in regard of monuments all over England had been continuous, whereas architecture had chopped and changed about, at one time going forward, at another time going back.

## THE NATIONAL OPERA HOUSE.

THE report of the architect, Mr. Fowler, upon the proposed completion of the National Opera House on the Embankment, the first stone of which was laid by the Prince of Wales exactly eight years ago, gives some particulars regarding the structure of the building and the objects to which it is to be dedicated, in the event of the projected completion being accomplished. Fifty thousand pounds, it appears, have already been expended upon it, but the owners have agreed to grant a lease of the building as it stands, and so much of the site as is required for it, for 15,000*l.*, to be paid on completion in boxes or stalls. The estimated cost of completion is 55,000*l.*, but it is now proposed that the building shall be on a less elaborate scale than was intended, both as regards the interior and exterior, though it is to have the same spacious internal accommodation. It will be larger even than the famous La Scala, but very similar in design. Altogether, it will provide comfortable accommodation for about 3,000 persons, a larger number than can be accommodated in the Grand Opéra in Paris. Of these one thousand persons will be in the gallery. It is calculated that this great accommodation will permit the lessee to give opera at half the present Italian Opera prices. The structure will be fire-proof, and will comprise a promenade, refreshment rooms, and smoking divan on a grand scale. It is contemplated that access shall be given from the District Railway by a covered way. It is Mr. Mapleson's intention to give Italian, French, or German opera during the summer season. During the spring and autumn it will be devoted to English opera, while at Christmas it will pass into the hands of "an English theatrical manager, under whose care the national drama is to be cultivated."

## ORIENTAL ART AT SOUTH KENSINGTON.

IT is proposed by Sir Rutherford Alcock that the authorities at South Kensington should rearrange their collections by bringing together whatever is illustrative of Oriental art. They have at present in their keeping collections, not only of Arab and Saracenic, but also of Persian and Indian art. They have, moreover, a very considerable collection of objects equally illustrative of Chinese and Japanese art. It would thus be possible to place under one roof, easy of access and scientifically arranged with a view to educational influence, all the chief forms and types of art-work which have prevailed throughout Asia from the earliest periods. One of the first results of so desirable an arrangement would be to show incontrovertibly how much more constant and frequent had been in remote ages the interchange of thought and ideas among the various tribes and races occupying the vast continent stretching from the Mediterranean across to the Sea of Okotsk in the far East. And not only of ideas, but of goods, fabrics, and works of art. Hence the traces, neither few nor difficult to distinguish, of Greek and Egyptian types through Persia and across the Indus, following Alexander's track into India and Central Asia. The Buddhist religion in the eastern half of Asia, as later the Mussulman faith in the west, materially contributed to the same end of encouraging and facilitating intercourse and the

interchange of prevailing modes of thought and industrial arts. Marco Polo and his uncles were not the only merchants who carried from the Levant and the borders of the Bosphorus wares of Greek, Byzantine, and Saracenic origin to the other extremity of Asia, and often brought back to the west specimens of Eastern work, industrial and artistic. Hence the recurrence of similar types and forms is not more instructive than the divergences and contrasts to be found in the modification of typical forms and arts derived from alien sources but adopted and assimilated into something more consonant with the native habits of thought or national customs. But to follow out this scheme of study such a grouping of various collections in the same building is very necessary.

How much is to be gained by offering facilities for a study of this kind from an educational and an industrial point of view may be inferred from the example we have had of the all-prevailing influence of Japanese art over all Europe, which only dates from the first collection of Japanese objects exhibited in this country in the National Exhibition of 1862. Sir Rutherford Alcock was at that time the British Minister in Japan, and in the desire to see Japan, only then just open to Western nations, duly represented, he made as careful a selection as he could of all that would best illustrate the excellence and originality of the art and industries of the country. The Japan court in that Exhibition was one of the most popular. It was generally crowded, and when the Exhibition closed nearly all the articles were eagerly bought up. From that date, in an incredibly short time, every capital in Europe, and soon the country towns, became flooded with Japanese fabrics and wares of all kinds, to meet a sudden and widespread demand which to all appearance still continues, and "Japanesque" goods of all sorts, adaptations, or imitations by European workmen try in vain to displace the genuine or attract the public.

It is unnecessary to point out how much Europe owes to China and Japan—to the first for China ware (still so called as distinctive), to Japan for lacquer, unrivalled and beyond competition, and till previously unknown in the West. Nor have they been our benefactors and instructors in these alone; in silk fabrics and embroideries, in bronzes and Cloisonné enamels, we are still their inferiors, and the Japanese as workers in metals have not been approached by any Europeans. Nothing, therefore, is more likely to produce emulation and to nourish among our workmen and their employers the love of excellence for its own sake, and of works which are beautiful by reason of the originality of design and the perfection of workmanship with which the Eastern craftsman, and the Japanese above all others, is imbued, than to have constantly before them the produce of such love of art in fellow-workmen of another race, with whom it becomes a second nature. The educational value of a series of collections judiciously arranged, and which in its scope should include all Oriental art and industries, cannot be disputed. Ample space, good light, and judicious arrangement are the essential conditions. The objects being already in possession, nothing more is needed, and none of these requirements should present any insuperable difficulties to the authorities of the South Kensington Museum.

### THE LAW COURTS CLOCK.

THE clock and bells in the tower of the Royal Courts of Justice were set in motion on Tuesday. Mr. Street and Mr. Blomfield were absent, and the cord which held the pendulum was cut by Mr. James Gandy. The frame of the clock is of cast iron, 8 feet by 3 feet 6 inches, planed perfectly true; the wheels, of which the larger are 24 inches in diameter, are all of gun metal, turned, cut, and polished by machinery, the pinions being cut out of solid steel. The escapement is of the kind technically known as the "double, three-legged gravity escapement," and the compensating pendulum, beating two seconds at each swing, has a rod 15 feet long, formed of zinc and iron tubes, which, expanding or contracting unequally, are so arranged as to prevent changes of weather affecting the length of the pendulum. The "bob" weighs 3 cwt. The weights, composed of 63 cylindrical pieces of iron of  $\frac{1}{2}$ -cwt. each, threaded on iron rods, have a total weight of 1 ton 11 $\frac{1}{2}$  cwt., of which 4 $\frac{1}{2}$  cwt. serve to drive the hands, 10 cwt. work the machinery which causes the hour bell to strike, and the remaining 17 cwt. drive that of the quarter chimes. Steel wire ropes are employed. Other features in the clock worthy of notice are the improved "maintaining power" and the winding gear; the former to keep the clock going while it is being wound up and the latter providing a safeguard against injury to the works if the handle should be accidentally turned the wrong way, or if it should be necessary for any purpose to let the weights down while the clock was going. The bells which give out the St. Mary of Cambridge chimes hang in the belfry, a lofty apartment above the clock-room, and it is from the top of the massive oak frames which carry them that the projecting drum of the clock is entered. The weights of the bells are as follows: The chime bells are—note B, 12 cwt. 14 lb.; note A, 15 cwt. 3 qrs. 4 lb.; note G, 1 ton 1 cwt. 1 qr.; and note D, 2 tons 7 cwt. 2 qrs. The hour bell, giving C, is 3 tons 8 cwt. The total weight of the bells is 8 tons 4 cwt. 2 qrs.

18 lb. The hammer head striking the big tenor bell is 180 lb. in weight.

Messrs. Gillett and Co.'s patent remontoir train has been introduced, and will be of advantage to the public in enabling passers-by to set their watches to a second. The dial, which is 8 feet 6 inches diameter, has been cast in one piece, and in consequence the danger of segments breaking away is obviated, and strength is further given by bolting the two dials through the "drum" with strong iron tie-rods. The square ornamental drum is of gun-metal, and is the work of Messrs. Potter & Son. The transparent face is made up of plates of opal glass, which are set in a star-shaped iron framework. To illuminate the dial there are four horizontal gas-pipes, with eleven jets altogether. An automatic gas regulator has been introduced, and the rotation of two small wheels acts on "eccentric" calipers, so that, as the days shorten, the gas (which is never quite let out) is turned up earlier, or, as the days lengthen, later night by night throughout the year. The whole of the clockwork, dials, bells, bell-frame, &c., have been cast and fashioned from the raw material in the steam-power clock factory of Messrs. Gillett & Co., at Croydon, and the firm have undertaken the entire work and responsibility of placing the clock and bells in position in the tower. The clock is guaranteed to keep time within one second per week.

### INTERNATIONAL HEALTH EXHIBITION, LONDON, 1884.

THE executive council of the Exhibition was appointed by H.R.H. the Prince of Wales, president; and consists of the Duke of Buckingham and Chandos, G.C.S.I., chairman; Sir James Paget, Bart., F.R.S., vice-chairman; Sir Frederick Abel, C.B., F.R.S.; Mr. Edward Birkbeck, M.P.; Dr. George Buchanan, F.R.S.; Sir Philip Cunliffe-Owen, K.C.M.G., C.B., C.I.E.; Sir Joseph Fayrer, K.C.S.I., M.D., L.L.D., F.R.S.; the Marquis of Hamilton; Mr. Ernest Hart; Sir John Lubbock, Bart., M.P., F.R.S.; the Right Hon. the Lord Mayor; Mr. Samuel Morley, M.P.; Dr. G. V. Poore; Lord Reay; and Sir John Rose, Bart., G.C.M.G. The secretary is Mr. Cunliffe-Owen, M.A.

This council is now meeting regularly, twice a week, at the Society of Arts House, by permission of the council of the Society. A large general committee is also in course of formation. From among the members of the general committee, the following sub-committees have been appointed: 1. The Dwelling; 2. Workshop and Factory Sanitation; 3. Food—raw materials; 4. Food and Cookery; 5. Heat; 6. School and Education; 7. Ambulance; 8. India; 9. Colonial. They will meet for the present at the Society of Arts, and will have under their superintendence the arrangements necessary for securing the efficient representation of the objects of the various sections of the Exhibition. It is announced that persons wishing to exhibit in any of the classes should apply to the secretary, Mr. E. Cunliffe-Owen, at the offices of the Exhibition, South Kensington. These offices, it may be added, are in the buildings formerly occupied by the Fisheries Exhibition.

### GREEK ART.

AN address on the history of art was delivered by the Rev. W. Greenwell at the distribution of prizes in the Durham School of Art. In the course of it he said:—

The nation that probably possessed the highest art instinct the world has ever seen, or possibly ever will see, was the great Greek nation—a nation consisting of a number of small States, some of them so small as almost to be represented by what we would call at the present day a largeish village. It did seem marvellous that little States like these, possessing a few thousand people and a few thousand acres in their territory, should have been a nation which has exercised in all times in the past, and will exercise to the end of time, an extraordinary influence both in art, in literature, in science, and in religion that the Greek race has done. No race seemed to him ever to have been so highly cultivated, mentally, as the Greeks. Of course, they did not get art from the Greeks entirely any more than from any other nation; but, as he had said before, it had spread itself from one country to another, originating probably with the first man; and, as it had passed from one nation to another, it had been very much modified and improved. The Greeks took the art which came to them from Egypt and from Assyria, and from the latter place it came to them in all ways. It came through the Phœnicians, it came through the country which is now called Asia Minor, now part of the Turkish dominions, where on the borders of the Ægean Sea, on the coasts of Asia Minor, and even on the coasts of the Black Sea, the land was occupied by settlements of Greeks. For the Greeks, like ourselves, were a great colonising people. They colonised the whole of the coasts of Asia Minor, they colonised a very considerable portion of North Africa; they colonised also all

the south of Italy; and, in fact, they sent colonists out to every part of the then known world. And due to their having colonised Asia Minor, and having a great number of flourishing States around its coasts, they there came in contact with other races. Art passed through these different races and through the Greek colonies to the natives of Greece, or rather he would not say natives, because probably the Greeks in many parts were only settlers there, but to that part of Greece with which they were so familiar by the names of Athens, Corinth, Sparta, and so on. The Greeks produced works of art of the very highest quality. In regard to their architecture, for its grand simplicity it has never been at all approached in a certain way; although, of course, he must modify that by paying some regard to what has been done in later times in Gothic architecture. But still he thought the great works of Greek architecture had never been surpassed or even rivalled in their grand simplicity. Besides that, they produced the very finest sculpture in the form of statues that has ever been seen. All the statues which have been produced in later times at the very best are mere imitations—and very poor imitations indeed—of Greek sculpture. We now only possess copies to a great extent which have been made in later times, but every person knew that a copy could not possess the merit of the original. We also possessed a certain number of original sculptures, but, unfortunately, in a very mutilated condition. Figures without heads, without legs, without arms, mere parts of the body, and so on. But these, even in their defective condition, showed such an extraordinary development of the very highest artistic feeling that one wondered how a man could ever have produced them. All Greek sculpture must be considered as idealised. No doubt they were in the habit of seeing forms of great beauty around them, just as we were in the habit of seeing forms of great beauty around us, though, of course, we do not see them as the Greeks did, as they lived in a very much warmer country than ours; therefore the body was more exposed, and more was seen of its great beauty than with us, who walk about every day clothed from head to foot. Not only in sculpture did the Greeks excel, but also in the application of art to various other objects. Probably most of them had seen what were called, and sometimes erroneously called, Etruscan vases. They were really Greek vases, and in that kind of work the Greeks had never been equalled. There was nothing like them to be found. If they took up a Greek vase, they would expect it to be very heavy, but they found that it was no weight at all. And yet it probably lasted from 500 years before Christ up to the present time. Referring to the Greek coinage, the speaker said this was also the most remarkable that the world has seen. Our coinage at its best was only equal to the very worst Greek coins; and as for our attempting to approach their finest works on their coins it was hopeless. He had seen imitations made by the best of our modern die sinkers, and when seen together, side by side, they would wonder that two persons could really make things so dissimilar. There must, of course, be some amount of exactness in the one as in the other, but the whole spirit of Greek art is entirely wanting in our modern coins.

#### RESTORATION IN NORTHAMPTONSHIRE.

THE annual report of the Northamptonshire Architectural Society gives a report of the restoration of churches of which the plans had been submitted to the committee of the society. At Long Buckby church it was proposed to improve the two aisles, added within the last century and a half, by putting on roofs and inserting windows, and building a south porch, all of good design. Yardley Hastings church had been visited by a sub-committee, to advise with the rector and Lord Northampton's agent, with a view to its partial restoration. The south aisle is to be rebuilt forthwith on the old lines, and sundry suggestions were offered by the sub-committee with reference to doors, windows, string-courses, &c. At Werrington church it was proposed to renew the roof over the nave, to insert new aisle windows, copying an old one now walled up, and to reseal the building throughout. Plans had been submitted to the committee for the building of new vestries at St. Edmund's, Northampton; and the report said that the foregoing were the only new cases which had been brought under the notice of the committee during the past year. The report went on to speak of Irthlingborough church, the condition of the tower of which was the cause of much anxiety to the committee. At the last annual meeting of the society, a sub-committee was appointed to examine the building. This they did in January last, and found the state of things there had lately much altered for the worse. A serious movement was evidently then going on, as indicated by the fall of stones within and without. To prevent injury to the walls the committee advised their removal. This advice was promptly acted upon by the churchwardens, and the walls had been taken down and removed a safe distance from the building. The opinion of Mr. Pearson, R.A., had been obtained, and was to the effect that the tower must come down and be rebuilt. Subsequently a committee of the Society for the Protection of Ancient Buildings visited Irthlingborough, and they too reported the tower to be in a very

critical condition, and they took for granted that it would not be allowed to fall, as in falling it would probably do untold damage to the adjoining church, fine vaulted crypt, &c., and endanger life. Their committee was opposed to the plan of rebuilding, and, among other things, suggested the carrying up of an octagon structure in brick within the present tower to support the lantern, and to tie the old crumbling tower walls to this new octagonal lining. The committee of the society, however, could not agree to the proposed lining of bricks, as it would only support four sides out of eight, and which would add enormously to the weight upon the foundations, which had already been tampered with in excavating for the adjoining crypt. Mr. Pearson had come to the same conclusion as the committee, and the latter trusted that the church authorities of Irthlingborough would lose no time in issuing their appeal for public aid, and in commencing the work of carefully taking down and rebuilding their fine tower and its elegant lantern. Earl's Barton tower was likewise inspected by the sub-committee, who found the old cracks and settlements apparently to be no more than they were three years ago. The vicar and churchwardens are fully aware that considerable repairs are necessary, and it was understood they were raising money for the purpose. The committee, however, regretted that in the circular issued by the new vicar no account was given of what was proposed to be done, nor under what supervision, but they had full confidence in the conservatism, as well as the practical skill of Mr. Carpenter, who had been employed in the repairs of the church, and had perfected plans of the parts of the tower affected by dislocation, as they existed a few years ago.

#### THE INSTITUTION OF CIVIL ENGINEERS.

THE annual general meeting of corporate members was held on Tuesday evening, December 18, Mr. Brunlees, F.R.S.E., president, in the chair, to receive a report from the outgoing council on the state and condition of the institution, and on the principal matters that had engaged their attention during the now expiring year.

It was stated in the report that, owing to the policy pursued by successive councils, the institution had become one of the most successful and prosperous of scientific societies, not only financially, but also in respect of the amount of professional knowledge diffused by its publications. The constitution was now sufficiently broad to include as corporate members all persons who had acquired eminence in the profession, or who, by their training and experience, were entitled to be considered civil engineers, whatever branch of engineering they might follow. The changes that had occurred in the several classes composing the institution, irrespective of the students, had included the transfer of 40 associate members to the class of members, and of 4 associates to that of associate members; the election of 1 honorary member, 41 members, 223 associate members, and 15 associates; and the restoration to the register of 3 associate members. The deductions arising from deaths, resignations, and erasures had been—1 honorary member, 33 members, 25 associate members, and 21 associates. The net result, therefore, was an increase of 48 members, and of 165 associate members, with a decrease of 10 associates, the honorary members remaining the same. The gross number on the books was 3,588, as against 3,385 twelve months ago, being an increase of 203, or at the rate of 6 per cent. During the session 81 students were elected associate members, and 175 candidates were admitted. The number of students now on the books was 722, as against 707 at the corresponding period last year.

It was stated that the large income now received was simply the result of growth in numbers, and was due to an increase in the subscriptions, which remained the same as in 1837, when the present scale was adopted, while the material advantages offered had in the interval increased tenfold. For five years the accounts had been so set forth as to show at a glance on the debit side the three items of income proper, capital, and trust funds, while on the credit side had also been given under three heads the general expenditure, investments, and trust fund disbursements. Five years ago these totals amounted to 14,230*l.* for receipts, and 14,450*l.* for expenditure; this year they were 17,578*l.* and 17,431*l.* respectively. The excess of income proper for the year 1883 over 1882 amounted to about 5½ per cent.

The invested funds of the institution now amounted to 43,250*l.* and of those under its charge as trusts to 14,642*l.*—together, 57,892*l.* Of these funds 16,893*l.* were in Government 3 per cents., and the remainder in 4 per cent. debenture stocks of the leading British railway companies.

In conclusion, the council thought that whether regard be had to the primary object of the institution—the advancement of the science of civil engineering—or whether it be had to the growth of the institution and to that of its funds, they might be looked upon as having faithfully discharged the trust confided to their care by this corporation.

The following gentlemen were elected to serve on the council for the ensuing year: President, Sir J. W. Bazalgette, C.B.;

vice-presidents, Sir Frederick Bramwell, F.R.S., Mr. E. Woods, Mr. G. B. Bruce, and Sir John Coode; other members of council, Mr. B. Baker, Mr. J. W. Barry, Mr. G. Berkley, Sir Henry Bessemer, F.R.S., Mr. E. A. Cowper, Sir J. N. Douglass, Mr. C. D. Fox, Mr. A. Giles, M.P., Mr. H. Hayter, Mr. W. Pole, F.R.S., Mr. W. H. Preece, F.R.S., Sir Robert Rawlinson, C.B., Sir E. J. Reed, K.C.B., M.P., Sir W. Thomson, F.R.S., and Sir Joseph Whitworth, Bart., F.R.S.

### LOW CEILINGS.

A REPORT from Dr. Sedgwick Saunders, Medical Officer of Health for the City, was read at the meeting of the City Commission of Sewers, on Tuesday. In it he urged the Court to reconsider that portion of the plans for the artisans' dwellings about to be erected in Petticoat Square which had reference to the height of the rooms. By the sectional drawings the height was shown to be eight feet only in all the rooms above the ground floor. In Dr. Saunders's opinion, that was totally inadequate to the requirements of the people intended to be benefited by those dwellings. The Act clearly expressed that accommodation was to be provided for the same number of persons of the class, vocation, and habits of those who might be dispossessed under any given scheme, and it was obvious that the provision of less cubical space than that enjoyed in the dwellings demolished would be a step of lamentable retrogression unworthy of an enlightened sanitary authority, and establishing an example which he feared might be too readily followed by other Corporations. The rooms were to be occupied by families of the lower section of the artisan class, and they should not be less than nine or ten feet in height. He founded that judgment on the practical experience of the ill-effects of low ceilings. He was quite sensible of the difficulty that might arise in that direction after the Court had accepted the tenders for the buildings in Petticoat Square and after the plans had been submitted to the Home Secretary, but he desired to place on record that the dimensions, appliances, and ventilation of the rooms, and other kindred matters, had never in any shape or form been submitted to him as the medical officer.

### LIGHTNING CONDUCTORS.

THE lightning conductor on the spire of Chichester Cathedral was shattered and partially fused during a storm on November 26. The nature of the accident was scientifically investigated on the 11th inst. by two parties of eminent electricians—Major R. Y. Armstrong and Capt. Philip Cardew, of the Royal Engineers; Dr. R. J. Mann, F.R.A.S., ex-president of the Meteorological Society, and Mr. Anderson; and the following report has been prepared by Dr. Mann:—

The lightning conductor was put up sixteen years ago, when the new tower and spire were erected after the fall of the old one. The conductor is one of now obsolete form, which was known at that time as Pratt's patent. It consists of twelve No. 15 gauge copper wires, placed by side, and connected together by a zinc wire crossing the copper wires from side to side in a continuous zigzag.

The conductor was not materially injured for about 40 feet downwards from the terminal point. It was then scattered into short fragments of copper wire about half an inch long, or broken into contorted and twisted-up fragments, for another 100 feet, until it reached the lead flushing of the roof. Below that it was not materially injured. But a rain-water pipe, descending from the roof of the transept and about 12 feet or 15 feet from the conductor, and consisting of successive joints of lead pipe finally carried into one of the ordinary iron rain-pipes, was broken where the iron pipe received the lead. About 4 inches or 5 inches of the iron pipe was shattered and scattered into fragments, leaving a clear gap.

The cause of the accident is quite manifest. The conductor was not of sufficient capacity for its work. It weighed only 10½ oz. to the yard. It was also of essentially bad construction. The copper wires had been materially injured by galvanic action, set up and gradually carried on, where they were crossed by the zinc wire traversing them from side to side. The breaking of the copper wires into short lengths was in all probability due to this cause. They were ruptured where they had been weakened and reduced by the galvanic action. The 1¼ inch solid copper tape, ⅝ inch thick, which is the smallest conductor that should have been trusted for the protection of a structure of this height and size, weighs 36 oz. the yard. The conductor was not injured below the roof of the transept and nave, because the lead flushing, and the water-pipes connected with it along the side walls, had from that point begun to assist the conductor in carrying the lightning discharge down to the earth. That this had been the case was substantially proved by the damage done to the one iron water-pipe.

The earth-contact had been made by carrying the lower end of the conductor down into a narrow, bricked, well-like shaft, sunk

into the soil of the old grave yard, about a dozen feet from the point where the descending conductor reached the ground. There was considerably greater resistance in this earth-connection (about 70 ohms) than a well-appointed *paratonnerre* should have. This virtually increased the inefficiency of the conductor, but probably was of less immediate consequence than the very weak section of the conductor itself under the circumstance of the supplementary conducting power of the lead flushing and water-pipes already spoken of.

The conductor, inefficient as it was for satisfactory and permanent performance of its work, unquestionably rendered good service to the spire and tower in preventing mechanical mischief to the masonry there. The uninjured state of the upper stretch of conductor at the top of the spire is very remarkable. In all probability the terminal point of the conductor above had in some way assisted to relieve the tension there at the time of the discharge. The force of the discharge virtually fell upon the conductor lower than this, on the side of the spire. The disintegrating force is always most energetically exerted when, so to speak, the electrical blow falls.

The breaking-up of the copper wire into short lengths was very curious. It will be noticed how these short lengths correspond with the crossings of the waving zinc wire. I find nearly the whole of the fragments that I brought away have tapering and shelving extremities—not transverse fractures—as if they had been chemically corroded away there before the fracture.

### THE IRISH TRAMWAY ACT.

A PAPER on "The Development of Railway and Tramway Communication in Ireland" was read by Mr. H. T. Crook at the last meeting of the Institution of Civil Engineers of Ireland. The author said that, in consequence of the legislation of last session, by which the Treasury is empowered to guarantee, under certain circumstances, dividend to the extent of 2 per cent. on the capital of light railway and tramway companies, a great impetus has been given to the promotion of schemes for the further development of such communication in Ireland. Supposing that anything like a reasonable proportion of the schemes which are mooted should be sanctioned, there would be a probability that the districts which are already best supplied would swallow up the major portion of the Government guarantee. The authorities consider, however, that when the difficulties of procedure under the Acts come to be faced that there will be nothing like the general extension of railways and tramways which is expected. The preliminaries to obtaining powers to construct a line are formidable. There are no less than four authorities to be satisfied—the grand jury, the Privy Council, the Board of Works, and the Treasury—and under certain circumstances the promoters may, after all, have to go to Parliament for a confirmation order. Where the proposed line runs into two or more counties there will be different grand juries, with different views and different interests. The guaranteeing baronies have, in the event of the earnings of a tramway not covering the expenses of working or maintenance, to make up the deficiency; and also, under certain circumstances, in the case of non-completion by the promoting company, to bear the cost of finishing the works. They may be expected, therefore, to jealously watch the proceedings. There are almost unlimited possibilities of appeals, and it may be much doubted whether the preliminary expenditure will be in any considerable degree lessened by the Tramways Acts. The Acts, however, are valuable in other respects, as the powers conferred will materially reduce the cost of construction of lines of a subsidiary nature. Lines may now be constructed without costly bridges and accommodation works, and where practicable the public roads may be made use of. The formation of a large number of very small companies, each with its separate board of directors and staff of managers, engineers, and officials, is to be greatly deprecated. Short branch lines, except under rare and exceptional circumstances, have but a poor chance of earning sufficient to cover their expenses. Traffic is never all in one direction, and there are already far too many towns in Ireland which are provided with railway accommodation, but from which it is most difficult to get except in one direction. The value of railway communication has been too often exaggerated. It is not the railways that bring prosperity, but prosperity which brings the railways. From much that has been said and written on this head lately, it appears to be thought that any kind of a railway or tramway, however lightly or cheaply constructed, is better than none at all. The mere fact that the casual passenger and the small produce of a remote country town is conveyed to the main line of railway upon a train road, instead of by more old-fashioned means, will not preserve that town from decay. Letter-kenny and the towns and villages on that line were decreasing in population at such a rate as to bring them within measurable distance of extinction. They have now a railway. Whether one train a day will avert the impending doom remains to be seen, but the prospect of a paying traffic does not appear to be brilliant. To saddle the country with a number of cheaply-constructed and badly-equipped tramways, constructed with no particular regard to

the possibilities of extension and through traffic, would be a great mistake. It is scarcely possible to construct any kind of line which shall not be too costly in its maintenance, and which will be capable of development in the event of an increase in the traffic, much under 3,000*l.* per mile. But, of course, no hard and fast line can be drawn, so much depending upon the nature of the country. There are other difficulties which will have to be faced in the working of these light lines. There is the difficult question of terminable facilities at junctions with the great trunk lines; there is the repair of locomotives and rolling stock, an important consideration in the case of a line situated, say, in the wilds of Donegal, Clare, or Galway, far from any place where mechanical skill or the necessary works for the repair of such stock can be found. In cases of branch lines in such parts, where the traffic is not considerable, one or two locomotives would possibly be all that the exigencies of the traffic would require. Possibilities of disablement are a serious matter. It would have been better, possibly, if, after due inquiry into the requirements of the unsupplied districts, the Government had granted a sum of money for the construction of one or two experimental lines. It may be urged that it has always been held that it is best to leave the promotion and construction of railways and tramways to private enterprise. But the case is altered when the Government steps in by means of a guarantee. Then the nation has some right to require that means shall be taken to insure that the Imperial funds shall be expended to the greatest advantage. As it is, the possibility of many of the counties being saddled with a load of debt for the construction of entirely unremunerative lines is not to be contemplated without concern. Moreover, the cost of construction, owing to the various preliminary inquiries and separate management, will be much greater than if the lines had been decided upon after one general inquiry, and the work put up to public tender. The risks are so great that it is scarcely likely that the local ratepayers will undertake the promotion of many lines, and in many cases resort will have to be had to the "stranger and the speculative capitalist." Only those who are capitalists can afford to face the risks of such an undertaking, and for their work and risk they will rightly expect a proportionate return. An unnecessary fear has been expressed that much of the work will fall into their hands, but it is by them only that really large and important schemes can be carried through. The Legislature has in view apparently the possibility of the creation of an inordinate number of small independent companies, for the Act specially provides for the promotion, construction, and working of several tramways by the same company. Whether any material addition will be made to the mileage of railways by the presumed facilities of the new Act, time alone will show. That the procedure is exceedingly complicated and beset with difficulties is already being discovered.

#### Mr. Street and Christ Church Cathedral, Dublin.

SIR,—An issue on a point of veracity with your correspondent "Not an Architect," is scarcely worth pursuing. "Mr. Drew has a short memory. He, *less than a month ago*, stated that the crypt drains had no outlet until he provided one." Now my *statements* have been in writing to the Dean and Chapter, and published in all the Dublin papers for anyone "not an architect" to read. The statements were distinct, that the *drainage of the whole subsoil and site* of the cathedral, abounding in springs, required an outlet, and that the crypt drains and their outlet, 2 feet under the crypt floor, was insufficiently deep for this purpose. Consequently I made an outlet under the foundations 8 or 10 feet deeper. I have made no other statement or any different one these six months past. If I have been interviewed unawares within the past month by a "man in the street," at the domestic hearth, or, by the way, in railway or tram car, my anonymous interviewer has made confusion of the crypt drains and the *drainage of the whole subsoil of the site and precinct*. My memory, I believe, is of average tenacity, and my accuracy of statement, perhaps, more habitual than that of one "Not an Architect."

"Will Mr. Drew deny," &c.? adds your correspondent. Has Mr. Drew ever been asked by him, or could he have any motive to deny that the Caen stone on the north side and elsewhere is decaying deplorably? My opinion has been freely stated, reported, and published, that a more injudicious selection of stone for our Irish climate could not have been made, and that there was little excuse for overlooking its dissimilarity in texture, structure, and weathering qualities from the old stone which has weathered some centuries so well. Why should I be challenged to "deny that the strong-room had a lath-and-plaster ceiling"? I have had nothing to do with "denying" facts, except one erroneously stated that fifty or more letters had been written to Mr. Street *about the drains*. I am officially aware of some letters having been written to Mr.

Street on other subjects and remaining unanswered, not, as one may charitably think of one now dead, as intentional discourtesy on the part of an overtaxed and overworked man; a qualification, I may say by the way, not to be extended, however, to similar omissions on the part of his successor or representatives, not privileged with the prerogatives of either genius or superlative eminence by right of inheritance.

Let every man weigh the value of such shortcomings as "Not an Architect" would unearth against Mr. G. E. Street's eminence of character, and the merit, as a whole, of his noble restoration of Christ Church Cathedral, Dublin.

Yours obediently,

THOMAS DREW, R.H.A.

Chapter Room, Cathedral of the Holy Trinity,  
Dublin: December 18, 1883.

#### Extras in Contracts.

SIR,—May we ask the opinion of some of your readers on the following circumstances. We contracted to build a church conformably to plans and specification, the price to be paid in five instalments, the fourth to be paid on the completion of the building and on getting the inspector's certificate—a balance of 100*l.* to be retained by the employers for twelve months. The architect was employed as inspector, and was constantly on the ground, and from time to time made alterations and additions. These additions, amounting to about 250*l.*, were paid to us together with the fourth instalment. The architect on the completion of the work granted us a certificate that the work was done to his entire satisfaction, and after twelve months he granted another certificate that we were entitled to the 100*l.* The employers now refuse to pay the money, their plea being that a great part of the extras were executed without their sanction, and they want us to send third parties to decide the matter. We would wish to know in this case if they have any grounds for opening up the question of extras after they have settled with us for them, or have they any right to retain the money in face of the certificates? Can they insist on having other parties sent to examine the work? Does not the architect's certificate settle the matter finally?

Yours obediently,

TWO CONTRACTORS.

#### CHURCH BUILDING AND RESTORATION.

**Ipswich.**—The church of St. Mary-le-Elms, Ipswich, has been enlarged by the addition of a chancel and organ chamber, and lengthening the north aisle, the accommodation having been increased thereby by over 100 sittings. The west gallery has also been removed, opening up the tower arch with good effect. The chancel has an oak roof of single hammer-beam construction, the space between the principals being divided into panels by moulded ribs; above the battlemented collar-beams and in the spandrels of the moulded ribs of the principals is open tracery work. The ends of the hammer-beams are finished with carved angels with outspread wings, each figure bearing a different device. The cornice is enriched with angels and pateræ, and the lower portion is pierced with tracery. The choir fronts and clergy desks in oak are elaborately wrought and carved. The floor is of Italian mosaic. On either side of the altar are sedilia, and credence table and a new altar table is to be added from a design by the architect. A finely-proportioned chancel arch in stone, with moulded jambs and arch richly-carved on both sides with emblems of the *Passion, Death, and Ascension of Our Lord*, divide the chancel from the nave. The outside walling is faced with cracked flintwork with stone dressings. The style is Perpendicular. The whole of the work, including the carvings and other details, have been carried out from the designs and under the superintendence of Mr. E. F. Bisshopp, architect, of Ipswich. Mr. George Kenney, of Ipswich, was the general contractor, and he has well and carefully executed the work. The cost has been borne by the vicar, the Rev. L. O. Kenyon Stow.

#### SCHOOL BUILDINGS.

**Preston.**—A Wesleyan chapel and class-room are about to be erected at Longridge, Preston, from the plans and designs of Mr. David Grant, architect, Preston.

**Midgley.**—A chapel and school have been erected from the designs of Messrs. Thomas Horsfield & Son, architects, of Manchester, formerly of Midgley. The style of the new chapel is a combination of the Italian and Queen Anne. On the ground floor there is a school to accommodate over 300 scholars. At the rear, on the same floor, there are three class-rooms, and over these two larger ones. The contractors for the various works are: Mr. T. Pickles, Midgley, mason; joiner, Mr. E. Marsland, Booth; slater and

plasterer, Mr. J. Alderson, Luddenden; plumber glazier, Mr. J. Alderson, Luddenden Foot.

**Newington, Hull.**—The parish rooms and Sunday-schools in connection with the church of St. John the Baptist are now completed, and were opened on the 13th inst. by the vicar in the presence of over 400 people. The building is in St. George's Road, adjoining the church, and comprises a large room, three class-rooms, soup kitchen, &c., and has been erected by Mr. Mark Harper, contractor, Hull, from the designs and under the supervision of Mr. Edward Starr, architect, Chancery Buildings, Manor Street, Hull, the total cost being about 900*l*.

### ENGINEERING WORKS.

**The Mersey Tunnel.**—There now remains less than 200 yards of rock to be passed through between the two ends of the tunnel. The latest returns are as follows: By Colonel Beaumont's boring machine, on the Birkenhead side, 30 yards; by hand, on the Liverpool side, 7 yards. Spaces between the two tunnels at end of previous week, 232 yards; deducting 38 yards for the past week, there remains 194 yards still to be done. Operations are in constant progress day and night at eight faces of the rock; two at the extreme ends of the heading, two at the extreme landward ends of the tunnels under Lord Street, Liverpool, and Hamilton Street, Birkenhead; two at the river ends of the tunnels which are about to break through into the level heading in the central part of the river, and two faces which are being worked back from the central heading to meet the tunnels. In the course of a few days this junction will take place on the one side of the river, and a week or two later on the other side; so that the main tunnels will then be continuous on each side of the river from their landward extremities to the points now so nearly approaching each other, where they will meet under the river. By arrangement with the Corporations of Liverpool and Birkenhead, temporary ventilating shafts are being sunk in Lord Street, Liverpool, and Hamilton Street, Birkenhead, for the health and convenience of the workmen.

### ART WORKMANSHIP.

**Reredos and Pulpit.**—A reredos has been erected in St. Barnabas's Church, Linslade. It is of Corsehill red sandstone, the central part above the altar having a pediment enriched with carved cresting, and a finial at the apex. The central panel has a richly-moulded and cusped arch, with a mottled alabaster inlay, over which is a circular medallion containing the Agnus Dei. The panels on either side of it are square trefoil-headed, with inlay of alabaster. The wings, containing circular cinquefoiled cusped panels, inlaid with yellow Mansfield stone, have a rich running foliated frieze, with circular medallions at intervals, containing sacred emblems. The surbase of the wings is of Forest of Dean stone. In the same church a memorial pulpit has been erected, the upper part of the wainscot being richly carved, with some open panels; the lower portion, of Corsehill stone, with richly-carved capitals, containing various emblematic flowers and foliage. Both works were executed, from the designs of Mr. B. Edmund Ferrey, F.S.A., by Messrs. White & Sons, of Vauxhall Bridge Road.

### ARCHÆOLOGY.

**Discoveries at Taplow.**—Another interesting archæological discovery near Maidenhead, about 100 yards west of the Thames, has been made by Mr. Rutland, the honorary secretary of the Berks Archæological and Architectural Society, assisted by Dr. Joseph Stevens, of Reading. On opening a tumulus at "Batlyngmead" a singular building was found, containing a fireplace, in which, among other articles, was a quantity of buff pottery, coated with greenish-black glaze of the fourteenth century. This discovery indicated the period at which the building was formed, but gave little help in deciding who the occupants were. They could not have been people of a lowly station to have used pottery of the character found. Earthenware vessels were costly at that period, and even the nobility used chiefly vessels of silver, wood, or pewter, on account of their durability. Mr. Rutland is of opinion that, as Queen Elizabeth let the fishing of the Thames in parcels for periods of twenty-one years, the hut was the abode of a river ranger. It might have been the casual residence of a forester or ranger in the ancient forest of Windsor, which although nominally disafforested in the thirteenth century, virtually remained a forest for centuries after that time, as disafforestation did not mean the actual destruction of the forest, but the parcelling out of portions of it to those who had rendered service to the Crown and others, thus leading ultimately to its destruction. Flint flakes and other flint implements had been present, together with bones of ox, pig, horse, and red deer, and scraps of Romano-British pottery, similar to those in the mould of the recently-excavated Taplow mound on the opposite side of the river. This goes to prove, Mr. Rutland believes, that various people had frequented both sides of the

river from the earliest times, and that the Saxons in removing the materials of the hill to form the tumulus had unknowingly built up their mound with earth containing relics of earlier occupants of the hill.

### GENERAL.

**A Colossal Statue** of Lord Beaconsfield, by Mr. Birch, A.R.A., has been unveiled in front of St. George's Hall, Liverpool.

**Canon Lonsdale** on Tuesday evening delivered a lecture at the Lichfield School of Art on "Recollections of the Restoration of Lichfield Cathedral."

**Mr. E. A. Ward**, for several years a student in the Nottingham School of Art, has painted on commission an historical picture entitled *Baffled*, portraying the scene in Sir Walter Scott's "Woodstock" of Albert Lee before Cromwell when discovered as having impersonated Charles II., while the hunted king made good his escape.

**A Small Collection** of pictures belonging to the late Lord Chief Baron Kelly is to be sold to-day (Saturday) by Messrs. Christie & Manson.

**The late Mr. R. Newsham**, of Preston, has bequeathed to the Corporation of that town his collection of pictures, bronzes, &c., the value of which is said to be over 60,000*l*.

**Mr. A. Peebles, F.R.I.B.A.**, has been made a Life Governor of the Royal Caledonian Asylum, in recognition of his services as honorary architect to the institution.

**The Professorship of Geology** in Trinity College, Dublin, has been conferred by the academic council upon Mr. Sollis, of Bristol.

**An International Photographic Exhibition** was opened on Tuesday at the Fine Arts Academy, Clifton. It comprises nearly 900 exhibits from all parts of the kingdom, and from America, Germany, Russia, Japan, and Switzerland.

**Plans** have been prepared for a science school at Kidderminster, and it is proposed to obtain 4,000*l*. for carrying out the scheme.

**A Stained-glass Window**, placed in the western end of the old Norman nave in Rochester Cathedral as a memorial of those who fell in the campaigns in Afghanistan and Zululand, was unveiled on Wednesday.

**The Roman Catholic Church** at Leamington was destroyed by fire on Wednesday night. The church was erected at a cost of 10,000*l*. about eighteen years ago, and the building was richly decorated with frescoes, &c.

**The Bromsgrove School Board** at their last meeting decided to obtain plans for an infant school at Sidemoor.

**The Truro Cathedral Committee** have resolved to complete at once the south transept as a memorial to the late Bishop of Truro, now Archbishop of Canterbury. The proposal to have a copper roof for the cathedral has been abandoned on the ground of expense.

**A Baptismal Font**, designed by Mr. Lawrence Booth, of Manchester, has been presented to Christ Church, Walmersley.

**The Leeds School Board** are about to obtain a loan of 6,785*l*. for concreting playgrounds of the Board's schools.

**Plans** have been prepared for the restoration and enlargement of Holy Trinity Church, Blackpool.

**The Tower of Winterton Church** has been restored under the direction of Mr. H. Green, architect, of Norwich. The bells have also been recast and rehung. The tower is 120 feet in height, and is built of stone and flint-work.

**The Scotch Court of Session** on Wednesday gave judgment in favour of the Perth Town Council, in an action brought by that body to compel the North British Railway Company to remove the still standing portion of the Tay Bridge. An appeal to the House of Lords is expected.

**Messrs. Meakin & Dean**, of Hampstead, have obtained the contract for the Alnwick and Cornhill Railway.

**Mr. T. Forman**, of Kennington, has made arrangements for the supply of oak flooring,  $\frac{3}{4}$  inch, 1 inch, and  $1\frac{1}{4}$  inch thick, in narrow widths, to meet the demand for oak borderings for floors. The boards are cut from selected wainscot oak.

**Messrs. Archibald Smith & Stevens**, of James Works, Queen's Road, Battersea, have accepted the contract for the erection of two hydraulic balance passenger lifts—on Stevens & Major's principle—at the new Winchester House, Broad Street, City. These lifts will be among the tallest in London.

**Messrs. J. Boyd & Sons** have received the order for the new palm house at Glasnevin, county Dublin, from the Office of Works. It will be 100 feet long, 80 feet wide, and 65 feet high, and is to be completed by October 1, 1884.

**Mr. R. Adams** has just opened extensive show-rooms at 17 Blackman Street, Borough, for the sale of his patent hinges, door springs, &c.

# SUPPLEMENT

TO THE

# ARCHITECT

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, DECEMBER 22, 1883.

### TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Supplement to THE ARCHITECT."

### EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

### TO AMERICAN SUBSCRIBERS.

All subscriptions are payable one year in advance, and may commence at any date.

The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.

Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED TO GILBERT WOOD, 175 Strand, W.C., London, England.

In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—

To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order.

### COMPETITIONS OPEN.

ABERDEEN.—July 1, 1884.—The Testamentary Trustees of the late Mr. John Steill, of Edinburgh, hereby notify that they will Receive Models for a Colossal Statue of Wallace, in Bronze, with Basement of Granite Blocks, to be placed on the Mound in the North-West part of the Duthie Public Park, near the City of Aberdeen, in conformity with Instructions left by Mr. Steill, at a cost not exceeding £3,000. Intending Competitors, on Application, accompanied with a Remittance of 10s. 6d. to Mr. John Otto Macqueen, 10 Bridge Street, Aberdeen, will be supplied with Copies of Mr. Steill's Instructions, Conditions of the Competition, and Lithograph Plan of the Duthie Park, showing Sections of the Mound. The Author of the Accepted Model will be employed to Execute the Work; and the Author of that next in order of merit will Receive a Premium of £50.

CAPE TOWN.—Jan. 30.—The Town Council of the City of Cape Town invite Plans and Specifications, accompanied with approximate estimate of cost, of a System of Drainage. Selected Plans and Specifications to become the absolute property of the Corporation. All others will be returned free of expense. Premium of 250*l*. A plan of the City, with levels, may be seen, and further information may be obtained, on application to the South African Loan, Mortgage, and Mercantile Agency, 9 King William Street, London, E.C.

HOWDEN.—Jan. 5.—For System of Sewerage and Sewage Disposal. Mr. Henry Green, Assistant Clerk to the Rural Sanitary Authority, Howden.

LONDON.—March 1, 1884.—The Commissioners of H.M. Works and Public Buildings are prepared to receive Designs for New Buildings proposed to be erected in Whitehall for the Admiralty and War Office. Mr. A. B. Mitford, Secretary, H. M. Office of Works, 12 Whitehall Place, London.

ST. PANCRAS.—Feb. 1.—Designs are invited for Buildings for Mortuary and Coroner's Court. Mr. T. Eccleston Gibb, Vestry Clerk, Vestry Hall, St. Pancras Road, N.W.

UXBRIDGE.—Jan. 31.—For System of Sewerage and Sewage Disposal. Mr. Charles Woodbridge, Clerk to the Rural Sanitary Authority, Uxbridge.

WALMER.—Jan. 21.—Designs are invited for Laying Out the Estate of St. Clare for Building Purposes. Messrs. W. & T. Denny, Walmer.

WOLVERHAMPTON.—Plans are required for the Erection of Volunteer Headquarters and Drill-hall. Major W. Blake Burke, Adjutant, Wolverhampton.

### CONTRACTS OPEN.

ACCRINGTON.—For Alterations and Additions at Rough Lea. Mr. H. Ross, Architect, 5 Birch Street, Accrington.

BLACKBURN.—Jan. 12.—For Wrought-iron Girders and Castings for Bridge over Blakewater. Mr. J. Braddon McCallum, Borough Engineer, Municipal Offices, Blackburn.

BLOXWICH.—Jan. 9.—For Alterations to Leamore Schools. Mr. S. Loxton, Architect, Park Street, Walsall.

BODMIN.—Dec. 31.—For Further Repairs and Restoration of Parish Church of St. Patrick. Mr. R. J. Withers, Architect, 11 Adam Street, Adelphi, W.C.

BOLTON.—Jan. 19.—For Construction of Outfall Sewage Works at the Hacken. The Borough Surveyor, Town Hall, Bolton.

BRADFORD.—Dec. 22.—For Building Warehouse, Stabling, and Cottages, in Carter Street. Mr. S. Jackson, Architect, 33 Kirkgate, Bradford.

CARDIFF.—Dec. 27.—For Building Engineering Works. The Wallsend Slipway and Engineering Company, Limited, 4 Mount Stuart Square, Cardiff.

CALLINGTON.—Dec. 27.—For Building Farm Houses. Mr. S. Rattenbury, Downgate, Stokeclimsland, Callington.

CHELMSFORD.—Dec. 28.—For Erection of Stabling, Iron Fencing, &c., at the Cattle Market. Mr. C. Pertwee, Surveyor, Bank Chambers, Chelmsford.

DEWSBURY.—Dec. 27.—For Rebuilding and Restoring Parish Church. Messrs. Kirk & Sons, Architects, Dewsbury. Mr. A. E. Street, M.A., and Mr. A. H. Kirk, Joint Architects.

DUKINFIELD.—For Ironwork, Girders, &c., for Fireproof Mill, for the Astley Mill Company. Messrs. Stott & Sons, 4 Corporation Street, Manchester.

DUMFRIES.—Dec. 31.—For Extension of Bridge over Highway at Passenger Station. Plans at the Engineer's Office, St. Enoch Station, Glasgow.

EAST WALKER.—Dec. 31.—For Building an Infants' School, and for Alterations and Additions to Board Schools. Mr. John Johnstone, Architect, 6 Clayton Street West, Newcastle-on-Tyne.

ECCLESFIELD.—Jan. 2.—For Heating Hillsborough Board School on the Low Pressure System. Messrs. Wilson & Masters, Architects, Sheffield.

ELGIN.—Dec. 24.—For Building Town Hall. Messrs. Matthews & Mackenzie, Architects, Aberdeen.

ELTHAM.—Jan. 10.—For Construction of Brick Sewer (14,000 feet). Sir J. W. Bazalgette, C.E., Metropolitan Board of Works, Spring Gardens, S.W.

EYEMOUTH.—Jan. 7.—For Building Mortuary, Forming Cemetery, &c. Mr. J. Donaldson, Eyemouth.

EYEMOUTH.—Jan. 8.—For Improvement Works to Harbour. Messrs. Thomas Meik & Sons, C.E., 6 York Place, Edinburgh.

EXETER.—Dec. 27.—For Additions to the Devon and Exeter Hospital for Out Patients. Mr. R. Medley Fulford, Architect, The Close, Exeter.

FOLESHILL.—For Reseating and other Works at Wesleyan Methodist Chapel, Bell Green. Messrs. Steane, Architects, 22 Little Park Street, Coventry.

GREAT CROSBY.—Dec. 24.—For Building Mortuary and Disinfecting Store. Mr. M. J. Hore, Clerk to the Local Board, Great Crosby.

GREAT HEATON.—Jan. 2.—For Removal of Bridge and Construction of New Bridge over the River Irk. Mr. William Radford, Bridgemaister, 1 Princess Street, Manchester.

HALIFAX.—Dec. 28.—For Building Premises for Liberal Club. Mr. James Farrar, Architect, Crossley's Building, 29 Northgate, Halifax.

HULL.—Jan. 17.—For Formation of Adit or Tunnel (one mile) from Springhead Pumping Station. Mr. D. Maxwell, Engineer, Town Hall, Hull.

INVERNESS.—Dec. 28.—For Building Villas in Adross Street. Mr. Alexander Ross, Architect, 42 Union Street, Inverness.

KEIGHLEY.—Dec. 29.—For Erection of Residence and Outbuildings Highfield Estate. Mr. J. B. Bailey, Architect, North Street, Keighley.

KING'S LYNN.—Dec. 22.—For Building Villa and Offices. Mr. E. J. Colman, Architect, Market Place, King's Lynn.

LEWISHAM.—Dec. 28.—For Building Swimming-baths, &c. Messrs. Wilson, Son, & Aldwinckle, 2 East India Avenue, Leadenhall Street, E.C.

LIBERTON.—Dec. 26.—For Building Public School and Teacher's Residence at Burdiehouse. Mr. D. Menzies, Architect, 39 York Place, Edinburgh.

LLANISHEN.—Dec. 31.—For Construction of Large Storage Reservoir with Embankments, Valve Well, Culverts, Gauge Basins, &c. Mr. J. A. B. Williams, C.E., Queen's Chambers, Queen Street, Cardiff.

# LINDSAY'S

## IMPROVED PATENT REVERSIBLE TREADS & LANDINGS

### FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

In Hospitals, or places where it is desirable to be free from dust, the blocks can be placed close together, not leaving any cracks, so that the treads or landings can be swept or washed quite clean; also, if it be necessary to get light under a Staircase or Landing, rough glass blocks can be fitted in the Iron frames, side by side with the wood, and a subdued light thus obtained.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be re-filled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works,

13, 14, & 15 SOUTH WHARF, PADDINGTON, LONDON, W.

## REPRINT of ART PLATES from "THE ARCHITECT."

Can now be obtained in a separate form, on PLATE PAPER suitable for Framing, the

## SHAKSPERIAN DECORATIVE PANEL

By H. STACY MARKS, R.A.

PRINTED IN COLOURS,

## SCENE FROM "THE TEMPEST."

Price One Shilling. Free by post, carefully rolled, One Shilling and Twopence each.

The following Illustrations, which have appeared in "THE ARCHITECT," can now be obtained in a separate form suitable for Framing.

## A Coloured Reproduction, by permission of THE FRENCH GOVERNMENT OF THE CELEBRATED FRIEZE, BY JULES DIDIER,

Exhibited in the Salon in 1882. In Nine Sections, price Sixpence each. Now ready. Sent by post, carefully rolled, price Sevenpence each.

May be obtained from all Newsagents or Booksellers, or at the

OFFICE OF "THE ARCHITECT," 175 STRAND, LONDON, W.C.

# The Architect.

THE YEAR 1883.

ANOTHER old year is going off the stage; and in architecture, as in all else, it has done its duty. If the life of a man is to be measured not so much by its duration in time as by the amount of life's work that he has done, then, by the same rule, in the life of a cause, the year is to be measured by the amount of progress that has been achieved within its limits.

In architecture, therefore, as one of the grand historic enterprises of human intellect (let those who are not in the secret disparage it if they will), in England, as one of the most prominent headquarters of all that is intellectual, and in this Victorian Age of ours as the noblest in most intellectual respects of all the ages of the world's history, we may expect to see that such a year as the Year 1883 has lived a good deal of life within its twelve months, and done a good deal of work if we could trace it.

The most notable architectural movement that is on hand just now in England is the subsidence of the great wave of Gothic revival. There is another wave rising, of course; but the advance of this is not so well defined as the recession of the other. What is to be the precise end of the "Free Classic" enterprise does not seem to be quite clear; but the cessation of that interest in the Mediæval style which has played so bold a part for the last fifty years is as clear as anything can well be. The year which is now drawing to a close has not seen so much done in establishing the Free Classic as in disestablishing the Free Gothic.

The so-called Queen Anne fashion appears to be showing itself more and more distinctly to be in reality not a building so much as a furnishing fashion. It does not seem to be sufficiently well understood that it was in furniture that it began. Nearly twenty years ago, when Mr. EASTLAKE's name was becoming popular as a reformer of sideboards and couches on Mediævalist lines, it was understood that a mysterious enthusiasm was taking possession of a few architects of a very quiet although eccentric order, the ultimate aim of which was to direct the attention of the world—too frivolous to be trusted too soon with the secret—to the hidden merits of the chairs and tables of the early part of the seventeenth century. In course of time, while Mr. EASTLAKE's graceful style of writing was doing a good deal more to create dissatisfaction with the current work of our cabinet-makers than his best designs could accomplish in the way of its practical improvement, the new school, proceeding upon much less harsh and revolutionary principles, was slowly growing into notice. To take the leading fact as a familiar illustration, the quaint because crabbed articles of furniture which pertained to anywhere or nowhere in the days of our monks and knights were brought into competition with the quaint and not crabbed things which belonged to the industrious Netherlands in the days of our Dutch WILLIAM; and it was presently apparent that the worship of *bric-à-brac* had vastly more both to enjoy and to adapt under the one category than under the other. And so it came to pass, naturally enough, that the admirers of ecclesiastical and baronial architecture stopped short at the acceptance of the coarse ecclesiastical and baronial benches and boards of the fourteenth century for family use in the nineteenth, and consented to be charmed instead with those much more odd than inconvenient—indeed, sometimes not at all inconvenient—chairs and tables which the comfortable land of ditches and storks had produced, in its unobtrusive and substantial way, only a hundred and fifty years ago. Once recognised, the "Batavian grace" of this style of furniture came by degrees to be associated with the corresponding presentableness which was to be perceived in the finishings of building. Movable furniture led the eye to fixed furniture, and fixed furniture to structural detail. All were obviously of a piece, and the same satisfaction that was to be had in one branch was to be had in the others. Accordingly, if it seems that Queen Anne archi-

itecture is almost wholly a matter of detail, this is the reason why; and the tendency of progress in the mode is a tendency, therefore, towards the more elaborate development of detail. The architecture, in other words, is a furniture style; and, indeed, we might almost say that the development of its detail is simply a certain increasing thoroughness in the adaptation of the features of the cabinet-maker's work to the uses of the builder.

It is this style of architectural design, then, which is, as we think, not foreshadowing as yet so clearly as might be desired its eventual outcome. It is idle criticism that is content to ridicule its weak points; the laws of artistic development are at work here as in all other movements of transition; and there will sooner or later appear a definite resultant which will be the equivalent in a new form of the sum of its component forces. Perhaps it may be said that of these components, one is certainly the decadent revived Gothic. It is not less easy to say that another component is the anticipatory influence of a revival of Classic; but it would be more correct to suggest that it is rather some already active influence, of which the restoration of the modern European or Neo-classic mode, to enter on a new career, is to be itself the effect. Classic architecture seems to be certainly in the wind, but what form it is to take is still a question for speculation.

Recent municipal competitions ought to have done much to settle the direction in which a revival of Classic architecture may be looked for. Perhaps it is one of the essentials of the new system of competition that the old-fashioned exhibition of the designs must be avoided, and the aspirations of competitors kept down to the level of tradesmen's tenders, for the sake of evading the public criticism of the award; but at any rate we cannot help regretting that the Glasgow designs in particular were not in some way or other, with the cordial encouragement of the promoters and the professional adjudicators, openly exhibited *en masse*. It has been affirmed that nothing of much artistic moment would have resulted; but we venture to think it is scarcely possible that absolutely nothing should result, and we prefer to believe that, although Mr. YOUNG's plans might still have been found to be the best practical adaptation of the authorised scheme, it would nevertheless have been equally true to say that other designs, taken on their artistic merits, pointed the way to progress as Mr. YOUNG's does not, and pointed the way, be it observed, not for the sake of the project itself and within its own mere limits, but for the sake of the Art as a thing of national interest.

We are looking forward with some anxiety to the competition for the Admiralty and War Offices in this aspect of the case. Within a short time there will be delivered into the hands of the Government a large number, we have no doubt, of elaborate artistic compositions, designed for a national edifice on the largest and most imposing scale, and for a site which offers many advantages to able and ambitious architects. We cannot suppose it possible that an open exhibition to the professional world of the whole of this collection of art-work could fail to be of great educational importance. We earnestly hope that some way of meeting this object may be devised. If plagiarism is what is dreaded, let the plans of internal arrangement be kept back; it is the artistic effect alone that is so far the matter of public interest, and plagiarism, we think, will scarcely venture to trespass upon that particular field. And, after all, is it not, in architecture especially, those designers that are most afraid of being robbed who are generally the least worth robbing?

If the coming year is destined to witness any considerable advance in Classic architecture on English soil, what is to happen with Gothic? What we say is, of course, scarcely even a speculation, but, as we cannot forget the rumour that English clergymen have been recently making inquiries about the practicability of building Classic churches, is it possible that some NORMAN SHAW, in some Bedford Park, may before long be so bold as to model a church upon something like the lines of Sir CHRISTOPHER WREN? For the present we observe that in minor ecclesiastical work, such as schools, the customary "small" Gothic still keeps up the race with what is often equally small Queen Anne or Dutch; but this struggle is not worth much in any historical way, and in even larger buildings of a kindred class the case is scarcely more interesting. Gothic church-work, be it remembered, has had a long innings, and has done itself and England great credit; what is to follow, when it comes, must do well indeed if it is to deserve equal praise.

## GREEK SCULPTURE.\*

THE second volume of Mr. MURRAY'S "History of Greek Sculpture" has followed the first as quickly as was possible, considering the nature of the work and the difficulty of preparing illustrations. The new volume extends from the time of PHEIDIAS to that of the Greco-Roman sculptors of portraits. It is illustrated by various kinds of plates and cuts, among which mention must be made of some which are by a process that appears to combine the advantages of photography with the softness of mezzotint engraving.

Mr. MURRAY begins with a consideration of the relation between realism and idealism in art—a subject which has given rise to a great deal of speculation, and is likely to remain unsettled while the world lasts. Every artist, whether painter or sculptor, has an ideal of his own which influences his representations even when he is copying inanimate forms. Suppose, for example, that Sir FREDERICK LEIGHTON, Mr. MILLAIS, Mr. MARKS, and Sir JOHN GILBERT were to make copies of one of RAPHAEL'S "Cartoons," in each artist's copy something would be found to indicate the authorship. Drawings of a living model would be no less suggestive of the particular artist's idiosyncrasy. In other words, it may be said that an object does not appear to two artists in the same way. The most realistic painter and sculptor, let him strive ever so hard, could never produce a work that will have the realism of a photograph. Something belonging to the artist himself must be imparted to the work, and this being so, it may be said that all artists are idealists, the only difference between them being the extent or quality of the idealism. How far the works of the great Greek sculptors corresponded with the bodies of the contemporary men and women we can never determine. Anyone who has observed the nude forms of modern athletes will be ready to admit that manly beauty does exist in the nineteenth century, although the exercises have a tendency to develop one part of the frame to excess. But in Greece there were more opportunities of the whole body being exerted, with the result of having less disproportion between the parts. A statue which to modern eyes appears an idealisation, may, therefore, be as accurate a copy of a living form as the artist could produce. A true artist will always find it difficult to define the limits of the real and ideal, but a theoretical philosopher who has only to deal with words can, with a stroke of the pen, place them in opposition. Mr. MURRAY has taken some pains to bring together many speculations concerning an artist's work by Greeks, Germans, and Frenchmen. But, however curious they may be, they do not enable us to understand PHEIDIAS any better. There is a nearer approach to that end in what Mr. MURRAY has drawn from his own observation of the statues and vases. Two points may be noted. One is the influence which was exercised on the sculptor's mind by the existence of accepted types for divinities and heroes, and approved ways of treating subjects. "A comparison of the early Greek vases," we are told, "will show with what constancy the main elements of composition were adhered to and respected as if they were artistic formulæ established for all time." A second influence was connected with the materials employed. It is an everyday experience that a fine block of marble, a new kind of canvas, improved paints or brushes are inspiring, and tempt men to surpass themselves. When, therefore, an abundance of ivory and gold was available for the use of PHEIDIAS, is it not reasonable to conclude that the materials suggested new possibilities in art? If, as ARISTOTLE held, a block of marble contained a statue which it was the office of the sculptor to set free, would not ivory and gold appear to be destined to give form to something that was too noble to be imprisoned in stone? "Their splendour might," says Mr. MURRAY, "if subservient to an ideal developed amidst the possibilities of marble or bronze, add little beyond subtle charms of softness and colour. But when this splendour and its possibilities enter into the formation of the ideal, it could scarcely be but that the imagination would derive from them a powerful guidance in its endeavours to people the unseen and unknown with beings of the loftiest type." The world has long since lost all trace of the cryselephantine works of PHEIDIAS, and the descriptions of them are too vague to be realised. We are, therefore, unable to imagine why gold and ivory

were best fitted to give expression to the sculptor's genius; but, since that was the case, it may be concluded that, however sublime may be the Parthenon frieze, we do not see PHEIDIAS at his best in the figures, and as he was known to the Greeks.

Before the description of the Parthenon sculpture is undertaken, Mr. MURRAY considers the question whether the older temple was not adorned with representations of similar subjects. A bas-relief has been found on which is seen a charioteer stepping into a chariot, and the slab has been said to form part of the building which was destroyed by XERXES. The evidence is slight enough; but if the conservatism of Greek artists is remembered, it is not unreasonable to assume, even if there were no slab, that there was a procession carved on the frieze of the older temple. The great frieze of PHEIDIAS becomes a puzzle if we regard it simply as something designed by him; but if considered as a new setting of a renowned scene, which had become sacred from its associations, the case is altered. It may be also mentioned that there was no novelty to an Athenian in the subjects which were illustrated on the pediments of the Parthenon. They had been treated before, and were to be seen elsewhere on the Acropolis.

One of the most striking peculiarities of the Panathenaic frieze is the dualism of the procession. The figures are not identical; but there are two sets of men, maidens, victims, youths, musicians, chariots, and horsemen. Then there are several gods and goddesses who are mingled with the Athenians, but who are supposed to be in Elysium, from whence they observe the procession. The invisibility of the deities has been made the subject of an article in *The Architect* by Mr. MURRAY. With regard to the dualism he writes:—

Take from the east frieze its central assembly of seated deities, and there remain on each side groups closely responding to each other of men and maidens. Then compare the whole of the south frieze with the north, and the various elements of each will be found to respond similarly. Or better, let us imagine the marble blocks on which these two friezes are sculptured to be placed back to back in their natural order, and it will be at once evident that they thus constitute the two sides of a procession, as seen at the same moment from two sides of the road. To annihilate in imagination the whole breadth of the Parthenon, which in reality separated these two friezes, and to have been able after seeing both separately to combine them in this manner, would hardly have presented a difficulty to Greeks of the time of Pheidias, familiar more or less with works of archaic art, in which the natural desire to have both sides of a thing pictorially represented, had gradually led to a fixed conventionalism in composition. On the earliest painted vases where animals occur, it sometimes happens that when a lion, for example, is represented, both sides of him are drawn. The result has the appearance as if it were two lions, standing confronted, but with only one head between them. Apparently the next stage was to represent two lions, both strictly in profile, standing closely confronted, when the intention was only to figure both sides of one lion. The two lions, as they appear to be, above the gateway of Mycenæ, are an instance of this.

In the treatment of the metopes it is also evident that the influence of archaicism is again exhibited, and sometimes it would seem to be in conflict with the sculptor's spirit. The action—that is, the subject—is not always simple and complete; the type of the heroes is different from that adopted in the frieze, and the masterly skill often displayed in the drapery contrasts with the hardness which marks it elsewhere. The sculptor was not always able to obey the promptings of his ability; he had to succumb to conventionalism; and, therefore, to judge the Parthenon marbles as if they were the works of modern sculptors would be to obtain a false notion of their principle. It was in this way that some critics were led astray at the time when the purchase of the Elgin collection was under discussion. They examined the marbles as if they had been sent in for exhibition at Somerset House. In 1816 there was no recognition of any traditional code having prevailed in Greece, and in consequence much of the interest which surrounds the sculpture was ignored. One of the advantages of Mr. MURRAY'S history is that the figures are considered, not only as being the product of the genius of a great sculptor, but of a power outside him, which PHEIDIAS was compelled to respect.

It is mainly in the choice of the subjects, and for their arrangement, that the pediments suggest an external influence. In the treatment of the figures the sculptor was apparently free. The increase in the admiration of the remains of the pediments testifies to the growth of knowledge of art as well as of good taste in this country. FLAXMAN, it will be remem-

\* *A History of Greek Sculpture under Pheidias and his Successors.* By A. S. Murray. Vol. II. John Murray.

bered, ranked the *Theseus* far below the *Apollo Belvedere*, and on the beautiful draped figures of goddesses he set little value. PHEIDIAS he considered was a rather good man to make a bas-relief, but was totally incompetent to undertake large statues. As this may appear to be an exaggeration, we give the sculptor's own words:—

Pheidias having had the advantage of studying painting, first gave a great freedom to his designs; that freedom he was able to execute, or to have executed, with great ease in small and flat works. But as the proportions of the particular drawings of the figures were not so well understood generally as they were a few years afterwards, there are some disproportions and inaccuracies in the larger figures—the necessary consequences of executing great works when the principles of an art are not well established.

This was the belief of the first sculptor in England, but, happily, no artist of any standing would now agree with FLAXMAN. More judgment was shown by BENJAMIN WEST, and he anticipated modern opinion when he said “the *Apollo of the Belvedere*, the *Torso*, and the *Laocoon* are systematic art; the *Theseus* and the *Ilissus* stand supreme in art.” The repose of the figures was without a precedent in Greek art, and PHEIDIAS here demonstrated that it was possible to make a god appear in a form worthy of a god. But it is remarkable that although so many figures remain, all attempts to produce restoration of the pediments have been failures. The drawings of the sculpture before removal are not satisfactory, and the ancient vases which represent similar subjects suggest arrangements which do not correspond with the figures. One cause of the disappointment is suggested by Mr. MURRAY when he says that there was no formal unity in the composition. “Every figure is independent bodily; it is only in sympathy that they are united into composition.” But, according to modern notions, independence in a sculptural competition is as great an evil as it is in party politics; it becomes a *dérèglement* which quickly ends in chaos.

In writing histories the first aim of the historian should be the discovery of the motive powers of which events are the consequence. This aim has been recognised by Mr. MURRAY. His book is not a descriptive catalogue of all the remains of ancient sculpture which have survived, but it is of more importance, for it suggests how those works obtained the qualities which characterise them. An impetus was given to sculpture by the appearance of PHEIDIAS; it was extended by his pupils, and has not yet ceased to be operative. In like manner PRAXITELES, SKOPAS, MYRON, and POLYKLEITOS were powers; and when the works of all those artists are understood there is little to be done, except to trace the proportion in which their influence was felt by succeeding sculptors. In Mr. MURRAY'S book we find everything concerning the works of the great artists that is worth knowing, and this is a more profitable arrangement for the public than to have space wasted on works which are copies of copies, and on others which are more or less commonplace. Mr. MURRAY helps us to comprehend the growth and decline of ancient sculpture, to recognise the qualities which impart style to masterpieces, and to discriminate between a work of genius and one of mere skill. All this was not easy to accomplish, and it would be absurd to suppose that the result should be a sparkling essay, which can be read through in an hour. There are already agreeable compilations of that class. The new “History of Greek Sculpture” is addressed to students who are in search of something better than amusement, and who are willing to pay attention to a man who is master of his subject.

#### PARIS NOTES.

THE excavations that have been lately in operation on the site of the Tuileries for the removal of the foundation-stones of the palace are now nearly finished, and have not been attended with the discovery of the anticipated treasure, valuable documents, or artistic relics. The immense cavity is being filled in, and in a week or two the last vestiges of the old palace will have disappeared, and its site levelled with that of the Rue des Pyramides alongside.

It is stated that the Société des Artistes Français are seriously considering the practicability of utilising the ruins of the Conseil d'Etat and Cour des Comptes, on the Quai d'Orsay, for the construction of a great Palais des Beaux-Arts. Two architects have been charged to make a careful inspection of the ruins, and report

to the society as to the possibility of adapting them for the purpose.

The Committee of Historic Monuments have taken up the question of the Papal Palace at Avignon, which, in addition to the architectural interest it possesses, contains, moreover, many old frescoes now in imminent danger of destruction. The building is at present used as a barrack. A petition was presented to the Government nearly two years ago for the removal of the troops, but without effect; now, however, that the powerful body above referred to is interesting itself in the matter some satisfactory result may be expected.

The Union Centrale des Arts Décoratifs have just published the programme for 1884 of its special classes for instruction in stone, wood, earth, and glass-working. There will be thirty competitions of various kinds, divided into two categories, one comprising sketches and models, the other, designed especially for industrial students, containing only fully-executed works. The prizes consist of large gold and bronze medals, bearing the words “Grand Prix de l'Union Centrale.” Competitors must send in their works between September 25 and October 1 inclusive; the jury will fulfil their duties from October 1 to October 5; and the public exhibition will open immediately afterwards.

The great Route d'Epinay is at last completed, and open for traffic. This superb thoroughfare, which was commenced during the administration of M. Haussmann, runs from the Place du Château d'Eau, under the successive names of the Boulevard Magenta, Boulevard Barbès, and Boulevard Ornano, to the Clignancourt Gate, crosses the Commune of Saint-Ouen, strikes the Seine, along which it continues, forming a splendid quay right through the town of Saint-Denis and the pretty village of La Briche, and finally joins the high road from Paris to Pontoise at Epinay. Throughout the whole distance of ten kilomètres (nearly 6½ miles) the new road keeps the appearance of a Paris boulevard, alike in width, arrangement, and bordering of trees.

The Paris authorities have utilised the iron sheds, formerly erected on the Place de la République for the flower market, as shelters for pedestrians in case of a rain-storm or sudden shower; two in the Champs Elysées and two in the Bois de Boulogne. As they now stand each of these shelters is 50 mètres long by 5 wide, and consists of a zinc roof supported upon cast-iron columns, with tar-pavement for flooring.

M. Bouguereau has proposed to the Académie des Beaux-Arts to petition the Minister of Public Instruction and Fine Arts to increase the yearly allowance of the students at the Villa Medici to the same amount as that received by the pupils of the French Art School in the same city. The matter has been referred to a special committee.

The Cercle Artistique de la Seine opened a fine exhibition of paintings on Christmas Day in its own galleries. Among the exhibitors may be mentioned MM. Feyen-Perrin, Vollon, Stevens, Ribot, Cazin, Lambert, Renoir, &c.

It is announced that the paintings in the Luxembourg Palace will shortly be removed to the Orangery, in order to leave more room for the various services of the Senate.

The designs of MM. Crauk and Croisy have been chosen for the monument to General Chanzy that is to be erected at Le Mans. The former will execute the statue itself, and the latter the pedestal, which will bear eleven figures in bas-relief representing soldiers of the Army of the Loire. Both portions of the work will be exhibited in next year's Salon.

The Chapelle Expiatoire, one of the curiosities of Paris, is threatened with destruction. It has already been disestablished as a religious edifice by the refusal of the Government to appoint a successor to the late incumbent, Abbé Combet, and now the Municipal Council has passed a vote in favour of its entire and immediate demolition. The City Commissioner of Works has consequently been instructed to communicate with the Government on the subject with a view to obtaining its consent, which, as the building is State property, is necessary before it can be touched.

The Chapelle Expiatoire, as it now stands, was commenced in 1816, from the plans of the architects Percier and Fontaine, and finished in 1826, at a total cost of more than 2,000,000 frs. Its aspect, as seen from the outside, recalls that of a temple of antiquity; the high altar stands in the centre, exactly on the spot where for twenty-two years the remains of Louis XVI. and his unhappy Queen had lain.

## THE STUDY OF ART.

THE following address was delivered by Mr. T. Gambier Parry at the annual meeting of the Gloucester School of Art:—

I fear that after having addressed the students and friends of this art school annually with very rare exceptions for the last twenty years I can find nothing new to tell, especially as the same difficulty exists as heretofore in speaking to a mixed audience who have but small interest in the specialities of art, which could be treated with pleasant freedom only before a company of students. But things have changed all round during the last quarter of a century as regards the subjects of public interest and attention, and, among them, in nothing more strikingly so than the estimate of that wide range of subjects included among the arts. There have been many causes for this change of attitude towards fine art. No doubt the facility and cheapness of travelling, the establishment of museums, and the opening of galleries, and many other causes have contributed to this change. The increase of independent wealth consequent on a long period of comparatively general peace may have been another cause, affording the means for the adornment of life that times of struggle and disturbance had kept hard and plain: but there was a cause that lay deeper than them all. The motive power of which those matters were in fact the result was the weariness of the national and individual heart for want of things beautiful—for beauty is a necessity of intelligent life. All good and great art had died out; what remained was forced, unnatural, and frivolous. All over civilised Europe there was no art for the people, and in our own country a contempt for it was a virtue bracketed with manliness. But the craving for beauty is irrepressible; it may be for a while kept still by pressing events of national or individual life—it may be poisoned by calamity, misdirected by vice, chilled by oppression, and dormant for the very want of all healthy food; but the hunger for it is a part of our nature, and is irrepressible, because of the conscious or unconscious conviction in the very depth of all hearts that life and beauty are inseparable. We cling to life, and we yearn for beauty, which is life's symbol. We regard life as our enduring inheritance, and with it therefore beauty is itself immortal. Well may we therefore hunger for it, which is the type of the highest qualities of our nature, the sign which directs the way of the loftiest aspirations of intellect or religion, and the pressing and unfailing evidence of the divinity of life.

It is not everyone who can or cares to realise the depths from which the spirit of fine art springs. Rough times and rude necessities had pressed that spirit down in England, but could not crush it out. It awoke, and our people recognised it. It forced on their attention the common mistake that classed rudeness with honesty, and regarded refinement of taste and cultivation of the poetry of life as incompatible with manly character. Neighbouring nations awoke before us, and forced our awakening into action. Men blunder when they first awake; the light is dim; or, if otherwise, the eyes are dazzled, and so were ours when the arts of other nations were pressed upon us. The faculties we needed to compete with them were dormant. Men there were who had never slept, but they were few; their examples were misunderstood; and their voices were not heeded. But our people awoke—their convictions were stirred, their respect was gained; but who were to be the guides of their first blundering steps, and where was to be found the means of training them, or the knowledge and judgment to make them strong? The arts were looked at with half-blind eyes. They were, as it were, superimposed on our national life, so things of art were confounded with things artificial; and as such they were treated with utter misconception. Art was without purpose, vague and unintelligent. The notion of ornament was as of something foreign to be applied and added to things. The idea of abstract or inherent beauty had not dawned upon our people; and much less so the idea of beauty's use. Use was associated with material, and any beauty in it was regarded as an accident. Intellectual use of beauty and the power and use of beauty's service to heart and life was not realised. Nor can it be so without training or the intuitive gifts of genius. The full conception of fine art cannot be immediately grasped in its full sense as the application of intellectual power to realise beauty. It is the function of genius aroused by the emotions of heart and mind that grasps the conception of beauty's excellence; and then it becomes the function of fine art to present it with all its spiritual force realised in material to the sight and hearts of other men. Such is the highest purpose of fine art, and when realised it is its greatest work.

But art is as wide and various as life, and ministers to it under countless characters. We are interested here in our art school; and if we look at our students now, and back at the many which have worked here, and notice their exceeding variety, the mechanical aptitude of some, the intellectual purpose, the higher aim, the poetical conception of others, our interest is still further aroused by the question that immediately presents itself: what is it in all this variety of aim or talent that a student should set before him, by what motive should he work, and to what purpose? The question is a large one, and one that students should ask themselves; but it is easily answered, for art is free, and as

a man's heart is so will his art be. The purpose of a student should be simply that of humble study. Practical success can only come of patient learning. Whether the student's aim be high or low, this is the truth. I have spoken of fine art in its highest and most serious aspect, but art has a thousand aspects, and when sincerely undertaken it is contemptible in none of them. Let the motive be what it may, whether for the amusement or the work of life, or even without any settled purpose, if it be only approached and pursued with sincerity, it must be, at its lowest estimate, a source of happiness, and therefore of the heart's profit. This is no slight gain; but beyond and beside it a student will learn to gauge his own powers, and if he is wise he will use this school as any other, and taking art as a department of education, as it is in truth for head, heart, and hand, he will master its technicalities, and those great rules and principles which are simply the recorded experience of the great men of other days; and then if he means to make art his life's work, let him throw himself into that line that suits him best; it cannot be forced, for, as I said before, art is free, and as a man's heart is so will his art be. There may be much variety of opinion about the system followed in these schools, but there can be no doubt about the benefit they have rendered to our people. It may be that a visitor strolling through these rooms, and noticing the occupation of the students, may walk away moodily, dissatisfied and displeased; questioning what is the worth of all these hours spent in copying forms which appear in their very nature inane, conventionalities of line and curve that are at once useless and uninteresting or worse still; plaster casts, which are but little else than travesties of natural forms, and with surfaces that quench all sense of the delicacy of life. Why not get natural forms at once? The sources of study would be infinitely richer, and the lessons learnt be infinitely more true. Yes, and so it is, and so they would be; but all such is only possible to students in special circumstances both of purpose and means, and where men of highest cultivation and attainment could be found to teach for love's sake. Where the wide sphere of a nation's art schools has to be provided for, the greater part of such speciality and resource is impossible. But beyond this, the impatient visitor has failed to see that the education of such classes as a nation most desires to draw within its art schools must begin with the barest elements of knowledge; like the child's alphabet for the future poet, first training the attention into a novel groove, and then, by the discipline of patience, teaching them to compare, to analyse, and then to understand what to the sight at first was irksome and to the hand weariness; till at last that sweet refreshment is gained which comes of the mind's first awakening to the sense of beauty. There is the secret spring of the artist's life; and the student, once awake to this, goes on his way rejoicing.

But the visitor still urges, "Why not learn all this from Nature; why not engage masters who can teach its beauty as well as analyse its forms?" Simply because with rarest exception neither the materials nor the men are available to answer to the call of such a multitude of schools and diversity of students. The masters themselves of such schools require a special education; for the elements of very many subjects have to be taught, and these schools are the only places for teaching them. The style of models also, from which the great majority of students work, could not be profitably replaced by natural objects; for the pupils are not commonly intuitive geniuses, but need the simplest training of their faculties of sight and observation. The comparative rudeness of their plaster models affords just the possibilities for easy elementary instruction by the master, and observation by themselves; where natural objects would only confound and confuse the unprepared mind of the students by the complex undulation of form and surface which life produces.

The artistic study of Nature is, of course, the best—where only the means of it can be found—for the moral effect of it alone is invaluable, drawing out the sweetest elements of human nature, and going far to warm the heart no less than train the studying eyes and hand. But let all students bear in mind that whatever motive may impel them, whatever project they have in distant view, whatever class of art they may adopt, the first thing needful is to learn how to see, and the second what to look for. And further, if high art be their purpose, let them be assured that the prose of obedient study is the only sure ground from which to rise to the poetry they aspire to obtain. But if, beyond respect to schools and scholars, we look for one moment on the broad subject of fine art, and consider its action, its influence, and the duty it has performed in the world, we find it to have been and to be a great and beneficent minister to the needs and happiness of human life. As the estimate and direction of that life may be, so is the character of art's ministry to it; as a thing of prose to record the facts and forms of things with precision and without comment, or a thing of poetry to brighten men's lives, arousing sympathy and communicating thought.

Fine art is of its own nature pure and sacred, for the impulses which gave it origin have come from the purest sources of emotion, which are the beauty of nature and the mystery of life. Even in times and scenes of low moral and indulgent luxury, Art has shown herself possessed of that pure and lofty spirit that all the perversion

and misuse of her by evil hands have never been able to drive away. And nowadays among ourselves she has ministered among all classes of our community, and, under countless forms, she has gained the heart of youth and age, instructing while she amused them, and elevating while she soothed them; and if, in a lower sense, men have found her value in a relief from the weariness and mechanism of society that spoils the enjoyment of natural life and mars its beauty, they have found the ministry of Art more precious still as a power to enliven and direct the divine endowment of imagination, which aids them to penetrate morally and spiritually beneath the surface of life's surroundings, and to rise to the great ideal of life's exalted destiny, and thus to find themselves possessed of an inestimable antidote and corrective to the materialising influences of modern interests, philosophy, and civilisation.

### LORD NAPIER OF MAGDALA ON CONSTRUCTION.

THE certificates awarded to the students of the Crystal Palace School of Engineering were handed to the students on Saturday last by Lord Napier of Magdala. His lordship said that the interest he had always taken in the profession of civil engineering made it very agreeable to him to accept the invitation to distribute the certificates on that occasion. He had paid one or two visits to the institution before, and that day he had visited all the workshops and drawing rooms, and it appeared to him that the course of instruction was exceedingly good, for it combined theory with practice. The colonial section, which he had visited in the summer, seemed to him very well adapted to the object in view. He congratulated those gentlemen who had now crossed the threshold of the civil engineers' profession. It was, indeed, impossible to over-estimate the importance of that profession, which was every day taking a higher position in the world. Civil engineers could point to great achievements in different quarters of the globe, especially in America; but he did not think any works there equalled—certainly they did not excel—works that had been executed in Great Britain. It had often appeared to him a question whether the profession of the civil engineer or the medical profession stood highest. The medical man saved life, relieved suffering, and investigated the state of the human frame; the civil engineer also saved life, he brought peoples together, annihilated time and space, and changed the geography of the world. The department which seemed most to require study and advancement was that of architecture. We did not in England seem to have arrived yet at the very best construction of buildings which should combine beauty with comfort and adaptability to their purpose. And that was a great point to present to the civil engineers of the day—to outdo their predecessors in all those great works to which he had alluded. He did not know any greater satisfaction than that which might be enjoyed by the civil engineer in the progress of a great work—in watching its progress and successful completion. The engineers who had to go to the colonies were pioneers. There a great deal depended upon their natural intellect and their ingenuity, because they were not like workers in a civilised country, where everything was ready to their fingers' ends, where they had to make the design and call upon the contractor to fulfil it. In the colonies they had to be their own engineers and their own contractors; they had to make everything, to invent everything, sometimes out of very little; so that they had perhaps a harder task than those who were in the higher part of the profession, though they would no doubt in time attain to that branch. It was very difficult to say to what extent the profession of the engineer might rise in England. Such wonderful works had been done that one's mind found it difficult to define what might be hereafter achieved. The design of the Forth Bridge, which he had seen, appeared to him a wonderful work, spanning 1,600 feet of the sea, and standing 300 feet above the water—a most wonderful work; yet that work, no doubt, in the course of time, would appear small compared to what might be expected from the profession. In architecture, to which he had made some allusion, we still had room for progress. Somehow or other, those nations which had not had science had jumped into the most beautiful structures, from which they might take some examples. In Europe we seemed to be tied between a few Roman and Grecian models and the works of our early architects, our Gothic architects. But the Mohammedans and the Hindoos ages ago, without textbooks, so far as we could learn, without scientific schools, and without guides or rules, had stumbled into the creation of the most beautiful structures, which those who had the good fortune to go to the East would see. It appeared as if the age of conquest in countries was the age of great buildings; so that the cathedrals and great buildings which followed the Norman conquest appeared to overshadow most of the later structures; and buildings in the East which followed the great invasion of the Mogul dynasty were the most beautiful structures. It had struck him that perhaps the construction of these grand buildings was due to the conquerors, who used the money and labour of the people whom they subjected. But now our efforts with our own money were devoted to works

of an utilitarian character. To the students now beginning their career in this admirable profession he would say that they must never cease to labour, for labour was the lot of their profession. The work of students must be characterised by the most perfect accuracy, and they must never omit any opportunity of improving themselves by observing the works of art or the actions of nature. To the practical engineer there was this consolation, that by far the greater portion of great inventions had been the work of practical men. The Forth Bridge was the development of a rude structure raised by the inhabitants of Thibet, Cashmere, and the mountains of India, and consisting of beams projecting from piers, each beam projecting beyond one that supported it, until the two sides approached sufficiently near to admit of a beam being laid across to connect them. This plan had been developed into a scientific and beautiful work by the art of the civil engineer. He wished the students every success in their career, and he trusted that the school would send forth engineers who would raise the name of their profession and the name of England for civil engineering all over the world.

### THE NEWSHAM COLLECTION.

THE collection of pictures and other works of art which the late Mr. Richard Newsham has left to the town of Preston, was, according to the *Herald*, garnered together with the judgment of a practised connoisseur, and the ungrudging purse of a gentleman of ample means. It is an open secret that the Emperor Napoleon III. in his palmiest days greatly desired to become the possessor of this magnificent art collection, which is so soon to become the property of the burgesses of Preston at large. Ten years ago the pictures alone were estimated to be worth between 60,000*l.* and 70,000*l.*, and adding to this the rest of the collection, including statuary, porcelain, and bronzes, it is plain to be seen that this latest gift to Preston will indeed prove one of a princely character. It may be interesting to state in this connection that the interior of the deceased gentleman's residence from an artistic point of view is peculiarly notable in many respects. The drawing-room and the dining-room are hung with many valuable oil paintings, but the oil collection cannot be considered nearly so fine as that of the water-colours, which grace the breakfast-room. The pictures in the latter room are especially noticeable, and the collection, which includes exactly twenty water-colour drawings by Wm. Hunt, is as choice, as far as it goes, as anything that can be found in the kingdom, the subjects being chiefly fruit and flowers. There is not a commonplace picture in the whole of the collection, which is particularly rich in Linnell senior, whose productions were always Mr. Newsham's favourites. *Antwerp Cathedral*, by D. Roberts, with whom Mr. Newsham was on friendly terms for many years, was one of his finest works. This picture was obtained by the deceased gentleman direct from the artist. Another painting is Wm. Etty's *By the Waters of Babylon*, which is unquestionably a charming work. There are also many other paintings of more than ordinary excellence from the brush of such artists as Herbert, Leslie, Creswick, Müller, Egg, MacLise, Cox, and Poole, as well as a small work or two by Frith, Holland, and Hook, in addition to a most valuable painting by Ansdell. In the breakfast room, besides the collection of Hunt's drawings, there is a sketch for the famous drawing *Chat Moss*, by David Cox, which is one of the finest sketches in existence. Several of the Hunt drawings in that room are as fine as any that artist ever produced. These are also accompanied by a magnificent drawing, *A Spanish Bolero*, which is a wonderful specimen of careful execution, by J. Lewis, and several small but exquisite drawings by David Cox. *The Guards coming up Whitehall*, by the latter artist, with the sun shining upon them, is one of the finest works of sunshine and shade playing upon the horses, men, and buildings that art can produce. The Müller pictures are very fine. Many years ago Mr. Newsham sold one of this collection; but, realising the mistake, it became his endeavour to regain possession of it, at the instigation of an old and intimate friend. The picture was finally obtained, and now adorns the walls of the room with which lasting memories of its original owner are associated. Interesting reminiscences hang round many of the pictures—of the way in which they were obtained, or incidents revealing the struggles of the artists who painted them. One of the pictures by Poole has a special interest attaching to it. An intimate friend of the artist was one night taking supper with him and his wife, when allusion was made to a picture in the possession of Mr. Newsham. Poole's friend referred to it as being one of the finest works, especially as to foreground, ever painted. The artist then said: "I painted that when I was a young man. It hung in my room for I don't know how many years, and I never could sell it. Eventually a gentleman invited me to Cambridge to paint a portrait. On going, I took the picture now in the possession of Mr. Newsham with me to try to sell it, and I found a purchaser for 3*l.* and a second-hand top-coat." The same picture now would sell for hundreds of pounds. This is but one of many of the incidents which might be recorded.

## NOTES AND COMMENTS.

MR. LACY W. RIDGE, the popular major of the popular "Artists' Corps," will be well supported, we believe, in his motion at the Institute of Architects on January 7, in favour of a return to the principle of a periodical "infusion of new blood into the Council." The system of monopoly of power has had a trial of several years' duration, and it cannot be said to have given satisfaction to anyone—not even to the fortunate members of Council, who by this time must have discovered the hollowness of the dignity which they were so eager to obtain, and the awkwardness of a distinction which separates them from their equals invidiously without being even beneficial to themselves. Architects and architecture cannot afford at the present day to be handicapped by anything that impedes free movement.

THE Institute of Architects has lost, by the death on Wednesday of M. LESUEUR, a corresponding member who had been elected in 1846. By a remarkable coincidence he was also a member of the Institute of France for the same period, having been chosen as the successor of M. VANDOYER. Soon afterwards he was appointed Professor of Architecture of the Beaux-Arts. M. LESUEUR was born in 1794, at Clairefontaine, near Rambouillet, in the department of Seine et Oise. He entered the Ecole des Beaux-Arts at seventeen years of age; took the second prize for architecture in 1811, and the grand prize in 1819. After his studies in Rome he returned to France, and was engaged to construct the parish church at Vincennes. He was also the architect of the Conservatory of Music at Geneva, and of a number of private buildings. M. LESUEUR was the author of several works, among them being his "Histoire et Théorie de l'Architecture," and his "Chronologie des Rois d'Egypte."

THE sending of Christmas cards having become almost universal, it may not be remembered that the origin of the custom was as recent as 1862. In that year Mr. JOHN LEIGHTON made two designs for small cards of the size of an ordinary gentleman's address card, with the inscription "A Merry Christmas and a Happy New Year." They were produced by Messrs. GOODALL & SON. The next step was the introduction of robins, holly branches, and landscapes. In 1868 the same firm produced cards with Little Red Riding-hood, &c. Messrs. MARCUS WARD & Co., of Belfast, were, however, the first publishers of cards on an extensive scale, and by the employment of clever artists they obtained capital designs and a great variety of subjects. They were followed by Messrs. DE LA RUE, EYRE & SPOTTISWOODE, and other firms. But while the majority of the cards may be designed in England, many publishers now have the printing executed abroad. This is not due to economy alone, but to the difficulty of insuring successful colour-printing in England.

How to house the poor is becoming a more serious question in Paris than in London. That class of inhabitants is daily increasing. In 1875 there were 9,297 lodging-houses, containing 113,987 French and 18,656 foreign lodgers. In 1883 there were 11,753 houses, with 196,229 French and 43,935 foreign tenants. This increase is the more remarkable if compared with that of the general population, which in the same period rose from 2,000,000 to 2,300,000—that is, 15 per cent.; while with the lodgers it was 80 per cent. One of the consequences of overcrowding is that the death-rate due to typhoid fever has been doubled. It is difficult to find a remedy in such a city as Paris, although over six hundred schemes have been sent to the Municipal Council. One scheme would, to carry out, cost twice the amount of the war indemnity paid to Germany. In the first place, it seems to be necessary to enlarge the area of Paris in order to obtain land, and for this purpose the belt of fortifications erected by M. THIERS will have to be removed. As regards the raising of funds, there is no want of money in France, and if security can be given it will be forthcoming for the erection of houses. But what capitalist will accept the bond of a proletariat?

MR. G. G. SCOTT, who was associated with his father in the erection of the new spire of Chichester Cathedral, gives some explanation of the failure of the lightning conductor. After sixteen years' use the conductor required renewal, but as Mr. SCOTT's responsibility ceased with the completion of the spire,

"the duty of replacing the conducting appliances by others of more modern kind rested with the professional advisers of the Chapter." Mr. SCOTT takes the opportunity of pointing out that "scientific persons are somewhat in the habit of throwing contempt upon those stupid people who have carried out in practical work the opinions which the scientists held the day before yesterday, but which they have since abandoned."

THE Leicester Corporation are promoting a Bill in the next session of Parliament for the levying of a borough rate of 2d. in the pound for the purpose of maintaining the free library, the town museum, and the establishment and maintenance of an art gallery. This rate will produce about 3,500*l.* per annum, which, it is believed, will amply provide for the maintenance of the three institutions. Already a considerable number of valuable pictures have been presented to the art gallery, and the town museum is undergoing a complete reconstruction and rearrangement. The antiquities, for which Leicester is famed, have been placed in a special room; while the Roman columns and the milestone of Hadrian's reign, marking the Roman occupation of Leicester by the Romans, with some handsome tessellated pavements, have been placed in a lantern-roofed annex. In the great zoological room, which is 80 feet long, 40 feet broad, and 25 feet high, a striking feature has been introduced in the pictorial representation of the fauna, with a view to showing their habits and their natural surroundings.

ACCORDING to M. CLERMONT GANNEAU, only seven inscriptions are known in Palestine of a date anterior to the destruction of Jerusalem by TITUS. The first is the famous Moabite stone. Four were found in Jerusalem, and they present the peculiarity of being engraved in a cartouch or hollow framing on the rock. Two are much mutilated. The third is a narrative of the excavation by Israelitish engineers of a tunnel 500 mètres long under Mount Moriah. The fourth indicates a small monolith naós of Egyptian style, which is an authentic specimen of native architecture. The next is an inscription marking the boundary of Gezer. The seventh is a stela, which was discovered in 1871 in the foundations of an old Arab edifice close to the Mosque of Omar, and contains the text of the famous law forbidding, under pain of death, to the Gentiles the entrance of the sacred precincts of the Temple, reconstructed by HEROD. It is by virtue of this law, invoked by the enraged Jews, that the Apostle PAUL, after having with great difficulty escaped tumultuary execution, was dragged before the Roman tribunal.

A PARLIAMENTARY Committee are likely to be engaged in considering the merits of rival schemes of communication between both sides of the Thames below London Bridge. The Metropolitan Board proposed a tunnel to cross the Thames from Nightingale Lane to Dockhead, a steam ferry at Woolwich, and one at Greenwich. The Corporation of the City proposed to establish free ferries, and to apply the income of the Bridge House estates to that purpose; the undertaking of the Thames Steam Ferry Company (Limited), and the widening and improvement of Tower Hill are included. A company will seek for authority to make opening bridges at the Tower, at Stepney, and at Greenwich. A subway in the bed or foreshore of the Thames is proposed in connection with each bridge. Another company will propose the construction of a navigable channel from Blackwall across the Isle of Dogs to Limehouse, the establishment of three steam ferries across the Thames, and a free steam ferry across the new channel. It is also proposed to construct a subway under the Thames, commencing in the vicinity of Newington Butts and terminating in King William Street, in the City.

ARCHITECTS have no reason to complain of a scarcity of diaries this year. There are the elegant little books of Messrs. DE LA RUE, some of which seem almost too dainty for everyday use. Of an opposite character are the cheap diaries of Messrs. SMITH. Messrs. LETTS & Co. depend for patronage not only on the character of the blank pages, but on the quantity of information relating to most departments of commerce. Messrs. HUDSON & KEARNS continue to be supreme in the production of diaries and account-books for architects and builders. This year paper and printing seem to be better, the binding is of an enduring kind, and the whole appearance of a copy has something substantial about it. The firm well deserves encouragement.

## ILLUSTRATIONS.

## DESIGN FOR PROPOSED MUNICIPAL BUILDINGS, GLASGOW.

**A**LTHOUGH unsuccessful in the competition, Mr. SKIRVING's design was one of the most characteristic submitted. It is based on the Greek style of architecture. Simplicity, breadth of treatment, and the avoidance of all littleness in parts were aimed at, while expression was given to the chief departments to show their designation in the arrangement of the orders. Thus, for example, the council-chamber is marked out and made an important feature by a Doric portico; the Ionic, from its elegance, is used for the municipal offices; and the festive character of the banqueting-hall by the Corinthian. Phonetic meaning would be further obtained by the addition of sculpture representing *Council, Law, Arts, &c.* The plan is symmetrical and well balanced; the external arrangement is planned to give architectural grandeur. The entrance vestibule hall, with its columns and grand staircase, are a series of combinations, surmounted by the domical roof, affording scope for the highest artistic treatment.

## DESIGN FOR ALL SAINTS CHURCH, IPSWICH.

**A**SINGLE and a double-page illustration of "Proposed Church of All Saints, Ipswich," represent the design submitted to the committee by Mr. MARK J. LANSDELL, A.R.I.B.A. As will be seen on reference to the sheet of geometrical drawings, an attempt has been made to grapple with the requirements set forth by the church committee, which have been given in previous numbers, other than in the ordinary nave and aisle plan. The plan has been arranged with a view to minimise the obstructions to view usually offered to worshippers by columns and the like, and the ingress and egress has received most careful consideration. The general handling of the design shows considerable originality, and considering the low cost of only 7 $\frac{1}{2}$  per sitting, a great effect of dignity, desirable in all town churches, has, as a reference to the perspective view will show, been obtained.

Out of about seventy-five sets of designs submitted by different architects to the committee, this was one of the few chosen by Mr. EWAN CHRISTIAN and retained by him, from which to make the final selection.

## COMPETITIVE DESIGN FOR THE BEDFORD TOWN AND COUNTY CLUB.

**T**HE accompanying illustration represents the design submitted in a limited competition by its conjoint authors, Messrs. A. HESSELL TILTMAN, M.R.I.B.A., 7 John Street, Bedford Row, and FREDERICK GOSLING, of Hampstead. The premises were designed to accommodate from 150 to 200 members, and consist on the ground floor of vestibule, with porter's box, large hall, ladies' room, reading-room, writing-room. Coffee and dining-room closely adjoining servery, kitchen, &c. Very complete lavatory and dressing arrangements are provided. On the first floor is a large smoking-room communicating with a large verandah. Billiard-room for two tables, card-rooms, and apartments for the caretaker. The material proposed to be used was red brick and LASCHELLES' concrete, the roof to be covered with green slates. The estimated cost was 3,280 $\frac{1}{2}$ ., exclusive of furniture and fittings.

## CHIMNEY, HAMPTON COURT.

**T**HIS illustration of one of the picturesque "bits" of Hampton Court has been reproduced from a drawing by Mr. H. M. MATEAR, of Liverpool, which was exhibited this year at the Royal Academy.

**The Produce Exchange Building**, now being erected in New York, will be of colossal dimensions. The foundation is built upon 15,034 piles; there are 109,796 feet of yellow pine capping timber, 17,530 square feet of base stone, and 64,732 square feet of building stone. The building fronts 307 feet on Broadway and Whitehall Street, 159 feet on Stone Street, 150 feet on Beaver Street, and 300 feet on New Street. The tower at the south-east corner of the building is 48 feet square; the height of main building from side-walk to base of tower, 120 feet; height from side-walk to top of tower, 225 feet; and height from side-walk to top of flagpole, 306 feet. The size of the main room of the building is 220 feet by 145 feet, and the height 47 $\frac{1}{2}$  feet. The number of square feet of foundation of the main building is 44,754, of the tower 2,725 feet, and terrace 4,128 feet, making a total of 51,607 square feet. The building and land will have cost 3,000,000 dols. when completed.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

**A** MEETING of the Association was held on the 20th inst. Mr. D. McGibbon, president, occupied the chair. Mr. E. Calvert, architect, read a paper entitled "Technical Training in the Collateral Trades a great Factor to Success." He remarked that many youths are apprenticed to the architectural profession through mistaken ideas on the part of their parents, who imagined that their sons were adapted for architects because they had shown a "taste for drawing," forgetting that more than mere drawing was required. He also referred to the large number of youths who completed their apprenticeship without having acquired a thorough knowledge of construction—being, in fact, little better than copying machines. Had they received some training in the collateral trades they might have developed into useful practical men, instead of swelling the ranks of an overstocked class in the profession. It was to be regretted that no technical schools existed in this country where students of architecture could be initiated in the technique of those trades so inseparably connected with the profession. The lecturer concluded by advising those who desired to gain this practical knowledge to work side by side with mechanics—a course which had been again and again adopted by some of the most distinguished architects, who had considered no post too humble or probation too severe.

## GLASGOW ARCHITECTURAL ASSOCIATION.

**A** LECTURE was delivered last week by Mr. Robert Scott, upon "Building Contracts." The president, Mr. P. M. Chalmers, occupied the chair. The lecturer urged that greater attention ought to be given on the architect's part to the preparation of both plans and schedules before tenders are sought for; that not only should there be scale drawings and details, but also a clear and particular specification; while on the measurer's part every item in the schedule should be so defined that the intending contractor is not obliged to trust to an inspection of the drawings to ascertain the sizes of materials. He then considered in detail the five principal clauses which constitute a Scotch building contract, viz., workmanship and material, with architect's powers; contractor's responsibility; arbitrators; proprietor's powers of omitting or adding to work without vitiating contract. Some of the conditions to be met with are both inequitable and legally untenable. After a considerable discussion of the subject, a vote of thanks was awarded to Mr. Scott.

## LICHFIELD CATHEDRAL.

**A** LECTURE has been delivered by the Rev. Canon Lonsdale on the "Restoration of the Interior of Lichfield Cathedral." The reverend canon said it was believed that the idea of restoration originated with Canon Hutchinson, was taken up by Archdeacon Hodson, and ultimately joined in by Dean Howard, who proved a munificent contributor to the cost. The architect, as is well-known, was the late Sir Gilbert Scott. The first work actually done was the warming of the cathedral from end to end—a work which has stood the test of twenty-five years; for though, of course, boilers and pipes have had to be renewed, the plan originally proposed has been winter after winter brought into action, and has never failed. At that time the nave and transepts were nearly destitute of furniture, while the walls, arches, and pillars were one uniform, dead, yellowish whitewash, many coats thick; as was also the choir, and indeed the whole of the interior. The nave was quite unused; indeed, except during service hours, the verger's silver key alone gave admission to any part of the church; and while morning and evening prayer was going on the nurserymaids, it is said, used to walk up and down the nave with babies in their arms; and even the smell of a cigar has been detected in the nave while service was being sung in the choir. The two parts of the building were altogether separate from each other. The choir was entered by doors under a high screen, composed partly of remains of Bishop "Chad's Shrine" and partly of other materials. This screen filled the whole of the first bay of the present choir. On each side of the entrance were vestries for the lay vicars and the choristers, and above these was placed the organ, the rest of the space, up to the roof, being filled in with glass, so that the separation of nave and choir was complete. The object of this separation was warmth—or the supposition of warmth, for the result was a signal failure, choir and nave being both bitterly cold. In the choir itself the remains of the original reredos, which stood at the spot where the present one is now fixed, had been removed by Wyatt at the end of the last century, and the holy table was carried to the extreme east of the Lady Chapel. On either side from the screen up to the very entrance of the Lady chapel were pews made of oak lined with green baize and studded with brass nails. The choir aisles all down the church were shut out from the choir, the arches being filled in by plaster—in order, as

was supposed, to help towards warmth. In the three bays eastward from the screen, the second, third, and fourth as they are now, were fixed stalls, composed of plaster, wood, rope, nails, &c., with canopies of the same material over them, which the old verger used to call "beautiful tabernacle work." The Dean and Canons Residentiary had stalls in the screen under the organ and facing eastward. At the end of the three bays occupied by the canopied stall, was placed on the south side the bishop's throne, and directly opposite to it the pulpit. The floor of the gangway between the pews was of black and white marble, such as is still to be seen in the Lady Chapel, and a flue ran down the centre for a certain distance, from which much more of cold than of hot air issued. The choir aisles, shut out from the choir, were long narrow passages, ending on the north side in a blank wall, on the south with the monument of the sleeping children. Canon Lonsdale afterwards described the work of restoration undertaken in the nave and transept. In moving the soil, on the west side of the present reredos, the workmen came upon bases of columns, which evidently formed no part of the existing building, for some of them were altogether out of the lines of the present arches, and such mouldings as could be traced on them were rude in character, evidently of an early date. No doubt a church had stood on the site from Norman and even from Saxon times, and here were the traces of it. In the course of these researches two, if not more, stone coffins were laid bare, and sundry odds and ends of early carving. The coffins were replaced in the spot where they were found; the pieces of carving are deposited in the library. The restoration of the nave was found to be comparatively plain sailing. The beautiful capitals, which it was feared might turn out to contain much plaster tinkering, were found, when the whitewash was removed, to be exactly as they are now. No reparation, even in the few places where the moulding is gone, was attempted. Of the stalls and throne the canon said: "The stalls and throne were executed by Mr. Evans, of Ellastone, and are a thoroughly good piece of work. Of course there was a contract price for them; but, when the payment was to be made, Mr. Evans put in a request for some 200*l.* or 300*l.* more than the contract, on the ground that he was so much out of pocket by the transaction. Although not the slightest variation had been made from the original design, Sir G. Scott pressed us to comply with this demand, but we steadily resisted it, urging that a contract was a contract, and that Mr. Evans was no novice at this kind of work. I was comforted shortly afterwards, when I told a Derbyshire friend of Mr. Evans's claim. 'Oh,' he said, 'you may make your mind easy; Mr. Evans is in the habit of driving about the country, and of pointing to a house here, and a church there, of which he has been the builder, saying, "Ah! I lost so much on this job, and so much on that," and yet,' added my friend, 'he is notoriously a well-to-do man.' I tell this story for the benefit of those who may be pressed in a like way." The pavement within the communion rails was alluded to as the noble gift of Messrs. Minton's. The first matter taken in hand after the reopening was the reredos, the money for which (2,000*l.*) was raised by the energy of Mrs. H. Howard, the wife of the dean. She had already presented the costly font in the nave. One main feature proposed for the reredos was that all the materials were to be taken from the diocese; and, with the exception of the green malachite, such was actually the case. The alabaster came from close to Tutbury, and the marbles the production of Derbyshire. The red marble employed was the special gift of the late Duke of Devonshire, and goes by the name of the Duke's Red. The then duke was said to be very chary of this marble, and would hardly allow the quarry to be opened. The interest, however, of Dean Howard caused an exception to be made in favour of the cathedral, and all that was wanted was freely supplied. The pulpit was a matter of much discussion. The opening sermon was preached by Bishop Wilberforce from a temporary wooden structure. It was suggested to Sir G. Scott that a stone pulpit should hang from the large pillar at the end of the nave, after the fashion of the beautiful model at Holy Trinity Church, Coventry. To this, however, he objected, because it would involve the cutting away of a large quantity of the original fabric. "Would the same objection," Canon Lonsdale ventured to say to him, "apply to metal?" "You have hit it," was his answer; and straightway Mr. Skidmore was commissioned to try his hand, the result being the pulpit of to-day. The last piece of restoration of importance was the so-called Consistory Court or Prebendary's Vestry. It is very early work, and in scraping the walls some puzzling features were discovered, pointed arches appearing in the north wall at a lower level than those of the same character which support the roof. Sir G. Scott felt baffled by this discovery, and it was decided to leave exposed what had come to light. A future generation may, perhaps, be able to solve the mystery. The work at this point was not finished until 1880. In conclusion, Canon Lonsdale said that, so far as the interior of the cathedral is concerned, the restoration is well nigh complete. Beyond the filling-in the statues of the ten niches in the Lady Chapel—a task which a public-spirited lady in the Close is doing her best to get executed—little has to be done by way of renewal. Additional stained windows and other ornamentation may of course be introduced, and it is hoped the north and south transept windows may be filled with better glass than that which they contain at present.

Of statuary we have well nigh more than enough; and it is hard to say where another recumbent figure could be lodged without inconveniently blocking the building.

### THE BIRLEY MEMORIALS.

THE sub-committee appointed on October 25 by a conference of the general purposes committee of the Manchester Church Building Society and the general purposes committee of the Board of Education—(1) to ascertain the form and cost of a suitable monument in the cathedral to the memory of the late Mr. Hugh Birley, M.P., and (2) to promote the formation of a committee to secure the erection of the proposed church in Denmark Road—have conferred with the dean and the cathedral architect, Mr. Crowther, on the first point, and have applied to several gentlemen of position and influence with respect to the second. Mr. Crowther advised that the cathedral monument should take the form of a tomb, with canopy, in Caen stone, and with marble recumbent figure. The dean approved of this form of monument, to be placed in the most easterly bay of the north aisle of the chancel, being the south-eastern bay of the Derby Chapel. The sub-committee recommend to the joint committee of the two diocesan societies that a monumental tomb should be erected on the site suggested by the dean and Mr. Crowther, at an estimated cost of 310*l.*, exclusive of figure. The cost of the figure is estimated to be 100*l.* in alabaster, and not less than 200*l.* if executed in white marble. It was subsequently decided to erect the tomb without a canopy, the general feeling further being that the material employed for the tomb should be polished granite in lieu of Caen stone, and the figure executed in white marble. Letters had been received in answer to applications for support of the proposal of a memorial church to be erected in Denmark Road. The secretaries of the Church Building Society have been asked to ascertain what other members of its committee are willing to contribute, and who will act as a committee for the new church.

### ARTISANS' DWELLINGS.

A PAPER on "The Artisans and Labourers' Dwellings Acts, with Suggestions for their Improvement," was read by Dr. Tripe, Medical Officer of Health for Hackney, at the meeting of the Society of Medical Officers of Health on the 21st inst. The author said that the Acts which dealt with artisans' dwellings were, if taken as a whole, very objectionable. In London they placed the duty of carrying out the provisions on two different local authorities—the Metropolitan Board of Works and the Vestries and District Boards. If the work was to be effectually carried out, great alterations must be made in the machinery for working the law as well as in the cost. It was scarcely seemly that the state of the law should be such as to allow of a representation from a medical officer of health to the effect that certain houses were unhealthy and required pulling down, being thrown from one Board to another like a shuttlecock. One thing he would propose was that a landlord might be enabled to obtain an order from a magistrate for the speedy eviction of a tenant on the certificate of a medical officer of health, corroborated by his own oath, that a room or house was unfit for human habitation, in consequence of its dirty or dilapidated condition, defective structure, or from overcrowding. The chief alterations in the law which Dr. Tripe proposed were—That there should be a central authority to whom all reports of houses unfit for human habitation, in consequence of their surroundings or of their defective structure, should be referred; and that improvements should be made in the cost of and the procedure for acquiring these houses and the land upon which they were built, as well as the regulations under which the new dwellings were to be erected; that houses which could be rendered fit for habitation without being pulled down should be dealt with by the local authority, the certificate of the medical officer of health, and the report of the surveyor to determine to which body the matter should be reported in the first instance; that regulations should be made for the whole of London for enforcing a periodical cleansing and repairing of houses at a less rental than 20*l.* a year and of all houses let in lodgings; that a register should be kept at the office of the local authority for registration of the names of the owners; and that the local authority should be able to close the whole or part of such house after the owner had been summoned before a magistrate for penalties and neglect. In the discussion that followed the reading of the paper, Dr. Dudfield said that Torrens's Act, according to his experience, was perfectly useless for purposes of improving the condition of the houses of the poor. It was perfectly monstrous that so much time, trouble, and expense should be necessary to get wretched hovels condemned. What was wanted was some very drastic legislation for dealing with this question. One great difficulty which had to be dealt with was that this wretched property was the best paying of any property. Some arbitrary power was wanted for enabling local authorities to purchase houses at something like the value of the property regarded

as dilapidated and uninhabitable houses. He thought that the medical officers of health should have the power to fix a fair rent. The amounts paid by the poor in some parts of London were entirely out of proportion. The poor should have insured to them fixity of tenure and fair rent. Several other medical officers present gave their experience of the working of existing laws for the purposes of sanitation. Complaint was made of the way in which the Metropolitan Board of Works carried out their duties in respect to the dwellings of the poor. Dr. Tripe replied, and stated that by persuasions and threats he had done more than he could have done by law. The offenders were generally very much afraid of publicity, and sooner than have their names brought before the public would spend a good deal of money in carrying out improvements.

### THE LIGHTING OF LIGHTHOUSES.

A LECTURE was delivered lately in Sunderland by Mr. B. Morton, superintendent of lighthouses for the north-east coast, on the "Lighting of Lighthouses." After sketching the early history of lighthouses, and referring to the first lighthouse built in this country at Dover by the Romans, he stated that from the first establishment of lighthouses, to late in the last century, the illuminaries were generally wood or coal fires. In 1696, tallow candles were adopted in the first Eddystone, and about 1763 rude flax wick oil lamps were employed at the Liverpool lighthouses, in combination with reflectors, the suggestion of Wm. Hutchinson, master mariner of that port. The invention of Argand about 1780 provided a more efficient means of illumination, which, in conjunction with paraboloidal reflectors, were soon generally adopted, and these again were replaced by the large concentric wick lamps and lenses of Augustin Fresnel. These originally could only be procured at Paris; but, owing to the energy and skill of Mr. James Chance, of the firm of Chance Brothers & Co., Birmingham, the industry had been transferred to Birmingham; but any one who had visited Souter Point Lighthouse could not fail to be struck with the perfection and finish in every part of the important apparatus, which was designed by Mr. James Chance, and manufactured by his firm; and apparatus produced by the firm may now be found in every part of the world. Up till about twelve or thirteen years ago, or a few years after the electric light had been introduced into the lighthouse service, the maximum power of a first-order four-wick lamp was 240 candles, and he was glad to say the electric light had had a satisfactory result in stirring up the question of lighthouse illuminants, with a view of obtaining the best possible results from oil and gas as it had been in the lighting world generally. About 1871 Mr. James Douglass—now Sir James Douglass—directed his attention to the improvement of lamps generally, and the Douglass lamp, which is now in universal use throughout the English lighthouse service. In the six-wick lamp the three outer flames would give a light equal to 340 candles, and the six wicks to 720 candles. This lamp had been further increased to eight wicks, and its greatest intensity is 1,150 candles. As the masthead lights of large steamers were now very bright, and might be mistaken for a fixed light under certain circumstances, there was the greater necessity that white fixed lights should be done away with, so as not to confound the one with the other. He then proceeded to explain the various methods adopted to give a distinctive character to each lighthouse. Fixed lights were gradually being altered to what was termed aculating, or blinking lights. Then there were flashing lights. He read the following statement showing the relative intensities of the lights in use throughout the service, as compared with what they were about twenty to thirty years ago, and the standard of comparison was Fresnel's four-wick lamp and fixed dioptric lens, the same as the Coquet light a few years ago; if this was supposed to give a light equal to 100 candles, a six-wick lamp would give 220 as used at the Start:—

#### *Dioptric Lights—Relative Intensities.*

	Candles.
1. Fixed dioptric light, with 4-wick lamps . . .	100
2. Fixed dioptric light, with 6-wick lamps . . .	220
3. Revolving (six sides) 6-wick lamps (Start) . . .	1,887
4. Double-flashing 6-wick lamps, single apparatus . . .	1,245
5. Double-flashing do., double apparatus . . .	2,560
6. Electric fixed (South Foreland) . . .	1,691
7. Electric fixed (Lizard) . . .	3,783
8. Electric revolving (Souter) . . .	7,797

Startling as these figures are, they showed how great had been the progress, not only in improving the power of the lamp, but, still more, how enormously the power of light had been increased by means of the more perfect lenses that were now fitted in lighthouses. The power of the electric light at Souter Point was 1,520, maximum power 3,040; at Foreland, 3,040; at the Lizard, 3,620 and 8,250. Although the power of the electric lamp at Souter was much less than the one employed at the Lizard, yet, owing to Souter being a revolving light, the power of the beam is about twice that of the Lizard. The Eddystone furnished good evidence of the progress in lighthouse illumination, and of the

enormous value of perfect optical apparatus for the utilisation of the illuminant. The original chandelier light in Smeaton's lighthouse was unaided by optical apparatus. It consisted of six tallow candles, weighing about six ounces each; the intensity of the light of each candle had been found to be about 2·8 standard sperm candles; thus the aggregate illuminating power radiating from the 24 candles was about 67 candle units. The consumption of the candles was about 3·4 lb. per hour, and the cost of the light per hour, at the current price of tallow candles, would be about 1s. 6½d. At the shore lighthouses mineral oil is adopted, and at the Eddystone, as at the other rock lighthouses, colza oil is employed on account of its greater safety in use and storage. For the whole year during which the lamps of the Eddystone are burning, between sunset and sunrise, 4,412 hours clear weather, 1,471 thick weather, the cost of the illuminating oil per hour, inclusive of wicks and glass chimneys, was 1s. 7¼d. per hour, being only ½d. more than the present cost per hour would be of the original candles, light at this station of only  $\frac{1}{3882}$ th part of the intensity of the present light. The actual candle power of the lamp is 184 times as powerful as Smeaton's light. On the other hand, as seen by the mariner, assisted by the optical apparatus, it is equal to about 150,000 candles, or 1,900 times the original power of Smeaton's light. Although the power of the light has been enormously increased, yet during certain states of the weather its visibility is not so great as might be expected. Mons. Allelarde, a distinguished French lighthouse engineer, has recently experimented upon the visibility of lights of different intensities during hazy and foggy weather, and according to the theory laid down by him, supposing the weather was such that Smeaton's 67 candle light was only visible at one mile, the audience may be surprised to learn that this magnificent light at the Eddystone would only be seen about three and a half miles. I may state further that the Trinity House is about to erect on St. Catherine's Point, Isle of Wight, an electric light produced by De Meritin dynamo. When one machine is at work the light will be equal to 30,000 candles, or about twenty times the intensity of the electric light at Souter Point; and when the two are employed the intensity will be equal to 60,000 candles, which, when assisted by the optical apparatus, will be a blaze of light of extreme brilliancy, and yet it is conjectured under similar circumstances to Smeaton's when seen at one mile, St. Catherine's will be visible about five miles. Mr. Morton described by diagrams how the light is condensed by the light apparatus. The power of the electric lamp is 1,520 candles, unaided by any optical apparatus; but by the arrangement of glass the light is made equal to the unassisted light of 800,000 candles. The lecturer said he had known three generations of the Darling family. For two thousand years lighthouse illumination had practically remained unchanged, there being nothing but coal fires used. To show the progress that had been made in three generations, he mentioned that one of the Darling family—which was a household word now in the north of England—the father of Grace Darling, had informed him that in the early period of his life as a light-keeper he kept the coal fire at the Brownsman Tower, one of the group of the Farne Islands, and that about the end of last century the reflex and Argand lamps were introduced, and were considered a marvel of scientific skill at the time. His (Mr. Darling's) son, William Brookes, was principal keeper at the Coquet lighthouse, where Fresnel's burner and the dioptric lens were in use; and now the son of the last-named was an assistant keeper at the Souter Point lighthouse, where the electric light was in use and nightly shedding its rays equal to 800,000 candles. The old Fresnel had been in use at the Coquet lighthouse till about six years ago.

### EXCAVATIONS AT ASSOS.

AN account is given in some German papers of the excavations which have been carried on at the site of Assos, one of the oldest cities of Asia Minor. It is mentioned in the Sallier papyrus among the auxiliaries of the Hittites, at Kadesh, on the Orontes, against Rhamses the Great, 1,400 years B.C. It was built on a steep hill, of volcanic origin, south of the Trojan plain, was well protected by its position from hostile attacks, and seems to have been inhabited by a purely Greek population far down into our era. Why it was abandoned we know not. It cannot have been because of its destruction, for most of its buildings are still well preserved; indeed, the best preserved specimens of profane Greek architecture are to be found here. Even the burial-places are in excellent preservation. One hundred and twenty-four sarcophagi were found in one row, all undisturbed; some of them dated from the seventh century before our era, and some belonged to the eleventh century after Christ. But few objects of value were to be found in the tombs. All around the market-place the buildings are in admirable condition. On one side is a pillared portico 110 metres long; on another is still to be seen the raised dais whence speakers harangued the public assembly; on a third side is the Bouleuterion, or council chamber, a handsome building. On the fourth side are the baths, the only Greek specimen of the kind. They are in four storeys, each of the lower two having 26 bathing chambers divided by a corridor. The water came from a

vast cistern constructed under the market-place. The upper storey seems to have been transformed into a Heroon, where the ashes of renowned citizens were deposited, and ashes were found in some funeral urns there. All the buildings have been erected out of the stone of the mountain, which resembles fine granite, and they show a regular architectural development. The exploration has been carried out under the superintendence of some American archæologists.

### GLASGOW ARCHÆOLOGICAL SOCIETY.

AT the last monthly meeting of the Glasgow Archæological Society Dr. David MacKinlay read a paper on "Stonehenge and Abury," illustrated by models and diagrams. Having given an account of the ruins as they stood when noticed by the earliest observers, and their present condition, he dealt with the suggestions as to their origin, and expressed the opinion that, instead of being an outcome of the religious feelings of the ancient Britons, they were rather of a monumental character, erected either to commemorate some great victory or the burial-place of the eminent dead. A discussion followed. Professor Veitch (the chairman) said there seemed to be an inclination between two extremes—if a monument of this kind was not thought to be of a religious character, it was assumed to be of a sepulchral character. He thought—and he judged so from various stones he had examined in the south of Scotland—that these relics were of a combined nature. They both represented the religious and the sepulchral elements, for the ancient Britons were worshippers of ancestors. Mr. W. G. Black also read a paper on "Lanarkshire Folklore."

### NEW MEXICO.

A CORRESPONDENT of the *Times* who is travelling in New Mexico, gives an account of some of the towns in that remote region. There are, he writes, two towns of El Paso, one on the Texas or American side, and the other on the Mexican bank of the river. A considerable military post is located near the former, and it presents an altogether curious example of a southern frontier town. Side by side in the streets stand the low whitewashed houses of the Mexicans, conspicuous by porches and water-spouts, and newly-erected blocks of red brick in the very latest fashion of that nondescript architecture so plentiful in Western American cities. The Chinese quarter is in the midst of the town. The ancient graveyard is crowded by a dingy sheep corral. Smallpox flags are common. There is a new railway station and an old hotel. The streets are filled with desperadoes and gamblers. The people speak English and Spanish, but neither correctly. One is willing, indeed anxious, to leave it behind. The Rio Grande at this point in its course is a broad, low-banked stream, which until lately was crossed by fording. Now there is an adequate bridge connecting the American El Paso and the Mexican El Paso Del Norte. There is an old and a new town of El Paso Del Norte, as in all the Mexican cities which have been galvanised into life by the advent of the railway. Del Norte new town is insignificant in extent as compared with the older quarter, which spreads out over a good many acres of ground. The new station built by the Mexican Central Railway is a modern building, preserving the characteristics of Mexican architecture. It has a wooden frame, but the walls are of mud, encircling an open court surrounded by porches, which, if not so simple in design as a Moorish colonnade, are lighter and less obstructive. The new features of the town, however, have no great interest for the traveller. He concerns himself more with the stranger life of another century which still survives in the native colony. El Paso Del Norte is the oldest settlement in Northern Mexico. A mission was established here by a Franciscan monk in 1585, when a colony formed of a dozen families from Old Castile took possession of the spot. A few years later they were joined by the Spaniards who had been driven out of New Mexico. The streets are long, narrow, and dusty. The houses are all of adobe, most of them surrounding miniature courts. Flowers, and sometimes a fountain, ornament these enclosures; but the street front of the house has no feature that is attractive. The windows, even, are barred or grated. The principal streets lead to the plaza, on one side of which stands an old Jesuit church, built, according to local tradition, three hundred years ago. The interior of the church is rough and bare. A few gaudy but utterly worthless trinkets adorn the altar, a few cheap prints in bright colours are nailed to the wall. The roof is held aloft by long logs of wood, rudely carved by the penitents of the old village. The only really interesting part is a gallery at the back, which is reached by a spiral staircase of curious workmanship. But the vandal could not spare this. He has been here with his paint pot, and daubed over much of the wood with thin white paint. Such of the beams and railings as the restorer has spared show the rich deep brown of the natural wood.

Chihuahua, 225 miles distant, has well-kept streets and rows of

chalk-white houses of stone or adobe. The plaza is more animated as the swarthy women with gourds and earthen pitchers on their heads pass and repass continually to the fountain. There is never an hour in the day when they are not coming or going. And men in gay coloured serapes loiter in the shade or move by with measured step. The water in this fountain is brought from a neighbouring mountain by a stupendous stone aqueduct, which has withstood the ravages of time for over 150 years without repair of any kind. A drive to the outskirts of the city brings the arcades of this vast piece of masonry into view, and shows how faithfully the enslaved labourers, building better than they knew, did their work. The cathedral facing the plaza is a remarkable structure for the country and manner in which it was built. If a thing so unworthy can be compared to a work so grand, it may be said to resemble the splendid cathedral of Antwerp. The structure is wholly of stone quarried from one of the mountains, and was built from a levy on each marc of silver produced from the St. Eulalia mine in Chihuahua, one of the richest in Mexico, and therefore in the world. The cathedral was 100 years building. Instead of having been hoisted, the stones were all carried to the top by mules. A hill was built up to the wall at the back, and on this the animals made the ascent. As the walls grew more dirt was hauled on to the incline, and so the task was pursued to the end. When all was finished it took between two and three years to remove the hill which had been thrown up, and which by that time (as the grade could never be heavy) had extended back into the city. On the façade of the church, between the half Gothic, half Moorish, columns are roughly sculptured effigies of the Apostles. Inside, the sights are not many. There is a certain amount of simple carving about the woodwork, and there are a few pictures. The present floor is a wooden one, and beneath it the bodies lie six and seven deep. The convent of San Francisco in the city has celebrity from the fact that it was there that the patriot Hidalgo was confined. To the market-place is but a step. A longer walk leads to the green semicircle of the Alameda, where Fashion mounts its chariot. Chance glimpses of the interiors of some of the houses are obtained from the street. Sometimes the brightly-painted walls are like visions of Naples, and the green courts are always attractive. The Chihuahua shopkeepers have a custom of displaying only samples to the eye of the public; the stock is stored away in some mysterious recess at the back, usually in an adjoining room.

### ELECTRIC LIGHTING FOR COUNTRY MANSIONS.

ALTHOUGH during the past year electric lighting has not made much progress towards coming into general use for the public, yet a considerable amount of work has been quietly carried out for private installations for supplying large country mansions, &c. Messrs. J. Edmundson & Co., of 19 Great George Street, Westminster, who have for many years made the lighting of large country mansions their speciality, have, during the past year, introduced the incandescent electric light very successfully into a number of large country residences, the following being some of the largest: Didlington Hall, Brandon; Membrand Hall, Ivybridge; Avenue House, Finchley; Warter Priory, Pocklington, &c. The motive power used is different according to circumstances; in some cases being steam, and in others a gas engine, whilst in one or two cases sufficient water power has been found to generate the electricity. Several of these installations have now been working for a considerable time, and have proved that there is no difficulty whatever in this mode of lighting for country-houses, which is both economical and pleasant, the absence of heat and all products of combustion enabling the lights to be used in places where gas or oil lamps would be quite inadmissible. An intelligent labourer can easily take charge of the apparatus.

#### The Housing of the Poor.

SIR,—My attention has been called to a paragraph in your journal to the effect that industrial dwellings are to be erected in St. Luke's on a plan devised by me. This statement is entirely devoid of foundation, and, as it has been copied into other journals, I must ask you to give prominence to my contradiction.

I am, Sir, yours obediently,

GEO. R. SIMS.

Harewood House, Tunbridge Wells :  
December 22, 1883.

## LEGAL.

**High Court of Justice.—Court of Appeal.—Dec. 21.**

(Before Lords Justices COTTON, LINDLEY, and FRY.)

RUSSELL v. WATTS.

LIGHT AND AIR CASE.

The question raised in this case was one of some importance as to the right to access of light. On March 31, 1866, Mr. J. R. Jeffery, who carried on a large drapery business at Liverpool, obtained grants from the Corporation of Liverpool of seven leases, described as A, B, C, D, E, F, and G, of seven plots of land in Liverpool, adjoining each other, for terms respectively of seventy-five years, and he covenanted thereby, for himself, his executors, administrators, and assigns, to build on the land, which comprised in the whole about two acres, according to plans to be submitted by him to, and to be approved by, the council of the borough. He originally intended to erect one large building on the whole of the land for the purposes of his business, but he was compelled by the insurance companies, with which he desired to effect insurances against fire, to alter this plan, and to erect instead seven blocks which communicated with each other and were capable of being occupied as one building, but which could be shut off from each other by means of iron doors and iron shutters to the windows. The whole building was known as Compton House. Some of the rooms in the block were lighted by means of windows looking upon deep well-holes or shafts which were covered with skylights. The building was completed and opened for business by Jeffery in May 1867. During the progress of the building Jeffery obtained advances of money by means of mortgages of the leases. By a deed of June 30, 1866, he mortgaged the property comprised in three of the leases (C, F, and G) to Messrs. E. & R. Moon, "together with all buildings, erections, &c., privileges, easements, and advantages to the said pieces of land appertaining, or with the same or any of them, demised, occupied, or enjoyed." This deed contained a recital of the intention of Jeffery to erect on the land thereby demised and on the other four plots one continuous building, but in such manner as to be capable of subdivision into separate buildings, and that the plans, having been approved by the council of the borough, had been, so far as related to the plots thereby demised, approved by the surveyor of Messrs. Moon, and it was agreed that subject and without prejudice to the provisions of the several leases Jeffery should build and finish on the land demised to Messrs. Moon in accordance with the plans approved by the surveyor. On December 17, 1866, Jeffery mortgaged the property comprised in lease B to Messrs. Brocklebank, Littledale & Tobin. In 1871 Jeffery became a bankrupt. In July 1872, Messrs. Brocklebank obtained a foreclosure decree absolute of the property comprised in lease B, and in January 1873, a similar decree was obtained by Messrs. Moon as to the property comprised in lease C. The plaintiff was originally an underlessee of Messrs. Brocklebank, and occupied the property underleased to him as an hotel, called the Compton Hotel. Messrs. Brocklebank subsequently surrendered the original lease to the corporation, and obtained a new one, and in June 1880, the plaintiff purchased their interest in the new lease. The defendants, in November 1876, purchased from Messrs. Moon their interest under the original lease C, and occupied the property comprised in that lease for their business of haberdashers. The plaintiff's premises were in part lighted by windows which opened on a well-hole situate on the defendants' premises, and the defendants in May 1880, blocked up those windows by nailing boards over them, and afterwards by tarring them over. The action was brought to restrain the defendants from committing acts of trespass, and also to restrain any obstruction of the plaintiff's light derived through the windows in question. Vice-Chancellor Bacon granted an injunction, and the defendants appealed. On the hearing of the appeal it was admitted that the acts of trespass could not be justified.

Lord Justice Cotton said the question was whether there was any implied reservation of an easement of light when the grant was made by Jeffery in June 1866, to the defendants' predecessors in title. There was an enormous difference between a grant and an implied reservation. As a general rule a man could not derogate from his own grant. As regarded a reservation, the matter stood in an entirely different position. The object of an implied reservation was to derogate from the grant, to render it less beneficial to the grantee. These were, no doubt, exceptions from the general rule, as in the case of an essential easement, such as an easement of mutual support of two houses, or the case of a way of necessity, as if a man sold the land surrounding a field which he did not sell. It would be assumed that he intended to use that field, and a way of necessity to it was said to be reserved by implication. There was also another case, which was not really an exception, when several grants were made by the same grantor, not actually contemporaneously, but so as to form really one transaction, then each grantee was held to have the benefit of an implied grant or reservation of those easements, which were really necessary to the enjoyment of the property granted to him. His Lordship was of opinion that there was nothing in the mortgage to Messrs. Moon to lead to an inference that it was intended there should be

any reservation, nor did he think that any reservation was to be implied from the circumstances. Each block of buildings had an interior area or well which, to a great extent, provided for its lighting. It was not suggested that the plaintiff's block could not be lighted from its own internal well. It was not like the case of a way of necessity; it was only a question of more or less commodious occupation. It would be wrong to imply any reservation from the nature of the grant or from the surrounding circumstances. Could it be said that the mortgages were really all one contemporaneous transaction? Could it be said that when the first mortgage was made by Jeffery the others were in his contemplation? His Lordship was of opinion that it could not. But the Vice-Chancellor had decided to a great extent on the ground that there was some equity against the defendants or their predecessors on the ground that they had allowed Jeffery to spend money in the erection of the other buildings. His Lordship could see no such personal equity. The defendants' predecessors did nothing but look on. It would be quite different if it could be shown that they had induced Jeffery to do some acts on the supposition that they would not interfere with him, or if they had known of any facts which he did not. They had no reason to suppose that he did not know his rights. His Lordship was of opinion that there was nothing to justify the conclusion of the Vice-Chancellor. The defendant Duckworth had done nothing to interfere with the plaintiff, and ought not to have been made a defendant, and as against him the action must be dismissed with costs. There would be no costs of the appeal.

Lord Justice Lindley differed. He said that the case was not that of a vendor of a piece of land attempting to derogate from his own grant. It was more like the case of several persons interested in several pieces of land all agreeing to build upon them in a particular way so as to accommodate one another, and of one of them afterwards, when the buildings are up, insisting on rights which were quite inconsistent with the enjoyment of the buildings as erected. There was no authority to show that in such a case any one of such persons could afterwards build on his own land so as to obstruct his neighbour's light, and in the absence of such authority he was of opinion that he could not do so. In such a case, it appeared to His Lordship that the cross-easements which were created in the first instance were impliedly granted in equity, if not at law, and, if such easements were apparent, no purchaser could protect himself against them by alleging that he bought without notice of them. As regarded notice the recitals in Moon's mortgage, and the state of the building, gave the defendants clear and direct notice of the mode in which it was intended to build on the several blocks, and of the mode in which that intention had been carried out. The defendants were in no better position than the mortgagees under whom they claimed. So far as the defendant Watts was concerned, His Lordship was of opinion that the decision of the Vice-Chancellor was correct, and that their appeal ought to be dismissed. As regarded Duckworth, the case was different. He had in no way interfered with the plaintiff's lights, and he ought not to have been made a defendant. This appeal ought, therefore, to be allowed, and the action against him ought to be dismissed with costs.

Lord Justice Fry concurred with Lord Justice Cotton. The Vice-Chancellor had characterised the conduct of the defendant Watts in blocking up the plaintiff's windows as "brutal," and His Lordship did not differ from that view, and he thought that the defendants ought to have no costs of the appeal.

## CHURCH BUILDING AND RESTORATION.

**Cheltenham.**—The church of St. Stephen, Tivoli, Cheltenham, has now been completed, with the exception of south porch and tower and spire, proposed to be built on the north side. The internal dimensions are—nave, 80 feet long and 22 feet wide and 41 feet 7 inches high; side aisles, 81 feet long and 10 feet 6 inches wide; chancel, 38 feet long and 22 feet wide. The style of architecture is Early English of late period. The material used is local stone for the external walling, the dressing and internal linings of the church being of Bath stone, relieved in the interior by the introduction of blue Forest stone and red Mansfield in connection with the piers, arches, shafts, and strings. The total cost has been under 6,000*l.*, and the church will accommodate 580 people. The whole has been built from the designs of Messrs. Middleton & Son, of Westminster and Cheltenham. The contractor was Mr. William Jones, of Gloucester. The carving of the chancel has been executed by Mr. Boulton, and that of the nave and stalls by Messrs. Martyn & Emms; the lighting and warming by Messrs. Marshall, and the ornamental hinges by Mr. Letheren, all of Cheltenham.

**Hereford.**—The chancel of Wellington Church, near Hereford, has been reopened, after complete restoration by the Ecclesiastical Commissioners. The restoration has been carried out in the strictest manner, according to the plans of Mr. Ewan Christian, architect to the Ecclesiastical Commissioners. Part of the walls had to be taken down, but every bit of the material was replaced

in its original position. A new oaken ceiling was fixed with moulded ribs and principals, and a new priest's door was made with ornamental iron decoration by Mr. Letheren, of Cheltenham. Handsomely-carved new oaken stalls and oaken altar rail, the latter with iron ornamental standard, were provided, and the flooring was paved with Godwin's encaustic tiles. Mr. W. Cullis, builder, of Hereford, carried out the work.

**Morley.**—The foundation-stone of a cemetery-chapel has been laid. The chapel will consist of mortuary, chapel, and vestries, and will be surmounted by a spire 75 feet high. The style is Gothic, and accommodation provided in the chapel will be for 84 persons. The structure will be built of Northowram delph stone, with Morley dressings, and will cost about 1,000*l*. The contractors for the various works are—Messrs. J. & J. Sugden, masons; Mr. J. W. Binks, joiner; Mr. E. Thornton, slater; Mr. W. H. Jackson, plumber; Mr. E. Wilson, plasterer; and Mr. J. Parkin, painter. Mr. Joseph Sykes, of Morley, is the architect.

**South Wales.**—The new church of St. Winefred, at Penrhiwceiber, has been opened. The new church, which has been erected in a most commanding position, is in the Gothic style of architecture, built of native stone, the outside dressings being of Ombesley stone, whilst the inside dressings are of Bath stone. The church has been substantially built from designs by Mr. Thomas Nicholson, diocesan architect, of Hereford, by Mr. W. Cullis, builder, also of Hereford.

## ARCHÆOLOGY.

**Excavations at Dodona.**—The excavations recently commenced by M. Carapanos on the site of the ancient Oracle of Dodona, have already led to the discovery of the foundations of the ancient temple of Zeus. Other relics of ancient times have likewise been brought to light in the course of the diggings. The most remarkable of these objects are a considerable number of leaden tablets, on which are written questions that were at one time or other submitted to the ancient Oracle. Such inquiries were naturally left behind at the temple, while the replies were naturally taken away by those who put the questions when they departed home. Hence it is that, with a single exception, no answers have been found on the numerous tablets that have been discovered. In this exceptional instance, besides the question which is on one side of the tablet, the reply of the Oracle is found on the other side. The subject is of little importance in itself. A certain person named Antiochus asks the Oracle to what deity he is to address his prayers, in order that the members of his family may recover from maladies that had long afflicted them. The answer of the Oracle is in the usual indirect and ambiguous style. Antiochus is told that he must go to the city of Hermione and worship the goddess, who will meet him from the opposite island of Idrea, which may, perhaps, be interpreted as a roundabout way of recommending the invalids to try the effects of a sojourn at the seaside. This remarkable tablet has been sent to the Paris Academy of Inscriptions and Fine Arts.

**Roman Remains at Martigny.**—The Cantonal Archæological Commission, organised by the Council of State of Canton Valais, have lately undertaken some excavations in the neighbourhood of Martigny and brought to light several important relics of the Roman period. The spot chosen for the excavations was a meadow in the middle of Martigny, supposed to be the site of the ancient Octodunum. Here, at no great depth from the surface, were found massive walls, chiselled stones, cornices of jurassic marble, and much miscellaneous building material. The character of the relics pointed to the probability that they had formed part of an imposing edifice, such as a temple or a theatre. The excavations being continued, further finds were made, and on November 23 the workmen came on some splendid fragments of gilt-bronze statues. The metal is well preserved but covered with verdigris. The parts so far discovered belong to the best Roman age; among them are an arm and a leg of colossal proportions, the lower part of the body of a personage draped in a toga, with a hand and a forearm almost complete, and a bull's head and foreleg. The excavations are being continued and will, it is hoped, result in the finding of the remaining portions of the statues, in which case they can be restored to their original form. Not far from the spot where these relics have been unearthed was found ten years ago a complete Roman *batterie de cuisine*, consisting of forty pieces, now in the museum at Geneva. The Archæological Commission are conducting excavations in another part of Martigny, where they have partially laid bare the ruins of a circus or amphitheatre. The walls, though considerably decayed, are in several places three mètres high and form an oval arena 75 mètres long and 65 wide. The country about Martigny is undoubtedly rich in Roman remains, but Canton Valais has neither much money to spend in antiquarian researches nor any great disposition to spend it, and there are unfortunately no rich enthusiasts in the neighbourhood able and willing to undertake the work at their own cost.

## GENERAL.

**An International Exhibition** will be held in the Crystal Palace, Sydenham, on April 23, 1884. It is anticipated that the paintings will comprise examples by Belgian, French, German, Spanish, and Swedish artists.

**Mr. W. C. Quilter's Collection** of pictures has been lent to the Bethnal Green Museum. It includes works by Messrs. Linnell, Millais, Hook, Briton Riviere, Leader, Brett, Davis, Gow, and other artists.

**An Industrial Art Exhibition** will be opened in the Palais des Beaux-Arts, Brussels, on to-day (Saturday).

**The Belgian Houses of Parliament** will be restored so as to present a similar appearance to that which existed before the fire. The assembly hall of the chamber will be enlarged in area.

**The Osmaston Manor Estate**, Derbyshire, comprising the large house, 3,400 acres of land, and the model village of Osmaston, has been purchased by Sir Andrew B. Walker, brewer, of Liverpool, Warrington, and Burton-on-Trent. The purchase also includes the whole of the furniture, decorations, and carvings in the mansion, which was built by Mr. Wright at a cost of 200,000*l*.

**A Limited Open Competition** for St. Barnabas Church, Blackburn, has just been decided. Mr. A. Bell, Manchester; Mr. Joseph Bintley, Kendal; Messrs. Stories & Gradwell, Blackburn; and Mr. Varley, F.R.I.B.A., Blackburn, were invited to compete, and all of them sent in plans. The design of Mr. Varley has been accepted. It is in the Early English style of architecture, and will seat 1,000 worshippers.

**The Public Works in Scotland**, to carry out which private Bills are to be promoted next session in Parliament, are estimated to cost 8,000,000*l*.

**The Indian Census Returns** show that there are in the empire 10,347 male and 584 female artists; 1,005 male and 79 female workers in prints and pictures; 15,338 male and 4,663 female workers in carving and figures; 819 male and 16 female workers in designs, medals, and dies; 808,712 male and 27,741 female workers in houses and buildings; 9,343 male and 797 female workers in furniture; 459,159 male and 13,799 female workers in gold, silver, and precious stones.

**San Francisco** now contains 1,097 streets, avenues, and alleys, with 27,550 buildings. There are 92 church organisations, all of which have houses of worship in various parts of the city. The various manufacturing industries number 850, and of these 297 are incorporated in companies, and employ altogether 40,000 mechanics, making a total yearly manufactured product of upwards of 75,000,000 dols.

**The New Rules for Patents.**—The following notice has been issued by the Board of Trade: No applications under the New Patents, &c., Act, will be accepted if they bear a date prior to January 1, 1884, the day upon which the Act comes into operation. Copies of the rules under the Act can be purchased at the Patent Office, Sale Department, Cursitor Street, Chancery Lane. It will not be possible to place the forms for applications under the Act for sale at various post-offices before December 29, but any persons, if they think fit, may prepare forms in manuscript in conformity with the rules.

**Mr. George Pownall** has, it is understood, been appointed as arbitrator under Torrens's Act. It is provided that whenever the local authority serves notice upon an owner for structural alterations or demolition of his property, the owner may call upon the authorities to purchase such property upon terms to be settled by arbitration, and it is in consequence of the Marylebone local authorities being the first called upon to purchase under this provision that Sir Charles Dilke has provided for the present arbitration, which he expects will lay down principles of important bearing with reference to future applications of the Act.

**A Catalogue of the Works of Marc Antonio Raimondi**, the engraver, will be prepared by order of the Trustees of the British Museum.

**Ventilation of the Hospital Ship "Castalia."**—The Local Government Board have approved the adoption, by the Metropolitan Asylums Board, of Messrs. Robert Boyle & Son's Patent Self-acting Air-Pump Ventilators for the ventilation of the twin-ship *Castalia*, which, having been acquired by the board, is being converted into a smallpox hospital. We understand that this is one of the largest ventilating contracts that Messrs. Boyle have yet undertaken, as there are twenty air-pump ventilators, 6 feet in diameter and sixteen 3-feet diameter, included in the contract, which embraces all the necessary shafting, fixing, &c., &c. When the work is finished, owing to the elaborate and complete nature of the arrangements, it is expected to be one of the most unique examples of ventilation in existence. The air-pump ventilators are also being applied to the transport steamers attached to the *Castalia*. Messrs. Boyle are at present executing a large navy contract for the Dutch Government, their patent ventilators, upcast and downcast, supplied for the iron-clads, being made wholly of copper.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, DECEMBER 29, 1883.

### TENDERS, ETC.

\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

\* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Supplement to THE ARCHITECT."

### EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

### TO AMERICAN SUBSCRIBERS.

All subscriptions are payable one year in advance, and may commence at any date.

The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.

Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED TO GILBERT WOOD, 175 Strand, W.C., London, England.

In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—

To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order.

### ADVERTISEMENT SCALE.

For Two Lines and under	£0 2 6
For every Additional Line	0 0 6
For Quarter Page	2 10 0
For Half Page	4 10 0
For a Page	8 8 0

On pages preceding and following matter, special rates.

Public Companies' Advertisements, 12l. 12s. per page; 1s. per line.

Special arrangement may be made for a series of insertions on application at the Office, 175 Strand, London, W.C.

### NOTICE TO THE PUBLIC.

By the Post Office arrangements THE ARCHITECT can now be sent to any part of the United Kingdom by an affixed Halfpenny stamp; hitherto the postage has very frequently been twopence per copy. The Publisher will be happy to forward, for 20s. per annum, post paid, THE ARCHITECT, to residents in towns and neighbourhoods to which there is no easy access by railway. Terms for the half-year, 10s.

Our readers are invited to address us on subjects of interest to themselves or the public. We shall be always ready to insert letters asking for a solution of any suitable questions of a professional or practical nature, and to receive replies to such inquiries.

### COMPETITIONS OPEN.

ABERDEEN.—July 1, 1884.—The Testamentary Trustees of the late Mr. John Steill, of Edinburgh, hereby notify that they will Receive Models for a Colossal Statue of Wallace, in Bronze, with Basement of Granite Blocks, to be placed on the Mound in the North-West part of the Duthie Public Park, near the City of Aberdeen, in conformity with Instructions left by Mr. Steill, at a cost not exceeding £3,000. Intending Competitors, on Application, accompanied with a Remittance of 10s. 6d. to Mr. John Otto Macqueen, 10 Bridge Street, Aberdeen, will be supplied with Copies of Mr. Steill's Instructions, Conditions of the Competition, and Lithograph Plan of the Duthie Park, showing Sections of the Mound. The Author of the Accepted Model will be employed to Execute the Work; and the Author of that next in order of merit will Receive a Premium of £50.

CAPE TOWN.—Jan. 30.—The Town Council of the City of Cape Town invite Plans and Specifications, accompanied with approximate estimate of cost, of a System of Drainage. Selected Plans and Specifications to become the absolute property of the Corporation. All others will be returned free of expense. Premium of 250l. A plan of the City, with levels, may be seen, and further information may be obtained, on application to the South African Loan, Mortgage, and Mercantile Agency, 9 King William Street, London, E.C.

HOWDEN.—Jan. 5.—For System of Sewerage and Sewage Disposal. Mr. Henry Green, Assistant Clerk to the Rural Sanitary Authority, Howden.
